**Explanation:** Where Renaming tool error message can be one of the following:
- Active Balancing File Space Calculation Failed
- Activity File Space Calculation Failed
- Failed to Adjust CTV members in CTD JCL data set
- Failed to Adjust members in CTD PARM data set
- Failed to Adjust members in CTD SKL data set
- Failed to Build ECAPARMC
- Failed to Build ECAPARMD for APPL=(D)
- Failed to Build ECAPARMD for APPL=(F)
- Failed to Build ECAPARMM
- Failed to build the IOAKPRM parameters member
- Failed to build the IOARULES member
- Failed to Build the IOASPRM parameters member
- Failed to build the IOAXPRM parameters member
- Failed to build the SECPARM member
- Failed to copy *Prod* procedures
- Failed to copy *Prod* started tasks
- Failed to Format IOA Data Base
- Failed to save Parameters
- Failed to Update Global Index File parameters
- Group File Space Calculation Failed
- IOA Log File Space Calculation Failed
- Media Database Space Calculation Failed
- Report File Space Calculation Failed
- Space Calculation for ACTive User File Failed
- Space Calculation for Columns File Failed
- Space Calculation for Databases File Failed
- Space Calculation for HiSTory User File Failed
- Space Calculation for MIgrated User File Failed
- Space Calculation for PeRManent User File Failed
- Space Calculation for Variables File Failed
- Stacking Database Space Calculation Failed
- Trace File Space Calculation Failed
- Vars Definition File Space Calculation Failed
Vars Generations File Space Calculation Failed

**Corrective Action:** Correct the problem and run the Renaming tool again.

**IOAI26W** *DataSetName (MemberName)*

**Explanation:** The format of the member differs in the two versions of IOA involved in the Express Upgrade process.

**Corrective Action:** Continue with the Express Upgrade. After performing the “Complete the Upgrade” step, check that no problems exist with the functionality of the products. If there are no problems, the message can be ignored and no further action is required.

**IOAI27E** Renaming tool cannot be invoked in this environment when the **MODE** is different from ALLOC

**Explanation:** The message is issued when the Renaming Tool is invoked on the base environment with the **MODE**=FULL or **MODE**=ADJUST.

**Corrective Action:** Set the **MODE** to ALLOC and then invoke the Renaming tool.

**Messages IOAJ 00 through IOAJ xx**

This group includes messages for the IOA (infrastructure) product.

**IOAJ 01I** CONDITION WAS ADDED AT LOC=rba DATE=date NAME=name BY USER=userId **J=**jobName (jobId)

**Explanation:** A condition was successfully added to the IOA Conditions file. This message is issued only when condition change logging is active. In a monitor address space, this message will be preceded by message IOAJ 59I. The variables in this message are:

- **rba** - The location in the Conditions file where the condition was stored (used for diagnostic purposes only).
- **date** - The date in local format of the condition that was added.
- **name** - The name of the condition that was added.
- **userId** - The user ID that is associated with the operation.
- **jobName** - The name of the job, started task, or TSO user address space associated with the operation.
- **jobId** - The JES job ID of the address space associated with the operation.

Logging of changes to the IOA Conditions file is controlled by the **CNDLOG** parameter in the **IOAPARM** member of the IOA PARM library. In ICE, you can specify the **CNDLOG** parameter, as follows:

1. From the IOA Installation Menu, select Customization.
2. Select the environment to customize.
3. In the Customization screen, set Product ID to IOA and select Product Customization.
4. Select Major Step 2, “Customize IOA Dataset Parameters.”
5. Select Minor Step 3, “Conditions File(s) Parameters.”

**Corrective Action:** No action is required.

IOAJ02I CONDITION WAS DELETED AT LOC=rba DATE=date NAME=name BY USER=userId jobName (jobId)

**Explanation:** A condition was successfully deleted from the IOA Conditions file. This message is issued only when condition change logging is active. In a monitor address space, this message will be preceded by message IOAJ59I.

The variables in this message are:

- **rba** - The location in the Conditions file where the condition was stored prior to being deleted (used for diagnostic purposes only).
- **date** - The date in local format of the condition that was deleted.
- **name** - The name of the condition that was deleted.
- **userId** - The user ID that is associated with the operation.
- **jobName** - The name of the job, started task or TSO user address space associated with the operation.
- **jobId** - The JES job ID of the address space associated with the operation.

Logging of changes to the IOA Conditions file is controlled by the CNDLOG parameter in the IOAPARM member of the IOA PARM library. In ICE, you can specify the CNDLOG parameter, as follows:

1. From the IOA Installation Menu, select Customization.
2. Select the environment to customize.
3. In the Customization screen, set Product ID to IOA and select Product Customization.
4. Select Major Step 2, “Customize IOA Dataset Parameters.”
5. Select Minor Step 3, “Conditions File(s) Parameters.”

**Corrective Action:** No action is required.

IOAJ10E NO PLACE TO ADD CONDITION USER=userId DATE=date NAME=name

**Explanation:** A condition was not added to the IOA Conditions file because there was no available space in the relevant records of the file. Note that the IOA Conditions file is divided into records according to the day of the month within the condition date; therefore, it is possible that other conditions with different dates can still be added even though conditions for a particular day of the month cannot.

The variables in this message are:
The operation is not carried out. The IOA Conditions file is left unchanged, but the address space requesting the operation may terminate as a result.

Corrective Action: In order to maintain production flow, try to add the condition from IOA online screen 4. If the problem persists, you may free up some space by deleting conditions that are not needed, that have the same day of the month as the condition that was not added. For example, if the date of the condition that was not added is 0312, and your dates are in European format, then you may try deleting other conditions whose day is 03, such as those with date 0301, 0302 etc. If the date is STAT then you may try deleting other conditions with date STAT.

If the problem is not due to a large number of conditions that were mistakenly added, contact your IOA administrator to seek a long-term solution. The IOAVERFY utility can be used to analyze the current capacity of the file and to see the distribution of conditions among the days of the month. The Control-M New Day procedure can be used to delete conditions from the IOA Conditions file on a daily basis, and the IOACLND utility can also be used to periodically delete unneeded conditions. If necessary, the IOA Conditions file may be reallocated and reformatted with a higher number of blocks per day, using the IOABCN utility. In that case, the DUAL IOA Conditions file (/DAALTCND) and/or the Control-M JOURNAL Condition file may need to be reallocated as well. Note that when reformating the file, all of the conditions that have been added to the file will be lost.

IOAJ10W CONDITION FILE IS prc% FULL. PLEASE NOTIFY THE IOA ADMINISTRATOR

Explanation: Highlighted, unrollable message.

The IOA Conditions file is nearly full. In order to prevent the IOAJ10E message the Control-x alerts the user if the IOA Conditional file is over 90% full for particular day.

The prc% in this message is the percent of day file space usage. Processing continues.

Corrective Action: Notify the INCONTROL administrator. Probably the IOA Condition File size should be increased. For more information, see the description of the IOAJ10E message.

IOAJ20S DACNDF QNAME=file_shrqnam WHILE IOAPARM SHRQNAM=parm_shrqnam

Explanation: The IOA Conditions file is not accessible due to an integrity check failure. The file may be corrupted, or it may have been formatted by the IOABCN utility with a shared resource QNAME which is different from the current shared resource QNAME. It is possible that an attempt was made to access an IOA Conditions file that belongs to another installation.

Access to the IOA Conditions failed. The address space requesting to access the IOA Conditions file may terminate as a result.

The variables in this message are:
file_shrqnam - The shared resource QNAME inside the file, corresponding to the shared resource QNAME which was defined at the time that the IOA Conditions file was formatted.

parm_shrqnam - The current shared resource QNAME, as defined in the IOA PARM library.

The shared resource QNAME is defined by the SHRQNAM parameter. In a customized installation, you specify SHRQNAM in ICE step 4.2. In a Default or Cloning installation, you specify SHRQNAM on panel (DI.4.0).

Corrective Action: Verify that the correct IOA Conditions file is being used. If the correct file is used, contact your IOA administrator to check if the file needs to be restored or reformatted. Note that when reformattting the file, all of the conditions that have been added to the file will be lost.

IOAJ21S DACNDF NOT FORMATTED AS CONDITION FILE, FILE ID=fid

Explanation: The IOA Conditions file is not accessible due to an integrity check failure. The file may be corrupted, or it may have not been formatted by the IOABCN utility. It is possible that an incorrect file is allocated to DDNAME //DACNDF.

In this message, fid is the three-letter internal file ID that is marked in the first record of the file (this should be SNC for an IOA Conditions file).

Access to the IOA Conditions failed. The address space requesting to access the IOA Conditions file may terminate as a result.

Corrective Action: Verify that the correct IOA Conditions file is being used. The name of the IOA Conditions file usually has a low level qualifier of CND, such as IOA.CND. If the correct file is used, contact your IOA administrator to check if the file needs to be restored or reformatted. Note that when reformattting the file, all of the conditions that have been added to the file will be lost.

IOAJ22S DACNDF IS NOT AVAILABLE, FILE STATUS=status

Explanation: The IOA Conditions file is not accessible due to an integrity check failure. The file may be corrupted, or it may have been partially formatted by the IOABCN utility. It is possible that an attempt was made to access an IOA Conditions file that began formatting but failed before completing.

In this message, status is the six-letter internal status that is marked in the first record of the file (should be FREE for a properly formatted IOA Conditions file).

Access to the IOA Conditions file failed. The address space requesting to access the IOA Conditions file may terminate as a result.

Corrective Action: Verify that the correct IOA Conditions file is being used. If the correct file is used, contact your IOA administrator to check if the file needs to be restored or reformatted. Note that when reformattting the file, all of the conditions that have been added to the file will be lost.

IOAJ23S DACNDF BLOCKS PER DAY=file_cndrec_num WHILE IOAPARM CNDREC#=parm_cndrec_num

Explanation: The IOA Conditions file is not accessible due to an integrity check failure. The file may be corrupted, or it may have been formatted by the IOABCN utility with a number of blocks per day which is different from the current number of blocks per day. It is possible that an attempt was made to access an IOA Conditions file that belongs to another installation.
Access to the IOA Conditions file failed. The address space requesting to access the IOA Conditions file may terminate as a result.

The variables in this message are:

- `file_cndrec_num` - The number of blocks per day inside the file, corresponding to the number of blocks per day which was defined at the time that the IOA Conditions file was formatted.
- `parm_cndrec_num` - The current number of blocks per day, as defined in the IOA PARM library.

The number of blocks per day is defined by the CNDREC# parameter. In ICE, you can specify the CNDREC# parameter, as follows:

1. From the IOA Installation Menu, select Customization.
2. Select the environment to customize.
3. In the Customization screen, set Product ID to IOA and select Product Customization.
4. Select Major Step 2, “Customize IOA Dataset Parameters.”
5. Select Minor Step 3, “Conditions File(s) Parameters.”

**Corrective Action:** Verify that the correct IOA Conditions file is being used. If the correct file is used, contact your IOA administrator to check if the file needs to be restored or reformatted. Note that when reformattting the file, all of the conditions that have been added to the file will be lost.

**IOAJ51W CONDITION NOT ADDED - ALREADY EXISTS. USER=userId DATE=date NAME=name**

**Explanation:** A condition was not added to the IOA Conditions file. The same condition, with the same name and same date, already exists in the file. The operation cannot be performed because the IOA Conditions file can contain only one instance of each condition.

The variables in this message are:

- `userId` - The user ID that is associated with the operation.
- `date` - The date in local format of the condition that was attempted to be added.
- `name` - The name of the condition that was attempted to be added.

The operation is not carried out. The IOA Conditions file is left unchanged, and the address space requesting the operation continues functioning.

**Corrective Action:** No action is required. However, if the message repeats then you may reconsider whether adding the condition under these circumstances is really necessary.

**IOAJ52W CONDITION NOT DELETED - DOES NOT EXIST. USER=userId DATE=date NAME=name**

**Explanation:** A condition was not deleted from the IOA Conditions file. A condition with the same name and same date does not exist in the file. The operation cannot be performed because only conditions that are contained in the IOA Conditions file can be deleted.

The variables in this message are:
• **userId** - The user ID that is associated with the operation.
• **date** - The date in local format of the condition that was attempted to be deleted.
• **name** - The name of the condition that was attempted to be deleted.

The operation is not carried out. The IOA Conditions file is left unchanged, and the address space requesting the operation continues functioning.

**Corrective Action:** No action is required. However, if the message repeats then you may reconsider whether deleting the condition under these circumstances is really necessary.

IOAJ53E INVALID CONDITION DATE=\(date\) FUNC=\(func\) USER=\(userId\) NAME=\(name\)

**Explanation:** An invalid DATE was specified in a call for condition services.

The variables in this message are:
• **date** - the invalid date provided in the call
• **func** - the internal function code representing the request type
• **userId** - the USERID associated with the request
• **name** - the condition name

The service is not performed. The caller of the service may decide to terminate or shut down.

**Corrective Action:** If the cause is not attributable to user error, contact BMC Software Customer Support.

IOAJ54E INVALID CONDITION NAME. FUNC=\(func\) USER=\(userId\) DATE=\(date\) NAME=\(name\)

**Explanation:** An invalid CONDITION NAME was specified in a call for condition services.

The variables in this message are:
• **func** - the internal function code representing the request type
• **userId** - the USERID associated with the request
• **date** - the date in local format provided in the call
• **name** - the invalid condition name

The service is not performed. The caller of the service may decide to terminate or shut down.

**Corrective Action:** If the cause is not attributable to user error, contact BMC Software Customer Support.

IOAJ55E INVALID CONDITION LEN=\(length\). FUNC=\(func\) USER=\(userId\) DATE=\(date\) NAME=\(name\)

**Explanation:** An invalid CONDITION length was specified in a call for condition services.

The variables in this message are:
- **length** - the invalid length of the condition specified in the call
- **func** - the internal function code representing the request type
- **userID** - the USERID associated with the request
- **date** - the date in local format provided in the call
- **name** - the condition name

The service is not performed. The caller of the service may decide to terminate or shut down.

**Corrective Action:** If the cause is not attributable to user error, contact BMC Software Customer Support.

**IOAJ57S IOACND INTERNAL ERROR. FUNC=func DIAG=diag**

**Explanation:** An internal error occurred in a call for condition services.

The variables in this message are:
- **func** - the internal function code representing the request type
- **diag** - the diagnostic code identifying the exact internal error code. This value is used by BMC to locate the exact place and circumstances of the error.

An SVC DUMP is taken, or a SNAP DUMP is written to //DACNDDMP. The caller of the service may decide to terminate execution.

**Corrective Action:** Review the job log and look for additional error messages with a prefix of IOAJ, such as IOAJ23S or a similar message, which were issued shortly before this message. If such a message is found, review the documentation for that message for a possible explanation of the source of the problem. If this does not help, or if no such preceding messages are found, save the job log and the DUMP which was produced, and contact BMC Software Customer Support.

**IOAJ58S IOACND UNKNOWN INTERNAL ERROR. FUNC=func DIAG=diag**

**Explanation:** An unidentified internal error occurred in a call for condition services.

The variables in this message are:
- **func** - the internal function code representing the request type
- **diag** - the diagnostic code identifying the internal error code. This value is used by BMC to locate the exact place and circumstances of the error.

An SVC DUMP is taken, or a SNAP DUMP is written to //DACNDDMP. The caller of the service may decide to terminate execution.

**Corrective Action:** Review the job log and look for additional error messages with a prefix of IOAJ, such as IOAJ23S or a similar message, which were issued shortly before this message. If such a message is found, review the documentation for that message for a possible explanation of the source of the problem. If this does not help, or if no such preceding messages are found, save the job log and the DUMP which was produced, and contact BMC Software Customer Support.
IOAJ59I CONDITION LOGGING IS ACTIVE. DESTINATION=\textit{log\_dest}

\textbf{Explanation:} Logging of changes to the IOA Conditions file is active. Note that this message only appears in monitor address spaces, not in batch jobs and not during online sessions.

For each condition that will be added to or deleted from the current address space, message IOAJ01I or IOAJ02I will be issued respectively.

In this message, \textit{log\_dest} is the destination where logging messages IOAJ01I and IOAJ02I will be issued, in either IOALOG or SYSLOG. This corresponds to the setting of the CNDLOG parameter in the IOAPARM member of the IOA PARM library.

Logging of changes to the IOA Conditions file is controlled by the CNDLOG parameter in the IOAPARM member of the IOA PARM library. In ICE, you can specify the CNDLOG parameter, as follows:

1. From the IOA Installation Menu, select Customization.
2. Select the environment to customize.
3. In the Customization screen, set Product ID to IOA and select Product Customization.
4. Select Major Step 2, “Customize IOA Dataset Parameters.”
5. Select Minor Step 3, “Conditions File(s) Parameters.”

\textbf{Corrective Action:} No action is required.

IOAJ5A1 CONDITION LOGGING IS INACTIVE

\textbf{Explanation:} Logging of changes to the IOA Conditions file is inactive. Note that this message only appears in monitor address spaces, not in batch jobs and not during online sessions. No logging with messages IOAJ01I or IOAJ02I will be done for conditions that are going to be added to or deleted from the current address space.

Logging of changes to the IOA Conditions file is controlled by the CNDLOG parameter in the IOAPARM member of the IOA PARM library. In ICE, you can specify the CNDLOG parameter, as follows:

1. From the IOA Installation Menu, select Customization.
2. Select the environment to customize.
3. In the Customization screen, set Product ID to IOA and select Product Customization.
4. Select Major Step 2, “Customize IOA Dataset Parameters.”
5. Select Minor Step 3, “Conditions File(s) Parameters.”

\textbf{Corrective Action:} No action is required.

IOAJ5BE GETMAIN IN ECSA AREA FAILED. FUNC=\textit{func} DIAG=\textit{diag}

\textbf{Explanation:} A GETMAIN request in ECSA failed in a call to condition services.

The variables in this message are:
**IOAJ5CE** GETMAIN IN PRIVATE AREA FAILED. **FUNC=func** **DIAG=diag**

**Explanation:** A GETMAIN request in private area failed in a call to condition services.

The variables in this message are:

- **func** - the internal function code representing the request type
- **diag** - the diagnostic code identifying the internal error code. This value is used by BMC to locate the exact place and circumstances of the error.

An SVC DUMP is taken, or a SNAP DUMP is written to //DACNDDMP. The caller of the service may decide to terminate execution.

**Corrective Action:** Review the job log and system log and look for other error messages which may help identify the source of the problem, not necessarily related to the IOA Conditions infrastructure. Review and adjust the appropriate storage limitations for the system or for the specific address space as necessary. If this does not help, save the job log, the relevant part of the system log and DUMP which was produced, and contact BMC Software Customer Support.

**IOAJ5DS** IOACND INTERNAL ERROR DURING INITIALIZATION. **DIAG=diag**

**Explanation:** An internal error occurred during condition services initialization.

In this message, **diag** is the diagnostic code identifying the exact internal error code. This value is used by BMC to locate the exact place and circumstances of the error.

The condition services initialization fails. The caller of the service may decide to terminate execution.

**Corrective Action:** Contact BMC Software Customer Support.

**IOAJ5EI** CONDITION LOGGING IS SUPPRESSED

**Explanation:** Logging of changes to the IOA Conditions file is inactive. It is possible that logging of changes to the IOA Conditions file was requested by the CNDLOG parameter in the IOAPARM member of the IOA PARM library; however, the program accessing the IOA Conditions file requested that logging be suppressed. Note that this message only appears in monitor address spaces, not in batch jobs and not during online sessions.

No logging with messages **IOAJ01I** or **IOAJ02I** will be done for conditions that are going to be added to or deleted from the current address space.

**Corrective Action:** No action is required.
IOAJ5FI WRITING TO DUAL CONDITIONS FILE (DAALTCND) IS ACTIVE

Explanation: Mirroring of changes to the IOA Conditions file is active. Each change that is done to the IOA Conditions file (/DAACNDF) will also be mirrored to the alternate IOA Conditions file (/DAALTCND). Note that this message only appears in monitor address spaces, not in batch jobs and not during online sessions.

For each record of the IOA Conditions file that is going to be updated from the current address space, the same data will be updated in the corresponding record in the alternate IOA Conditions file.

Mirroring of changes to the IOA Conditions file is controlled by the DUALDB parameter in the IOAPARM member of the IOA PARM library. In ICE, you can specify the DUALDB parameter, as follows:

1. From the IOA Installation Menu, select Customization.
2. Select the environment to customize.
3. In the Customization screen, set Product ID to IOA and select Product Customization.
4. Select Major Step 2, “Customize IOA Dataset Parameters.”
5. Select Minor Step 3, “Conditions File(s) Parameters.”

Corrective Action: No action is required.

IOAJ5GE CONDITION NOT ADDED - NOT AUTHORIZED. USER=userID
DATE=date NAME=name

Explanation: A call to add a condition has not been authorized by the security interface.

The variables in this message are:
- userID - the USERID associated with the request
- date - the date in local format provided in the call
- name - the condition name

The condition is not added.

Corrective Action: Determine whether the user should be authorized to add the condition and if not, why an unauthorized user tried to add the condition.

If any variable in the message is invalid and the cause is not attributable to user error, contact BMC Software Customer Support.

IOAJ5HE CONDITION NOT DELETED - NOT AUTHORIZED. USER=userID
DATE=date NAME=name

Explanation: A call to delete a condition has not been authorized by the security interface.

The variables in this message are:
- userID - the USERID associated with the request
- date - the date in local format provided in the call
- name - the condition name

The condition is not deleted.
Corrective Action: Determine whether the user should be authorized to delete the condition and if not, why an unauthorized user tried to delete the condition.

If any variable in the message is invalid and the cause is not attributable to user error, contact BMC Software Customer Support.

IOAJ5IE CONDITION CHECK NOT AUTHORIZED. USER=userID DATE=date NAME=name

Explanation: A call to check the status of a condition has not been authorized by the security interface.

The variables in this message are:
- userID - the USERID associated with the request
- date - the date in local format provided in the call
- name - the condition name

The status of the condition is not returned and the operation fails.

Corrective Action: Determine whether the user should be authorized to check the condition and if not, why an unauthorized user tried to check the condition status.

If any variable in the message is invalid and the cause is not attributable to user error, contact BMC Software Customer Support.

IOAJ5JI NO CONDITION DELETED - NONE FOUND. USER=useID FROM=fromDate TO=toDate DATE=date NAME=name

Explanation: This information message indicates that a call to delete all conditions according to given criteria has not found any condition matching the criteria.

The variables in this message are:
- userID - the USERID associated with the request
- fromDate - start of the date range provided in the call
- toDate - end of the date range provided in the call
- date - additional specific date (such as STAT, 0101) to delete provided in the call
- name - the condition name

Corrective Action: No action is required.

IOAJ5KI NO CONDITION DELETED - NONE FOUND. USER=useID FROM=fromDate TO=toDate NAME=name

Explanation: This information message indicates that a call to delete all conditions according to given criteria has not found any condition matching the criteria.

The variables in this message are:
INCONTROL for z/OS Messages Manual

- `userID` - the USERID associated with the request
- `fromDate` - start of the date range provided in the call
- `toDate` - end of the date range provided in the call
- `name` - the condition name

**Corrective Action:** No action is required.

**IOAJ5LI NO CONDITION DELETED - NONE FOUND. USER=*useID* DATE=*date* NAME=*name***

**Explanation:** This information message indicates that a call to delete all conditions according to given criteria has not found any condition matching the criteria.

The variables in this message are:
- `userID` - the USERID associated with the request
- `date` - specific date (STAT, 0101, or mask) to delete provided in the call
- `name` - the condition name

**Corrective Action:** No action is required.

**IOAJ5MI NO MATCHING CONDITION DELETED - ALL IGNORED. USER=*useID* FROM=*fromDate* TO=*toDate* DATE=*date* NAME=*name***

**Explanation:** This information message indicates that a call to delete all conditions according to given criteria has found some condition matching the criteria, but the caller requested to skip the deletion of each found condition.

The variables in this message are:
- `userID` - the USERID associated with the request
- `fromDate` - start of the date range provided in the call
- `toDate` - end of the date range provided in the call
- `date` - additional specific date (such as STAT, 0101) to delete provided in the call
- `name` - the condition name

**Corrective Action:** No action is required.

**IOAJ5NI NO MATCHING CONDITION DELETED - ALL IGNORED. USER=*useID* FROM=*fromDate* TO=*toDate* NAME=*name***

**Explanation:** This information indicates that a call to delete all conditions according to given criteria has found some condition matching the criteria, but the caller requested to skip the deletion of each found condition.

The variables in this message are:
INCONTROL for z/OS Messages Manual

- **userID** - the USERID associated with the request
- **fromDate** - start of the date range provided in the call
- **toDate** - end of the date range provided in the call
- **name** - the condition name

**Corrective Action:** No action is required.

**IOAJ50I** NO MATCHING CONDITION DELETED - ALL IGNORED.
USER=userid DATE=date NAME=name

**Explanation:** This information message indicates that a call to delete all conditions according to given criteria has found some condition matching the criteria, but the caller requested to skip the deletion of each found condition.

The variables in this message are:
- **userID** - the USERID associated with the request
- **date** - the specific date in local format or date mask provided in the call
- **name** - the condition name

**Corrective Action:** No action is required.

**IOAJ60I** WRITING TO DUAL CONDITIONS FILE (DAALTCND) IS SUPPRESSED

**Explanation:** Mirroring of changes to the IOA Conditions file is inactive. Changes that are done to the IOA Conditions file (/DAACNDF) will not be mirrored to the alternate IOA Conditions file (/DAALTCND). It is possible that mirroring of changes to the IOA Conditions file was requested by the DUALDB parameter in the IOAPARM member of the IOA PARM library; however, the program accessing the IOA Conditions file requested that mirroring be suppressed. Note that this message only appears in monitor address spaces, not in batch jobs and not during online sessions.

**Corrective Action:** No action is required.

**IOAJ70E** PARAMETER IS NOT SUPPORTED PLEASE TRY AGAIN.PROGRAM TERMINATED

**Explanation:** An invalid parameter was entered for the IOAPCP3 utility.
The wrong parameter is logged with a return code of 20.

**Corrective Action:** Change the parameter to a valid value.

**IOAJ71E** ENVIRONMENT INITIALIZATION FAILED, IOAENV RC=rc

**Explanation:** The IOAPCP3 utility could not initiate an environment.

Additional error messages are displayed prior to this message. The program terminates with a return code of 16.

**Corrective Action:** Correct the preceding error messages, and rerun the job.
IOAJ 72E GETMAIN FOR INPUT DDNAME DASACND FAILED.

Explanation: The IOAPCP3 utility could not allocate an area of virtual storage for the input step. The system informs the user which of the steps did not execute, and exits with a return code of 16.

Corrective Action: Increase the region size, and rerun the job.

IOAJ 73E GETMAIN FOR OUTPUT DDNAME DASACND FAILED.

Explanation: The IOAPCP3 utility could not allocate an area of virtual storage for the output step. The system informs the user which of the steps did not execute, and exits with a return code of 16.

Corrective Action: Increase the region size, and rerun the job.

IOAJ 74E OPEN INPUT DDNAME DASACND FAILED.

Explanation: The IOAPCP3 utility could not open the file from which it had to read. The system informs the user which of the steps did not execute, and exits with a return code of 12.

Corrective Action: Verify that the file exists, there is no problem accessing the file, and that nobody else is currently using the same file.

IOAJ 75E OPEN OUTPUT DDNAME DASACND FAILED.

Explanation: The program could not open the file from which it had to read. The system tells the user know which of the steps did not execute and exits with a return code of 12.

Corrective Action: Verify that the file exists, there is no problem accessing the file, and that nobody else is currently using the same file.

IOAJ 76E ERROR AT IOACND INTERNAL FUNCTION= FUNCTION, SEE IOACND FAILURE.

Explanation: A failure occurred in the IOACND member. The system tells the user know which of the steps did not execute and exits with a return code of 8.

Corrective Action: Check the return code with the IOACND error message for further response.

Messages IOAL00 through IOALxx

This group includes messages for the IOA (infrastructure) product.

IOAL00I IDL FACILITY RECEIVED REQUEST (request)

Explanation: This information message indicates that IDL facility received the specified request either through a modify command or programmatically.

In this message, request is the name of the request. Valid values are:

- SNAP

Note:
When this message is issued for a SNAP request, the current date is additionally issued as DATE (dd/mm/yyyy).

**Corrective Action:** No action is required.

IOAL01I module csect offset length date time release apar lng from

**Explanation:** This information message specifies a line of the level information for a separate CSECT. A group of IOAL01I messages are preceded by header message IOAL02I.

The variables in this message are:
INCONTROL for z/OS Messages Manual

- **module** - name of a module
- **csect** - name of a CSECT
- **offset** - offset value for the indicated CSECT, relative to the beginning of the module
- **length** - CSECT length
- **date** - date of compilation
- **time** - time of compilation
- **release** - IOA release this CSECT belongs to
- **apar** - last APAR ID applied to the indicated CSECT
- **lng** - language in which this CSECT is written. Valid values are:
  - ASM (Assembler)
  - S/C (SAS/C)
- **from** - where this module was taken from, to identify its level. Valid values are:
  - storage - from storage
  - library - from disk

**Corrective Action:** No action is required.

IOAL02I MODULE CSECT OFFSET LENGTH DATE TIME RELEASE APAR LNG FROM

**Explanation:** This information message is a header for a group of subsequent IOAL01I messages.

**Corrective Action:** No action is required.

IOAL03I size kb OF IDL DATA SUCCESSFULLY SNAPPED AT 
(address-time-date) sss.tt sec CPU used; DUP=dup_value

**Explanation:** This information message indicates that IDL facility successfully performed a SNAP request.

The variables in this message are:

- **size** - number of kilobytes the SNAP data occupies in storage
- **address** - starting address of the SNAP data in storage
- **time** - time the SNAP data was written
- **date** - date the SNAP data was written
- **sss.tt** - number of seconds the CPU takes to generate and write the SNAP data into memory
- **dup_value** - value of the DUP parameter. Valid values are:
  - HANDLE - each instance of a duplicate module is handled
  - IGNORE - only the first instance from a group of duplicate modules is handled
The DUP value is set by the program and can be replaced at any time by the DUP={ HANDLE | IGNORE } modify command.

**Corrective Action:** No action is required.

**IOAL04I FIRST IDL SNAP REQUEST RECEIVED**

**Explanation:** This information message indicates that IDL facility received the first SNAP request since startup.

**Corrective Action:** No action is required.

**IOAL05S INTERNAL ERROR OCCURRED (error) IN IDL FACILITY, UNABLE TO CONTINUE**

**Explanation:** The IDL facility encountered an internal problem, which is specified by the `error` value. The only valid value for `error` is:

<table>
<thead>
<tr>
<th>error</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>040</td>
<td>The IDL facility did not discover the SNAP data, even though at least one SNAP request was already performed</td>
</tr>
</tbody>
</table>

The IDL facility removes itself. Normal processing of the INCONTROL product continues.

**Corrective Action:** No action is required.

**IOAL06I IDL ENVIRONMENT REMOVED SUCCESSFULLY**

**Explanation:** This information message indicates that IDL facility has removed itself. Normally this message is issued when the INCONTROL product goes down.

**Corrective Action:** No action is required.

**IOAL07W IDL ROUTINE (routine) FAILED WITH RC (rsn) REQUEST (request)**

**Explanation:** The IDL facility encountered an error when performing a request.

The variables in this message are:

- `routine` - name of a routine that discovered an error
- `rsn` - reason code of an error
- `request` - name of the request that is performed when the IDL facility encountered a specified error

The indicated request fails.

**Corrective Action:** Contact BMC Software Customer Support.
IOAL08S FAILURE (rc) TO CREATE SNAP TOKEN FOR IDL

**Explanation:** A severe error was encountered when the IDL facility tried to create an MVS token. The IDL facility removes itself. Normal processing of the INCONTROL product continues.

**Corrective Action:** Contact BMC Software Customer Support.

IOAL09W CALL (call) OF BINDER API FAILED WITH RC (rc) REASON (rsn), MODULE (mod)

**Explanation:** The IDL facility encountered the specified error when performing a Binder API call. This message is followed by one of the messages from IOAL10W-IOAL1YW or IOAL31W-IOAL3HW, which describes the reason for the failure.

**Corrective Action:** If necessary, contact BMC Software Customer Support.

**Note:**
You should contact BMC Software Customer Support if the variables in this message differ from the following:
- RC=08
- REASON=83000514
- MODULE=mod

This means that the specified module is changed (replaced or moved) in the load library during an INCONTROL product run. This may happen when a new PTF is applied or the LOAD library is compressed.

IOAL0AI  mod tcb cbName owner epa length subpool use attribute resident amode alias

**Explanation:** This information message describes a separate load module. A group of IOAL0AI messages are preceded by header message IOAL0BI.

The variables in this message are:
- mod - name of a module
- tcb - TCB address
- cbName - name of the control block that controls the indicated module.

**Valid values are:**
- RB
- LLE
- **owner** - TCB address of an owner subtask
- **epa** - entry point address of a module
- **length** - size of a module
- **subpool** - subpool number in which a module resides
- **use** - use counter of a module
- **attribute** - attributes of a module.
  
  Valid values are:
  - Rent
  - Reus
  - AC1

- **resident** - area in which this module resides.
  
  Valid values are:
  - FLPA
  - PLPA
  - MLPA
  - JPA
  - >16

- **amode** - addressing mode of a module.
  
  Valid values are:
  - 24
  - 31
  - ANY

- **alias** - name of a module of which the indicated module is an alias.

**Corrective Action:** No action is required.

**Explanation:**
This information message is a header for a group of subsequent IOAL0AI messages.

**Corrective Action:** No action is required.

**Explanation:**
The IDL facility discovered the specified module has been reloaded since the previous SNAP request was performed.

The variables in this message are:
• mod - name of a module that IDL facility discovered was reloaded
• time Stamp - timestamp of the last SNAP request before the specified module was reloaded

Corrective Action: No action is required.

IOAL0DI MODULE (mod) WAS DELETED SINCE LAST IDL SNAP (time Stamp)

Explanation: This information message indicates that the IDL facility discovered the specified module has been deleted since the previous SNAP request was performed.

The variables in this message are:
• mod - name of a module that IDL facility discovered was deleted
• time Stamp - timestamp of the last SNAP request before the specified module was deleted

Corrective Action: No action is required.

IOAL0EI NEW TASK (mod / tcbAddress) STARTED SINCE LAST IDL SNAP (time Stamp)

Explanation: This information message indicates that the IDL facility discovered that a new subtask has been started since the previous SNAP request was performed.

The variables in this message are:
• mod - name of a main module running under the control of a new subtask
• tcbAddress - TCB address of a new subtask
• time Stamp - timestamp of the last SNAP request before the specified subtask started

Corrective Action: No action is required.

IOAL0FW MODULE (mod / csect) CHANGED SINCE LAST IDL SNAP (old time Stamp / new time Stamp)

Explanation: The IDL facility discovered a change in the specified module/csect, which occurred between the instances specified by two subsequent timestamps.

The variables in this message are:
• mod - name of a module which in the IDL facility discovered a change
• csect - CSECT of a module which in IDL facility discovered a change
• old time Stamp - timestamp of the previous SNAP request
• new time Stamp - timestamp of the last SNAP request

Corrective Action: No action is required.
IOAL0GI APAR (old_apar / new_apar) CODE COMPILED (old_time / new_time / old_date - new_date)

**Explanation:** This information message follows message IOAL0FW and describes the change that the IDL facility discovered in the module specified in message IOAL0FW.

The variables in this message are:
- **old_apar**: last APAR ID applied to the CSECT specified by IOAL0FW before the change
- **new_apar**: last APAR ID applied to the CSECT specified by IOAL0FW after the change
- **old_time**: compilation time of the CSECT specified by IOAL0FW before the change
- **new_time**: compilation time of the CSECT specified by IOAL0FW after the change
- **old_date**: compilation date of the CSECT specified by IOAL0FW before the change
- **new_date**: compilation date of the CSECT specified by IOAL0FW after the change

**Corrective Action:** No action is required.

IOAL0HW CSVQUERY FAILED TO GET REQUESTED DATA, RC (004)

**Explanation:** The IDL facility encountered an error when performing an internal CSVQUERY request. The current IDL request fails. Processing continues.

**Corrective Action:** Contact BMC Software Customer Support.

IOAL0IW CSVQUERY FAILED TO LOCATE MODULE (mod) EPA (address)

**Explanation:** The IDL facility encountered an error when performing an internal CSVQUERY request to locate the specified module. The current IDL request fails. Processing continues.

**Corrective Action:** Contact BMC Software Customer Support.

IOAL0JW CSVQUERY FAILURE: RC (rc)

**Explanation:** The IDL facility encountered a failure when performing an internal CSVQUERY request. The current IDL request fails. Processing continues.

**Corrective Action:** Contact BMC Software Customer Support.

IOAL0KI OLD TASK (mod tcbAddress) COMPLETED SINCE LAST IDL SNAP (timeStamp)

**Explanation:** This information message indicates that the IDL facility discovered that a specified subtask has been completed since the previous SNAP request was performed.

The variables in this message are:
**mod** - name of a main module that ran under the control of a completed subtask

**tcbAddress** - TCB address of an old subtask

**timeStamp** - timestamp of the last SNAP request before the specified subtask was completed

**Corrective Action:** No action is required.

**IOAL0LI** **BINDER API OUTPUT (DABAPI) HAS BEEN {ENABLED | DISABLED}**

**Explanation:** This information message is sent in response to the DABAPI={ENABLE | DISABLE} modify command issued by an operator:

- When DABAPI=ENABLE, the DABAPI output file is enabled, and the original IBM diagnostic messages of the Binder API are sent to this output.
- When DABAPI=DISABLE, the DABAPI output file is disabled. (Default)

**Corrective Action:** No action is required.

**IOAL0MW** **INVALID GROUP SPECIFIED (group_ID), DEFAULT GROUP ID (default_group_ID) WILL BE USED**

**Explanation:** An invalid group ID was specified in an IDL=SHOWGROUP=group_ID modify command issued by an operator.

The "IOA" group ID is used instead of the requested group. Processing continues.

**Corrective Action:** Correct the group ID and reissue the modify command.

**IOAL0OW** **IDL FACILITY RECEIVED INVALID REQUEST (request)**

**Explanation:** An unknown IDL= request modify command was issued by an operator.

The invalid request is ignored.

**Corrective Action:** Correct the request and reissue the modify command.

**IOAL0PI** **IDL ENVIRONMENT CREATED SUCCESSFULLY; APAR (apar) RELEASE (release) IDL (address)**

**Explanation:** This information message indicates that the IDL facility has been successfully started and its environment has been created.

The variables in this message are:

- **apar** - last APAR ID applied to the main IDL module
- **release** - IOA release to which the main IDL module belongs
- **address** - area address of IDL internals

**Corrective Action:** No action is required.

**IOAL0QW** **NO IDL ENVIRONMENT CREATED, RC (rc)**

**Explanation:** The IDL facility has failed to create its environment.
Corrective Action: Contact BMC Customer Support, specifying the return code displayed.

IOAL0RI IDL REQUEST (request) PROCESSED SUCCESSFULLY, sss.tt sec CPU used; ITEMS: item1/item2

Explanation: This information message indicates that the IDL facility has successfully processed the IDL request.

The variables in this message are:

- request - name of the request the IDL facility processed
- sss.tt - CPU time that was consumed by the IDL facility to process the request
- item1 - first output parameter of the processed request. In most cases, this variable contains the number of elements the IDL facility processed when implementing the request.
- item2 - second output parameter of the processed request. In most cases, this variable contains the number of elements the IDL facility did not process (skipped) when implementing the request.

Corrective Action: No action is required.

IOAL0SW IDL ENVIRONMENT ALREADY EXISTS

Explanation: The IDL facility failed to create another IDL environment, because one already exists.

Corrective Action: Contact BMC Software Customer Support.

IOAL0TS IDL FACILITY FAILED (rc) TO ALLOCATE ddName OUTPUT DD STATEMENT, IOALLOC (rc)

Explanation: A severe error was encountered when the IDL facility was trying to allocate the DAPRIIDL output DD statement.

The IDL environment is not created. Normal processing continues.

Corrective Action: Contact BMC Software Customer Support.

IOAL0UW CSVQUERY RETURNED ZERO ENTRY POINT TOKEN FOR EPA (address)

Explanation: The IDL facility encountered a failure when performing an internal CSVQUERY request for the specified entry point address.

The module with the specified entry point address is not processed. Normal processing continues.

Corrective Action: Contact BMC Software Customer Support.

IOAL0VI BINDER API OUTPUT (DABAPI) ALREADY {ENABLED | DISABLED}

Explanation: This information message is sent in response to the DABAPI={ENABLE | DISABLE} modify command issued by an operator.
When DABAPI=ENABLED, the DABAPI output file is already enabled, and the original IBM diagnostic messages of the Binder API are sent to this output.

- When DABAPI=DISABLED, the DABAPI output file is already disabled. (Default)

Corrective Action: No action is required.

IOAL0WW BINDER API FAILED TO PROCESS MODULE \( (mod) \), NO LEVEL DATA WRITTEN; RC \( (rc) \) REASON \( (rsn) \)

Explanation: One of the Binder API functions failed (with the specified return code and reason code) when the IDL facility tried to process the specified module.

The specified module is not processed. Normal processing continues.

Corrective Action: Contact BMC Software Customer Support.

IOAL0XI \( mod \) csect offset size timeStamp release apar entrypoint-token attributes sp apf

Explanation: A set of IOAL0XI messages is issued in response to a SHOWSNAP request. Each IOAL0XI message specifies a line of the level information for a separate CSECT.

The variables in this message are:
- \( mod \) - name of a module
- \( csect \) - name of a CSECT
- \( offset \) - offset value for the indicated CSECT relative to the beginning of the module
- \( size \) - CSECT size
- \( timeStamp \) - time and date of the CSECT compilation
- \( release \) - IOA release to which this CSECT belongs
- \( apar \) - last APAR ID applied to the indicated CSECT
- \( entrypoint \) - entry point token of the module
- \( attributes \) - attributes of the module
- \( sp \) - subpool number in which the module resides
- \( apf \) - APF authorization code of the module

Corrective Action: No action is required.

IOAL0YS FAILURE TO GET STORAGE size KB FOR IDL SNAP BUFFER

Explanation: The IDL facility failed to allocate storage for the SNAP buffer.

The IDL environment removes itself. Normal processing continues.

Corrective Action: Contact BMC Software Customer Support.
IOAL0ZS IDL FAILED TO LOAD MODULE (mod)

Explanation: The IDL facility failed to load the specified module. The IDL environment removes itself. Normal processing continues.

Corrective Action: Contact BMC Software Customer Support.

IOAL10W EDITING REQUEST FAILED DURING INCLUSION OF THE MODULE

Explanation: One or more editing requests (delete, change, or replace operations) failed during inclusion of the module.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000502.

Corrective Action: Contact BMC Software Customer Support.

IOAL11W INCLUDED MODULE NOT EDITABLE

Explanation: The included module was marked NOT-EDITABLE.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000505.

Corrective Action: Contact BMC Software Customer Support.

IOAL12W FORMAT ERROR ENCOUNTERED

Explanation: A format error was encountered in a module being included.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000507.

Corrective Action: Contact BMC Software Customer Support.

IOAL13W ERRORS ENCOUNTERED IN THE INCLUDED MODULE

Explanation: Errors were encountered in the included module.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000510.

Corrective Action: Contact BMC Software Customer Support.
IOAL14W RECURSIVE STATEMENT ENCOUNTERED

**Explanation:** A control statement in an included file attempted to include the file containing the statement, or include another file that, in turn, included the original file.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000511.

**Corrective Action:** Contact BMC Software Customer Support.

IOAL15W EITHER VERSION OF REQUESTED MEMBER OR TTR ADDRESS IN LIBRARY WAS CHANGED

**Explanation:** The Binder API is unable to process the indicated module, either because of its version or because the TTR address in the library was changed since the module was first loaded.

**Note:**
You should contact BMC Software Customer Support if the variables in this message differ from the following:
- RC=08
- REASON=83000514

MODULE=module

This means that the specified module is changed (replaced or moved) in the load library during an INCONTROL product run. This may happen when a new PTF is applied or the LOAD library is compressed.

**Corrective Action:** No action is required.

IOAL16W FORMAT ERROR ENCOUNTERED IN CONTROL STATEMENT

**Explanation:** A format error has been encountered in one or more control statements.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000516.

**Corrective Action:** Contact BMC Software Customer Support.

IOAL17W NAME STATEMENT ENCOUNTERED, BUT NO TARGET LIBRARY SPECIFIED

**Explanation:** A NAME control statement was encountered, but no target library (MODLIB) was specified.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000517.

**Corrective Action:** Contact BMC Software Customer Support.
IOAL18W NAME STATEMENT ENCOUNTERED IN A SECONDARY INPUT FILE

Explanation: A NAME control statement was encountered in a secondary input file.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000518.

Corrective Action: Contact BMC Software Customer Support.

IOAL19W ERRORS (INVALID DATA) FOUND IN A MODULE BROUGHT BY INCLUDE

Explanation: Errors (invalid data) were found in a module being brought in by an INCLUDE control statement.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000519.

Corrective Action: Contact BMC Software Customer Support.

IOAL1AW DATA SET OR LIBRARY MEMBER SPECIFIED BY INCLUDE STATEMENT NOT FOUND

Explanation: The data set or library member specified by an INCLUDE control statement could not be found.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000520.

Corrective Action: Contact BMC Software Customer Support.

IOAL1BW I/O ERROR WHEN READING INPUT DATA SET OR DIRECTORY SPECIFIED IN INCLUDE

Explanation: An I/O error occurred while trying to read an input data set (or directory) specified on an INCLUDE control statement.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000521.

Corrective Action: Contact BMC Software Customer Support.
IOAL1CW DATA SET SPECIFIED IN INCLUDE STATEMENT COULD NOT BE OPENED

Explanation: The input data set specified on an INCLUDE control statement could not be opened.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000522.

Corrective Action: Contact BMC Software Customer Support.

IOAL1DW IDENTIFY DATA CANNOT BE PROCESSED DUE TO SECTION NOT INCLUDED PRIOR TO IDENTIFY STATEMENT

Explanation: Identify data could not be processed because the section was not included prior to the identify statement.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000527.

Corrective Action: Contact BMC Software Customer Support.

IOAL1EW LACK OF REQUIRED PARAMETERS FOR INTYPE

Explanation: Not all the parameters required for the specified INTYPE were provided.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000101.

Corrective Action: Contact BMC Software Customer Support.

IOAL1FW INCLUDE ATTEMPTED TO INCLUDE A SECOND MODULE WHEN ACCESS USED

Explanation: The INCLUDE call attempted to include a second module when the processing intent is ACCESS.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000500.

Corrective Action: Contact BMC Software Customer Support.

IOAL1GW I/O ERROR OCCURRED WHILE READING INPUT DATA SET OR ITS DIRECTORY

Explanation: An I/O error occurred while trying to read the input data set or its directory.
This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000503.

**Corrective Action:** Contact BMC Software Customer Support.

**IOAL1HW MODULE SUCCESSFULLY INCLUDED, BUT ALIASES OR ATTRIB OPTION COULD NOT BE HONORED**

**Explanation:** The module was successfully included, but the ALIASES or ATTRIB option could not be honored because the directory was not accessible.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000504.

**Corrective Action:** Contact BMC Software Customer Support.

**IOAL1IW FILE COULD NOT BE OPENED**

**Explanation:** The file could not be opened.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000513.

**Corrective Action:** Contact BMC Software Customer Support.

**IOAL1JW FORMAT ERROR IN THE REQUESTED MODULE**

**Explanation:** For INTENT=ACCESS, the requested module contained a format error and was not been placed in the workmod.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000523.

**Corrective Action:** Contact BMC Software Customer Support.

**IOAL1KW OPTION VALUE MISSING OR INVALID**

**Explanation:** The option value is invalid for the specified keyword.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000108.

**Corrective Action:** Contact BMC Software Customer Support.
IOAL1LW OPTIONS OPTION ENCOUNTERED IN THE OPTIONS FILE

Explanation: There was a syntax error or unrecognized option in the parameter list.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000111.

Corrective Action: Contact BMC Software Customer Support.

IOAL1MW FAILURE TO OPEN PRINT DATA SET

Explanation: A print data set could not be opened during initialization.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000200.

Corrective Action: Contact BMC Software Customer Support.

IOAL1NW INVALID OPTIONS SPECIFIED IN STARTD

Explanation: One or more invalid options, specified in STARTD, were ignored.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000201.

Corrective Action: Contact BMC Software Customer Support.

IOAL1OW FAILURE TO OPEN TERM DATA SET

Explanation: The SYSTERM data set could not be opened during initialization.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000203.

Corrective Action: Contact BMC Software Customer Support.

IOAL1PW CURRENT TIME IS UNAVAILABLE FROM THE OPERATING SYSTEM

Explanation: The date and time could not be obtained from the operating system.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000205.

Corrective Action: Contact BMC Software Customer Support.
IOAL1QW FAILURE TO OPEN SYSTERM DATA SET

Explanation: The data set or file allocated to TERM could not be found.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000206.

Corrective Action: Contact BMC Software Customer Support.

IOAL1RW FAILURE TO OPEN SYSPRINT DATA SET

Explanation: The data set or file allocated to PRINT could not be found.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000207.

Corrective Action: Contact BMC Software Customer Support.

IOAL1SW WORKMOD IA IN AN ALTERED STATE AND PROTECT=YES SPECIFIED

Explanation: The workmod was in an altered state, but PROTECT=YES was specified.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000707.

Corrective Action: Contact BMC Software Customer Support.

IOAL1TW BUFFER IS NOT LARGE ENOUGH FOR ONE RECORD

Explanation: The buffer is too small for a single record.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000750.

Corrective Action: Contact BMC Software Customer Support.

IOAL1UW REQUESTED ITEM DID NOT EXIST OR EMPTY

Explanation: The requested element was not found or was empty.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000801.

Corrective Action: Contact BMC Software Customer Support.
IOAL1VW BUFFER VERSION INCOMPATIBLE WITH THE MODULE CONTENT

**Explanation:** The workmod data is incompatible with the specified buffer version.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000813.

**Corrective Action:** Contact BMC Software Customer Support.

IOAL1WW WORKMOD IS IN AN UNBOUND STATE

**Explanation:** The workmod was in an unbound state. GET calls are not allowed.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000102.

**Corrective Action:** Contact BMC Software Customer Support.

IOAL1XW UNEXPECTED CONDITION OCCURRED WHILE ENDING THE DIALOG

**Explanation:** An unexpected condition occurred while ending the dialog.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000704.

**Corrective Action:** Contact BMC Software Customer Support.

IOAL1YW ONE OR MORE WORKMODS WERE IN AN ACTIVE STATE AND PROTECT=YES

**Explanation:** One or more workmods were in an active state, and PROTECT=YES was specified or defaulted.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000708.

**Corrective Action:** Contact BMC Software Customer Support.

IOAL1ZW THERE IS NO IDL MESSAGE FOR THE INDICATED REASON AND RC COMBINATION

**Explanation:** The IDL facility does not recognize the RC and Reason combination returned by the Binder API.

**Corrective Action:** Contact BMC Software Customer Support.
IOAL21I SHOWMODULES - SHOW MAP OF THE ADDRESS SPACE

**Explanation:** This information message indicates that an operator issued the IDL=HELP modify command and the IDL facility displayed the usage of the SHOWMODULES command: to display all modules and tasks running in an address space.

**Corrective Action:** No action is required.

IOAL22I SHOWGROUP[=...] - SHOW IDL INFO ABOUT GROUP OF MODULES PRE-DEFINED IN SUMMARY TABLE

**Explanation:** This information message indicates that an operator issued the IDL=HELP modify command and the IDL facility displayed the usage of the SHOWGROUP[=...] modify command: to display IDL information about a group of modules predefined in the IOALSUM table.

**Corrective Action:** No action is required.

IOAL24I SHOWSNAP - SHOW CONTENTS OF THE LAST IDL SNAP

**Explanation:** This information message indicates that an operator issued the IDL=HELP modify command and the IDL facility displayed the usage of the SHOWSNAP modify command: to display the contents of the last IDL snapshot.

**Corrective Action:** No action is required.

IOAL27I HELP - SHOW LIST OF AVAILABLE MODIFY COMMANDS

**Explanation:** This information message indicates that an operator issued the IDL=HELP modify command and the IDL facility displayed the usage of the HELP modify command: to display a list of available IDL modify commands.

**Corrective Action:** No action is required.

IOAL2CI SNAP - WRITE DOWN IDL SNAP INTO MEMORY

**Explanation:** This information message indicates that an operator issued the IDL=HELP modify command and the IDL facility displayed the usage of the SNAP modify command: to generate and write IDL snapshots into memory.

**Corrective Action:** No action is required.

IOAL2DI SHOWMODULE - SHOW IDL INFO ABOUT SPECIFIC MODULE OR MODULES[*]

**Explanation:** This information message indicates that an operator issued the IDL=HELP modify command and the IDL facility displayed the usage of the SHOWMODULE modify command: to display IDL information about a specific module or modules.

**Corrective Action:** No action is required.
IOAL2EI WTOMODULE - WTO IDL INFO ABOUT SPECIFIC MODULE OR MODULES[*]

**Explanation:** This information message indicates that an operator issued the IDL=HELP modify command and the IDL facility displayed the usage of the WTOMODULE modify command: to display IDL information on the console about a specific module or modules.

**Corrective Action:** No action is required.

IOAL2FI SHOWCSECT - SHOW IDL INFO ABOUT SPECIFIC CSECT OR CSECTS[*]

**Explanation:** This information message indicates that an operator issued the IDL=HELP modify command and the IDL facility displayed the usage of the SHOWCSECT modify command: to display IDL information about a specific CSECT or CSECTs.

**Corrective Action:** No action is required.

IOAL2GI WTOCSECT - WTO IDL INFO ABOUT SPECIFIC CSECT OR CSECTS[*]

**Explanation:** This information message indicates that an operator issued the IDL=HELP modify command and the IDL facility displayed the usage of the WTOCSECT modify command: to display IDL information on the console about a specific CSECT or CSECTs.

**Corrective Action:** No action is required.

IOAL2HI SHOWFULL - SHOW *FULL* IDL INFO ABOUT ENTIRE RUNNING CODE

**Explanation:** This information message indicates that an operator issued the IDL=HELP modify command and the IDL facility displayed the usage of the SHOWFULL modify command: to display full IDL information about currently running code.

**Corrective Action:** No action is required.

IOAL2II SHOWLEVEL - SHOW MAIN IDL INFO ABOUT ENTIRE RUNNING CODE

**Explanation:** This information message indicates that an operator issued the IDL=HELP modify command and the IDL facility displayed the usage of the SHOWLEVEL modify command: to display the main IDL information about the currently running code.

**Corrective Action:** No action is required.

IOAL2JI WTOLEVEL - WTO MAIN IDL INFO ABOUT ENTIRE RUNNING CODE

**Explanation:** This information message indicates that an operator issued the IDL=HELP modify command and the IDL facility displayed the usage of the WTOLEVEL modify command: to display the main IDL information on the console about the currently running code.
Corrective Action: No action is required.

IOAL2KI SHOWUNKNOWN - SHOW LIST OF UNKNOWN ELEMENTs

Explanation: This information message indicates that an operator issued the IDL=HELP modify command and the IDL facility displayed the usage of the SHOWUNKNOWN modify command: to display a list of CSECTs unknown to the IDL facility.

Corrective Action: No action is required.

IOAL2LI SHOWUNIDENT - SHOW LIST OF KNOWN BUT UNIDENTIFIED ELEMENTs

Explanation: This information message indicates that an operator issued the IDL=HELP modify command and the IDL facility displayed the usage of the SHOWUNIDENT modify command: to display a list of the CSECTs that are known to the IDL facility but are unidentified.

Corrective Action: No action is required.

IOAL2MI SHOWFOREIGN - SHOW LIST OF FOREIGN (NON-BMC) ELEMENTs

Explanation: This information message indicates that an operator issued the IDL=HELP modify command and the IDL facility displayed the usage of the SHOWFOREIGN modify command: to display a list of foreign CSECTs, that is, CSECTs not proprietary to BMC Software.

Corrective Action: No action is required.

IOAL2NI SHOWSHORT - SHOW LIST OF ELEMENTs THAT ARE TOO SHORT TO BE IDENTIFIED

Explanation: This information message indicates that an operator issued the IDL=HELP modify command and the IDL facility displayed the usage of the SHOWSHORT modify command: to display a list of CSECTs too short to be identified.

Corrective Action: No action is required.

IOAL2OI SHOWMEMORY - DISPLAY MEMORY, MODULE OR CONTROL BLOCK (DATTRACE OUTPUT)

Explanation: This information message indicates that an operator issued the IDL=HELP modify command and the IDL facility displayed the usage of the SHOWMEMORY modify command: to print memory, module, or control block into DATTRACE output.

Corrective Action: No action is required.

IOAL2PI REFRSUMMARY - REFRESH SUMMARY TABLE

Explanation: This information message indicates that an operator issued the IDL=HELP modify command and the IDL facility displayed the usage of the REFRSUMMARY modify command: to dynamically refresh the IOALSUM summary table.

Corrective Action: No action is required.
IOAL2QI DUP={ handle | ignore } - ALTER TREATING OF DUPLICATE MODULEs

Explanation: This information message is the response to the modify command IDL=HELP showing the DUP= IDL sub-command:

- handle - duplicate modules are handled as they are the original module.
- ignore - ignore duplicate modules. The first found module entry will contain the module description.

For more information about the Identity Level (IDL) facility, see the chapter about IOA administration in the INCONTROL for z/OS Administrator Guide.

Corrective Action: No action is required.

IOAL2RI DEFGROUP= - SET or CHANGE DEFAULT ID OF A GROUP OF MODULEs PRE-DEFINED IN SUMMARY TABLE

Explanation: This information message is the response to the modify command IDL=HELP showing the DEFGROUP= IDL sub-command.

For more information about the Identity Level (IDL) facility, see the chapter about IOA administration in the INCONTROL for z/OS Administrator Guide.

Corrective Action: No action is required.

IOAL2UI SNAPS CANNOT BE COMPARED: DUPLICATE MODULEs TREATING HAS CHANGED

Explanation: This information message indicates that the IDL facility cannot compare two snap tables because the duplicate mode was different when the two snap tables were made.

For more information about the Identity Level (IDL) facility, see the chapter about IOA administration in the INCONTROL for z/OS Administrator Guide.

Corrective Action: No action is required.

IOAL2VI DUPLICATE MODULEs WILL BE ={handle | ignore}. ; DEFAULT GROUP ID (groupId)

Explanation: This information message indicates how duplicate modules will be handled when found (duplicate mode):

- handle - duplicate modules are handled as they are the original module.
- ignore - ignore duplicate modules. The first found module entry will contain the module description.

For more information about the Identity Level (IDL) facility, see the chapter about IOA administration in the INCONTROL for z/OS Administrator Guide.

Corrective Action: No action is required.
IOAL2WI  HANDLING OF DUPLICATE MODULEs HAS BEEN ={ handle | ignore }

**Explanation:** This information message is the response to the modify command IDL= DUP={ handle | ignore } and indicates how the IDL facility handles duplicates modules:

- handle - duplicate modules are handled as they are the original module.
- ignore - ignore duplicate modules. The first found module entry will contain the module description.

For more information about the Identity Level (IDL) facility, see the chapter about IOA administration in the INCONTROL for z/OS Administrator Guide.

**Corrective Action:** No action is required.

IOAL2XW  MEMORY {address | size} IS NOT ALLOCATED

**Explanation:** This message indicates that the IDL facility received the SHOWMEMORY request; however, it has become clear that the specified memory is unavailable.

The current request fails. Processing continues.

**Corrective Action:** Correct and re-issue the SHOWMEMORY request.

IOAL2YE  FAILURE (code) TO {PROCESS | REFRESH} SUMMARY TABLE, SHOWGROUP SUPPORT DISABLED

**Explanation:** The IDL facility failed to process or refresh the IOALSUM summary table. The SHOWGROUP request is disabled.

**Corrective Action:** Try to correct the IOALSUM table and recycle the product. If this does not resolve the problem, contact BMC Software Customer Support.

IOAL2ZI  SUMMARY TABLE HAS BEEN {PROCESSED | REFRESHED} SUCCESSFULLY ADDRESS (add)

**Explanation:** This information messages indicates that the IDL facility successfully processed or refreshed the IOALSUM summary table.

**Corrective Action:** No action is required.

IOAL30W  ALL MODULES PROVIDED BY provider WILL NOT BE TRACKED BY IDL

**Explanation:** The Binder API will not handle any module retrieved from the provider system area. In this message, the only valid value for provider is LLA.

**Corrective Action:** No action is required.

IOAL31W  DATA INCOMPATIBLE WITH BUFFER VERSION

**Explanation:** The workmod data is incompatible with the specified buffer version.
INCONTROL for z/OS Messages Manual

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 08 and a reason code of 83000813.

No data is returned. Processing continues.

Corrective Action: Contact BMC Software Customer Support.

IOAL32W INVALID WORKMOD TOKEN

Explanation: An invalid workmod token was received.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000001.

The request was rejected. Processing continues.

Corrective Action: Contact BMC Software Customer Support.

IOAL33W INVALID DIALOG TOKEN

Explanation: An invalid dialog token was received.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000002.

The request was rejected. Processing continues.

Corrective Action: Contact BMC Software Customer Support.

IOAL34W BINDER INVOKED FROM WITHIN USER EXIT

Explanation: A binder was invoked from within a user exit.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000003.

The request was rejected. Processing continues.

Corrective Action: Contact BMC Software Customer Support.

IOAL35W INVALID FUNCTION CODE SPECIFIED

Explanation: An invalid function code was specified.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000004.

The request was rejected. Processing continues.
Corrective Action: Contact BMC Software Customer Support.

IOAL36W INVALID PARAMETER

Explanation: An invalid call parameter was specified.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000005.

The request was rejected. Processing continues.

Corrective Action: Contact BMC Software Customer Support.

IOAL37W PASSED SYMBOL CONTAINS UNACCEPTABLE CHARACTERS

Explanation: A symbol passed in the parameter list contains characters outside the range acceptable to the binder.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000007.

The current request to the IDL facility fails. Processing continues.

Corrective Action: Contact BMC Software Customer Support.

IOAL38W WRONG NUMBER OF ARGUMENTS SPECIFIED

Explanation: The wrong number of arguments was specified.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000008.

The request was rejected. Processing continues.

Corrective Action: Contact BMC Software Customer Support.

IOAL39W PARAMETER LIST CONTAINS INVALID ADDRESS

Explanation: One or more parameters not accessible by the binder.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000009.

The request was rejected. Processing continues.

Corrective Action: Contact BMC Software Customer Support.

IOAL3AW PARAMETER LIST IS NOT ADDRESSABLE BY THE BINDER

Explanation: The parameter list was not addressable by the binder.
This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 8300010.

The request was rejected. Processing continues.

**Corrective Action:** Contact BMC Software Customer Support.

IOAL3BW IMPROPER COMBINATION OF PARAMETERS

**Explanation:** An invalid combination of parameters was specified.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 12 and a reason code of 83000101.

The request was rejected. Processing continues.

**Corrective Action:** Contact BMC Software Customer Support.

IOAL3CW STORAGE LIMIT ESTABLISHED BY WORKSPACE OPTION EXCEEDED

**Explanation:** The storage limit established by the workspace option was exceeded.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 16 and a reason code of 83000050.

The dialog was terminated. Processing continues.

**Corrective Action:** Contact BMC Software Customer Support.

IOAL3DW INSUFFICIENT STORAGE AVAILABLE

**Explanation:** Insufficient storage was available.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 16 and a reason code of 83000051.

The dialog was terminated. Processing continues.

**Corrective Action:** Contact BMC Software Customer Support.

IOAL3EW OPERATING SYSTEM NOT AT CORRECT DFSMS/MVS LEVEL

**Explanation:** The operating system was not at the correct DFSMS/MVS level. No dialog was established and the requested function was not processed.
This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 16 and a reason code of 83000060.

The current request to the IDL facility fails. Processing continues.

Corrective Action: Contact BMC Software Customer Support.

IOAL3FW IEWBIND MODULE COULD NOT BE LOADED

Explanation: The IEWBIND module could not be loaded.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 16 and a reason code of 83000FFF.

The current request to the IDL facility fails. Processing continues.

Corrective Action: Contact BMC Software Customer Support.

IOAL3GW BINDER LOGIC ERROR

Explanation: A binder logic error occurred.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 16 and a reason code of 83EE2900.

The dialog was terminated. Processing continues.

Corrective Action: Contact BMC Software Customer Support.

IOAL3HW BINDER ABEND OCCURRED WITH AAA ABEND COMPLETION CODE

Explanation: A binder abend occurred with a system abend completion code of AAA.

This message is preceded by message IOAL09W, which contains a specific combination of return and reason codes returned by the IBM Binder API. For further explanation of the Binder API, see the IBM manual z/OS MVS Program Management: Advanced Facilities. In this case, message IOAL09W contains a return code of 16 and a reason code of 83FFAAA0.

The dialog was terminated. Processing continues.

Corrective Action: Contact BMC Software Customer Support.

IOAL3YW IDL RECOVERY EXIT INTERCEPTED ABEND(abCode); PROCESSING WILL BE RETRIED

Explanation: The Recovery exit of the IDL facility intercepted an abend (abCode) that took place in IDL code, and an attempt will be made to retry processing.

The following system actions occur:
- A DUMP is issued.
- The IDL facility is disabled.
- The ABEND is contained and processing continues.

**Corrective Action:** Forward the DUMP to BMC Software Customer Support.

---

**IOAL3ZW IDL RECOVERY EXIT INTERCEPTED ABEND(\textit{abCode}); IMPOSSIBLE TO RETRY**

**Explanation:** The Recovery exit of the IDL facility intercepted an abend (\textit{abCode}) that took place in IDL code, and an attempt to retry processing is not possible.

The following system actions occur:

- A DUMP is issued.
- The ABEND is percolated.

**Corrective Action:** Forward the DUMP to BMC Software Customer Support.

---

**IOAL41I INITIALIZING IOAIDL**

**Explanation:** This information message indicates that the program is going to initialize the IDL facility.

**Corrective Action:** No action is required.

---

**IOAL42W FAILED TO RELEASE DESB BLOCK**

**Explanation:** The program failed to release the memory allocated for the DESB block.

**Corrective Action:** No action is required.

---

**IOAL43I TERMINATING IOAIDL**

**Explanation:** This information message indicates that the program is going to terminate the IDL facility.

**Corrective Action:** No action is required.

---

**IOAL44W FAILED TO TERMINATE IDL**

**Explanation:** The program failed to terminate the IDL facility.

**Corrective Action:** No action is required.

---

**IOAL45W FAILED TO CLOSE THE LOAD DATA SET**

**Explanation:** The program failed to close the load data set.

**Corrective Action:** No action is required.

---

**IOAL46I CREATING THE SORT CONTROL STATEMENT**

**Explanation:** This information message indicates that the program is going to create the sort control statement.

**Corrective Action:** No action is required.
IOAL47E FAILED TO CLOSE THE DAPRMDF DATA SET

Explanation: The program failed to close the data set containing the sort control statement. The program terminates with a return code of 8.
Corrective Action: No action is required.

IOAL48W FAILED TO RELEASE THE STORAGE

Explanation: The program failed to release the previously allocated storage.
Corrective Action: No action is required.

IOAL49E FAILED TO SETUP ESTAE

Explanation: The program failed to setup the recovery routine. The program terminates with a return code of 8.
Corrective Action: No action is required.

IOAL4AE I/O ERROR OCCURED DURING PROCESSING DAPRIDL

Explanation: The program failed while processing the data set allocated to DAPRIDL. The program terminates with a return code of 12.
Corrective Action: Fix the data set’s allocation attributes in the job.

IOAL4BE BAD PARAMETER RECEIVED

Explanation: The program received an invalid parameter. The program terminates with a return code of 8.
Corrective Action: Fix the program’s PARM string in the job.

IOAL4CE IOASTOR GETMAIN FAILED

Explanation: The program failed to allocate storage below the line. The program terminates with a return code of 8.
Corrective Action: Increase the REGION and rerun the program.

IOAL4DE FAILED TO OPEN THE LOAD DATA SET

Explanation: The program failed to open the load data set. The program terminates with a return code of 8.
Corrective Action: Ensure that the load data set can be opened.

IOAL4EE FAILED TO OPEN THE DAPRMDF DATA SET

Explanation: The program failed to open the sort control statement data set. The program terminates with a return code of 8.
**Corrective Action:** Ensure that the DAPRMDF data set can be opened.

**IOAL4FE FAILED TO PUT TO DAPRMDF DATA SET**

**Explanation:** The program failed to put the data into the sort control statement data set. The program terminates with a return code of 12.

**Corrective Action:** Fix the allocation attributes of the data set in the job.

**IOAL4GE DESERV FAILED**

**Explanation:** The program failed during execution of the DESERV macro. The program terminates with a return code of 12.

**Corrective Action:** Check the validity of the load data set definition.

**IOAL4HE IOAIL INITIALIZATION FAILED**

**Explanation:** The program failed to initialize the IDL facility. The program terminates with a return code of 8.

**Corrective Action:** Check the IDL facility trace messages in order to detect the source of the problem.

**IOAL4IE BLDL FAILED FOR THE MODULE modName**

**Explanation:** The BLDL macro failed for the `modName` module. The program terminates with a return code of 12.

**Corrective Action:** Check the properties of the `modName` module.

**IOAL4JE TERMINATING BECAUSE LOAD FAILURE**

**Explanation:** The program failed to load a member from the load data set. The program terminates with a return code of 12.

**Corrective Action:** No action is required.

**IOAL4KE IOAIL SHOWGROUP FAILED**

**Explanation:** The IDL facility failed to execute the SHOWGROUP request. The program terminates with a return code of 12.

**Corrective Action:** Check the IDL facility trace messages to detect the source of the problem.

**IOAL4LI GROUPID: groupId**

**Explanation:** This message is issued for a SHOWGROUP request. In this message, `groupId` is a predefined group of modules, as listed in the IOALSUM Summary Table.

**Corrective Action:** No action is required.
Messages IOAM00 through IOAMxx

This group includes messages for the IOA (infrastructure) product.

**IOAM01I FUNCTIONAL MONITOR STARTED**

**Explanation:** This information message indicates that the Functional monitor was started.

**Corrective Action:** No action is required.

**IOAM02E FUNCTIONAL MONITOR NOT APF-AUTHORIZED**

**Explanation:** The Functional monitor is not APF authorized. The IOAFMON module is not in an APF authorized library, and it does not have the AC=1 attribute.

The Functional monitor ends with a return code of 8.

**Corrective Action:** Add the name of the library in which IOAFMON resides to the IEAAPF00 member in the SYS1.PARMLIB library.

**IOAM03E INVALID MODIFY PARAMETER. VALID PARAMETERS ARE:**

**Explanation:** An invalid parameter was passed to the Functional monitor by means of a modify command. Following this message, one or copies of message IOAM14I appear on the operator console, each containing a valid modify parameter.

The modify command is ignored.

**Corrective Action:** Specify the modify command with a valid parameter.

**IOAM04E BLDL/ATTACH FAILED FOR SUBTASK taskName**

**Explanation:** Initialization of one of the Functional monitor subtasks failed. Possible causes are:

- The specified subtask is not found in the IOA LOAD library.
- Insufficient storage is available for the Functional monitor.

The Functional monitor shuts down.

**Corrective Action:** Call your system programmer for assistance. If necessary, increase the region size of the Functional monitor.

**IOAM05E UNRECOVERABLE ERROR ENCOUNTERED**

**Explanation:** An unrecoverable error occurred in the IOA Functional Monitor.

The IOA Functional Monitor stops running.

**Corrective Action:** Check for any accompanying message that describe the nature of the problem, correct accordingly, and restart the monitor.

**IOAM06E ONE OF THE FUNCTIONAL MONITOR SUBTASKS HAS ABENDED**

**Explanation:** A subtask of the Functional monitor abended.
The Functional monitor shuts down with user abend 0006. A dump of the abending subtask is included in the SYSABEND output file.

**Corrective Action:** Call your system programmer for assistance. If the problem is not resolved, contact BMC Software Customer Support.

**IOAM07I SHUT DOWN ON REQUEST FROM OPERATOR**

**Explanation:** This information message indicates that an operator command requesting shutdown of the Functional monitor was issued.

The Functional monitor starts to shut down.

**Corrective Action:** No action is required.

**IOAM10W FUNCTIONAL MONITOR IS ALREADY ACTIVE. QNAME "qName"**

**Explanation:** A Functional monitor was started with the same QNAME as an already active Functional monitor. It is impossible to run two Functional monitors with the same QNAME at the same time.

The newly started Functional monitor is shut down.

**Corrective Action:** No action is required.

**IOAM11I FUNCTIONAL MONITOR SHUTTING DOWN**

**Explanation:** This information message indicates that the Functional monitor is shutting down. Messages describing the reason for the shutdown are in at least one of the following:

- The IOA Log.
- The Functional monitor JES messages file.
- The Functional monitor SYSPRINT file.

**Corrective Action:** If the shutdown was not requested, check messages in the above mentioned locations for more information on the reasons for the shutdown.

**IOAM12S FUNCTIONAL MONITOR ENDED WITH ERROR**

**Explanation:** The Functional monitor ended with an error. Messages describing the error may be in the following locations:

- The IOA Log.
- The Functional monitor JES messages file.
- The Functional monitor SYSPRINT file.

The Functional monitor shuts down.

**Corrective Action:** Check the above mentioned locations for the reasons for the error. If necessary, ask your system programmer for assistance.
IOAM13E INTERVAL MUST BE A TWO-DIGIT NUMBER BETWEEN 03 AND 99 SECONDS

Explanation: An invalid Functional monitor Sleeping Interval was specified in a modify command. The Functional monitor Sleeping Interval is specified in seconds. It must be a 2-digit value from 03 through 99.

The modify command is ignored.

Corrective Action: Enter the following modify command with a valid sleeping interval: F monitorname,INTERVAL=xx

IOAM14I valid_parm

Explanation: An invalid parameter was specified for a modify command. In this message, valid_parm is a valid modify parameter for the relevant command. This information message follows message IOAM03E. It may be issued more than once, with each occurrence specifying another valid parameter.

Corrective Action: No action is required.

IOAM15I FUNCTIONAL MONITOR INTERVAL IS SET TO "nn" SECONDS

Explanation: This information message indicates that the specified Functional monitor sleeping interval (nn) has been set by means of a modify command.

Corrective Action: No action is required.

IOAM16S INSUFFICIENT MEMORY FOR IOA FUNCTIONAL MONITOR

Explanation: The available storage is insufficient for execution of the Functional monitor. The Functional monitor shuts down.

Corrective Action: Increase the region size and restart the Functional monitor.

IOAM17S SEVERE INTERNAL ERROR WHILE PROCESSING AUTOEDIT INSTRUCTIONS, RC=rc SERVICE serv

Explanation: An internal error was detected during the AutoEdit initialization phase of the specified service. In this message, rc is the return code from the AutoEdit initialization phase.

The service is shut down, and as a result the Functional monitor shuts down.

Corrective Action: Have your system programmer call BMC Software Customer Support for assistance.

IOAM18I UNSERVICEABLE REQUEST FROM taskName. TYPE: taskType. REQUEST IGNORED

Explanation: When an input task attempted to place a request in queue for the Functional monitor no executor was found in the IOAFMON table for this request. This message indicates an internal error.

The variables in this message are:
INCONTROL for z/OS Messages Manual

- **taskName** - the name of the input task.
- **taskType** - the type of request.

The request is ignored.

**Corrective Action:** Contact BMC Software Customer Support.

**IOAM19S SERVICE service CANNOT PROCESS REQUESTS FROM TYPE "type"**

**Explanation:** An internal error occurred during the validity checks phase of the specified service. The service is shut down and as a result the Functional monitor shuts down.

**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

**IOAM20S INTERNAL ERROR IN FUNCTIONAL MONITOR. RC=rc**

**Explanation:** The Functional monitor encountered a severe internal error. The Functional monitor shuts down.

**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

**IOAM21S SERVICE serv FAILED TO LOAD MODULE CTMJ SP**

**Explanation:** The specified service failed to load the CTMJ SP module. Possible causes are:
- The IOA LOAD library is not in the load modules search list.
- Insufficient memory is available to load the CTMJ SP module.
- The CTMJ SP module does not exist in the IOA LOAD library.

The service shuts down and, as a result, the Functional monitor shuts down.

**Corrective Action:** Correct the problem and restart the Functional monitor.

**IOAM22S INSUFFICIENT MEMORY**

**Explanation:** The IOAFCPL utility was unable to obtain the necessary main storage. The IOAFCPL utility is ended.

**Corrective Action:** Increase the region size for the IOAFCPL utility.

**IOAM23S CANNOT OPEN FMLOG FILE**

**Explanation:** An attempt to open the Functional monitor Log failed. The FMLOG DD statement may be missing or in error in the JCL of the Functional monitor.

The Functional monitor is shut down.

**Corrective Action:** Check and correct the FMLOG DD statement. Restart the Functional monitor.
IOAM24S FMLOG FILE IS FULL

**Explanation:** Either the Functional monitor or the IOAFCPL utility determined that writing the next record into the FMLOG file would destroy previously written information that is not yet obsolete. FMLOG is a cyclic file with periodic checkpoints. A checkpoint is a record of all information in the queue of the functional monitor at a given time. Possible causes are:

If the FMLOG file is too small, this message may result from an attempt to write a new checkpoint to the FMLOG file. If an FMLOG file bigger than 100 tracks is allocated, it will never become full, thereby preventing the problem indicated by this message.

The Functional monitor shuts down.

**Corrective Action:** Allocate a bigger FMLOG file, and copy the contents of the old file into the new one by means of the IOAFCPL utility.

IOAM25S LOGICAL ERROR IN FMLOG. RESTORE FMLOG FROM BACKUP OR ALLOCATE A NEW FILE

**Explanation:** The last checkpoint could not be found in the Functional monitor Log (FMLOG). The FMLOG file is unusable. This message indicates an internal error.

The program that issued this message is terminated.

**Corrective Action:** Suggested actions:

- Allocate a new FMLOG file, or restore it from backup and restart the Functional monitor.
- Report the problem to BMC Software Customer Support, and supply a copy of the FMLOG file, the IOA Log, and output from the last IOAFMON execution.

IOAM26W SHOUT DESTINATION TABLE dest_table WAS NOT LOADED

**Explanation:** Loading of the shout destination table (dest_table) failed. Possible causes are:

- The IOA LOAD library is not in the load modules search list.
- Insufficient memory is available to load the dest_table member.
- The dest_table member does not exist in the LOAD library.

**Corrective Action:** Correct the problem and issue the modify command with the NEWDEST parameter.

IOAM27E NEWDEST PARAMETER MISSING OR INVALID

**Explanation:** Invalid NEWDEST command was given to Functional monitor. Valid format is NEWDEST or NEWDEST=dest_table.

The modify command is rejected.

**Corrective Action:** Enter a valid NEWDEST modify command. The format is: F monitorname,NEWDEST/NEWDEST=dest_table.

IOAM28I FORMATTING FMLOG FILE

**Explanation:** This information message indicates that the Functional monitor now starting, determined that the FMLOG is in an invalid format.
The Functional monitor reformats the FMLOG file.

**Corrective Action:** No action is required.

**IOAM29S I/O ERROR:** `explan`

**Explanation:** I/O error occurred on FMLOG the file. In this message, `explan` is the information provided about this error by MVS macro SYNADAF.

The program that issued this message is terminated.

**Corrective Action:** Allocate a new FMLOG file, or restore the old one from backup. If the text in this message indicates a software related problem, report it to BMC Software Customer Support and send a copy of the FMLOG file.

**IOAM30I NEWDEST COMMAND ACCEPTED:** `NEWDEST=dest_table`

**Explanation:** This information message indicates that a NEWDEST operator command was passed to Functional monitor and was accepted.

The Functional monitor directs shout messages according to the new destination table.

**Corrective Action:** No action is required.

**IOAM33S FUNCTIONAL MONITOR INITIALIZATION PHASE FAILED**

**Explanation:** The initialization phase of the Functional monitor failed. Messages describing the error can be found in the following locations:

- the IOA Log
- the Functional monitor JES messages file
- the Functional monitor SYSPRINT file

The Functional monitor shuts down.

**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

**IOAM34I USER EXIT IOAX038 WAS NOT LOADED**

**Explanation:** This information message indicates that user exit IOAX038 is not active. The exit was probably deleted. Exit IOAX038 checks each request to be written to the request queue.

Processing proceeds without checking requests written to the request queue.

**Corrective Action:** Check if exit IOAX038 was deleted from the IOA Load library. Notify your INCONTROL administrator.

**IOAM35I REQUEST FROM taskName TYPE taskType REJECTED BY exitName**

**Explanation:** An exit called to validate a request produced a non-zero return code.

The variables in this message are:
taskName - The name of the input subtask that supplied the request.

taskType - The request type.

exitName - The exit that rejected the request. In this message, IOAX038 or IOASE38.

The request is not processed.

Corrective Action: No action is required.

IOAM36W DO-SET REQUEST FAILED. MEMBER=memName, DSN=dsn, LINE=lin

Explanation: Processing of a DO SET request failed. The Functional monitor failed to add the specified line to the specified member in the dsn data set.

The Functional monitor does not perform this DO SET command, and proceeds to handle subsequent requests.

Corrective Action: For more information, look for previous messages in the IOA Log and in the DASETPRT DD statement, which is allocated by the Functional monitor.

IOAM37I DO-SET REQUEST PERFORMED. MEMBER=memName, DSN=dsn, LINE=lin

Explanation: This information message indicates that a DO SET request was successfully performed. The Functional monitor inserted the lineNum line into the memName member in the dsn data set.

Corrective Action: No action is required.

IOAM38S CANNOT OPEN THE type FILE

Explanation: Open failed for input or output file. The DD statement specifying this file is either missing or in error.

In this message, type is the type of file that failed to open. Valid values are:

- INPUT
- OUTPUT.

The program that issued this message is terminated.

Corrective Action: Correct the JCL and restart the program.

IOAM39S INCORRECT FORMAT OF INPUT FILE

Explanation: The input file specified for the IOAFCPL utility is not in correct FMLOG format.

The IOAFCPL utility is terminated.

Corrective Action: Verify that the FMLOGI DD statement points to a valid FMLOG file.

Messages IOAP00 through IOAPxx

This group includes messages for the IOA (infrastructure) product.
IOAP01I - IOAP2AI Information messages issued by the IOADPT utility to display IOA Access Method file data component attributes as they are in the control record.

**Explanation:** These messages are issued by the IOADPT utility when FUNC=DB0 is specified.

**Corrective Action:** No action is required.

IOAP2BI ESTIMATED FREE SPACE num%

**Explanation:** This information message displays the estimated percentage of free space remaining in an IOA Access Method file.

**Corrective Action:** No action is required.

IOAP2EW SECONDARY SPACE IS NOT DEFINED FOR THE USER FILE dsn

**Explanation:** This warning message indicates that the secondary space is not defined for the user file dsn. The message is issued only when the IOADPT utility is run with the FUNC parameter set to CHKSPACE.

The utility continues processing, however, when the utility finishes it ends with a return code of 4.

**Corrective Action:** Use the following procedure to resolve this issue:

1. Check the User file definitions in the DEFxxx member
2. Specify secondary space in the DEFxxx member
3. Run the IOADBF utility with the FUNC parameter set to CHANGE

IOAP2FW AUTOMATIC ALLOCATION OF NEW EXTENTS IS NOT DEFINED FOR THE USER FILE dsn

**Explanation:** This warning message indicates that the option to automatically extend the file is not specified for the user file dsn. The message is issued only when the IOADPT utility is run with the FUNC parameter set to CHKSPACE.

The utility continues processing, however, when the utility finishes it ends with a return code of 4.

**Corrective Action:** Use the following procedure to resolve this issue:

1. Check the User file definitions in the DEFxxx member.
2. Specify EXTEND=A in the DEFxxx member
3. Run the IOADBF utility with the FUNC parameter set to CHANGE

IOAP2GW NUMBER OF EXTENTS FOR THE USER FILE dsn MORE THEN 50

**Explanation:** This warning message indicates that the number of extents for the specified user file dsn is more then 50. This warning is issued because a large number of extents can adversely impact performance when accessing the user file. The message is issued only when the IOADPT utility is run with the FUNC parameter set to CHKSPACE.

The utility continues processing, however, when the utility finishes it ends with a return code of 4.
**Corrective Action:** Check the User file definitions in the DEFxxx member. If the reason of for the large number of extents is a small secondary space definition, increase the space values in the DEFxxx member. Then perform a reorganization of the User file reformatting the files with the new SPACE parameters.

**IOAP21W FREE SPACE IN THE USER FILE dsn REACHED THE THRESHOLD CAPACITY**

**Explanation:** This warning message indicates that the free space in the specified user file dsn has reached the threshold capacity and neither the secondary space or the automatically extend option were specified. This warning message is issued when one of the following conditions is true:

- estimated free space in the Data component is less then 15 percent of the total space
- free space in the Index component is less then 5 percent of the total space

The message is issued only when the IOADPT utility is run with the FUNC parameter set to CHKSPACE.

**Corrective Action:** Check the User file definitions in the DEFxxx member. If the reason of for the large number of extents is a small secondary space definition, increase the space values in the DEFxxx member. Then perform a reorganization of the User file reformatting the files with the new SPACE parameters.

**IOAP30I IOAPFSTC UTILITY STARTED**

**Explanation:** This information message indicates that the IOAPFSTC utility, which prints IOA Application Server performance statistic reports, started.

**Corrective Action:** No action is required.

**IOAP31E INVALID PARAMETER: parm**

**Explanation:** The parm input parameter specified for the IOAPFSTC utility is not valid. The utility stops with return code 16.

**Corrective Action:** Correct the invalid input parameter in the JCL and resubmit the job. For more information, see the IOAPFSTC utility in the INCONTROL for z/OS Utilities Guide.

**IOAP32E REDUNDANT PARAMETER: parm**

**Explanation:** The parm input parameter for IOAPFSTC utility is specified twice although it can only be specified once in this statement. The utility stops with return code 16.

**Corrective Action:** Remove the redundant input parameter from the JCL and resubmit the job. For more information, see the IOAPFSTC utility in the INCONTROL for z/OS Utilities Guide.

**IOAP33E INVALID LENGTH OF  PARAMETER parm**

**Explanation:** The length of the parm input parameter is not available for this parameter. The utility stops with return code 16.
**Corrective Action:** Correct the invalid input parameter in the JCL and resubmit the job. For more information, see the IOAPFSTC utility in the *INCONTROL for z/OS Utilities Guide.*

**IOAP34E REQUIRED PARAMETER parm IS NOT SPECIFIED**

**Explanation:** The obligatory parm input parameter is not specified in the input stream for the IOAPFSTC utility.

The utility stops with return code 16.

**Corrective Action:** Correct the input parameter in the JCL and resubmit the job. For more information, see the IOAPFSTC utility in the *INCONTROL for z/OS Utilities Guide.*

**IOAP35E INCORRECT COMBINATION OF DATEFROM AND DATETO VALUES**

**Explanation:** The end date specified in the parameter DATETO is less than the beginning date specified in the parameter DATEFROM.

The utility stops with return code 16.

**Corrective Action:** Correct the input parameter in the JCL and resubmit the job. For more information, see the IOAPFSTC utility in the *INCONTROL for z/OS Utilities Guide.*

**IOAP36W PARAMETER parm IS IGNORED FOR FUNCTION=CLEAN**

**Explanation:** This warning message is issued when the parm parameter is specified for FUNCTION=CLEAN in the IOAPFSTC utility input parameters. No additional parameters are processed for FUNCTION=CLEAN. The parm parameter is ignored.

**Corrective Action:** Check the input parameters specified for the utility. Correct the parameters and resubmit the job if it is necessary. For more information, see the IOAPFSTC utility in the *INCONTROL for z/OS Utilities Guide.*

**IOAP3AW NO PERFORMANCE STATISTIC RECORDS IN PERMANENT USER FILE**

**Explanation:** The IOAPFSTC utility has not found any IOA Application Server performance statistic records in the Permanent User File. This can occur if the statistic collecting is not activated at the site (optional wish WIN102 is set to APPLY=NO).

**Corrective Action:** If necessary, apply the optional wish WIN102.

**IOAP3BI nnnnn PERFORMANCE STATISTIC RECORDS HAVE BEEN READ**

**Explanation:** This information message indicates how many IOA Application Server performance statistic records were read from the Permanent User File during the IOAPFTSC utility run.

**Corrective Action:** No action is required.

**IOAP3CI nnnnn PERFORMANCE STATISTIC RECORDS HAVE BEEN SELECTED**

**Explanation:** This information message indicates how many IOA Application Server performance statistic records have been selected according to selection parameters specified for the utility IOAPFTSC.

1976
IOAP3DI  \textit{nnnnn} PERFORMANCE STATISTIC RECORDS HAVE BEEN DELETED

**Explanation:** This information message indicates how many old IOA Application Server performance statistic records have been deleted from the Permanent User File during the IOAPFTSC utility run with FUNCTION=CLEAN.

**Corrective Action:** No action is required.

IOAP3EI IOAPFTSC UTILITY ENDED SUCCESSFULLY

**Explanation:** This information message indicates the utility IOAPFTSC ended successfully.

**Corrective Action:** No action is required.

Messages IOAQ00 through IOAQxx

This group includes messages for the IOA (infrastructure) product.

IOAQ01S APPLICATION SERVER VERSION \textit{srvr} IS ACTIVE

**Explanation:** This information message indicates that the IOA Application server has been initiated and is ready to receive requests.

**Corrective Action:** No action is required.

IOAQ02S LOADING OF RECIPIENT TREE FAILED

**Explanation:** The Control-D Recipient Tree could not be loaded during initialization of the Application server.

The IOA Application server is terminated.

**Corrective Action:** Correct the problem with the Recipient Tree and restart the Application server.

IOAQ03S LOADING OF APPROVAL TREE FAILED

**Explanation:** The Control-D Approval Tree could not be loaded during initialization of the Application server.

The IOA Application server is terminated.

**Corrective Action:** Correct the problem with the Approval Tree and restart the Application server.

IOAQ04E MODIFY COMMAND INVALID

**Explanation:** The user sent an invalid MODIFY (F) command to the IOA Application server. The list of valid MODIFY commands is displayed on the operator console.

The invalid command is ignored.

**Corrective Action:** Reissue a valid MODIFY command.
IOAQ05W INVALID TIMEOUT VALUE PASSED. DEFAULT num SEC IS SET

Explanation: This warning message indicates that an invalid timeout value was passed by IOAGATE when the IOA Application server was started. The invalid value is ignored and default value will be used.

Corrective Action: No action is required.

IOAQ07E CONTROL MESSAGE OF UNKNOWN TYPE HAS BEEN RECEIVED FROM MANAGER

Explanation: This message indicates that a control message of an invalid type was passed by IOAGATE. The control message is ignored.

Corrective Action: Report the problem.

IOAQ08W INVALID MAXMSGSZ VALUE PASSED. DEFAULT XXXXX IS SET.

Explanation: Since an invalid value was specified for the MAXMSGSZ parameter in the ECAAPPL member, MAXMSGSZ is set to its default value instead.

Corrective Action: Specify a correct value for the MAXMSGSZ parameter in the ECAAPPL member of the IOAENV library.

IOAQ10E MAILBOX opn ERROR. RC=rc

Explanation: The specified Mailbox operation (READ or WRITE) failed. The IOA Gateway and the IOA Application server communicate through mailboxes. The Application server subtask is terminated.

Corrective Action: Report the problem, the return code, and any additional relevant messages to BMC Software Customer Support.

IOAQ11E INVALID REQUEST TYPE reqType

Explanation: The IOA Application server received a request of an unknown type. The request is probably not recognized by the Application server because the software on the mainframe and the PC are not the same release level.

The request is ignored and this error message is sent to the client.

Corrective Action: Do not use the feature that is discussed in this message until the appropriate software is upgraded.

IOAQ12E SESSION HANDLE NOT FOUND

Explanation: The IOA Application server received a request from a client, but a corresponding session did not exist. The session was probably terminated due to a timeout, a restart of the IOA Gateway, or a restart of the IOA Application server.

The request is ignored and this error message is sent to the client.

Corrective Action: Exit the problematic session and start a new session.
IOAQ13E USER userId NOT AUTHORIZED

**Explanation:** An unauthorized user attempted to log in to the IOA Application server. The user name or password is checked by Security Exit IOAX016 through the security subsystem, for example, RACF, ACF2SAF, or Top Secret.

The request is ignored and this error message is sent to the client.

**Corrective Action:** If the user is authorized to use the server, set the authorized user name and password in the client software.

IOAQ14I SESSION FOR USER userId TERMINATED DUE TO TIMEOUT

**Explanation:** This information message indicates that the IOA Application server terminated a session that was dormant longer than the specified timeout interval. The timeout interval is specified in the TIMEOUT parameter in the Application server declaration. For details see the parameters for IOAGATE.

The session is terminated. All storage areas connected with the session in the Application Server are freed.

**Corrective Action:** Exit the problematic session and start a new session.

IOAQ15I USER userId LOGGED IN APPLICATION SERVER

**Explanation:** This information message indicates that the Application server started a new session for the specified user.

**Corrective Action:** No action is required.

IOAQ16I USER userId LOGGED OUT. USED CPU TIME nnnnn.nn SEC

**Explanation:** This information message indicates that the Application server terminated a session for the specified user. This message reports the CPU time used.

**Corrective Action:** No action is required.

IOAQ17I USER STATUS LAST REQ CPU TIME

**Explanation:** This information indicates that the IOA Application server processed the DISPLAY (D) command successfully. This message displays the column headings for information supplied by message IOAQ18I, which follows. The DISPLAY (D) command displays a list of active sessions.

**Corrective Action:** No action is required.

IOAQ18I userId stat last cpuTime

**Explanation:** This information message displays information about a currently open session for the IOA Application server. The first occurrence of this information message always follows the IOAQ17I message. Multiple occurrences of this information message display a table of currently open sessions. IOAQ18I is displayed in response to a DISPLAY (D) command. The IOAQ19I message follows immediately after the last occurrence of this message. The following information is included in each occurrence of this message:
userId - the user ID of the user currently logged on to the system

stat - the current status of the user

last - time of the last request made by this user in hh:mm format

cpuTime - the amount of CPU time used by this user during the current session in the format sssss.th, where
  
  • sssss - seconds
  • t - tenths of seconds
  • h - hundredths of seconds

**Corrective Action:** No action is required.

**IOAQ19I TOTAL NUMBER OF SESSIONS IS num**

**Explanation:** This information message indicates the total number of sessions open for the IOA Application server. This message marks the end of a table displayed by IOAQ18I and IOAQ17I messages. These messages are displayed in response to a DISPLAY command sent to the IOA Application server.

**Corrective Action:** No action is required.

**IOAQ1AE INVALID PARAMETERS FOR PERFORMANCE STATISTICS ACCUMULATION PROGRAM**

**Explanation:** This message is issued because of an internal error. Performance statistics cannot be accumulated.

**Corrective Action:** Report the problem.

**IOAQ1BE PERFORMANCE STATISTICS CANNOT BE INITIATED**

**Explanation:** This message can be issued if the IOAPFST module, which accumulates performance statistics, is absent from the STEPLIB library, or because of an internal error. This message can appear at the start of the application server or after the STATINIT MODIFY command. Performance statistics collection is not initiated. The MODIFY command is ignored.

**Corrective Action:** If the module is present, report the problem to BMC Customer Support.

**IOAQ1CI PERFORMANCE STATISTICS INITIATED**

**Explanation:** This information message is normal reaction on MODIFY command STATINIT.

**Corrective Action:** No action is required.

**IOAQ1DI PERFORMANCE STATISTICS TERMINATED**

**Explanation:** This information message is a normal reaction to the MODIFY command STATTERM.

**Corrective Action:** No action is required.
IOAQ1EE INVALID PARAMETERS FOR TRACE LIMITATION PROGRAM

Explanation: This message is issued because of an internal error. Trace cannot be limited.
Corrective Action: Report the problem to BMC Customer Support.

IOAQ1FE TRACE LIMITATION CANNOT BE INITIATED/SHOWN

Explanation: This message can be issued if the IOATRSRP module, which performs perfromance trace limitation commands, is absent from the STEPLIB library, or because of an internal error. This message can appear after MODIFY command TRCSHARP.
Performance statistics collection is not initiated.
The MODIFY command is ignored.
Corrective Action: If the module is present, report the problem to BMC Customer Support.

IOAQ20E ACCESS DENIED FOR USER userId: rsn

Explanation: A user tried to log on to the IOA Application server. However, the IOASE16 security module or the IOAEX16 user exit rejected the request. The message displays the reason provided by the security package for rejecting the user. Your security software documentation will have an explanation of the reason code.

- userId - the name of the user
- rsn - the reason for denying access

The login request is rejected.
Corrective Action: Check that the user name and password are spelled correctly and retry. If necessary, contact your security administrator.

IOAQ21E Output message of xxxxxxxx exceeds the allowed max value

Explanation: The OUTPUT message created by Application Server for Control-D/WebAccess server, is longer than the value defined by the MAXMSGSZ parameter in the ECAAPPL member of the IOAENV library. The request is not performed. Additional information is written to DATRACE.
Corrective Action: Check the IOA Log and the system log for additional error messages. Report the problem, DATRACE content, and any additional error messages to BMC Software Customer Support.

IOAQ22E Initialization of application U failed

Explanation: Application U, specified in the IOA Application Server declaration (see IOAGATE parameters), could not be initiated. The message can be preceded with other messages, which provide further explanation.
The application is not initiated and is available for requests.
Corrective Action: If possible, correct the problem and restart the Application server. Otherwise, report the problem, supplying all appropriate messages.
IOAQ23E CPU limit has been exceeded for the request

**Explanation:** The amount of CPU required for processing the Control-D/WA request exceeds the value set in the optional wish WD3473. The request processing has terminated.

**Corrective Action:** Examine the selection parameters for the report list request to find the probable cause of the long processing time. Alternately, try increasing the value of the WD3473 optional wish.

IOAQ24E Application has not been found for user UUUUUUUU

**Explanation:** A user tried to log on to the IOA Application server. However, his request can be served. The user sent a request with the code of an application that has not been initiated in this Application server. The reasons can be as follows:

- Software on the mainframe and the PC are not of the same release level.
- The application is specified in the Application server declaration, but the Application server does not support this feature.
- Initiation of the application failed when the Application server started. In this case this message is preceded with the message IOAQ22E.

The request is ignored and this error message is sent to the client.

**Corrective Action:** Do not use the feature that explains this message until the appropriate software is upgraded, or repeat the request after the Application server restart if the reason for the IOAQ22E message can be corrected.

IOAQ25W TOTAL NUMBER OF SESSIONS HAS BEEN EXCEEDED LIMIT OF 800 SESSIONS

**Explanation:** This warning message indicates that the number of sessions opened in Application Server exceeded the limit of 800 sessions. This limit is designed to prevent insufficient memory problems in Application Server.

**Corrective Action:** Define an additional Control-D Application Server for the IOA Gateway.

IOAQ30S IOAREQ ERROR. RC=rc

**Explanation:** The IOA Application server executor subtask failed to retrieve a request from the queue. The executor subtask processes requests such as OPEN/CLOSE operations from other subtasks inside the Application server address space.

The Application server abends with code U0005.

**Corrective Action:** Contact BMC Software Customer Support.

IOAQ31E ABEND DURING REQUEST EXECUTION

**Explanation:** The Application Server executor subtask detected an error while processing a request. The executor subtask processes requests such as OPEN/CLOSE operations from other subtasks inside the Application Server address space.

The current request abends. Processing continues with the next request.

**Corrective Action:** Report the problem to BMC Software Customer Support. Supply the abend sysout produced at the time of the problem.
Messages IOAS00 through IOASxx

This group includes messages for the IOA (infrastructure) product.

IOAS01I DATABASE REORGANIZATION STARTED

**Explanation:** This information message indicates that an IOA Access Method (IAM) file data component record reorganization started. While processing an IAM file data component, the I/O performance degradation threshold was reached. To maximize I/O performance, the IAM file data component records are dynamically sorted.

**Corrective Action:** No action is required.

IOAS02I DATABASE REORGANIZATION ENDED WITH RC=rc

**Explanation:** This information message indicates that an IOA Access Method (IAM) file data component record reorganization process ended. The IAM file data component dynamic record sorting process completed with the indicated return code.

**Corrective Action:** If IAM reorganization ended with a non-zero return code, check the IOA Log file and system log for additional messages that describe the error. Correct the problem before rerunning the program. If the problem remains unsolved, contact BMC Software Customer Support.

IOAS03I DCBOUT OPEN ERROR

**Explanation:** The file referenced by the SYSPRINT DD statement could not be opened by the sort program. This file is used to write message output during program execution.

The sort program terminates.

**Corrective Action:** Check the IOA Log file and system log for additional messages that describe the error, and correct the problem accordingly.

IOAS04I ERROR DURING OPENING OF PARAMETER FILE

**Explanation:** An attempt to open and read the file containing an IOA Access Method sorting parameters failed.

The sort program terminates.

**Corrective Action:** Check the IOA Log file and system log for additional messages that describe the error, and correct the problem accordingly.

IOAS05I INSUFFICIENT STORAGE TO RUN REORGANIZATION

**Explanation:** Not enough memory is available to sort IOA Access Method file records for a data component. An attempt to obtain storage for sorting records for a database file data component failed because not enough region storage was available.

The data is not sorted. Processing continues. I/O performance may degrade.

**Corrective Action:** Increase the REGION size.
IOAS06E DYNAMIC DATABASE SORTING STOPPED. PARAMETER STOP-WHEN-OVER CANNOT BE REACHED

**Explanation:** The level of reorganization specified by the STOP-WHEN-OVER parameter is not achievable. The STOP-WHEN-OVER parameter determines the maximum number of different data blocks that can be referenced by all the index records in any single index block after reorganizing the index block. Database sorting stopped, because more data blocks are referenced by the records for the last index block than the number specified in the STOP-WHEN-OVER parameter.

Database file data record sorting terminates. Processing continues. I/O performance may be degraded.

**Corrective Action:** Increase the value of the STOP-WHEN-OVER parameter or use the IOADBF utility to allocate an additional database extent. If the problem remains unresolved, contact BMC Software Customer Support.

IOAS07I DATABASE DOES NOT NEED SORTING

**Explanation:** This information message indicates that the level of sorting specified by the START-WHEN-OVER parameter was not reached. The START-WHEN-OVER parameter determines the number of different database file data blocks referred to by all the index records within any single index block that automatically triggers record reorganization. This trigger level was not reached. Therefore, database reorganization was not performed.

The database file data records are not sorted. Processing continues.

**Corrective Action:** No action is required.

IOAS08I INCORRECT INPUT PARAMETER parm

**Explanation:** An invalid parameter was passed to the database sorting routine. Therefore, database reorganization is not performed.

In this message, parm is the identity of the invalid parameter.

Processing continues. I/O performance may degrade.

**Corrective Action:** Correct the problematic parameter.

IOAS09I DATABASE SORT TASK STARTED

**Explanation:** This information message indicates that the database sort routine subtask that will dynamically inspect a database file data component to determine whether the component records should be sorted to improve Database I/O performance was started and initialized.

**Corrective Action:** No action is required.

IOAS10I DATABASE SORT TASK ENDED

**Explanation:** This information message indicates that the database sort routine that dynamically determines whether a database file data component records should be sorted ended.

**Corrective Action:** No action is required.
IOAS13E ERROR IN func FUNCTION. RC = rc

**Explanation:** An internal error occurred while attempting to access a database file component. Processing of an IOA Database file component could not be completed because an internal error was encountered by an IOA Database utility.

The sort program terminates.

**Corrective Action:** Check the IOA Log file and system log for additional messages that describe the error. Correct the problem before rerunning the program. If the problem remains unresolved, contact BMC Software Customer Support.

Messages IOAT00 through IOATxx

This group includes messages for the IOA (infrastructure) product.

IOAT00S FAILURE TO LOCK WS TRACE WORK AREA

**Explanation:** The tracing facility failed to lock the internal (WS) trace work area.

The tracing request is ignored. Processing continues.

**Corrective Action:** Contact BMC Software Customer Support.

IOAT01S FAILURE TO LOCATE DDNAME(ddName) SUPPLIED TO IOATRC

**Explanation:** The tracing facility failed to locate the *ddName* DD statement.

In this message, *ddName* is the name of the DD statement that was supplied to the trace facility as an internal parameter.

The tracing request is ignored. Processing continues.

**Corrective Action:** Contact BMC Software Customer Support.

IOAT02E APF-AUTHORIZATION REQUIRED TO INVOKE SVC DUMP

**Explanation:** An SVCDUMP request was received by the tracing facility. Such a request requires APF authorization for STEPLIB load libraries.

The SVCDUMP tracing request is ignored. Processing continues.

**Corrective Action:** Ensure that STEPLIB load libraries have APF authorization, and restart the product monitor.

IOAT03E INVALID BUFID (bufid) HAS BEEN SUPPLIED IN INPUT PARAMETERS

**Explanation:** The Buffer ID specified in one of the parameters contains invalid characters. Valid characters for the Buffer ID are A-Z, 0-9, @, #, $.

Processing of parameters is stopped.

**Corrective Action:** Check the input parameters in the operator command or in the DATRCIN/DATRCBF input files and make appropriate adjustments as needed. Then rerun the command or product monitor.
IOAT04E SYNTAX ERROR IN INPUT PARAMETERS

Explanation: This error message indicates there is a syntax error in one of the input statements. Processing of parameters is stopped.

Corrective Action: Check the input parameters in the operator command or in the DATRCIN/DATRCBF input files and make appropriate adjustments as needed. Then rerun the command or product monitor.

IOAT05W BUFFER (bufid) IS NOT DEFINED. FLUSH COMMAND IGNORED

Explanation: The buffer (bufid), which is required to flush in operator MODIFY command, is NOT allocated. The Flush command is ignored.

Corrective Action: In the Flush command, check the buffer ID.

IOAT06E UNKNOWN COMMAND/KEYWORD (keyword) IN INPUT PARAMETERS

Explanation: An unknown command or keyword is specified in one of the input statements. The processing of parameters is stopped.

Corrective Action: Check the input parameters in the operator command or in the DATRCIN/DATRCBF input files and make appropriate adjustments as needed. Then rerun the command or product monitor.

IOAT07E INVALID ARGUMENT FOR KEYWORD (keyword)

Explanation: An invalid value was specified for the keyword. The processing of parameters is stopped.

Corrective Action: Check the input parameters in the operator command or in the DATRCIN/DATRCBF input files and make appropriate adjustments as needed. Then rerun the command or product monitor.

IOAT08S INTERNAL ERROR ENCOUNTERED. MODULE: module REASON: rsn

Explanation: An internal error was encountered in the module module.

The variables in this message are:

- module - the name of the module where an internal error was encountered
- rsn - the exact reason for the error. Valid values are:
  - DESCRIPTOR LOST
  - NO DESCRIPTOR ADDR

The option to trace into a buffer is disabled. Processing continues.

Corrective Action: Contact BMC Software Customer Support.

IOAT09E INVALID LEVEL PARAMETER SPECIFIED IN INPUT PARAMETERS

Explanation: An invalid LEVEL parameter was detected in an input statement.
Corrective Action: Check the input parameters in the operator command or in the DATRCIN/DATRCBF input files and make appropriate adjustments as needed. Then rerun the command or product monitor.

IOAT0BW BUFFER x IS NOT DEFINED. DEFAULT BUFFER WILL BE USED INSTEAD
Explanation: This warning message indicates that redirection to the x buffer was required, but the buffer is NOT allocated. The messages are redirected to the default buffer.
Corrective Action: No action is required.

IOAT0CI THE FOLLOWING TRACE LEVELS IN THE BUFFERS: buflD[1, buflD2, . . . buflDn]
Explanation: This information message is issued after command TRACE= with keyword BUF= is performed. It is a header for subsequent IOAD02I messages. Normal processing continues.
bufID[1, bufID2, . . . bufIDn] are one or more buffer IDs.
Corrective Action: No action is required.

IOAT0DI FOR THE DESTINATIONS: dest[1, dest2, dest3, dest4]
Explanation: This information message is issued after command TRACE= with keyword BUF= is performed. This message is a header for subsequent IOAD02I messages. Normal processing continues.
dest[1, dest2, dest3, dest4] can be one or more of the following:
- PRINT
- CHAIN
- WTO
- GTF
Corrective Action: No action is required.

IOAT0FE TRACE trc_num CAN NOT BE TURNED ON AS EXTERNAL TRACE. WILL NOT BE ISSUED.
Explanation: This message indicates that the tracing for trc_num trace number (where trc_num is the trace number requested in the TRACE MODIFY command) has not been turned on because of the environment limitation.
Corrective Action: Contact BMC Software Customer Support.

IOAT0HI TRACING INTO A BUFFER HAS BEEN DISABLED
Explanation: This information message indicates that the tracing into a buffer facility has been disabled.
Corrective Action: No action is required.
IOAT01E DDNAME(\textit{ddName}) NOT FOUND; FAILURE TO FLUSH THE TRACE BUFFER

\textbf{Explanation:} The TRACE=FLUSH modify request was issued, but tracing into a buffer facility failed to perform the request, because the DD statement that was supplied to the trace facility as an internal parameter was not found.

In this message, \textit{ddName} is the name of the DD statement that was supplied to the trace facility as an internal parameter.

The TRACE=FLUSH request is ignored. Normal processing continues.

\textbf{Corrective Action:} No action is required.

IOAT0JS FAILURE TO GETMAIN STORAGE FOR TRACE BUFFER \textit{bufID}

\textbf{Explanation:} This message indicates an attempt to getmain trace buffer \textit{bufID} failed.

The option to trace into a buffer is disabled.

The processing of parameters is stopped.

\textbf{Corrective Action:} Try specifying REGION=0 in the JOB JCL statement and run the product monitor again. Otherwise, contact BMC Customer Support.

IOAT0KI TRACING INTO BUFFERS IS ENABLED

\textbf{Explanation:} This information message indicates that the tracing into a buffer facility has been successfully initialized and enabled. Normal processing continues.

\textbf{Corrective Action:} No action is required.

IOAT0LI \textit{number1} LINES (\textit{number2} KB) ARE ALLOCATED FOR TRACE BUFFER \textit{x}

\textbf{Explanation:} This information message indicates that trace buffer \textit{x} of the specified size is successfully allocated. Normal processing continues.

\textbf{Corrective Action:} No action is required.

IOAT0MW TRACING INTO A BUFFER IS NOT SUPPORTED

\textbf{Explanation:} This warning message indicates the TRACE= modify command with the BUF= parameter was issued, but the tracing into a buffer facility is not supported.

The TRACE= modify command is ignored. Normal processing continues.

\textbf{Corrective Action:} No action is required.

IOAT00E FAILURE TO FLUSH THE TRACE BUFFER: UNABLE TO LOCK

\textbf{Explanation:} The TRACE=FLUSH modify command was issued, but it could not be performed because of the failure to lock the trace buffer.

The TRACE= FLUSH modify command failed. Normal processing continues.

\textbf{Corrective Action:} Contact BMC Software Customer Support.
IOAT0RS FAILURE TO LOAD *module* PROCESSOR OF TRACE=*command*
MODIFY COMMAND

**Explanation:** The specified load module failed to load, and therefore did not perform the *command*
modify command.

The variables in this message are:
- *module* - name of the load module that was attempted to be loaded
- *command* - name of the modify command that initiated loading of the module.

The modify request is ignored. Processing continues.

**Corrective Action:** Contact BMC Software Customer Support.

IOAT0UI TRACE BUFFER (*bufid*) HAS BEEN WRAPPED AROUND *nnnn* TIMES

**Explanation:** This information message indicates that the tracing buffer became full with tracing records, and it has been recycled *nnnn* times.

**Corrective Action:** No action is required.

IOAT0WE FAILURE TO OPEN DDNAME(*ddName*) TO FLUSH TRACE BUFFER

**Explanation:** The specified DDNAME needed to perform the TRACE=FLUSH modify request could not be opened.

In this message, *ddName* is the name of the DD statement that was supplied to the trace facility as an internal parameter.

The TRACE= FLUSH modify request failed. Normal processing continues.

**Corrective Action:** Check the indicated DD statement, correct if necessary, and try running a product monitor again.

IOAT0XI *number* TRACE RECORDS HAVE BEEN FLUSHED INTO *ddName* FROM BUFFER *x*

**Explanation:** This information message indicates that the TRACE=FLUSH modify request was issued and successfully processed. Normal processing continues.

The variables in this message are:
- *number*--number of trace records flushed into the output
- *ddName*--name of the DD statement supplied to the trace facility as an internal parameter
- *x*--ID of the flushed buffer

**Corrective Action:** No action is required.
IOAT0YS IOATRC RECEIVED WS ADDRESS ABOVE THE LINE; CANNOT PROCEED

**Explanation:** The tracing facility received an invalid internal request.
The tracing request is ignored. Processing continues.

**Corrective Action:** Contact BMC Software Customer Support.

IOAT0ZS FAILURE TO GET MCT ADDRESS

**Explanation:** An internal problem was encountered.
The system action is unpredictable. Action depends on the internal problem.

**Corrective Action:** Contact BMC Software Customer Support.

Messages IOAV00 through IOAVxx

This group includes messages for the IOA (infrastructure) product.

IOAV02E INVALID VALUE FOR MODE

**Explanation:** In the IOA Variables Facility Entry screen (Screen IV), the MODE field contains an invalid value.
The only valid values for the MODE field are:
- **ADMIN**
- **''** (Blank)

**Corrective Action:** Type a valid value in the MODE field.

IOAV04E DATABASE/POOL NAME DOES NOT EXIST

**Explanation:** In the IOA Variables Facility Entry screen (Screen IV), the DATABASE field contains a name, but no database nor pool with that name exists.

**Corrective Action:** Either correct the name in the DATABASE field, or select a database or pool from the list.

IOAV06E SPECIFIED DATABASE NAME ALREADY EXISTS

**Explanation:** The user tried to insert a new variable database in the List of Databases - IOA Database Facility screen (Screen IV), and typed a name for the new database in the New Database window, but that database name already exists.

**Corrective Action:** Type a different new database name.

IOAV07E THE DATABASE/POOL IS IN USE. PLEASE TRY AGAIN LATER

**Explanation:** An attempt was made to access a variable database, using the IOA Variables Facility Entry screen (Screen IV), but that database is already in use by another user.

**Corrective Action:** Try again later.
IOAV08E THE NUMBER OF ROWS MUST BE GREATER THAN 1

Explanation: In the New Database Window of the List of Databases - IOA Database Facility screen (Screen IV), one of the following occurred:

- No value was inserted in the NUMBER OF ROWS field.
- The value "1" was inserted in the NUMBER OF ROWS field.

The NUMBER OF ROWS field is used to determine the amount of storage space allocated for the variable database. The number inserted in this field must be greater than 1.

Corrective Action: Correct the number in the NUMBER OF ROWS field.

IOAV09E COLUMN NAME HAS NOT BEEN FOUND

Explanation: An attempt was made to update a column in an existing variable database by typing U (Update) or D (Delete) in the OPT field beside a column name. However, the column name was not found in the database.

Corrective Action: Contact BMC Software Customer Support.

IOAV0AE A COLUMN WITH THIS NAME+NUMBER ALREADY EXISTS

Explanation: An attempt was made to define a new column in an existing variable database. However, a column with the same values for COLUMN and NUMBER already exists.

Corrective Action: Specify new values for COLUMN and NUMBER.

IOAV10E NO ROOM AVAILABLE TO INSERT LINE HERE

Explanation: An attempt was made to insert a row into a variable database, but no row number is available at the location where the new row was to be inserted.

Rows in a variable database are originally numbered in thousands. Rows inserted later are assigned numbers in the gaps. For more information on how row numbers are assigned in a variable database, see the Control-O User Guide.

Corrective Action: Renumber the existing rows in the variable database, as follows:

1. Use the IOAVARUL job to unload the variable database variables file. This job is in the IOA JCL library and invokes the IOADUL utility.
2. Use the IOAVARLD job to reload the file, ensuring that the RENUM parameter is included. This job is in the IOA JCL library and invokes the IOADLD utility.

For more information about the IOADUL and IOADLD utilities, see the INCONTROL for z/OS Utilities Guide.

IOAV12E NO ROWS IN THE POOL. CAN'T BE VIEWED.

Explanation: An attempt has been made to view the variables in a pool, but the pool does not contain any rows. Such a pool cannot be viewed.

Corrective Action: No action is required.
IOAV13E INVALID VARIABLE NAME

**Explanation:** While trying to view the IOAVAR variable database or pool, an invalid variable name was specified.

**Corrective Action:** Specify a valid variable name.

IOAV14E NO AUTHORIZATION FOR PERFORMING THIS OPERATION

**Explanation:** The user is not authorized to perform the operation that was attempted.

**Corrective Action:** If you consider that you ought to have authority to perform an operation of this type, contact your INCONTROL administrator.

IOAV17E MAXIMUM NUMBER OF ROWS EXCEEDED

**Explanation:** An attempt was made to add a new variable into a Variable database by the I or R option in the Variable Database Display screen but the database is full.

The action is aborted.

**Corrective Action:** Increase number of rows in the Variable database. It can be done by updating number of rows (For more information, see the INCONTROL for z/OS Administrator Guide, Chapter 2). Another option is to reformat the database with bigger space parameters. (For more information, see the INCONTROL for z/OS Installation Guide: Installing, Step 7 - Set Global Variables database, and the INCONTROL for z/OS Upgrade Guide, Step 40)

IOAV18E THE NUMBER OF ROWS CANNOT BE GREATER THAN 65535

**Explanation:** An attempt was done to specify value bigger than 65535 for the NUMBER OF ROWS parameter in the option U in the Database List screen.

The action is aborted.

**Corrective Action:** Specify a valid value and press ENTER to save the database parameters or specify N for the UPDATE field or press the RESET key (PF04) to close the window without saving the database parameters.

IOAV1AE CONTROL-O/CMEM MONITOR IS NOT ACTIVE

**Explanation:** An attempt was made to enter the Pools List or to view a pool, but the Control-O or CMEM monitor is not active.

To use this function, the Control-O or CMEM monitor must be active.

The request is rejected.

**Corrective Action:** Start the Control-O or CMEM monitor.

IOAV1BE THE COLUMN CONTAINS VARIABLES. CANNOT BE DELETED.

**Explanation:** An attempt was made to delete a column from a variable database, but the column contains variables.

**Corrective Action:** Delete all variables from the column, then try again to delete the column.
IOAV1CE ERROR DURING DB/POOL ACCESS RC=rc, FUNCTION=func

Explanation: The user attempted to gain access to a variable database or pool, but failed.
Corrective Action: Note the values of rc and func and contact BMC Software Customer Support.

IOAV1DE NO COLUMNS IN THE DATABASE/POOL

Explanation: An attempt was made to view the variables in a variable database or pool. However, the database or pool does not contain any columns. Such a database or pool cannot be viewed.
Corrective Action: No action is required.

IOAV20I IOAGLV UTILITY STARTED

Explanation: This information message indicates that the IOAGLV utility, which handles IOA global variables, started.
Corrective Action: No action is required.

IOAV21I nnnnn VARIABLES ARE READ FROM IOAVAR

Explanation: This information message indicates how many IOA Global Variables are read from the pool during the IOAGLV utility run.
Corrective Action: No action is required.

IOAV22E CONTROL-O/CMEM MONITOR IS NOT ACTIVE

Explanation: An attempt was made to submit the IOAGLV utility but the Control-O or CMEM monitor is not active. The Control-O or CMEM monitor must be active to use this utility.
Corrective Action: Start the Control-O or CMEM monitor, and then resubmit the utility.

IOAV23E ERROR DURING IOAVAR POOL ACCESS: RC=rc, REASON CODE =rsn.

Explanation: The IOAGLV utility attempted to access IOA Global Variables from the IOAVAR pool but the access failed.
The utility stops with RC=8.
Corrective Action: Check the return code (rc) and the reason code (rsn). The return and reason codes are described in the tables attached to the API575E message description. Correct the problem and resubmit the utility.

IOAV24E INVALID FUNCTION: func

Explanation: The func function cannot be specified for the IOAGLV utility input parameters. The following functions can be specified:
The utility stops with RC=16.

**Corrective Action:** Correct the input parameters in the JCL and resubmit the job. For more information, see the IOAGLV utility in the *INCONTROL for z/OS Utilities Guide.*

**IOAV25E**  INVALID PARAMETER: parm

**Explanation:** The parm input parameter specified for the IOAGLV utility is not valid.

The utility stops with RC=16.

**Corrective Action:** Correct the invalid input parameters in the JCL and resubmit the job. For more information, see the IOAGLV utility in the *INCONTROL for z/OS Utilities Guide.*

**IOAV26E**  REQUIRED PARAMETER parm IS NOT SPECIFIED

**Explanation:** The mandatory parm input parameter is not specified in the input stream for the IOAGLV utility.

The utility stops with RC=16.

**Corrective Action:** Correct the input parameters in the JCL and resubmit the job. For more information, see the IOAGLV utility in the *INCONTROL for z/OS Utilities Guide.*

**IOAV27W**  NO VARIABLES HAVE BEEN SELECTED

**Explanation:** No variables matching the specified path or path prefix were found in the IOA Global Variables pool.

The utility stops with RC=4.

**Corrective Action:** Check the input parameters in the JCL. Correct the input parameters in the JCL, if necessary, and resubmit the job. For more information, see the IOAGLV utility in the *INCONTROL for z/OS Utilities Guide.*

**IOAV28E**  PARAMETER parm LENGTH EXCEEDED

**Explanation:** The length of the parm input parameter exceeds the maximum allowable length for this parameter.

The utility stops with RC=16.

**Corrective Action:** Correct the invalid input parameters in the JCL and resubmit the job. For more information, see the IOAGLV utility in the *INCONTROL for z/OS Utilities Guide.*
IOAV29E  REDUNDANT PARAMETER: parm

**Explanation:** The parm input parameter for the IOAGLV utility is specified twice although it can be specified only once in this statement.

The utility stops with RC=16.

**Corrective Action:** Remove the redundant input parameters in the JCL and resubmit the job. For more information, see the IOAGLV utility in the INCONTROL for z/OS Utilities Guide.

IOAV2AW  INCORRECT LINE

**Explanation:** An incorrect line was read from the input dataset, which was specified by the FROM parameter for the IOAGLV utility processing the LOAD function. This warning message is followed by the incorrect line itself.

The incorrect line is skipped and the utility continues processing other lines from the dataset. The utility ends with RC=4 if at least one incorrect line was detected in the dataset.

**Corrective Action:** Check the input dataset. Fix it and, if necessary, resubmit the utility. For more information, see the IOAGLV utility in the INCONTROL for z/OS Utilities Guide.

IOAV2BI  VARIABLE IS ADDED TO IOAVAR

**Explanation:** This information message indicates that the IOAGLV utility added a variable to the IOA Global Variables pool. The variable itself is printed in the next line using the following format:

varname=value.

**Corrective Action:** No action is required.

IOAV2CI  VARIABLE IS UPDATED IN IOAVAR

**Explanation:** This information message indicates that the IOAGLV utility added a variable to the IOA Global Variables pool. The variable itself is printed in the next line using the following format:

varname=value.

**Corrective Action:** No action is required.

IOAV2DI  nnnnn VARIABLES ARE SELECTED

**Explanation:** This information message indicates how many IOA Global Variables, matching the specified path, are selected during the IOAGLV utility run.

**Corrective Action:** No action is required.

IOAV2EI  nnnnn PATHS ARE SELECTED

**Explanation:** This information message indicates how many IOA Global Paths, matching the specified prefix, are selected during the IOAGLV utility run.

**Corrective Action:** No action is required.

IOAV2FI  nnnnn VARIABLES ARE ADDED

**Explanation:** This information message indicates how many variables are added to the IOA Global Variables pool during the IOAGLV utility run.
Corrective Action: No action is required.

IOAV2GI  nnnnn VARIABLES ARE DELETED
Explanation: This information message indicates how many variables are deleted from the IOA Global Variables pool during the IOAGLV utility run.
Corrective Action: No action is required.

IOAV2HI  nnnnn VARIABLES ARE UPDATED
Explanation: This information message indicates how many variables are updated in the IOA Global Variables pool during the IOAGLV utility run.
Corrective Action: No action is required.

IOAV2II  IOAGLV UTILITY COMPLETED SUCCESSFULLY
Explanation: This information message indicates that the IOAGLV utility completed successfully.
Corrective Action: No action is required.

IOAV2JE  DYNAMIC ALLOCATION ERROR, RC=rc, REASON=rsn, DSN=dsname
Explanation: Dynamic Allocation of the input dataset (dsname), specified in the FROM parameter for the IOAGLV utility with function LOAD, failed. The utility stops with RC=8.
For explanations of the return code (rc) and reason code (rsn) displayed as part of this message, see the MVS Programming: Authorized Assembler Services Guide (IBM manual).
Corrective Action: Examine the return and reason codes, take the appropriate corrective actions, and resubmit the utility.

IOAV2KE  MAXIMUM NUMBER OF ROWS nnnnn IN IOAVAR POOL EXCEEDED
Explanation: The IOAGLV utility, using either the LOAD or SETVAR functions, attempted to add a variable to the IOA Global Variables pool, exceeding the maximum number of variables in the IOAVAR database.
The utility writes from the pool to the database only the variables in the pool that were added or updated before exceeding the maximum limit, and then stops with RC=8.
Corrective Action: Do the following:
1. Increase the maximum number of rows in the IOAVAR database from the online IV screen.
2. Reload the IOAVAR pool from the database using the LOADGLOBAL=IOAVAR modify command issued for the Control-O or CMEM monitor.
3. Resubmit the utility.
IOAV2LE  ONLY ONE FUNCTION CAN BE SPECIFIED

**Explanation:** Multiple specifications of the following functions, or combinations of them are invalid in IOAGLV:
- LIST
- VIEW
- LOAD
- DELETE

(Only the SETVAR function can be specified multiple times, other functions must be specified singularly.)

**Corrective Action:** Correct the input parameters in the JCL and resubmit the job. For more information, see the IOAGLV utility in the *INCONTROL for z/OS Utilities Guide*.

IOAV2ME  REQUIRED FUNCTION IS MISSING

**Explanation:** No function was specified.

**Corrective Action:** Correct the input parameters in the JCL and resubmit the job.

Messages IOAZ00 through IOAZxx

This group includes messages for the IOA (infrastructure) product.

IOAZ00I The performance trace limitations are as follows:

**Explanation:** This is the first of a series of information messages that together display the current performance trace limitation settings.

This message is followed by the IOAZ01I message.

**Corrective Action:** No action is required.

IOAZ01I The following requests groups are to be traced:

**Explanation:** This is the second of a series of information messages that together display the current performance trace limitation settings.

This message is preceded by the IOAZ00I message, and followed by the IOAZ02I message.

**Corrective Action:** No action is required.

IOAZ02I request group1  request group2

**Explanation:** This is the third of a series of information messages that together display the current performance trace limitation settings. The contents of this message lists the group(s) of requests to be traced. The request group can be one of the following: LIST, REPORT, ALL (where ALL means no limitation).

This message is preceded by the IOAZ01I message, and can be followed by the IOAZ03I message.

**Corrective Action:** No action is required.
IOAZ03I The following users are to be traced:

**Explanation:** This is the fourth of a series of information messages that together display the current performance trace limitation settings.

The contents of this message form part of the headers of the columns of statistics.

This message is preceded by the IOAZ02I message, and followed by the IOAZ05I message.

**Corrective Action:** No action is required.

IOAZ05I user-id

**Explanation:** This is the fifth of a series of information messages that together display the current performance trace limitation settings.

The content of this message is the user ID whose actions are to be traced. The first instance of this message is preceded by the IOAZ03I message. This message is repeated with new user-id values until all the user IDs to be traced have been displayed.

**Corrective Action:** No action is required.

IOAZ11E ZIIP ENCLAVE CREATION FAILED. RC=rc RSN=rsn

**Explanation:** The Workload Management Service (IWM4ECRE macro) failed during enclave creating for ZIIP usage. For explanations of the return code (rc) and reason code (rsn) displayed as part of this message, see the IBM manual *MVS Programming: Workload Management Services*. The address space continues to work, but does not use the ZIIP processor.

**Corrective Action:** Contact BMC Software Customer Support.

IOAZ12W NO ZIIP CONFIGURED TO WHICH WORK COULD BE OFFLOADED TO. ZIIP WORK WILL BE REPORTED AS "SUP_ON_CP" WORK. RC=rc RSN=rsn

**Explanation:** This warning message indicates that the Workload Management Service could not be configured for offloading work to the ZIIP. The address space continues to work and uses the ZIIP processor but ZIIP work will be reported as specific work.

**Corrective Action:** For explanations of the return code (rc) and reason code (rsn) displayed as part of this message, contact BMC Software Customer Support.

IOAZ13E NO ZIIP CONFIGURED TO WHICH WORK COULD BE OFFLOADED TO. ZIIP PROCESSING DISABLED. RC=rc RSN=rsn

**Explanation:** The Workload Management Service could not be configured for offloading work to the ZIIP. The address space continues to work, but does not use the ZIIP processor.

**Corrective Action:** Contact BMC Software Customer Support.

IOAZ14E ZIIP OFFLOAD CPU PERCENTAGE FAILED. RC=rc RSN=rsn

**Explanation:** The Workload Management Service failed during setting offload CPU percentage for ZIIP usage. The address space continues to work, but does not use the ZIIP processor.
**Corrective Action:** Contact BMC Software Customer Support.

IOAZ15E ZIIP ENCLAVE DELETION FAILED. RC=rc RSN=rsn

**Explanation:** The Workload Management Service (IWM4EDEL macro) failed during ZIIP enclave deleting. The address space continues to work, but does not use the ZIIP processor.

**Corrective Action:** Contact BMC Software Customer Support.

IOAZ16I INTERFACE TO XBM IS ACTIVE

**Explanation:** The message is issued when the interface to XBM is initialized successfully.

**Corrective Action:** No action is required.

IOAZ17I THE XBM MODIFY COMMAND IS IGNORED BECAUSE parameter_name PARAMETER IS SET TO N

**Explanation:** The message is issued when the XBM modify command is ignored because the parameter_name parameter was set to N, where parameter_name is one of the following: ZIIPXBMO, ZIIPXBMP, or ZIIPXBMA.

**Corrective Action:** No action is required.

IOAZ18I CPU TIME OFFLOADED TO ZIIP: dddD hhH mmM ss.ccS

**Explanation:** The message is issued upon a termination of the XBM-enabled address space. It contains the number of days (ddd), hours (hh), minutes (mm), seconds (ss) and hundredths of a second (cc) of CPU time offloaded to ZIIP.

**Corrective Action:** No action is required.

IOAZ19I INTERFACE TO XBM IS INACTIVE

**Explanation:** The message is issued when the interface to XBM is not initialized for the following possible reasons:

- The ZIIPXBMx parameter (where ZIIPXBMx is one of the following: ZIIPXBMO, ZIIPXBMP or ZIIPXBMA) in the IOAPARM parameter member is set to N.

- XBM address space is inactive, regardless the value of the ZIIP parameter.

**Corrective Action:** No action is required.

IOAZ1AI NO ONLINE ZIIP PROCESSORS FOUND

**Explanation:** The message is issued when no online ZIIP processors were found.

**Corrective Action:** No action is required.

JAR messages

This group includes messages for the Control-V product.
Messages JARG00 through JARGxx
This group includes messages for the Control-V product.

JARGD01 CONTROL-V JCL ARCHIVING STARTED
**Explanation:** This information message indicates that the CTVJAR Job Archiving utility started.
**Corrective Action:** No action is required.

JARGD11 CONTROL-V JOB ARCHIVING ENDED O.K.
**Explanation:** This information message indicates that the CTVJAR Job Archiving utility ended successfully.
**Corrective Action:** No action is required.

JARGD21 CONTROL-V JOB ARCHIVING FAILED
**Explanation:** This information message indicates that the CTVJAR Job Archiving utility failed. Other messages generated in response to the failure describe the cause for the failure.
**Corrective Action:** Examine all messages issued by the Job and correct the failure. If necessary, correct the input and rerun the CTVJAR Job Archiving utility.

JARGD31 *** PARM=TEST SPECIFIED - SIMULATION MODE ***
**Explanation:** This information message indicates that the CTVJAR Job Archiving utility was run in TEST mode. CTVJAR was activated using the TEST parameter in the PARM field of the executive statement. When CTVJAR is active in TEST mode, no updates are performed to the Active User file. Only a report is created.

**Note:**
If the user sets the SYNC parameter to YES in CTVJAR, active generic decollation will close the recently created CDAM file. The active generic decollation will wait for new decollations until the CTVJAR Job Archiving utility is terminated.
No updates are performed to the Active User file. A report is created.
**Corrective Action:** Do the following:
1. Check the results of the TEST mode run.
2. If results are acceptable, rerun the CTVJAR utility with PARM set to PROD.

JARGD4E INVALID RETURN CODE FROM SORT, RC=rc
**Explanation:** The CTVJAR Job Archiving utility received an invalid return code from the SORT utility. CTVJAR called the SORT utility to sort the entry being consolidated, and the sort failed.
**In this message, rc** is the invalid return code.
The system terminates CTVJAR.
**Corrective Action:** Examine the messages generated by the SORT utility for a description of the problem. Correct the problem and rerun CTVJAR.

**JARGD5E OPEN OF SORT FILE FAILED. DDNAME "SORTIN"**

**Explanation:** The CTVJAR Job Archiving utility was unable to open the file referenced by the SORTIN DD statement. Either the SORTIN DD statement is missing in the JCL of CTVJAR, or the definition of the SORTIN DD statement is invalid.

CTVJAR terminates.

**Corrective Action:** Correct the DD statement and rerun the CTVJAR utility.

**JARGD6I NUMBER OF CONSOLIDATED reptype RECORDS=num**

**Explanation:** This information message indicates that multiple records of type reptype were joined together into a single report. The CTVJAR Job Archiving utility consolidates multiple records, of type SYSDATA, USER or INDEX, into a single record according to type.

The variables in this message are:
- reptype - the type of record consolidated
- num - the number of consolidated records

**Corrective Action:** No action is required.

**JARGD7I NUMBER OF NEWLY GENERATED REPORTS =num**

**Explanation:** This information message indicates how many new reports were created by a run of the CTVJAR Job Archiving utility. CTVJAR consolidates multiple SYSDATA, USER, or INDEX type records into a single record, according to type.

**Corrective Action:** No action is required.

**JARGD8S INVALID INPUT PARAMETER**

**Explanation:** An invalid parameter was specified as input for the CTVJAR utility.

CTVJAR terminates.

**Corrective Action:** Correct the input parameters, and rerun the utility

**JARGD9S INVALID PARAMETER, VALID PARAMETER: MODE=TEST OR MODE=PROD**

**Explanation:** An invalid value was specified for the MODE parameter of the CTVJAR Job Archiving utility. The only valid values for the MODE parameter are TEST and PROD.

CTVJAR terminates.

**Corrective Action:** Specify either TEST or PROD, and rerun the CTVJAR utility.
**JARGDAW INDEX RECORD WITHOUT SYSDATA RECORD FOUND** *fileName*

**Explanation:** Control-V attempted to match an index record with a corresponding SYSDATA record. However, a corresponding SYSDATA record could not be found for the index record. During Job archiving, selected index and user records are matched with their corresponding SYSDATA records.

In this message, *fileName* specifies the CDAM file name defined by the index. The index originally belonged to the SYSDATA record that satisfied the CTVJAR selection criteria.

The system ignores the index record. All other index and user records relating to this SYSDATA are also ignored.

**Corrective Action:** Determine the cause for the missing SYSDATA record. Correct if possible and rerun CTVJAR.

**JARGDBW SYSDATA RECORD FOUND WITH NO USER RECORDS** *fileName*

**Explanation:** Control-V attempted to match a SYSDATA record with a corresponding user record. However, a corresponding user record could not be found for the SYSDATA record. During Job archiving, Control-V matches selected index and user records with their corresponding SYSDATA records.

In this message, *fileName* is the CDAM file name of the SYSDATA record.

The system ignores the SYSDATA record.

**Corrective Action:** Determine why the user record is missing. Determine if the required user records were deleted using the online U screen.

**JARGDCE CTDRPUF FAILED. RC: rc**

**Explanation:** Control-V called routine CTDRPUF to create a report entry in the Active User file of the newly archived report. However, CTDRPUF was unable to create the new report. In this message, *rc* is the CTVJAR return code.

CTVJAR processing continues with the next report.

**Corrective Action:** Check the IOA log for all messages generated for this failure. If the cause for the failure remains unclear, contact BMC Software Customer Support.

**JARGDEE INVALID PARAMETERS RECEIVED FROM USER. RC =rc**

**Explanation:** There are invalid parameters in the SYSIN file. This is a summary message. Preceding messages clarify the error. CTVJAR issues the return code *rc*.

The system terminates job archiving.

**Corrective Action:** Check all messages generated for this error. Correct the input parameters, and rerun job archiving.

**JARGDFE THE PARAMETER parm MUST BE SPECIFIED FOR JOBARC UTILITY**

**Explanation:** The user attempted to execute the CTVJAR Job Archiving utility without specifying the parm parameter. The parm parameter is mandatory for CTVJAR.

The CTVJAR Job Archiving utility terminates.
**Corrective Action:** Add the parm parameter, and rerun CTVJAR.

**JARGE0E INVALID PARAMETER:** - parm

**Explanation:** An invalid parameter was specified in the parameter statement for the CTVJAR Job Archiving utility. In this message, parm is the invalid parameter specified by the user.

The CTVJAR Job Archiving utility terminates.

**Corrective Action:** Correct the values in the PARM statement, and rerun the CTVJAR Job Archiving utility.

**JARGE1E REDUNDANT PARAMETER:** - parm

**Explanation:** A parameter was specified more than once in the input for the CTVJAR Job Archiving utility. That parameter can be specified only once in the input for this utility.

In this message, parm is the redundant parameter specified by the user.

The CTVJAR Job Archiving utility terminates.

**Corrective Action:** Ensure that the parm parameter is specified only once, and rerun CTVJAR.

**JARGE2E ERROR IN PARAMETERS: FODATE IS HIGHER THAN TODATE**

**Explanation:** A later date value was specified in FODATE than in TODATE in the input for the CTVJAR Job Archiving utility. The FODATE and TODATE parameters indicate a date range for reports to be consolidated by CTVJAR. A date range is valid only if FODATE is earlier than, or the same as, TODATE.

The CTVJAR Job Archiving utility terminates.

**Corrective Action:** Ensure that the date value specified for FODATE is not later than the date value for TODATE. Rerun CTVJAR.

**JARGE3E INVALID DATE SPECIFIED:= ddName**

**Explanation:** An invalid date value was specified in the ddName DD statement in the input for the CTVJAR Job Archiving utility.

The CTVJAR Job Archiving utility terminates.

**Corrective Action:** Check and correct the date value and rerun CTVJAR.

**JARGE4E NO USER RECORDS FOUND FOR -fileName**

**Explanation:** Control-V found a SYSDATA record for CDAM file fileName. However, CDAM file fileName contained no user records that corresponded to the SYSDATA record. In the input for the CTVJAR utility, the user specified a CDAM file that contained no user records in the input for the CTVJAR utility.

In this message, fileName is the name of the CDAM file in error.

CTVJAR ignores the SYSDATA record, and continues processing normally.

**Corrective Action:** Check why the user records are missing. If the user records were deleted using the U screen, restore user records from a backup.
JARGE5I JOB ARCHIVING FOR FILE: cdamfil USER: userId

Explanation: This information message provides details about a consolidated report that is being produced by the CTVJAR utility.

The information about the report is provided in message CTDI0CI, which follows this message.

Corrective Action: No action is required.

JARGE6E CTVXVAL FAILED FOR - indexFile - SEE OTHER ERROR MESSAGES

Explanation: The CTVXVAL internal routine was unable to process the indexFile index file.

The system skips the index file, and continues processing.

Corrective Action: To determine the cause, check the other messages generated by the failure of CTVXVAL.

JARGE7I REPORT ALREADY CONSOLIDATED FOR CDAM: cdamfil

Explanation: This information message indicates that Control-V found a previously consolidated report in the ACTIVE user file. A CDAM file was specified to the CTVJAR utility. However, a consolidated report already exists for this CDAM file. It is unnecessary to consolidate a previously consolidated report.

In this message, cdamfil is the name of the CDAM file for which a consolidated report already exists.

The system skips the consolidation of this CDAM file and continues processing normally.

Corrective Action: No action is required.

JARGE8E CTDTRE FAILED RC: 08

Explanation: An internal routine failed with a return code of 08. The CTVJAR Job Archiving utility uses the CTDTRE routine to determine the validity of each user name supplied by the user for the consolidated report.

CTVJAR terminates.

Corrective Action: Determine the cause by checking preceding error messages generated by the failure. Verify that the user tree is properly defined and rerun the CTVJAR utility.

JARGE9E USER NAME userId IS NOT FOUND IN TREE. JOB ARCHIVING WILL NOT BE PERFORMED

Explanation: The specified user name could not be found by the CDTRE utility. The CTVJAR Job Archiving utility uses the CTDTRE utility to determine the validity of the user name supplied by the user for the consolidated report. User name userId was specified by the USER parameter of the CTVJAR utility, but could not be found in the Control-D recipient tree.

CTVJAR terminates.

Corrective Action: Correct the user parameter and rerun CTVJAR.
JARGEAI USER PARAMETERS FOR CONSOLIDATION: parm

Explanation: This information message indicates the parameters specified by the user as input for the CTVJAR Job Archiving utility. Multiple incidences of this message creates a list of all the user specified parameters.

Corrective Action: No action is required.

JARGEBE INDEX indexName IS NOT FOUND IN FILE fileName

Explanation: The CTVJAR utility did not find an expected index in the specified index file. The CTVJAR utility consolidates all small index files created by the decollation with the ALLOCOPT CDAM parameter and consolidates them into a single index file. For more information on ALLOCOPT, See the Control-D and Control-V User Guide.

The variables in this message are:
- indexName - the name of the expected index
- fileName - the name of the index file

The CTVJAR utility terminates.

Corrective Action: Check why the specified index was not found, correct the error, and if necessary, rerun the CTVJAR utility.

JARGECE SYNC= PARAMETER INVALID. ONLY SYNC=YES OR SYNC=NO ARE VALID

Explanation: An invalid value was specified for the SYNC parameter of the CTVJAR Job Archiving utility. Valid values for the SYNC parameter are YES and NO.

The CTVJAR Job Archiving utility terminates.

Corrective Action: Correct the SYNC parameter and rerun CTVJAR.

JARGEEE THERE ARE TOO MANY MATCHING CDAM DATASETS KEPT OPEN BY CONTROL-D MONITORS. UTILITY TERMINATES.

Explanation: The CTVJAR Job Archiving utility terminated execution without creating consolidated reports. This occurred under option SYNC=NO, because too many CDAM datasets matching selection criteria are opened by the Control-D decollation monitor.

Corrective Action: Execute the utility with parameter SYNC=YES.

JDL messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.
Messages J DLK00 through J DLKxx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

J DLK40I PRIORITY PROPAGATION PROCESS STARTED

**Explanation:** This information message indicates that the Priority Propagation process has been started by the Control-M monitor.

**Corrective Action:** No action is required.

J DLK41I PRIORITY PROPAGATION PROCESS ENDED

**Explanation:** This information message indicates that the Priority Propagation process has ended.

**Corrective Action:** No action is required.

J DLK42E INSUFFICIENT STORAGE FOR CALCULATION

**Explanation:** The Control-M monitor did not have enough storage for either the Deadline Scheduling Calculation process or for the Priority Propagation process.

The process is aborted.

**Corrective Action:** Increase the storage for the Control-M monitor.

J DLK43W WAITING FOR DEPENDENCIES FILE. DDNAME "ddName"

**Explanation:** The Control-M monitor cannot access a file because it is being used by another component. The monitor requires exclusive access to the file.

The monitor waits for the file to be released.

**Corrective Action:** Check who is holding the file and have it released.

J DLK44S QNAME MISMATCH IN DEPENDENCIES FILE

**Explanation:** The Dependencies file allocated to the Control-M monitor does not belong to the current installation.

The process is aborted.

**Corrective Action:** Verify that the correct Dependencies file is allocated to the Control-M monitor through the DAGRAPHD DD statement.

J DLK45I numRecd JOBS RECEIVED HIGHER PRIORITY. numHeld JOBS HELD

**Explanation:** This information message is issued when the Priority Propagation process ends. The message indicates the number of jobs that received higher priority, and the number of jobs whose priority was not changed, that is, were held.

**Corrective Action:** No action is required.
JDLK46I  DEADLINE SCHEDULING PROCESS STARTED

**Explanation:** This information message indicates that a request to resolve all deadline scheduling requests was received either from a modify command, or from a user entering command REFRESH in the Jobs Dependencies screen.

The Control-M monitor resolves all deadline scheduling definitions.

**Corrective Action:** Wait for message JDLK47I or CTMK47I, to signal the end of the process.

JDLK47I  DEADLINE SCHEDULING PROCESS ENDED

**Explanation:** This information message indicates that the Control-M monitor successfully finished resolving all deadline scheduling definitions. This message is accompanied by message JDLK48I or CTMK48I which displays the number of updated jobs.

**Corrective Action:** No action is required.

JDLK48I  num1 JOBS DUE OUT TIME UPDATED. num2 JOBS HELD/FINISHED

**Explanation:** This information message indicates that the Control-M monitor successfully finished resolving all deadline scheduling definitions.

The variables in the message are:

- **num1** - the number of jobs with DUE OUT times that were updated
- **num2** - the number of jobs that were not updated, because
  - the job was held
  - the job ended
  - the job record was not available for change

This message follows the JDLK47I message.

**Corrective Action:** No action is required.

JDLK49E  DEADLINE SCHEDULING FACILITY IS DISABLED. PROCESSING STOPPED

**Explanation:** A request has been made to resolve deadline scheduling, but the Deadline Scheduling Facility has not been enabled in the Control-M defaults member.

Deadline scheduling is not performed.

**Corrective Action:** Ask your INCONTROL administrator to enable the Deadline Scheduling Facility in the Control-M default parameters member.
J DLK4AE CREATOR OF IN-CONDITION NOT FOUND. PROCESSING ABORTED.

**Explanation:** A job or group entity that produces an out-condition that acts as an in-condition for the job being processed was not found in an internal table. This internal error was detected during the processing of the REFRESH DEADLINE (deadline scheduling) command while it was analyzing a group entity and its component jobs.

The REFRESH DEADLINE command is aborted.

**Corrective Action:** Contact your INCONTROL representative for assistance. Have the complete job log and the output of the Control-M monitor address space available.

J DLK4BE GROUP CROSS-REFERENCE LIST NOT FOUND. PROCESSING ABORTED

**Explanation:** An internally-created cross-reference table used for group processing was missing when the REFRESH DEADLINE (deadline scheduling) command was analyzing a group entity and its component jobs.

The REFRESH DEADLINE command is aborted.

**Corrective Action:** Contact your INCONTROL representative for assistance. Have the complete job log and the output of the Control-M monitor address space available.

J DLK50I INITIALIZATION OF DEPENDENCIES FILE COMPLETED

**Explanation:** This information message indicates that the Dependencies file was successfully formatted and is ready for use. The current dependencies between jobs can be viewed after entering the REFRESH command from the appropriate screen.

**Corrective Action:** No action is required.

J DLK51S BAD PARAMETER SUPPLIED TO REFRESH COMMAND

**Explanation:** A REFRESH command was issued to the Control-M monitor with an unrecognizable parameter.

The REFRESH command is not executed.

**Corrective Action:** Check the command syntax and reissue the command.

J DLK52E DEADLINE COMMAND DOES NOT ACCEPT PARAMETERS

**Explanation:** A REFRESH DEADLINE command was submitted with parameters. However, this command does not take any parameters.

The command is not executed.

**Corrective Action:** Delete the parameters and resubmit the command.
J DLK53E TOO MANY INTERJOB CONNECTIONS

**Explanation:** The number of prerequisite conditions for dependency calculations exceeds the maximum number supported. The maximum number of conditions is ten times the maximum number of records in the Active Jobs file.

The dependency calculation process is aborted.

**Corrective Action:** Increase the size of the Active Jobs file.

J DLK54I DEPENDENCIES FILE REFRESH DONE

**Explanation:** This information message is issued to the IOA Log file after the Job Dependencies file is updated.

**Corrective Action:** No action is required.

J DLK55W DEADLINE SCHEDULING INTERNAL ERROR - DIAGNOSTIC DUMP PRODUCED

**Explanation:** The Control-M monitor encountered an internal error during REFRESH processing in the Control-M Active Environment screen.

The system produces a diagnostic dump, and continues processing.

**Corrective Action:** Ask your system programmer to record the error message, the diagnostic dump, and the Control-M monitor full output; and contact BMC Customer Support.

J DLK56S INVALID INPUT TO SHIFT. DATA SHOULD BE +NNN/-NNN

**Explanation:** The user specified invalid parameters for operator command SDOUT.

The operator command is ignored.

**Corrective Action:** Specify valid parameters for operator command SDOUT. See the Control-M chapter of the INCONTROL for z/OS Administrator Guide for a details about this operator command.

J DLK57I shiftnum JOBS DUE-OUT TIME SHIFTED. heldnum JOBS HELD

**Explanation:** This information message is issued after successful execution of operator command SDOUT.

The variables in this message are:

- `shiftnum` - The number of jobs for which the DUE OUT time was shifted the requested number of minutes.
- `heldnum` - The number of jobs that are currently in HELD status and were therefore not shifted.

**Corrective Action:** No action is required.

J DR messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.
Messages J DRK00 through J DRKxx
This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

J DRK15I REFRESH REQUESTED BY USER usr
Explanation: This information message is issued to the IOA Log file after a user issues a refresh request.
Corrective Action: No action is required.

J DS messages
This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages J DSN00 through J DSNxx
This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

J DSN06I NO MATCHING ENTRIES FOUND
Explanation: The Control-M CTMRJDS utility did not find any data set names in the Control-M statistics file that matched those specified in the DSN utility control statements.
Processing terminates.
Corrective Action: Change the DSN control statements and rerun the utility.

J DSN09I FUNCTION NOT SPECIFIED -- LIST ASSUMED
Explanation: The Control-M CTMRJDS utility detected a missing function statement.
The utility continues processing as if the LIST=DSN function had been specified.
Corrective Action: No action is required.

J ES messages
This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages J ES200 through J ES2xx
This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.
JES260S OID=orderId OPEN OF DDNAME ddName FAILED

**Explanation:** Control-M monitor failed to open a work data set defined by the ddName DD statement.
This data set must be defined as a temporary or fixed work area for Control-M monitor. The ddName DD statement is probably missing.
Control-M monitor will shut down with errors.

**Corrective Action:** Correct the JCL for the Control-M monitor, and start again.

JES261S taskTypememNamejobNamejobId OID=orderId ALLOCATION OF {SYSOUT FILE | ARClVE FILE} dsn FAILED: R15=rc ERR=erc INFO=irc

**Explanation:** Dynamic allocation to the specified dsn failed.
Control-M dynamically allocates the job sysout data sets, and/or the archive data set. The allocation failed for the specified reasons. For an explanation of the return codes displayed as part of this message, see the IBM manual *MVS Programming: Authorized Assembler Services Guide.*

Return codes in this message:
- rc - the contents of R15 in hexadecimal notation.
- erc - error reason code in hexadecimal notation.
- irc - information reason code in hexadecimal notation.

The requested function is stops. If analysis of job results was in process, the job terminates NOTOK with Reason Unknown (*UKNW).

**Corrective Action:** Check the relevant IBM publication for the reason.
- For sysout data sets, check if the sysout was purged while the Control-M monitor was trying to read it.
- For archive files, the Control-M monitor allocates archive files with DISP=(NEW,CATLG). Therefore, the same data set name should not be used in different sysout archive instructions, even for the same job.

If your system programmer is unable to resolve the problem, prepare the Control-M monitor full output and contact BMC Customer Support.

JES262W taskTypememNamejobNamejobId OID=orderId num UNSUCCESSFUL ATTEMPTS TO READ JOB DATA BY SUBSYSTEM REQUEST. RETRY CONTINUES

**Explanation:** This message is issued every num unsuccessful attempts to read job data by subsystem request.
Whenever the Control-M monitor does not succeed in reading job sysout, this message appears on the operator console. For example, when a job is not run due to a JCL error, then the third sysout data set is missing and this message is issued.
Control-M continues to retry reading the job data for a predefined number of times. If the error persists, this job is not read and error message CTMD50S is issued.
Corrective Action: For the appropriate action, refer to the section on the Control-M Monitor and JES in the Control-M for z/OS Administrator Guide.

**JES263S taskType memName jobName/jobId OID=orderId OPEN OF SMB FILE DSNAME dsn FAILED. RC=rc**

Explanation: Open of sysout data set of the job by Control-M monitor failed. Control-M cannot read the job sysout and analyze it. Possible causes are:

- Someone purged the output of the job while Control-M monitor was trying to read it.
- Internal Control-M monitor error.
- General problems with JES that caused JES to terminate.

The job will finish with status FAILED - REASON UNKNOWN.

Corrective Action: If the job was not purged, and JES did not have any problems, prepare the Control-M monitor full output and contact BMC Customer Support.

**JES264S taskType memName jobName/jobId OID=orderId POINT TO DSNAME dsn FILE FAILED. FDBK code**

Explanation: Control-M reads the jobs output as a VSAM file. For some reason it failed in a VSAM operation. Control-M cannot read the jobs sysout and analyze it. Possible causes are:

- Someone purged the output of the job while Control-M monitor was trying to read it.
- Internal Control-M monitor error.
- General problems with JES that caused JES to terminate.

The job will finish with status FAILED - REASON UNKNOWN.

Corrective Action: If the job was not purged, and JES did not have any problems, prepare the Control-M monitor full output and contact BMC Customer Support.

**JES265S taskType memName jobName/jobId OID=orderId GET TO DSNAME dsn FILE FAILED. FDBK code**

Explanation: Control-M reads the jobs output as a VSAM file. For some reason it failed in a VSAM operation. Control-M cannot read the jobs sysout and analyze it. Possible causes are:

- The output of the job was purged while Control-M monitor was trying to read it.
- Internal Control-M monitor error.
- General problems with JES that caused JES to terminate.

The job will finish with status FAILED - REASON UNKNOWN.

Corrective Action: If the job was not purged, and JES did not have any problems, prepare the Control-M monitor full output and contact BMC Customer Support.
**JES266S** OID=orderId READING JOB DATA BY SUBSYSTEM REQUEST FAILED

**Explanation:** Control-M monitor could not read all the data sets of the job, and analyze the data. Possible causes are:
- Internal Control-M monitor error.
- General problems with JES that caused JES to terminate.
- Someone has purged the output of the job while the Control-M monitor was trying to read it.

The job finishes with status FAILED - REASON UNKNOWN.

**Corrective Action:** Look for prior messages in the IOA Log. If the job was not purged, and JES did not have any problems, prepare the Control-M monitor full output and contact BMC Customer Support.

**JES267S** taskType memName jobName/jobId OID=orderId ARCHIVE FUNCTION ABENDED ON abCode

**Explanation:** An abend occurred during sysout archiving function. Common abend codes:
- SB37, SE37 - No more space for the sysout in the file.
- S913 - Security violation.

Archiving stops.

**Corrective Action:** For an 5x37 type of abend, consult your INCONTROL administrator for the possibility of changing the default Control-M archive file allocation size in the Control-M installation parameters (CTMPARM). For an S913 abend, check with your security administrator. For other abends, check IBM publications for the reason.

**JES268S** taskType memName jobName/jobId OID=orderId INVALID INSTALLATION PARAMETERS FOR SYSOUT ARCHIVING

**Explanation:** Highlighted, unrollable message.

Invalid values of the Control-M Installation Parameters (CTMPARM) which control the sysout archiving function.

The archiving function is terminated. Control-M will not perform any sysout archiving and valuable data may be lost.

**Corrective Action:** Consult your INCONTROL administrator immediately. See the section on Control-M operational parameters in the Control-M chapter of the INCONTROL for z/OS Installation Guide for the valid values of the sysout archiving parameters. To load new parameters, shut down the Control-M monitor and start it again.

**JES269W** OID=orderId INVALID RESPONSE FROM IEFSSREQ: SSOBFUNC=func R15=r15 SSOBRETN=ssobrc PHASE=x

**Explanation:** A failure during sysout operation. The Control-M monitor is using subsystem request services to process the job sysout. A sysout function failed.
The Control-M monitor sometimes recovers from this kind of situation, and completes the function. If another error message indicating a sysout operation failure follows this one, then follow the User Response instructions.

**Corrective Action:** If the Control-M monitor does not recover from the failure, consult BMC Software Customer Support. To solve the problem, support personnel require the data of the message, a list of all the IOA Log messages concerning the problematic job, and the small SNAP (DUMP) of storage areas that the Control-M monitor produces in this event.

**JES26AS** OID=orderId ABEND code WHILE READING SYSOUTS. JOBORDER joborder HELD

**Explanation:** Control-M could not read the output of a job from the spool. Control-M may be unable to read the output of a job because the OUT180 data set in which the data is placed overflows. The reason for this abend is either that the job output is unusually large, or that a spool corruption occurred that caused Control-M to read a very large amount of information, not related to the specific job, into its OUT180 data set.

The Control-M monitor changes the job status to HELD PROBLEMS READING SYSOUT.

**Corrective Action:** If the OUT180 data set is too small for the job output, increase the space value in the OUT180 DD, restart Control-M monitor, and free the job order in the Active Jobs file (AJF).

**Messages JESD00 through JESDxx**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**JESD50S** READING JOB DATA BY IEFSSREQ FAILED num TIMES. LAST RC rc. fileNum_jobName/jobId

**Explanation:** This message is issued after the number of unsuccessful attempts to read job data by subsystem request reaches the defined maximum. After searching for the job data the maximum number of times, Control-M changes the job status to DISAPPEARED and stops searching.

The job status changes to DISAPPEARED.

**Corrective Action:** For the appropriate action, refer to the section on the Control-M monitor and JES in the INCONTROL for z/OS Administrator Guide.

**JESD51S** OID=orderId NO MORE SPACE FOR SYSOUT ARCHIVING (SB37)

**Explanation:** No space is available on the designated volumes to archive SYSDATA sysouts.

Archiving of SYSDATA is not completed due to lack of the space on the volumes designated for allocation of the Archived Sysout Datasets.

Control-M issues additional messages describing the nature of the problem and terminates.

**Corrective Action:** Please do the following before attempting to restart the Control-M monitor:

1. Make sure that there is sufficient free space on the volumes defined by the AMVOL parameter of the CTRPARM member.
2. If it is not possible to provide enough space on the volumes defined by the AMVOL parameter of CTRPARM, please add another volume to the list of volumes designated for allocation of the Archived Sysout Data Sets.

3. If it is not possible to add more volumes to the AMVOL parameter of the CTRPARM member, remove all of them. Then the Archived Sysout Data Sets will be allocated only according to the AMUNIT parameter of the CTRPARM member.

4. Start the Control-M monitor.

5. If the problem persists, prepare the Control-M monitor full output and contact BMC Customer Support.

JESD52W OID=orderId PROBLEM PROBABLY CAUSED BY PREVIOUS MVS SYSTEM CRASH. END-OF-FILE ASSUMED

**Explanation:** A failure occurred during sysout processing.

Control-M received a bad return code from JES (feedback code of 0C0204) during sysout processing. This is a typical return code for a system crash event which prevented JES from closing the sysout in a standard manner.

The Control-M monitor ignores the return code, assumes that end-of-file has been encountered, and continues normally.

**Corrective Action:** No action is required.

JESD53S OID=orderId UNABLE TO ALLOCATE COMPRESSED DATASET FOR SYSDATA SYSOUT ARCHIVING. LAST RC=rc

**Explanation:** Dynamic allocation of an Archived Sysout Dataset has failed.

This message will be preceded by other messages detailing the nature of the problem, the DD name, the return code, and the reason code.

The Archived Sysout Dataset is not allocated and Control-M terminates.

**Corrective Action:** Record all relevant messages, prepare the Control-M monitor full output, and contact BMC Customer Support.

**JOB messages**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**Messages JOB300 through JOB3xx**

This group includes messages for the Control-M for z/OS product, including: Control-M/Assist, Control-M/Links for z/OS and Control-M/Restart products.
** JOB330E ** taskType memName OID=orderId ODATE odate INVALID RC
FROM CTMMEM rc NOTIFY THE IOA ADMINISTRATOR

**Explanation:** Internal error. Non-zero return code from the CTMMEM internal program while reading a calendar.

The job order is not scheduled.

**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

** JOB331E ** taskType memName OID=orderId ODATE odate READING DATEMEM (CALENDAR) calName FAILED

**Explanation:** Reading of a calendar failed.

The job order or mission is not scheduled. Depending on whether or not optional wish WM0738 is applied, the program will terminate or continue with the next job.

**Corrective Action:** Look for prior messages in the IOA Log that explain why this error occurred and make any necessary corrections.

- For a batch daily, correct date-3 (or date-5), positions 25-30 (or positions 50-55) in the Date Control Record (the DACHK DD statement), to the values of date-2 (or date-4).
- For a rerun of the same daily, correct all the dates to the value of the day before. Beware of ordering the same job or mission twice during a rerun on the same day. We suggest that you delete the ordered jobs or missions from the Active Jobs or Active Missions file and then run the Daily again.

If the previous abend happened after many jobs or missions had been ordered, a manual request is recommended (the CLIST CTMJOBRQ for jobs; the CLIST CTDREPRQ, CTDPRTRQ, CTDBKPRQ or CTDSTRRQ for missions).

** JOB332E ** taskType memName OID=orderId ODATE odate CALENDAR calName - OPEN FAILED

**Explanation:** Reading of a calendar failed.

The **calName** calendar member does not exist in the library described by the DACAL DD statement.

The job order or mission is not scheduled.

**Corrective Action:** Correct the name of the **calName** member in the scheduling table, to a name of a valid calendar.

Check whether the DACAL DD statement describes one (and only one) valid Calendar library. Data set concatenation is not supported in this DD statement.

- For a batch daily, correct date-3 (or date-5), positions 25-30 (or positions 50-55) in the Date Control Record (the DACHK DD statement), to the values of date-2 (or date-4).
- For a rerun of the same daily, correct all the dates to the value of the day before. Beware of ordering the same job or mission twice during a rerun on the same day. We suggest that you delete the ordered jobs or missions from the Active Jobs or Active Missions file and then run the Daily again.

If the previous abend happened after many jobs or missions had been ordered, a manual request is recommended (the CLIST CTMJOBRQ for jobs; the CLIST CTDREPRQ, CTDPRTRQ, CTDBKPRQ or CTDSTRRQ for missions).
JOB333E  taskType memName OID=orderId ODATE odate MISSING
DDNAME "DACAL"

Explanation: Reading of a calendar failed.  
The DACAL DD statement describes the calendar library.  
The job order or mission is not scheduled.

Corrective Action: If this problem occurs during the New Day procedure, correct the JCL and rerun it.  
Correct date-3 (or date-5), positions 25-30 (or positions 50-55) in the Date Control Record (the DACHK DD statement), to the values of date-2 (or date-4).

For a rerun of the same daily, correct all the dates to the value of the day before. Beware of ordering the same job or mission twice during a rerun on the same day. We suggest that you delete the ordered jobs or missions from the Active Jobs or Active Missions file and then rerun the Daily again.

If the previous abend happened after many jobs/missions had been ordered, a manual request is recommended (the CLIST CTMJOBRQ for jobs; the CLIST CTDREPRQ, CTDPTRQ, CTDBKPRQ or CTDSTRQRQ for missions).

JOB334E READING CALENDAR calName FAILED

Explanation: Reading of the specified calendar failed.  
The job order or mission is not scheduled.

Corrective Action: Look for prior messages in the IOA Log that explain why the calendar could not be read.

If the error occurred during the New Day procedure or a User daily, correct date-3 (or date-5), positions 25-30 (or positions 50-55) in the Date Control Record (DD statement DACHK), to the values of date-2 (or date-4).

For a rerun of the same daily, correct all the dates to the value of the day before. Beware of ordering the same job or mission twice during a rerun on the same day. We suggest that you delete the ordered jobs or missions from the Active Jobs or Active Missions file and then rerun the Daily again.

If the previous abend happened after many jobs or missions have been ordered, a manual request is recommended (the CLIST CTMJOBRQ for jobs; the CLIST CTDMSRQ for missions).

JOB335E  taskType memName OID=orderId ODATE odate CALENDAR calName CONTAINS TOO MANY YEARS

Explanation: A calendar contains too many years to be processed.  
The job order or mission is not scheduled.

Corrective Action: Delete the oldest years in the calendar. Keeping a history of many years of calendars is unnecessary.

JOB336E  taskType memName OID=orderId ODATE odate AN ABEND - abCode OCCURRED WHILE READING CALENDAR calName

Explanation: An abend occurred while reading a calendar.
The job order or mission is not scheduled. The New Day procedure terminates with a condition code of 08.

**Corrective Action:** Look for the abend code in the relevant IBM literature and respond accordingly.

**JOB337E** **STATISTICAL CALENDAR** **statCal** **MUST BE PERIODIC**

**Explanation:** During the job ordering process, the **statCal** statistical calendar specified in a group or job scheduling definition was found to be in a non-periodic format.

The job order is not scheduled.

**Corrective Action:** Replace the **statCal** calendar in the job scheduling definition with a periodic calendar, or modify the **statCal** calendar to make it periodic.

**JOB338E** **ORDERING DATE** **odate** (YYMMDD) **NOT FOUND IN STATISTICAL CALENDAR** **calendar**

**Explanation:** The Statistical Calendar defined in a job definition does not include the date specified for the Ordering Date of the job. This error usually occurs when the Statistical Calendar does not include the year indicated in the Ordering Date. The ordering process fails.

**Corrective Action:** Add the definition for the year used in the Ordering Date to the Statistical Calendar.

**JOB350S** **taskType memName** **OID=orderId** **ODATE** **odate** **INSUFFICIENT MEMORY TO PERFORM** **func** **FUNCTION**

**Explanation:** There is insufficient memory to perform the internal New Day procedure function **func**.

The job order is not scheduled, but the New Day procedure continues to process other job orders.

**Corrective Action:** For batch, increase REGION size. For TSO, logon again using a larger SIZE parameter.

**JOB351I** **warning_msg**

**Explanation:** This message is a user-defined warning message that is issued by the WRN task type.

**Corrective Action:** No action is required.

**JOB354E** **taskType memName** **OID=orderId** **ODATE** **odate** **OPEN OF MEMBER FAILED**

**Explanation:** Open of the warning messages member failed.

This could be due to one of the following:

- The member does not exist in the specified library.
- There is not enough memory to open the member.

The warning order is not activated.

**Corrective Action:** Do the following:
Check the validity of the member and library.

Increase the REGION size allocated for the New Day procedure.

**JOB355E**  
*taskType* *memName* *OID=orderId* *ODATE* *odate* *DSN* *dsn* IN USE  
(DISP=OLD)

**Explanation:** The data set described in the MEMLIB parameter is in use.
Another user is holding the data set described by the MEMLIB parameter with DISP set to OLD.
The warning order is skipped.

**Corrective Action:** Try again later (or try to find the other user).

**JOB356E**  
*taskType* *memName* *OID=orderId* *ODATE* *odate* *DSN* *dsn* - NOT A LIBRARY

**Explanation:** The data set described in the MEMLIB parameter is not a library (partitioned data set).
The warning order will not be issued.

**Corrective Action:** Correct the production parameters table and try again.

**JOB357E**  
*taskType* *memName* *OID=orderId* *ODATE* *odate* *DSN* *dsn* - RECFM NOT FIXED

**Explanation:** The record format of the data set described by the MEMLIB parameter is not fixed.
The warning order is not issued.

**Corrective Action:** Correct the production parameters table and try again.

**JOB358E**  
*taskType* *memName* *OID=orderId* *ODATE* *odate* *DSN* *dsn* - LRECL NOT 80

**Explanation:** The record length of the data set described by the MEMLIB parameter is not 80.
The warning order is not issued.

**Corrective Action:** Correct the production parameters table and try again.

**JOB359E**  
*taskType* *memName* *OID=orderId* *ODATE* *odate* *DSN* *dsn* NOT FOUND

**Explanation:** The data set described by the MEMLIB parameter is cataloged, but is not found on the disk.
The warning order is not issued.

**Corrective Action:** Correct the production parameters table or the catalog and try again.
JOB360E  taskType memName ODATE odate DSN dsn - DYNAMIC ALLOCATION FAILED

Explanation: Dynamic allocation for the data set described by the MEMLIB parameter failed. The warning order is not issued.

Corrective Action: Check the validity of the data set name or call BMC Software Customer Support for assistance.

JOB361E  taskType memName OID=orderId ODATE odate INTERNAL ERROR ON func- MISSING PARAMETER. NOTIFY THE IOA ADMINISTRATOR

Explanation: Internal error in the New Day procedure while performing a warn task type. The warning order will not be issued.

Corrective Action: Have your system programmer call BMC Software Customer Support for assistance.

JOB362E  taskType memName OID=orderId ODATE odate INTERNAL ERROR ON func- ACT BEFORE INIT. NOTIFY THE IOA ADMINISTRATOR

Explanation: Internal error in the New Day procedure while performing a warning task type. The warning order will not be issued.

Corrective Action: Have your system programmer call BMC Software Customer Support for assistance.

JOB363E  taskType memName OID=orderId ODATE odate INTERNAL ERROR - INVALID REQUEST FROM CTMLIB. NOTIFY THE IOA ADMINISTRATOR

Explanation: Internal error in the New Day procedure while performing a warning task type. The warning order will not be issued.

Corrective Action: Have your system programmer call BMC Software Customer Support for assistance.

JOB364W  taskType memName OID=orderId ODATE odate TOO MANY DSNAMES FOR CTMLIB

Explanation: Internal error in the New Day procedure while performing a warning task type. The warning order will not be issued.

Corrective Action: Have your system programmer call BMC Software Customer Support for assistance.

JOB365E  taskType memName OID=orderId ODATE odate DSN dsn NOT CATALOGED

Explanation: The data set described by the MEMLIB parameter is not cataloged. The warning order will not be issued.
**Corrective Action:** Correct the production parameters table and try again.

**Job366E**  
_taskType_ memName OID=orderId ODATE odate UNEXPECTED ERROR ON CTMLIB FUNCTION func. NOTIFY THE IOA ADMINISTRATOR  
**Explanation:** Internal error in the New Day procedure while performing a warning task type. 
The warning order will not be issued. 
**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

**Job367S**  
_taskType_ memName OID=orderId ODATE odate INITIALIZATION OF MAIN LIB FAILED. DDNAME ddName  
**Explanation:** Initialization of main library failed (the _ddName_ DD statement). 
Internal error in the New Day procedure while performing a warning task type. 
The warning order will not be issued. 
**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

**Job368S**  
INSUFFICIENT MEMORY TO PERFORM func FUNCTION  
**Explanation:** Insufficient memory to perform the internal New Day procedure function func. 
The job order is not scheduled, but the New Day procedure continues to process other job orders. 
**Corrective Action:** For batch, increase REGION size. For TSO, logon again using a larger SIZE parameter.

**Job369I**  
warning_msg  
**Explanation:** This message is a user defined warning message that is issued by the WRN task type. 
**Corrective Action:** No action is required.

**Job370E**  
_taskType_ memName ODATE odate OPEN OF MEMBER memName DSN dsn FAILED  
**Explanation:** Open of the warning messages member failed. 
Possible causes are:  
- The member does not exist in the specified library.  
- There is insufficient memory to open the member. 
The warning order is not activated. 
**Corrective Action:** Do one or both of the following:
Check the validity of the member and library.

- Increase the New Day procedure REGION size.

**JOB371E DSN dsn IN USE (DISP=OLD)**

**Explanation:** Data set described in the MEMLIB parameter is in use. Another user is holding the data set described by the MEMLIB parameter with DISP set to OLD. The warning order is skipped.

**Corrective Action:** Try again later, or find the other user.

**JOB372E DSN dsn - NOT A LIBRARY**

**Explanation:** The data set described in the MEMLIB parameter is not a library (partitioned data set). The warning order will not be issued.

**Corrective Action:** Correct the production parameters table and try again.

**JOB373E DSN dsn - RECFM NOT FIXED**

**Explanation:** The record format of the data set described by the MEMLIB parameter is not fixed. The warning order will not be issued.

**Corrective Action:** Correct the production parameters table and try again.

**JOB374E DSN dsn - LRECL NOT 80**

**Explanation:** The record length of the data set described by the MEMLIB parameter is not 80. The warning order will not be issued.

**Corrective Action:** Correct the production parameters table and try again.

**JOB375E DSN dsn NOT FOUND**

**Explanation:** The data set described by the MEMLIB parameter is cataloged, but is not found on the disk. The warning order will not be issued.

**Corrective Action:** Correct the production parameters table or the catalog and try again.

**JOB376E DSN dsn - DYNAMIC ALLOCATION FAILED**

**Explanation:** Dynamic allocation for the data set described by the MEMLIB parameter failed. The warning order will not be issued.

**Corrective Action:** Check the validity of the data set name. If necessary, call BMC Software Customer Support for assistance.
JOB377E INTERNAL ERROR ON func - MISSING PARAMETER. NOTIFY THE IOA ADMINISTRATOR

**Explanation:** Internal error in the New Day procedure while performing a warning task type. The warning order will not be issued.

**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

JOB378E INTERNAL ERROR ON func - ACT BEFORE INIT. NOTIFY THE IOA ADMINISTRATOR

**Explanation:** Internal error in the New Day procedure while performing a warning task type. The warning order will not be issued.

**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

JOB379E INTERNAL ERROR - INVALID REQUEST FROM CTMLIB. NOTIFY THE IOA ADMINISTRATOR

**Explanation:** Internal error in the New Day procedure while performing a warning task type. The warning order will not be issued.

**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

JOB380W TOO MANY DSNAMES FOR CTMLIB

**Explanation:** Internal error in the New Day procedure while performing a warning task type. The warning order will not be issued.

**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

JOB381E DSN dsn NOT CATALOGED

**Explanation:** The data set described by the MEMLIB parameter is not cataloged. The warning order will not be issued.

**Corrective Action:** Correct the production parameters table and try again.

JOB382E UNEXPECTED ERROR ON CTMLIB FUNCTION func. NOTIFY THE IOA ADMINISTRATOR

**Explanation:** Internal error in the New Day procedure while performing a warning task type. The warning order will not be issued.

**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

JOB383S INITIALIZATION OF MAIN LIB FAILED. DDNAME ddName

**Explanation:** Initialization of main library failed (the ddName DD statement). Internal error in the New Day procedure while performing a warning task type.
The warning order will not be issued.

**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

**Messages JOB500 through JOB5xx**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**JOB501I** CTMJOB STARTED JOB=username/jobID TYPE=jobType

**Explanation:** This information message indicates that the CTMJOB program has started. The CTMJOB program is usually activated as part of the New Day procedure.

**Corrective Action:** No action is required.

**JOB502S OPEN OF SCHEDULE DATA FAILED. DDNAME "DAJOB"**

**Explanation:** Open of scheduling tables data set failed (the DAJOB DD statement).

This error message is issued by the CTMJOB program, which is usually activated as part of the New Day procedure, and could be due to one of the following:

- The DAJOB DD statement is missing.
- The data set described by the DAJOB DD statement cannot be opened for sequential read or record length is not 80.

The CTMJOB program will end with errors.

**Corrective Action:** Correct the JCL for the job or CLIST.

**JOB503S OPEN OF USER DATE CONTROL RECORD FAILED - DDNAME "DACHK"**

**Explanation:** Open of the file containing the User Date Control Record failed (the DACHK DD statement).

Issued by the CTMJOB program which is usually activated by the New Day procedure.

Possible causes are:

- The DACHK DD statement is missing.
- The data set (member) described by the DACHK DD statement does not exist.

The CTMJOB program will end with errors.

**Corrective Action:** Correct the JCL for the job or CLIST.

**JOB504S USER DATE CONTROL RECORD IS EMPTY**

**Explanation:** The data set described by the DACHK DD statement is empty.

The CTMJOB program will end with errors.

**Corrective Action:** Correct the JCL for the job or CLIST.
JOB505S PREVIOUS RUN OF CTMJOB DID NOT FINISH OK

Explanation: A previous run of the CTMJOB program did not finish OK. This program is usually activated as part of the New Day procedure.

Date-2 and date-3 (or date-4 and date-5) of the Date Control Record are not equal. Possible causes are:

- The previous run of the CTMJOB program did not finish OK.
- Someone has modified the contents of the User Date Control Record (the DACHK DD statement).

For more information, see the Control-M chapter in the INCONTROL for z/OS Administrator Guide.

The CTMJOB program will end with errors.

Corrective Action: Change date-3 (or date-5), positions 25-30 (or positions 50-55) in the Date Control Record (the DACHK DD statement) to the values of date-2 (or date-4).

To rerun the same daily, correct all the dates to the value of the day before. Be careful not to order the same job twice during a rerun on the same day. We recommend that you delete the ordered jobs from the Active Jobs file and then run the daily again.

If the previous abend happened after many jobs had been ordered, we recommend requesting the remaining jobs manually using CLIST CTMJOBQ.

JOB506S SCHEDULING FAILED FOR MEMBER memName

Explanation: Scheduling failed for the memName member. This error message is issued by the CTMJOB program which is usually activated as part of the New Day procedure.

The IOA Log or the job output should contain an additional message concerning the reason for failure.

The job order of the memName member is not placed in the Active Jobs file. Depending on the severity of the problem, the New Day procedure will continue to the next job order or terminate with the condition code 08.

Corrective Action: Check the IOA Log or the job output for the reason.

JOB507S LAST MONTHLY SCHEDULING DATE GREATER THAN THE CURRENT ORIGINAL SCHEDULING DATE

Explanation: Invalid last monthly Scheduling Date.

The last monthly Scheduling Date (positions 18-23) in the User Date Control Record is greater than the current original Scheduling Date (positions 1-6). Possible causes are:

- The previous run of the CTMJOB program did not finish OK.
- Someone has modified the contents of the User Date Control Record (the DACHK DD statement).

For more details refer to the INCONTROL for z/OS Administrator Guide.

The CTMJOB program will end with errors.

Corrective Action: Correct the User Date Control Record (the DACHK DD statement).
JOB508S LAST MONTHLY SCHEDULING DATE WAS MORE THAN 28 DAYS AGO, CHECK IT

**Explanation:** The last monthly scheduling date is more than 28 days ago.

Possible causes are:

- The User New Day procedure has not been used for more than 28 days. Correct the dates in the record to “yesterday.”
- Someone has modified the contents of the General Date Control Record incorrectly.

For more details refer to the *INCONTROL for z/OS Administrator Guide*.

**Corrective Action:** Correct the dates in the User Date Control Record (the DACHK DD statement).

JOB510S SEVERE ERROR IN THE SCHEDULING DATA - NOTIFY THE IOA ADMINISTRATOR

**Explanation:** Severe error in the scheduling data.

This message is produced when scheduling tables (described by the DAJOB DD statement) contain erroneous data. It can be due to the following:

- The contents of a table were incorrectly modified using an editor or program, and the format of the table is invalid.
- Internal error in Control-M.

The program terminates with a condition code of 08.

**Corrective Action:** Try to restore the table to its original state. If you cannot, prepare the Control-M monitor full output and have your system programmer contact BMC Customer Support.

If it is a batch Daily using a permanent Date Control Record, correct the contents of the record before running the Daily again. If issued during a User Daily or New Day procedure, see message JOB505S for further details.

JOB511I OID=orderId ODATE odate TASK=owner / systemId / jobName PLACED ON AJF

**Explanation:** This information message indicates that the job order was placed successfully in the Active Jobs file (AJF).

The task is now in the Active Jobs file in Wait Schedule state.

The following variable TASK fields are displayed:

- **owner** - the security user ID under which the ordering job that issued the JOB511I message was run
- **systemId** - the system ID of the ordering job
- **jobName** - the job name of the ordering job

**Corrective Action:** No action is required.
JOB512W LIBRARY *lib* SHOULD BE COMPRESSED

**Explanation:** The library specified in the PDS parameter contains fewer free tracks than the number specified in the MINIMUM parameter.

The PDS and MINIMUM parameters are used for automatically compressing a library. If the MINIMUM condition is satisfied, then the CTMJOB program will issue this message and the job order will be placed in the Active Jobs file.

For more details, refer to the Control-M chapter of the *Control-M for z/OS User Guide*.

The job order will be placed in the Active Jobs file.

**Corrective Action:** No action is required.

JOB513I SCHEDULE FAILED FOR *number* CONTROL-D CATEGORIES

**Explanation:** This information message indicates that a number of Control-D decollating missions categories were not found in the library allocated to the DAREPMIS DD statement.

The Control-M New Day procedure continued processing.

**Corrective Action:** Look at the IOA Log for the failed categories and associated reasons for failure.

JOB514S INSUFFICIENT STORAGE FOR THE JOB

**Explanation:** There is insufficient storage for processing the job order.

The program terminates with a condition code of 08.

**Corrective Action:** Increase the REGION size of the task which issued the request.

JOB515S ERROR IN SCHEDULING DATA - TOO MANY CARDS FOR ONE JOB

**Explanation:** Too many statements for one job. Scheduling data used to describe the job order are too large to be processed by Control-M.

The job order will not be placed on the Active Jobs file. The New Day procedure will terminate with a condition code of 08.

**Corrective Action:** Check the contents of the job order, using the Online Scheduling Facility and remove unnecessary scheduling data. Prepare the Control-M monitor full output and contact BMC Customer Support.

JOB516S ERROR IN SCHEDULING DATA - FIRST CARD SHOULD START WITH "D"

**Explanation:** There is invalid scheduling data in the first data set described by the DAJOB DD statement.

The first statement of a valid scheduling table should start with D. This could be due to one of the following:

- The data set described by the DAJOB DD statement is not a scheduling table.
- The scheduling data has been manually modified incorrectly.

The CTMJOB program ends with errors.
Corrective Action: Check contents of the data set described by the DAJOB DD statement and if the problem is not solved, check to find the person who may have manually changed the scheduling data.

JOB517S SCHEDULING DATA NOT AVAILABLE
Explanation: The DD statement pointing to the job scheduling tables is empty or missing.
The program ends with errors.
Corrective Action: Correct the JCL for the job or CLIST.

JOB518S INVALID YEAR IN USER DATE CONTROL RECORD
Explanation: There is an invalid year in the User Date Control record used by the New Day procedure.
This year is not supported by the release of Control-M you are using.
The CTMJOB program ends with errors.
Corrective Action: Please correct the year field (the DACHK DD statement).

JOB519S INVALID PREVIOUS WEEKLY SCHEDULING DATE IN USER DATE CONTROL RECORD (POSITIONS 43-48)
Explanation: Invalid previous weekly Scheduling Date in the User Date Control record (positions 43-48).
This error message is issued by the CTMJOB program, which is usually activated as part of the New Day procedure.
This date (date-4 of User Date Control record) might not be equal to date-5 (positions 50-55) or in invalid format.
Valid formats are:
- ddmmyy
- mmdyy
Possible causes are:
- The previous run of the CTMJOB program did not finish OK.
- Someone has incorrectly modified the contents of the User Date Control Record (the DACHK DD statement).
For more details, see the INCONTROL for z/OS Administrator Guide.
The New Day procedure will end with errors.
Corrective Action: Correct your Date Control Record (the DACHK DD statement) and rerun the New Day procedure.

JOB520S OPEN OF IOA LOG FILE FAILED
Explanation: Open of IOA Log file failed (the DALOG DD statement).
This error message is issued by the CTMJOB program, which is activated as part of the New Day procedure, and is due to one of the following:
The DALOG DD statement is missing.

The data set described by the DALOG DD statement is not the IOA Log file.

The data set described by the DALOG DD statement is the IOA Log file, but of a different version of Control-M or of a different Control-M monitor.

The New Day procedure ends with errors.

**Corrective Action:** Do the following:

1. Look for additional messages that will help identify the problem.
2. Correct the JCL or the CLIST.
3. Rerun the job.

**JOB522S INVALID ORIGINAL SCHEDULING DATE IN USER DATE CONTROL RECORD (POSITIONS 1-6)**

**Explanation:** Invalid original scheduling date in the User Date Control Record (positions 1-6). This error message is issued by the CTMJOB program which is usually activated as part of the New Day procedure.

Valid formats are:

- `ddmmyy`
- `mmdadyy`

The message may be due to one of the following:

- The previous run of the CTMJOB program did not finish OK.
- Someone has incorrectly modified the contents of the User Date Control Record (the DACHK DD statement).

For more details, see the *INCONTROL for z/OS Administrator Guide*.

The New Day procedure will end with errors.

**Corrective Action:** Correct your Date Control Record (the DACHK DD statement) and rerun the New Day procedure.

**JOB523S INVALID PREVIOUS MONTHLY SCHEDULING DATE IN USER DATE CONTROL RECORD (POSITIONS 18-23)**

**Explanation:** Invalid previous monthly scheduling date in the User Date Control Record (positions 18-23). This error message is issued by the CTMJOB program, which is usually activated as part of the New Day procedure.

This date (date-2 of User Date Control Record) should be equal to date-3 (positions 24-29) or in valid format.

Valid formats are:

- `ddmmyy`
- `mmdadyy`

The message may be due to one of the following:
The previous run of the CTMJOB program did not finish OK.

Someone has incorrectly modified the contents of the User Date Control Record (the DACHK DD statement).

For more details, see the INCONTROL for z/OS Administrator Guide.

The CTMJOB program will end with errors.

Corrective Action: Correct your Date Control Record (the DACHK DD statement) and rerun the New Day procedure.

JOB524S CTMJOB ENDED WITH ERRORS

Explanation: The CTMJOB program ended with errors. It is activated as part of the New Day procedure.

The IOA Log should contain prior messages concerning the errors.

The New Day procedure will finish executing with a condition code of 08.

Corrective Action: Check the IOA Log for the errors. If necessary, correct the Date Control Record (date-3 and date-5) manually to allow the next run of the New Day procedure. If you cannot find any prior error messages in the IOA log or job log, ensure that the Control-M Job Scheduling library is not being compressed simultaneously with any job ordering.

For more details, see the INCONTROL for z/OS Administrator Guide.

JOB525I CTMJOB ENDED JOB=username/jobID TYPE=jobType

Explanation: This information message is a normal message issued when the CTMJOB program terminates. CTMJOB is activated as part of the New Day procedure.

Corrective Action: No action is required.

JOB526S **** ERROR IN SCHEDULING DATA FORMAT ****

Explanation: The scheduling table has been corrupted. Scheduling data do not conform to Control-M valid format.

This message is followed by a number of JOB527 messages which describe all the statements that belong to the damaged job order. The asterisk (*) appears in the line under the erroneous data.

The CTMJOB will terminate with a condition code of 08.

Corrective Action: If you cannot restore the table to its original state, have your system programmer call BMC Software Customer Support for assistance.

If it is a batch Daily using a permanent Date Control Record, correct the contents of the record before running the Daily again. For considerations, please see message JOB505S.

JOB527S CARD = stmt

Explanation: The scheduling table has been corrupted.

This message follows message JOB526, and displays each statement in the damaged job order in the scheduling table. An asterisk (*) appears in the line under a damaged statement.

The CTMJOB program ends with errors.
Corrective Action: If you cannot restore the table to its original state, have your system programmer call BMC Software Customer Support.

If it is a batch Daily using a permanent Date Control Record, correct the contents of the record before running the Daily again. For considerations, please see message JOB505S.

**JOB528I** MEMBER *memName* ID=orderid ODATE odate PLACED ON ACTIVE JOBS FILE- *descr*

**Explanation:** This information message is a standard message indicating that a job order has been placed on the Active Jobs file.

The task is now on the Active Jobs file in WAIT SCHEDULE state.

**Corrective Action:** No action is required.

**JOB529S** LAST WEEKLY SCHEDULING DATE GREATER THAN THE CURRENT ORIGINAL SCHEDULING DATE

**Explanation:** The last weekly scheduling date in the Date Control Record is greater than the current original scheduling date.

This error message is issued by the CTMJOB program which is usually activated as part of the New Day procedure. Date-4 (positions 43-48) should not be greater than date-1 (positions 1-6) in the Date Control Record. The message may be due to one of the following:

- The previous run of the CTMJOB program did not finish OK.
- Someone modified the contents of the User Date Control Record (the DACHK DD statement).

For more details, see the *INCONTROL for z/OS Administrator Guide*.

Program execution stops with a condition code of 08.

**Corrective Action:** Correct the User Date Control Record (the DACHK DD statement) and rerun the New Day procedure.

**JOB530S** LAST WEEKLY SCHEDULING DATE WAS MORE THAN 28 DAYS AGO, CHECK IT

**Explanation:** The last weekly scheduling date is more than 28 days ago.

Possible causes are:

- The User New Day procedure has not been used for more than 28 days. Correct the dates in the record to yesterday.
- Someone has modified the contents of the General Date Control Record incorrectly.

For more details, refer to the *INCONTROL for z/OS Administrator Guide*.

Program execution stops with a condition code of 08.

**Corrective Action:** Correct the dates in the Date Control Record (the DACHK DD statement) and rerun.
**JOB531W MEMBER memName ODATE odate - SCHEDULING CANCELLED BY USER EXIT**

**Explanation:** Scheduling cancelled by user exit CTMX001; the memName member did not pass user checking.

User exit CTMX001 is activated for each job order before it is placed on the Active Jobs file. The exit can specify to the New Day procedure not to place the job order on the Active Jobs file, in which case this message is issued.

The job order will not be placed on the Active Jobs file.

**Corrective Action:** Look for additional messages in the I/OA Log clarifying the reason for the cancellation (usually security). If you cannot find a reason, consult your system programmer.

**JOB532S OPEN OF CONTROL-M ACTIVE JOBS FILE FAILED. DDNAME "DACKPT"**

**Explanation:** Open of Control-M Active Jobs file failed.

This error message is issued by the CTMJOB program, which is usually activated as part of the New Day procedure, and is due to one of the following:

- The DACKPT DD statement is missing.
- The data set described by the DACKPT DD statement is not the Control-M Active Jobs file.
- The data set described by the DACKPT DD statement is the Control-M Active Jobs file but of a different version of Control-M, or of a different Control-M monitor.

Program execution stops with a condition code of 08.

**Corrective Action:** Correct the JCL for the job or CLIST and rerun it.

**JOB534S SEVERE ERROR ON CONTROL-M ACTIVE JOBS FILE**

**Explanation:** Severe error on Control-M Active Jobs file.

This could be due to one of the following:

- An I/O error, or the file allocated to the DACKPT DD statement is not the Control-M Active Jobs file.
- The Active Jobs file has been corrupted.

The CTMJOB Control-M program which is activated as part of the New Day procedure will end with errors.

**Corrective Action:** Prepare the Control-M monitor full output and have your system programmer contact BMC Customer Support. Check whether the file has been updated from two computers without global ENQ control, or maybe by an unauthorized program.

**JOB535S CONTROL-M ACTIVE JOBS FILE IS BEING FORMATTED. TRY AGAIN LATER**

**Explanation:** Control-M Active Jobs file is currently being formatted. This error message is issued by the CTMJOB program which is usually activated as part of the New Day procedure.

The General New Day procedure is currently running and is formatting the file.
Corrective Action: Try again later.

**JOB536S SEVERE ERROR IN SCHEDULING DATA CARDS**

**Explanation:** Severe error was found in the scheduling data statements. This error message is issued by the CTMJOB program, which is usually activated as part of the New Day procedure.

Scheduling fails for the job order. The CTMJOB program terminates with a condition code of 08.

**Corrective Action:** Look for additional messages concerning the error, correct the error and rerun.

**JOB537S NO MORE INTERNAL WORK AREA. SEE MESSAGES AND CODES FOR REQUIRED ACTION**

**Explanation:** Internal work areas of the New Day procedure have been exhausted.

The job order contains more data than can be handled by the current release of Control-M.

The New Day procedure will terminate with a condition code of 08.

**Corrective Action:** Prepare the Control-M monitor full output and have your system programmer contact BMC Customer Support.

**JOB538E taskType memName OID=orderId ODATE odate SCHEDULING FAILED**

**Explanation:** Scheduling failed. This error message is issued by the CTMJOB program which is usually activated as part of the New Day procedure.

The IOA Log or the output of the job should contain prior message concerning the reason for failure.

The job order of member is not placed in the Active Jobs file.

**Corrective Action:** Check the IOA Log or the job output for the reason.

**JOB539W taskType memName ODATE odate SCHEDULING CANCELLED BY USER EXIT userExit**

**Explanation:** An unauthorized user attempted to send a job to the AJF.

The job order will not be placed on the Active Jobs file.

**Corrective Action:** Do the following:

1. Check your authorization.
2. The next step depends on how the job is being ordered, as follows:
   - If the job is being ordered online, log off and log on again.
   - If the job is being ordered by the Control-M monitor, restart the monitor.
   - If the job is being ordered by the New Day procedure, rerun the New Day procedure.
3. Look in the IOA Log for additional messages that clarify the reason for the job being cancelled. If there is no such message, check the `userExit` user exit.
**JOB53AS** A J F IS ALMOST FULL AND REACHED THE ‘STOP ORDER’ THRESHOLD. JOB IS NOT ORDERED

**Explanation:** When the amount of used space in the AJF increases and reaches the percentage threshold specified in the STOPORDR CTMPARM parameter, Control-M stops ordering jobs.

Control-M stops ordering jobs but all other functions (for example, job submission and post-processing) continue normally.

**Corrective Action:** The user must compress the AJF.

**JOB53BE** JOB CAN NOT BE ADDED BECAUSE THE MOST RECENT GROUP ON THE AJF IS DELETED

**Explanation:** An attempt was made to use the DYNAMIC INSERT JOB INTO GROUP option "R" (recent) to add a job to a deleted group.

**Corrective Action:** No action is required.

**JOB540E** ERROR IN CARDS. REASON=rsn, CODE=field

**Explanation:** A severe error was found in the scheduling data statements. This message is issued by Control-M (the CTMINP program) when it discovers an invalid value in a data statement.

The variables in this message are:

- **rsn** - a reason code that describes the probable cause of the error
- **field** - the field in which the error was found

Possible values of **rsn** and **field**, with explanations, are shown in the following tables.

<table>
<thead>
<tr>
<th>rsn</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>Invalid option</td>
</tr>
<tr>
<td>02</td>
<td>Nonnumeric character</td>
</tr>
<tr>
<td>03</td>
<td>Out of bounds. Field exceeds its limits.</td>
</tr>
<tr>
<td>04</td>
<td>Invalid time format</td>
</tr>
<tr>
<td>05</td>
<td>Plus or minus sign expected</td>
</tr>
<tr>
<td>06</td>
<td>Invalid date format</td>
</tr>
<tr>
<td>07</td>
<td>Conflict with a previous field</td>
</tr>
<tr>
<td>08</td>
<td>Minus or blank expected</td>
</tr>
<tr>
<td>09</td>
<td>Invalid or missing parameter or scheduling data statement</td>
</tr>
</tbody>
</table>
### rsn | Explanation
--- | ---
10 | Internal format error

### field | Explanation
--- | ---
00 | Internal Parameter
01 | TASKTYPE
02 | MAXWAIT
03 | TIME FROM
04 | TIME UNTIL
05 | DUE OUT
06 | MEMLIB
07 | CTB STEP

<td>22</td>
<td>STATISTICS</td>
</tr>
</tbody>
</table>

Job order scheduling will fail. The User Daily will terminate with a condition code of 08.  
**Corrective Action:** Use the values of `rsn` and `field` to locate the problem in the job definition. Correct the problem and run the User Daily again.

**JOB541I JOB PLACED ON ACTIVE JOBS FILE AT RBA: rba**

**Explanation:** This information message indicates that a job has been successfully placed in the Active Jobs file, and displays the job's rba.

**Corrective Action:** No action is required.

**JOB547W TABLE TblName IS NOT A SMART TABLE. RBC STATEMENT IGNORED**

**Explanation:** The SELECT or IGNORE RBC statement refers to a job which is not part of a SMART Table. SELECT and IGNORE RBCs always follow an ORDER statement for a SMART Table. They are meaningless for a job which is not part of a SMART Table.

The SELECT or IGNORE RBC statement is ignored. The job is ordered.

**Corrective Action:** No response needed.

**JOB548E OID=orderId SEVERE ERROR IN CALENDAR calName OR YEAR NOT FOUND IN CALENDAR**

**Explanation:** Severe error in the `calName` IOA calendar, or the year not found in the calendar.

Either the year is not defined in the calendar or the calendar has been incorrectly modified.

The job order is not issued. Processing of other job orders continues.

**Corrective Action:** Check the contents of the job order and the calendar.

**JOB549W CONTROL-M/RESTART NOT AVAILABLE. IFRERUN ACTION IGNORED FOR MEMBER memName**

**Explanation:** The scheduling table contains the IFRERUN definition, but Control-M was unable to act on this definition.

The probable cause is that CTR is set to N in IOAPARM, the IOA installation parameters member.

The scheduling table is ordered without the IFRERUN definition.
**Corrective Action:** Ensure that CTR is set to Y in IOAPARM.

**JOB550W CONTROL-M/RESTART NOT AVAILABLE. SET ACTION IGNORED FOR MEMBER memName**

**Explanation:** The scheduling table contains the SET definition, but Control-M was unable to act on this definition.

The probable cause is that CTR is set to N in IOAPARM, the IOA installation parameters member.

The scheduling table is ordered without the SET definition.

**Corrective Action:** Ensure that CTR is set to Y in IOAPARM.

**JOB551S LOAD OF CTMPARM FAILED IN CTMRSG GROUP PROCESSING**

**Explanation:** During group order processing the Control-M configuration parameters could not be accessed.

The program aborts the order processing.

**Corrective Action:** Contact your INCONTROL administrator who should verify that the CTMPARM member exists in the installation library.

**JOB552S LOAD OF CTMPARM FAILED IN CTMRSG GROUP PROCESSING**

**Explanation:** The CTMRSG program could not allocate storage.

Group processing is terminated.

**Corrective Action:** Increase the region size.

**JOB553S AJF (CKP) FILE OPEN FAILED IN CTMRSG GROUP PROCESSING**

**Explanation:** During Group Order processing, the CTMRSG program was unable to open the Active Jobs File (AJF).

Group Order processing terminates.

**Corrective Action:** Correct the AJF file problem, and order the group again.

**JOB554I INPUT CONDITION REMOVED: CONDITION=cond, MEMBER=memName, GROUP=grp**

**Explanation:** This information message is issued during group order processing, when Control-M determined that in a certain group, an output condition of a member that was not scheduled, is an input condition for a member that was scheduled.

The input condition is removed as a prerequisite for job execution.

**Corrective Action:** No action is required.

**JOB555I MEMBER memName SCHEDULING FORCED BY USER EXIT**

**Explanation:** This information message indicates that the memName member was ordered due to a user exit decision.
This message is only issued when user exit CTMX001 is called before normal Control-M scheduling logic has been performed, or when CTMX001 overrides a Control-M scheduling decision not to order the job. This message can appear only after optional installation feature WM2603 has been enabled.

**Corrective Action:** No action is required.

**JOB556W MEMBER memName: INVALID RETURN CODE FROM USER EXIT IGNORED. PRESUMED TO BE 0**

**Explanation:** User exit CTMX001 returned an invalid return code. Control-M continues as if the user exit had not been called.

**Corrective Action:** Contact your INCONTROL administrator to correct user exit CTMX001.

**JOB557W OID=orderId SCHEDULING FORCED BY USER EXIT**

**Explanation:** A member was ordered as a result of a user exit decision. This message is issued when user exit CTMX001 is called before normal Control-M scheduling logic has been performed, or when CTMX001 overrides a Control-M scheduling decision not to order the job. This message can appear only after optional installation feature WM2603 has been enabled.

**Corrective Action:** No action is required.

**JOB558W OID=orderId ILLEGAL RETURN CODE FROM USER EXIT IGNORED**

**Explanation:** User exit CTMX001 returned an invalid return code. Control-M continues as if the user exit had not been called.

**Corrective Action:** Contact your INCONTROL administrator to correct user exit CTMX001.

**Messages JOBDOO through JOBDxx**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**JOBD65E JOB jobName OID=orderId ODATE odate BYPASSED DUE TO MISSING PREV/NEXT DATES - descr**

**Explanation:** The job was not scheduled by Control-M because the requested previous or next original scheduling date (ODAT), could not be calculated.

The job to be scheduled contains IN and/or OUT conditions with ODAT PREV or ODAT NEXT. However these dates could not be calculated by Control-M, possibly because the calendar for the previous or next year is missing.

The job is not scheduled. Processing continues with the next job.

**Corrective Action:** Correct the situation and then reschedule the job manually.
JOBD66E MEMBER memName ODATE odate BYPASSED DUE TO MISSING PREV/NEXT DATES - descr

Explanation: The member was not scheduled by Control-M because the requested previous or next original scheduling date (ODAT) could not be calculated.

The member to be scheduled contains IN and/or OUT conditions with ODAT PREV or ODAT NEXT. However, these dates could not be calculated by Control-M, possibly because the calendar for the previous or next year is missing.

The member is not scheduled. Processing continues with the next member.

Corrective Action: Correct the situation and then reschedule member manually.

JOBD67S ORDERING CHECKPOINT RECORD IS INVALID FOR THIS DAILY

Explanation: The Ordering Checkpoint Record contains recovery information which is invalid for this Daily run.

The Ordering Checkpoint Record, which is in the same member as the User Date Control Record, contains data specifying recovery for the CTMJOB program, but these data are incorrect for the jobs that were ordered in this run of CTMJOB.

The CTMJOB program ends with errors.

Corrective Action: Either run CTMJOB with the same data (ordered jobs) as were in the last (abending) run, or blank out the values of the keywords in the Ordering Checkpoint Record, and run CTMJOB without recovery.

JOBD68S STRUCTURE OF ORDERING CHECKPOINT RECORD IS INVALID

Explanation: The Ordering Checkpoint Record contains invalid keywords, or valid keywords in invalid offsets. The Ordering Checkpoint Record, which is in the same member as the User Date Control Record, contains keywords in an unexpected structure.

The CTMJOB program ends with errors.

Corrective Action: Either correct the Ordering Checkpoint Record, or delete the Ordering Checkpoint Record, and run CTMJOB without recovery.

JOBD69I NO JOBS WERE SCHEDULED DURING SCHEDULING REQUEST

Explanation: This information message indicates that no jobs matched the ordering criteria during a scheduling request. This message is issued after the scheduling request has been processed, and no jobs were ordered.

Corrective Action: If you think a job should have been ordered in this scheduling request, check and correct the scheduling parameters as required, and rerun the scheduling request.

JOBD6AI RETRO SCHEDULING BYPASSED FOR JOBS WITHIN GROUP

Explanation: This information message indicates that Y was specified in the RETRO field in a group entity or in one of the group jobs. RETRO processing is not supported in GROUPS. Setting RETRO to Y in a group can cause jobs to be scheduled on inappropriate ODATES.

The RETRO field is ignored in group processing.
**Corrective Action:** Set the RETRO field to N and retry.

**JOBD6BI NUMBER OF JOBS ORDERED - jobsnum**

**Explanation:** This information message indicates the number of jobs ordered by the present invocation of CTMJOB.

**Corrective Action:** No action is required.

**JOBD90E RECOVERY RECORD INCOMPATIBLE WITH DATE RECORD**

**Explanation:** The Date Control Record indicates that recovery is not necessary, but the recovery record, that is, the second record of the Date Control Record member used for Enhanced Daily Checkpointing, indicates that recovery is needed.

This error message is issued by the CTMJOB program, which is usually activated as part of the New Day procedure. In the Date Control Record, date-2 (columns 18-23) is equal to date-3 (columns 25-30) and date-4 (columns 43-48) is equal to date-5 (columns 50-55). However, the recovery record contains non-blank values for the recovery parameters.

For more details, please refer to the description of the Date Control Record in the *INCONTROL for z/OS Administrator Guide*.

The program terminates with a condition code of 08.

**Corrective Action:** If recovery is required, set date-3 to the day before date-2, and date-5 to the day before date-4. If recovery is not required, replace the values in the recovery record with blanks.

**JOBD91E INVALID PREVIOUS MONTHLY SCHEDULING DATE IN USER DATE CONTROL RECORD (POSITIONS 25-30)**

**Explanation:** Invalid previous monthly scheduling date in the User Daily Date Control Record date-3 (columns 25-30). This error message is issued by the CTMJOB program, which is usually activated as part of the New Day procedure.

Valid formats for the date are:
- ddmmyy
- mmddyy
- yymmdd

Possible causes are:
- The previous run of the CTMJOB program did not complete successfully.
- The contents of the User Daily Date Control Record (the DACHK DD statement) have been incorrectly modified manually.

For more details please refer to description of the Date Control Record in the *INCONTROL for z/OS Administrator Guide*.

The program terminates with a condition code of 08.

**Corrective Action:** Correct the Date Control Record (the DACHK DD statement) and rerun the New Day procedure.
Messages JOBL00 through JOBLxx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

JOBL34E INVALID ORDER REQUEST STARTING keyName

**Explanation:** A syntax error was found on the previously displayed line.

The CTMJOB program ends with errors.

**Corrective Action:** Correct the erroneous keyword or data in the order request.

JOBL35I ORDER REQUEST LINE

**Explanation:** This information message is a standard message when a request order is being processed.

**Corrective Action:** No action is required.

JOBL36E DUPLICATE KEYWORD keywd IN ORDER REQUEST

**Explanation:** A keyword was given twice in the same order request. The order request which was listed prior to this message contains the same keyword twice, regardless of whether or not the values are identical.

The CTMJOB program ends with errors.

**Corrective Action:** Delete the duplicate keyword in the order request.

JOBL37S SIZE OF TABLE table_mem FROM DSN lib GREATER THAN MAXIMUM

**Explanation:** The table member either exceeds the maximum allowed size, or contains invalid data.

The CTMJOB program ends with errors.

**Corrective Action:** Check that the table member contains less than 32,000 records of valid scheduling definitions.

JOBL38S ERROR READING MEMBER table_mem FROM DATASET lib. RC=rc.

**Explanation:** Reading the specified table member failed.

The order request could not be done either because the library did not exist, or could not be allocated, or the table member was not found.

The CTMJOB program ends with errors.

**Corrective Action:** Check that the order request is given to an existing 80-bytes record length library, and the member can be accessed. If the problem persists, prepare the Control-M monitor full output and contact BMC Customer Support.

JOBL39E INVALID DATE date IN ORDER REQUEST

**Explanation:** The date specified in the order request is not a valid date.
The CTMJOB program ends with errors.

**Corrective Action:** Check that the specified date is specified correctly according to your installation standards.

**JOBL40E** JOB jobName GROUP groupName COMBINATION NOT FOUND IN TABLE table_mem

**Explanation:** None of the jobs in the table satisfy both selection criteria of “JOB” and “GROUP”, specified in the ORDER request.

**Corrective Action:** Specify other values to order the jobs.

**JOBL41E** MISSING OBLIGATORY PARAMETER parm IN ORDER REQUEST

**Explanation:** The specified parameter was not given in the order request.

Some parameters are obligatory in each order request. Failing to specify one of them results in this message being issued.

The CTMJOB program ends with errors.

**Corrective Action:** Supply the missing parameter.

**JOBL42E** MUTUALLY EXCLUSIVE KEYWORDS SPECIFIED IN ORDER REQUEST

**Explanation:** Two keywords which are mutually exclusive where given in the same order request.

Certain keywords, such as DSNAME and DDNAME, cannot appear together on the same order request.

The CTMJOB program ends with errors.

**Corrective Action:** Specify one of the keywords.

**JOBL43W** DASTAT DD CARD MISSING

**Explanation:** The DASTAT DD statement is missing from the file allocation of the job step.

This warning message is issued by the CTMJOB program.

The Automatic Tape Adjustment facility is skipped. Jobs are ordered, but required resource quantities are not computed for these jobs.

**Corrective Action:** Add a DASTAT DD statement for future runs.

**JOBL44W** AUTO TAPE DRIVE RESOURCE ADJUSTMENT IS BYPASSED DUE TO PREVIOUS MESSAGE

**Explanation:** This warning message indicates that the Automatic Tape facility cannot adjust resources for jobs currently being processed.

This is a summary message. It is preceded by a message that describes the reason for the error.

The Automatic Tape Adjustment facility is skipped. Jobs are ordered without computing the quantity of required resources.
**Corrective Action:** View the error message that precedes this message and correct the problem described there.

**JOBL45E** ERROR ANALYZING PARM MEMBER "UNITDEF" AT LINE lineNum

**Explanation:** An invalid definition was found in the UNITDEF parameter member. The UNITDEF parameter member associates logical names to physical resources. In this message, lineNum is the number of the line in the UNITDEF parameter member where the error occurred.

Resource definition example in the UNITDEF file:
```
CARTRIDGE=(0480-0483,0440-0445,0300-031F,0552-0553,0556-0557),DESC=3490 RANGE
```

The Automatic Tape Adjustment facility is skipped. Jobs are ordered without computing the required amount of resources.

**Corrective Action:** Correct the error at the specified line. View the description in the UNITDEF file supplied during the installation.

**JOBL46W** DAUNITDF DD CARD MISSING

**Explanation:** The UNITDEF DD statement is missing. This warning message is issued by the CTMJOB program. The Automatic Tape Adjustment facility is skipped. Jobs are ordered without computing the required amount of resources.

**Corrective Action:** Add a UNITDEF DD statement to the JCL stream.

**JOBL47S** GETMAIN FAILED IN CTMATD AUTO TAPE PROCESSING

**Explanation:** The Control-M Daily Subsystem stopped due to insufficient memory. The Daily job stops execution.

**Corrective Action:** Increase the region size defined in the Daily job and rerun the job.

**JOBL48W** CONDITION IN JOB NOT ADJUSTED

**Explanation:** The requirement that a prerequisite condition exist (for a job which is part of a group) was not deleted. The “adjust conditions in a group” feature failed to delete the requirement that a prerequisite condition exist for one of the jobs of a group.

The job is ordered with the prerequisite condition requirement intact.

**Corrective Action:** Determine if the condition prevents the job from running. If so, add the required condition manually in screen 4 or erase the requirement for the condition from the job in zoom screen 3.Z.

**JOBL49W** NOT ALL CONDITIONS IN JOB COULD BE ADJUSTED

**Explanation:** The requirement for prerequisite conditions for a job which is part of a group were not deleted.
This message accompanies message JOBL48W.
The job is ordered prerequisite condition requirement intact.
**Corrective Action:** Determine if the condition prevents the job from running. If so, add the required condition manually in screen 4 or erase the requirement for the condition from the job in zoom screen 3.Z.

**JOBL4AE DSN data_set_name**
**Explanation:** The scheduling library in which the table mentioned in JOBL40E resides.
This message accompanies message JOBL40E.
**Corrective Action:** Specify the correct values to order the jobs.

**JOBL50E DYNAMIC ORDER FAILED**
**Explanation:** A request to dynamically insert a job into a Group Entity that is already on the Active Jobs file has failed. The reason for the failure is detailed in an accompanying message.
Dynamic ordering of the job was not performed.
**Corrective Action:** Check the accompanying message to determine the cause of the failure, and respond accordingly.

**JOBL51E RBA rba IS NOT POINTING TO A VALID GROUP IN THE AJF**
**Explanation:** A request to dynamically insert a job into a group failed because the rba, which points to the Group Entity in the Active Jobs file, was not pointing to a Group Entity.
Dynamic ordering of the job is not performed.
**Corrective Action:** Find the correct Group Entity rba, and change the order request accordingly.

**JOBL52E JOB jobName NOT FOUND IN GROUP grpname RBA rba**
**Explanation:** A request to dynamically insert a job as part of a group failed, because the job is not a member of the group. Users can dynamically insert jobs only if the jobs are members of the group definition.
The job is not ordered.
**Corrective Action:** Correct the order request appropriately.

**JOBL53E GROUP grpname RBA rba IS FULL. NO MORE JOBS CAN BE DYNAMICALLY INSERTED**
**Explanation:** A request to dynamically insert a job into a group in the AJF failed, because the group already contains the maximum number of jobs allowable in a group.
The job is not ordered.
**Corrective Action:** No action is required.
JOBL54E DUPLICATE JOB jobName FOUND IN GROUP grpname RBA rba

Explanation: A request to dynamically insert a job into a group in the Active Jobs file failed because a job with same name already exists in the group, and the order request did not specify the DUP (duplicate) parameter.

The job is not ordered.

Check if the job should still be inserted in the group. If so, dynamically insert a duplicate job into the group using the DUP parameter in the ORDER statement.

Corrective Action: No action is required.

JOBL55E TABLE table IS NOT A SMART TABLE

Explanation: The table specified is not a SMART table.

Corrective Action: Specify a SMART table.

JOBL57E SELECT/IGNORE RBC COMMAND IN ERROR

Explanation: There is a syntax error in the SELECT or IGNORE RBC statement. The ORDER statement (to which this SELECT or IGNORE RBC command refers) is ignored. The daily job resumes processing with the next ORDER statement.

Corrective Action: Use one of the following syntaxes:
  - SELECT RBC rbcname
  - IGNORE RBC rbcname

JOBL58I JOB xxxxxxxx ORDERID=nnnnn ODATE YYYYYY ORDERED

Explanation: Job has been ordered successfully.

Corrective Action: No action is required.

JOBL59I JOB xxxxxxxx NOT ORDERED

Explanation: Job has not been ordered.

Corrective Action: Check for additional messages that explain why the job was not ordered successfully.

JOBL60I SMART ENTITY xxxxxxxx ORDERID=nnnnn ODATE YYYYYY ORDERED

Explanation: SMART Entity has been ordered successfully.

Corrective Action: No action is required.

JOBL61I SMART ENTITY xxxxxxxx NOT ORDERED

Explanation: SMART Entity has not been ordered.

Corrective Action: Check for additional messages that explain why the SMART Entity was not ordered successfully.
JOBL62I JOB xxxxxxxx ORDERING BYPASSED

**Explanation:** Ordering of job has been bypassed because the SMART Table has not been ordered.

**Corrective Action:** Refer to previous message(s) that describe why SMART Table has not been ordered.

JOBL63I NO JOBS WERE SCHEDULED. REQUEST IS IGNORED

**Explanation:** Performing ORDER request, but no JOB was eligible to be ordered because the scheduling criteria were not satisfied.

**Corrective Action:** No action is required.

JOBL64E ORDERING FAILED FOR SMART TABLE xxxxxxxx

**Explanation:** Performing ORDER request of a SMART Table. The order request failed because of an error in the SMART Table.

**Corrective Action:** Refer to previous message(s) that describes the error.

JOBL65W ORDERING CANCELED BY USER EXIT

**Explanation:** Performing ORDER request of a SMART Table. The order request failed because of an error return code from either the Control-M user exit CTMX001 or the security module CTMSE01.

**Corrective Action:** Refer to previous message(s) that describes the error.

JOBL66I ORDERING UNIQUE FLOW PROCESS STARTED

**Explanation:** This information message indicates that the CTMJOB program has started a UNIQUE FLOW (UFLOW) order request.

**Corrective Action:** No action is required.

JOBL67I ORDERING UNIQUE FLOW PROCESS ENDED - ID WAS SET TO uid

**Explanation:** This information message indicates that the CTMJOB program has successfully ordered a UNIQUE FLOW (UFLOW) request.

The *uid* is the three characters that the CTMJOB adds to all IN and OUT conditions that are part of the UNIQUE FLOW.

**Corrective Action:** No action is required.

JOBL68W ORDERED UNIQUE FLOW ID. NO VALID CONDITION FOUND. UFLOW REQUEST IGNORED

**Explanation:** This warning message indicates that the CTMJOB program did not find any valid conditions that satisfy the UNIQUE FLOW (UFLOW) rule.

For a description of UNIQUE FLOW, refer to the Control-M for z/OS User Guide.

The CTMJOB program will perform the ORDER request as a regular order.

**Corrective Action:** No action is required.
JOBL69E ERROR IN UNIQUE FLOW ID PROCESSING --- - BACKED OUT

**Explanation:** This error message indicates that the CTMJOB program succeeded in backing out jobs that were ordered as part of the UNIQUE FLOW (UFLOW).

Message JOB511I was issued for the JOBs that were ordered.

The jobs will not be placed in the AJF.

If `order_number` equals “000” it means that the error occurred before any jobs were ordered as part of the UNIQUE FLOW (UFLOW).

**Corrective Action:** Correct the error as described in the previous message and reorder the table.

JOBL6AE ERROR IN ORDER FOR UNIQUE FLOW ID --- - BACKED OUT

**Explanation:** This error message indicates that the CTMJOB program succeeded in backing out jobs that were ordered as part of the UNIQUE FLOW (UFLOW).

Message JOB511I was issued for the JOBs that were ordered.

The jobs will not be placed in the AJF.

If `order_number` equals “000” it means that the error occurred before any jobs were ordered as part of the UNIQUE FLOW (UFLOW).

**Corrective Action:** Correct the error as described in the previous message and reorder the table.

JOBL6BE UNIQUE FLOW ID - CONDITION IS TOO LONG `condition_name`

**Explanation:** This error message indicates that the CTMJOB program found an IN or OUT condition name whose length is greater than 36 characters. When the UNIQUE FLOW process adds a prefix of three characters to the condition name, the name will become invalid.

The UNIQUE FLOW process will fail and all jobs will be backed out.

**Corrective Action:** Shorten the condition name and reorder the table.

JOBL6CE UNIQUE FLOW ID - NOT ENOUGH SPACE FOR CONDITION -

**Explanation:** This error message indicates that the CTMJOB program failed to add the JOB to the AJF because the UNIQUE FLOW process increased the size of the IN or OUT condition name.

The UNIQUE FLOW process will fail and all jobs will be backed out.

**Corrective Action:** Compress the AJF or increase the AJF file size. Refer to the INCONTROL for z/OS Administrator Guide.
JOBL6DE ORDER REQUEST REJECTED BECAUSE KEYWORDS "UFLOW" AND "JOB=" ARE MUTUAL EXCLUSIVE

Explanation: This error message indicates that the CTMJOB program identified that the UNIQUE FLOW is filtered by "JOB=". UNIQUE FLOW is only for jobs in the table whose scheduling criteria are satisfied. The UNIQUE FLOW process will not continue.

Corrective Action: Remove the JOB or the UFLOW from the ORDER request and reorder the table.

JOBL6ES ORDER UFLOW SEVERE ERROR RC=return_code

Explanation: CTMJOB was performing an ORDER request with a Unique Flow ID (UFLOW), but the process failed with an internal error, indicated by RC=return_code.

Corrective Action: Perform the ORDER request again. If the problem persists, do the following:

1. Add IOA TRACE LEVEL=128 to the JOB as follows:
   ```
   //DATRACE DD SYSOUT=* 
   //DATRCIN DD * 
   TRACE=128 
   ```
2. Perform the ORDER request again.
3. Collect the JOB's outputs.
4. Contact BMC Customer support or open an ISSUE about the problem, attaching the JOB's outputs to the ISSUE.

J SA messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages J SA900 through J SA9xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

J SA901S SORT FAILED RC=rc

Explanation: A sort program activated by the CTMJ SA utility failed.

In this message, rc is the SORT return code.

The utility stops executing with a condition code of 12.

Corrective Action: Check the SORT manual for the return code and correct.
JSA903S OPEN OF JOBS EXECUTION STATISTICS FILE FAILED. RC=rc ERROR=errCode

Explanation: The CTMJ SA utility is unable to open Control-M Jobs Execution Statistics file.
Possible causes are:

- The DASTAT DD statement is missing.
- The DASTAT DD statement describes a file different from the Control-M job execution statistics file.
- VSAM open error.
- The statistics file was not properly initialized. (See the FORMSTT job in the Control-M installation library.)
- The CTMJ SA utility was invoked simultaneously from batch and from the online facility (Option S in the Status screen).

The utility stops executing with a condition code of 12.

Corrective Action: Look for VSAM messages or other system messages. Correct the JCL and rerun the job.

JSA904S INVALID RC WHILE READING JOBS EXECUTION STATISTICS FILE. RC=rc ERROR=errCode

Explanation: An unexpected return code from VSAM during read operation by the CTMJ SA utility.
The utility stops executing with a condition code of 12.

Corrective Action: Check the return codes in the related IBM VSAM manuals, and correct the problem accordingly.

JSA905S INVALID RC WHILE WRITING JOBS EXECUTION STATISTICS FILE. RC=rc ERROR=err

Explanation: An unexpected return code from VSAM during write operation by utility CTMJ SA.
The utility stops executing with a condition code of 12.

Corrective Action: Check the return codes in the related IBM VSAM manuals, and correct the problem accordingly. If the Job Execution Statistics file reaches its capacity, it is highly recommended to check whether the CTMJ SA utility is also accumulating “ad hoc” jobs. Your system programmer should use Control-M exit CTMX005 to control the jobs accumulated to the statistics file.

JSA906S ACCUMULATION STOPPED BECAUSE OF A REQUEST FROM USER EXIT 005

Explanation: The CTMX005 Control-M user exit returned a return code to stop the run of the CTMJ SA utility.
The utility stops executing with a condition code of 12.

Corrective Action: Check for messages from the user exit that will clarify the reason.
JSA907S INVALID CLEANUP DATE PARAMETER

**Explanation:** An invalid value was specified in the CLEANUP parameter of the CTMJSA utility. The CTMJSA utility is used to collect statistics about Control-M jobs. The utility ends with errors.

**Corrective Action:** Specify a valid date (in the format in use at your site), and rerun the utility.

JSA908S {READ | WRITE} ERROR err_num REASON rsn WHILE PERFORMING "CLEANUP". OPERATION WILL BE SKIPPED.

**Explanation:** An error was encountered while the CTMJSA utility processed the statistics file. The `err_num` and `rsn` are IBM codes returned by IBM VSAM. Old records are not removed from the statistics file. However, updates to this file are attempted.

**Corrective Action:** Check the IBM manual *Macro Instruction for Data Sets* for a list of reason codes and their meaning when processing VSAM files, such as the Control-M statistics file.

JSA909I STAT RECORD: MEMBER memName GROUP groupName WAS action

**Explanation:** This information message indicates the action taken against the indicated Statistics job record (with the `memName` member and `groupName` group in its key), based upon the CLEANUP criteria specified during a run of the CTMJSA utility.

When the action is DELETED, the entire job record is removed from the Statistics file. When the action is CLEANED, the individual job occurrences in the job record (but not the job record itself) are removed.

**Corrective Action:** No action is required.

JSA921I ACCUMULATION OF JOB EXECUTION STATISTICS STARTED

**Explanation:** This information message is a normal starting message of the CTMJSA utility.

**Corrective Action:** No action is required.

JSA922I ACCUMULATION OF JOB EXECUTION STATISTICS ENDED WELL

**Explanation:** This information message is a normal ending message of the CTMJSA utility.

**Corrective Action:** No action is required.

JSA924S INVALID DATE FORMAT. "DDMMYY" OR "MMDDYY" EXPECTED

**Explanation:** Invalid date format specified in the parameters to the CTMJSA utility. The utility stops executing with a condition code of 12.

**Corrective Action:** Correct the parameter and rerun the utility. See the *INCONTROL for z/OS Utilities Guide* for a description of the parameters of the utility.
JSA925S MULTIPLE USE OF PARAMETER. ONLY ONE OCCURRENCE IS ALLOWED

**Explanation:** The same parameter has been specified more than once (the CTMJ SA utility).

The utility stops executing with a condition code of 12.

**Corrective Action:** Correct the parameter and rerun the utility. See the *INCONTROL for z/OS Utilities Guide* for a description of the parameters of the utility.

JSA926S INVALID ACCUMULATION PARAMETER

**Explanation:** Invalid parameter specified to the CTMJ SA utility.

The utility stops executing with a condition code of 12.

**Corrective Action:** Correct the parameter and rerun the utility. See the *INCONTROL for z/OS Utilities Guide* for a description of the parameters of the utility.

JSA927S INVALID DATE FORMAT. "DDMMYY" OR "MMDDYY" OR "-NN" EXPECTED

**Explanation:** Invalid date format specified in the parameters to the CTMJ SA utility.

The utility stops executing with a condition code of 12.

**Corrective Action:** Correct the parameter and rerun the utility. See the *INCONTROL for z/OS Utilities Guide* for a description of the parameters of the utility.

JSA928S "ODATE" MUST BE SPECIFIED WHEN RELATIVE DATE IS USED

**Explanation:** The parameters of the CTMJ SA utility contained a relative date reference. Therefore, an ODATE must be specified.

The utility stops executing with a condition code of 12.

**Corrective Action:** Correct the parameter and rerun the utility. See the *INCONTROL for z/OS Utilities Guide* for a description of this utility.

JSA929S MISSING OBLIGATORY PARAMETERS

**Explanation:** Some obligatory parameters are missing for the CTMJ SA utility.

The utility stops executing with a condition code of 12.

**Corrective Action:** Correct the parameter and rerun the utility. See the *INCONTROL for z/OS Utilities Guide* for a description of the parameters of the utility.

JSA930S "FROMDATE" IS AFTER "TODATE"

**Explanation:** Wrong date range to the CTMJ SA utility.

The utility stops executing with a condition code of 12.

**Corrective Action:** Correct the parameter and rerun the utility. See the *INCONTROL for z/OS Utilities Guide* for a description of the parameters of the utility.
**JSA932W MEMBER=memName MAXIMUM NUMBER TAPE UNITS (number) EXCEEDED FOR JOB**

**Explanation:** During execution of the Control-M utility CTMJ SA (Statistics Accumulation), message SPY28GI (Tape usage for the Automatic Tape Adjustment feature) was processed, which specified more than 15 tape units (number) for a tape device type allocated in a job ordered under the memName MEMNAME.

Future automatic allocations of Control-M tape resources may be under-allocated for jobs that exceed a maximum of 15 tape units of a given device type.

A maximum of 15 units for the tape device in question will be stored in the Control-M Statistics file and displayed in the Statistics screen (3.S) for the member.

**Corrective Action:** No action is required.

**JSA933S ERROR MERGING STATISTICS FILE RECORDS.**

**FUNCTION=function RC= rc ERROR=errCode**

**Explanation:** An unexpected return code from an operation by the CTMJ SA utility. If the function prefix is VSM, the attempted operation is indicated as 'oooo' in the FUNCTION=VSMoooo parameter. A function prefix of BSR indicates a non-VSAM internal routine error.

The utility stops executing with a condition code of 12.

**Corrective Action:** If the function prefix is VSM, check the return codes in the related IBM VSAM manuals and correct the problem accordingly. If the function prefix is BSR, contact BMC Software Customer Support.
K - M

This group includes messages for the Control-D (including Control-D/Image and Control-D/Page on Demand), Control-M for z/OS (including Control-M/Assist, Control-M/Links for z/OS Control-M/Restart), Control-M/Tape, Control-O, and IOA products.

KOA messages

This group includes messages for the Control-O product.

Messages KOA0 through KOA0xx

This group includes messages for the Control-O product.

KOA003E VTAM APPLICATION IS NOT RESPONDING

**Explanation:** The VTAM application did not respond within the time limit. The VTAM application is probably not active.

The response time limit is specified in two places:

- the KOATIME parameter in the CTOPARM member
- the TIMEOUT parameter in the IOAYCNST member

The KOA session terminates.

**Corrective Action:** Ensure that the required VTAM application is active. If the application is active but does not respond, contact your system administrator. Consider increasing the value set for the KOATIME parameter.

KOA004E A LOGICAL OR PHYSICAL ERROR OCCURRED. SENSE= rc. fdb2.fdbk2

**Explanation:** An error occurred while exit routine LERAD/SYNAD was activated for this session.

The variables in this message are:

- rc - MVS return code
- fdb2 - MVS FDB2 function
- fdbk2 - MVS FDBK2 function

For more information, see the description of RPL-based macroinstruction errors and special conditions in the IBM manual *VTAM Programming*.

Session terminates.

**Corrective Action:** Contact your system administrator.
KOA005E VTAM CANNOT ESTABLISH THE REQUESTED SESSION

**Explanation:** The application received a network service request unit. The network service request unit was one of these:
- Cleanup session request unit
- Notify request unit
- Network services procedure error request unit

For more information, see the description of the NSEXIT Exit Routine in the IBM manual *VTAM Programming*.

Session terminates.

**Corrective Action:** Contact your system administrator.

KOA008E INSUFFICIENT STORAGE. INCREASE THE REGION SIZE

**Explanation:** Insufficient memory to perform the task.

**Corrective Action:** For jobs, increase the REGION size. For TSO, log on again using a larger SIZE parameter or exit one of the screens.

KOA009E THE SPECIFIED LU IS ALREADY BEING USED

**Explanation:** The Logical Unit is active in another session.

The session terminates.

**Corrective Action:** Change the Logical Unit name or contact your system administrator.

KOA00AE THE SPECIFIED LU IS NOT DEFINED

**Explanation:** The requested Logical Unit name was not defined in VTAM or was not activated.

The session terminates.

**Corrective Action:** Contact your system administrator.

KOA00BE ALL THE DEFINED APPLICATIONS ARE BEING USED

**Explanation:** No Logical Units are available.

The session terminates.

**Corrective Action:** Change the Logical Unit name or contact your system administrator. Consider increasing the number of Logical Terminals specified in the KOATERM parameter in the CTOPARM member.

KOA00CE THE SPECIFIED APPLICATION IS NOT AVAILABLE

**Explanation:** The requested application was not defined in VTAM.

The session terminates.

**Corrective Action:** Contact your system administrator.
KOA00EE FUNCTION func FAILED. SENSE = rc. fdb2. fdbk2

Explanation: The user requested function func. However, func cannot be executed.
The variables in this message are:
- rc - MVS return code
- fdb2 - MVS FDB2 function
- fdbk2 - MVS FDBK2 function

For more information, see Return Codes and Sense Fields for RPL-based Macro instructions in the IBM manual VTAM Programming.
The session terminates.

Corrective Action: Contact your system administrator.

KOA00FE NON-LU2 TYPE HAS BEEN DEFINED

Explanation: The user specified a Logical Unit name with a non-LU2 type.
The session terminates.

Corrective Action: Contact your system administrator.

KSL messages

This group includes messages for the IOA (infrastructure) product.

Messages KSL300 through KSL3xx

This group includes messages for the IOA (infrastructure) product.

KSL320E MAXIMUM NUMBER OF ARGUMENTS IN A CALL COMMAND IS 9

Explanation: A CALLMEM command was followed by more than nine (9) arguments.
The maximum number of arguments in a CALLMEM command is 9. The arguments must be separated with blanks. An argument specified between quotes and containing blanks is interpreted as a few arguments.
The KeyStroke Language Report will terminate with a condition code of 08 or 12.

Corrective Action: Correct the syntax of the CALLMEM command.

KSL321E CALLMEM MEMBER IS EMPTY

Explanation: The member that has been invoked by the CALLMEM command was empty.
The KeyStroke Language Report will terminate with a condition code of 12.

Corrective Action: Correct the syntax of the CALLMEM command or put a valid command in the called member.
KSL322E ARGUMENT REPLACEMENT WILL EXPAND THE CARD OVER ITS MAXIMUM LENGTH

Explanation: The result of argument replacement in a line of the member invoked by a CALLMEM command caused the line to be expanded over column 72. The problem line is printed before this message.

The KeyStroke Language Report will terminate with a condition code of 12.

Corrective Action: Correct the syntax of the CALLMEM command or of the erroneous line.

KSL337I text

Explanation: This information message indicates that at KeyStroke Language Report termination, the variable %MSG contained the text.

It is usually a message which is intentionally issued as part of the report definition.

Corrective Action: No action is required.

KSL338E INVALID VALUE OF %RC - val

Explanation: At KeyStroke Language Report termination, the variable %RC contained an invalid value.

A valid %RC value must be a numeric string of no more than 4 characters and not higher than 4095.

The KeyStroke Language Report will terminate with a condition code of 4095.

Corrective Action: Correct the syntax of the report.

KSL339E LINE IDENTIFIER id IS NOT DEFINED

Explanation: A line identifier specified in a PRINTLINE command has not been previously defined by a SETLINE command.

In this message, id is the undefined line identifier.

The KeyStroke Language Report will terminate with a condition code of 12.

Corrective Action: Correct the syntax of the PRINTLINE command.

KSL340E SCREEN SIZE ALREADY SET, OR SCREEN COMMANDS ALREADY ACTIVATED

Explanation: A SCREENSIZE command has already been issued, or a screen related command has already been activated (for example, TYPE, ENTER, and so on).

Screen size cannot be defined twice in the same report. Upon execution of a screen related command, if the screen size has not been set, a default of 24 lines and 80 columns is assumed.

The KeyStroke Language Report will terminate with a condition code of 12.

Corrective Action: Correct the syntax of the report.
KSL341E PAGE SIZE ALREADY SET, OR PRINT/HEADER/BOTTOM COMMANDS ALREADY ACTIVATED

**Explanation:** A PAGESIZE command has already been issued, or a print related command has already been activated (for example, HEADERLINE, PRINT SCREEN).

Page size cannot be defined twice in the same report. Upon execution of a print related command, if the page size has not been set, a default of 60 lines, 132 columns is assumed.

The KeyStroke Language Report will terminate with a condition code of 12.

**Corrective Action:** Correct the syntax of the report.

KSL342E INTERNAL PRINTING ERROR. RC= rc

**Explanation:** Internal error in the Control- x KeyStroke Language printing routines.

The KeyStroke Language Report will terminate with a condition code of 12.

**Corrective Action:** Contact BMC Software Customer Support. A printed sample of the erroneous report and the report definition will be required, preferably with the TRACE ON option.

KSL343E LABEL ALREADY DEFINED

**Explanation:** The label specified in the previous line has already been defined in the same report member.

The KeyStroke Language Report will terminate with a condition code of 08 or 12.

**Corrective Action:** Correct the syntax of the report.

KSL344E GOTO TO AN UNDEFINED LABEL label

**Explanation:** A label specified in a GOTO command is not defined in the report member.

The KeyStroke Language Report will terminate with a condition code of 08 or 12.

**Corrective Action:** Correct the syntax of the report.

KSL345E IFSCREEN COMMAND NOT IN SCREEN RANGE

**Explanation:** The string to compare with the contents of the screen in the current cursor position exceeds the width of the screen line. Therefore it cannot be compared.

The KeyStroke Language Report will terminate with a condition code of 12.

**Corrective Action:** Correct the syntax of the IFSCREEN command.

KSL346E MAXCOMMAND ALREADY SET

**Explanation:** The MAXCOMMAND has already been activated.

The MAXCOMMAND command cannot be activated twice in the same report (this may result in an endless loop).

The KeyStroke Language Report will terminate with a condition code of 12.

**Corrective Action:** Correct the syntax of the report.
KSL347E HEADERSIZE/BOTTOMSIZE MUST BE ACTIVATED BEFORE A HEADERLINE/BOTTOMLINE COMMAND

Explanation: A HEADERLINE command or a BOTTOMLINE command has been activated before both the header and bottom size have been defined by a HEADERSIZE and BOTTOMSIZE command.

The KeyStroke Language Report will terminate with a condition code of 08 or 12.

Corrective Action: Correct the syntax of the report.

KSL348E UNDEFINED VARIABLE - varName

Explanation: A reference to a user variable which has not yet been defined by a SETVAR command.

A user variable is valid only inside the same report member. A user variable defined in another report member is not accessible from other report members (including the calling member).

The KeyStroke Language Report will terminate with a condition code of 12.

Corrective Action: Correct the syntax of the report.

KSL349E ERROR WHILE EXECUTING COMMAND - cmdText

Explanation: A severe error occurred during the processing of a command. Previous messages should describe the error.

In this message, cmdText is the text of the command that was being executed when the error occurred.

The KeyStroke Language Report will terminate with a condition code of 12.

Corrective Action: Correct the syntax of the report.

Messages KSL400 through KSL4xx

This group includes messages for the IOA (infrastructure) product.

KSL401I A KEYSTROKE REPORT STARTED

Explanation: This information message is a normal start message of a KeyStroke Language Report.

Corrective Action: No action is required.

KSL402I A KEYSTROKE REPORT ENDED SUCCESSFULLY

Explanation: This information message indicates that a KeyStroke Language Report ended successfully.

The report ended successfully from the point of view of report syntax and execution. A user may set the condition code to any condition code and send a message indicating otherwise. It is recommended to check the condition code as well (using the Control-M/D facilities).

Corrective Action: No action is required.

KSL403E TEXT EXPECTED BETWEEN QUOTES IN THE COMMAND

Explanation: A text between quotes is expected as one of the command parameters. The command line is printed in the previous line.
The KeyStroke Language Report will terminate with a condition code of 08 or 12.

**Corrective Action:** Refer to the *Control-M for z/OS User Guide* or the *Control-D and Control-V User Guide* for the valid command syntax.

**KSL404E REDUNDANT PARAMETERS IN THE REPORT COMMAND**

**Explanation:** Redundant text in the report line (columns 1-80). The command line is printed in the previous line.

The KeyStroke Language Report will terminate with a condition code of 08 or 12.

**Corrective Action:** Correct the syntax of the report.

**KSL405E MISSING/INVALID PARAMETERS IN THE REPORT COMMAND**

**Explanation:** A parameter of a command has an invalid value, or an obligatory command parameter is missing. The command line is printed in the previous line.

The KeyStroke Language Report will terminate with a condition code of 08 or 12.

**Corrective Action:** Refer to the *Control-M for z/OS User Guide* or the *Control-D and Control-V User Guide* for valid command syntax.

**KSL406E INVALID LINE/COL NUMBER - num (OR OUT OF RANGE)**

**Explanation:** A line number or a column number used in a KeyStroke Language Report command is not within the limits of the screen size or the limits of the print page size (or the header/bottom size), or cannot be referred to in the erroneous command.

The KeyStroke Language Report will terminate with a condition code of 08 or 12.

**Corrective Action:** Refer to the KSL section of your CONTROL product user guide for valid command syntax.

**KSL407E INTERNAL COMMAND HANDLER ERROR RC rc**

**Explanation:** An internal error occurred in the KeyStroke Language (KSL) command handler.

The return code (*rc*) is for internal use only.

The KSL report terminates with a condition code of 12.

**Corrective Action:**

1. Verify that all the sysouts produced by the KSL procedure point to a printable class.
2. Add TRACE ON and DBGLEVEL 255 statements to the KSL or KOA script to produce trace information:
3. Submit the job.
4. Report the problem with all the sysouts of the job and the return code (*rc*) to BMC Software Customer Support.
INCONTROL for z/OS Messages Manual

KSL408E MAXIMUM NUMBER OF COMMANDS EXCEEDED. REPORT IS TERMINATED

Explanation: The maximum number of report commands as defined in MAXCOMMAND, has been exceeded.

The default MAXCOMMAND value is 400. It can be set to any number up to the seven digit value 9999999.

The KeyStroke Language Report terminates with a condition code of 12.

Corrective Action: Check for a possible loop. Correct the syntax of the report, and set a larger value for MAXCOMMAND.

KSL409E A KEYSTROKE REPORT ENDED WITH ERROR(S)

Explanation: Syntax/execution error during processing of a report.

The KeyStroke Language Report will terminate with a condition code of 08 or 12.

Corrective Action: Look for the error in the report listing (the DAKSOUT DD statement).

KSL410E TYPING IN A "SCREEN" PROTECTED AREA IS NOT PERMITTED - THE REPORT IS TERMINATED

Explanation: A text (string) used in a TYPE command does not fall within the limits of one unprotected data field on the screen.

As in normal screen processing, it is impossible to type over protected screen areas.

The KeyStroke Language Report will terminate with a condition code of 12.

The current screen and the current cursor position are printed to help resolve the problem.

Corrective Action: Correct the syntax of the report.

Messages KSLA00 through KSLAxx

This group includes messages for the IOA (infrastructure) product.

KSLA60I EXCEPTIONAL CONDITION RC=rc, ERROR=err, FEEDBACK=feedback, APPLID= applId

Explanation: This information message indicates that an exceptional VTAM condition was encountered during the execution of a KOA communication command.

This informational message is issued by the KOA Facility. Return code, error and feedback information are detailed in the KeyStroke Language (KSL) User Guide.

The KOA script continues processing. If an ON SCREENERROR statement was specified, the processing resumes at the label specified in the ON statement.

Corrective Action: Analyze the specific VTAM error, and take the corresponding corrective actions. Make sure that the error is handled correctly by the KOA script.
KSLA61E SCREEN COMMAND EXECUTED WITH NO SCREEN AVAILABLE

Explanation: A screen command was executed; however, no screen was available to the KOA script. Either a screen command was executed before a KOA session was established by means of a LOGON command, or the KOA session was lost due to communication errors. The KOA script is terminated.

Corrective Action: Check previous error messages. If necessary, correct the error handling inside the KOA script.

KSLA62E CONTROL-O IS NOT ACTIVE. GLOBAL VARIABLES CANNOT BE USED

Explanation: A SETOGLB KOA statement was executed while the Control-O monitor was not active. Control-O Global variables may be set by a KOA script only while Control-O is active. The KOA script is terminated.

Corrective Action: Correct the KOA script, or start the Control-O monitor.

KSLA63E SPECIFIED SESSION ID IS NOT ACTIVE

Explanation: A SETSESS KOA statement specified the ID of a session which is not active. Either the session was not established through a LOGON command, or the session was lost due to communication errors. The KOA script is terminated.

Corrective Action: Check for previous error messages. Correct the KOA script accordingly, and resubmit.

KSLA64E KEYSTROKE UTILITY DETECTED INTERNAL ABEND abCode

Explanation: An internal abend was intercepted by the KeyStroke utility. The KSL/KOA script is terminated.

Corrective Action: Check the associated error messages. Correct the KOA script accordingly, and resubmit.

KSLA65E ALLOC OF DDNAME ddName FAILED, RC = rc, ERROR= err, DSN= dsn

Explanation: An ALLOC statement failed due to a dynamic allocation error. The KSL/KOA script is terminated.

Corrective Action: Check the return code and error information. Correct the KSL/KOA script accordingly, and resubmit.

KSLA66E FREE OF DDNAME ddName FAILED

Explanation: A FREE statement failed due to a dynamic deallocation error.
The KSL/KOA script is terminated.

**Corrective Action:** Correct the KSL/KOA script accordingly, and resubmit.

KSLA67E OPEN OF DDNAME *ddName* FAILED

**Explanation:** An OPENFILE statement failed.

The KSL/KOA script is terminated.

**Corrective Action:** Check the preceding KSL or MVS error messages. Correct the KSL/KOA script accordingly, and resubmit.

KSLA68E CLOSE OF DDNAME *ddName* FAILED

**Explanation:** A CLOSEFILE statement failed.

The KSL/KOA script is terminated.

**Corrective Action:** Check the preceding KSL or MVS error messages. Correct the KSL/KOA script accordingly, and resubmit.

KSLA69E I/O ERROR WHEN READING FROM DDNAME *ddName*

**Explanation:** A GETFILE statement failed due to an I/O error.

The KSL/KOA script is terminated.

**Corrective Action:** Check the preceding KSL or MVS error messages. If necessary, check that the DCB characteristics of the file are correct. Correct the KSL/KOA script accordingly, and resubmit.

KSLA6AE I/O ERROR WHEN WRITING TO DDNAME *ddName*

**Explanation:** A PUTFILE statement failed due to an I/O error.

The KSL/KOA script is terminated.

**Corrective Action:** Check the DCB characteristics of the file. Make sure it is a fixed length record data set. Correct the KSL/KOA script accordingly, and resubmit.

KSLA6BE UNSUPPORTED DCB CHARACTERISTICS FOR DDNAME *ddName*

**Explanation:** The KeyStroke utility handles only fixed length record data sets. An OPENFILE statement failed because the record format of the specified data set is not fixed or the record length exceeds 150 characters.

The KSL/KOA script is terminated.

**Corrective Action:** Check the DCB characteristics of the file. Make sure the file is a fixed length record data set with a record length that does not exceed 150 characters. Correct the KSL/KOA script accordingly and resubmit.

KSLA6CE ENQ ERR RC= rc, Q= queueName, R= resourceName

**Explanation:** The execution of the KSL OPEN statement issued an Enqueue request which failed.

The request is terminated.
**Corrective Action:** Check the return code of the Enqueue failure and proceed accordingly.

KSLA6DE RSV ERR RC= rc, Q= queueName, R= resourceName

**Explanation:** The execution of the KSL OPEN statement issued a Reserve request which failed. The request is terminated.

**Corrective Action:** Check the return code of the Reserve failure and proceed accordingly.

KSLA6EE DDNAME ddName NOT FOUND

**Explanation:** Control-O was unable to locate the specified data set while executing an OPENFILE request. The OPENFILE request fails.

**Corrective Action:** Check why `ddName` is not allocated. Correct the KOA/KSL script or the JCL, and rerun.

KSLA6FE SETOLOC/SETOGLB ERROR CODE = rc REASON = rsn, TEXT=AutoEdit_expression

**Explanation:** An error was detected while trying to resolve a SETOGLB or SETOLOC KSL/KOA statement. The KSL/KOA program is terminated.

**Corrective Action:**
1. Ensure that the AutoEdit expression in the SETOLOC or SETOGLB statement is correctly written.
2. For an explanation of the return code and reason code included in this message, see the table in the explanation of message WTO283E.

KSLA70E THERE IS AN ERROR IN IOAKPRM MEMBER. PLEASE CHECK THE SMFID FIELD.

**Explanation:** The SMFID of the CPU to which the KSL job was submitted does not appear in the IOAKPRM member in the IOA PARM library. The KSL stops running.

**Corrective Action:** Add the SMFID by making the appropriate entry in the IOAKPRM member. The best way of doing this is by means of the INCONTROL Installation and Customization Engine (ICE). For more information on ICE, see the ICE chapter in the INCONTROL for z/OS Installation Guide.

**LDT messages**

This group includes messages for the Control-O product.

**Messages LDT500 through LDT5xx**

This group includes messages for the Control-O product.
LDT500I RULE= rule TYPE= rule_typ TABLE= tableName LIB= lib

**Explanation:** This information message provides information about each rule in the table that was not loaded by ORDER or FORCE requests.

The variables in this message are:
- **rule** - the name of the rule
- **rule_typ** - the type of rule
- **tableName** - the name of the table containing the rule
- **lib** - the name of the library containing the table

**Corrective Action:** Examine previously issued messages to ascertain the reason why the rule identified in this message was not loaded, and take appropriate corrective action.

LDT501I func OF RULE TABLE(S) STARTED

**Explanation:** This information message indicates that the function func started on the rule tables.

**Corrective Action:** No action is required.

LDT502E MEMBER IN USE= memb DSN= dsn

**Explanation:** The user attempted to load a rule table but the table was currently being used. This message is issued immediately after message CTM684E to give the name of the member and data set that are in use.

The table is not loaded.

**Corrective Action:** Try to load the required table manually or by an automated operations product when the table is not in use.

LDT503S RULE ORDER LIST IS EMPTY. DDNAME= {DARULLST | DACTMLST}

**Explanation:** Open of rule list data set failed (the DARULLST or DACTMLST DD statement).

Possible causes are:
- The DARULLST or DACTMLST DD statement is missing.
- The data set described by the DARULLST or DACTMLST DD statement cannot be opened for sequential read, or the record length is not 80.

The Control-O or CMEM monitor shuts down or continues processing according to the status of the monitor.

**Corrective Action:** Correct the JCL and restart the Control-O or CMEM monitor.

LDT504S INVALID DATA IN RULE ORDER LIST CARDS

**Explanation:** Invalid data has been found in the rule order list.

For valid format information, see the INCONTROL for z/OS Administrator Guide.
**Corrective Action:** Check the format of the rule list in the PARM library; correct and restart the Control-O or CMEM monitor.

LDT505S MEMBER `memName` NOT FOUND IN LIBRARY `lib`

**Explanation:** The `memName` member that was specified in the rule order was not found in the `lib` library. The member (rule table) may be specified incorrectly or may be missing from the library. The rule table is not ordered.

**Corrective Action:** Check and correct the member specification; reorder the rule table.

LDT506S ORDER OF TABLE `tableName` RULE `ruleName` FAILED

**Explanation:** The order of rule `ruleName` from table `tableName` failed. Prior messages usually explain why the rule table could not be ordered. The rule is not be ordered.

**Corrective Action:** Check earlier messages for reasons the rule order failed. Correct as necessary, and reorder the rule table.

LDT507I LOAD ENDED FOR TABLE `tableName` LIBRARY `lib`

**Explanation:** This information message indicates that after ordering or forcing a Control-O rule table, loading of rules from the table ended.

**Corrective Action:** No action is required.

LDT508I `{ORDER | FORCE} OF RULE(S) TABLE(S) ENDED`

**Explanation:** This information message indicates that ordering or forcing of the Control-O rule table ended.

**Corrective Action:** No action is required.

LDT509I NUMBER OF TABLES `numtbl1` PROCESSED. `numrul1` RULES LOADED AND `numrul2` RULES REJECTED

**Explanation:** This information message indicates the number of tables processed, and the number of rules that were loaded or deleted (not loaded) as a result of an ORDER or FORCE request. This information can be used for manual verification purposes.

**Corrective Action:** Check the results to ensure that the rule loading was performed correctly.

LDT50AI NUMBER OF TABLES `numtbl` RULES `numrul` DELETED

**Explanation:** This information message indicates the number of tables (`numtbl`) and the number of rules (`numrul`) deleted as a result of a MODIFY command to the Control-O or CMEM monitor.

**Corrective Action:** No action is required.
LDT50BE HOLD BY jobId ASID asid ON SYSTEM systemId

Explanation: An ORDER or FORCE command to the Control-O or CMEM monitor to load a table or tables of rules failed, because the library is held by the jobId job with the asid ASID on the systemId system.

The command fails.
Corrective Action: Try to determine why the library is held. If possible, release it, and try again to ORDER or FORCE the table or tables.

LDT50CE LIBRARY WAS MIGRATED BY HSM DSNAME=

Explanation: An ORDER or FORCE command to the Control-O or CMEM monitor to load a table or tables of rules failed, because the library had been migrated by HSM.

The command fails.
Corrective Action: If possible, restore or recall the library, then try again to ORDER or FORCE the table or tables.

LDT50FI text

Explanation: This information message displays the control record from the DARULLST or DACTMLST DD statement.
Corrective Action: No action is required.

LDT516S ERROR IN RULE DATA - MANDATORY stmt_type CARD IS EITHER MISSING OR IN AN INCORRECT ORDER

Explanation: A stmt_type statement is either missing or in the wrong order in a rule definition member.
Someone may have tampered with the rule definition data; the data do not conform to a valid Control-O or CMEM format.
The rule is not ordered.
Corrective Action: Restore the table to its original state from a backup copy, and reorder the rule table.

LDT517S RULE DATA NOT AVAILABLE: MEMBER memName IS EMPTY

Explanation: The memName member that was designated in the rule list is empty. This error message is issued by the CTOLDT program, which loads tables when a new Control-O or CMEM monitor is activated.
The table is not ordered.
Corrective Action: Check that the specification of the member in the rule list is correct. If so, check why the member is empty. Correct, and reorder the rule table.

LDT518S INVALID SCHEDULING DATE - date

Explanation: An invalid scheduling date format was used in the rule list or in a order/force request.
Valid date formats are:
ddmmmyy - Day, month, and year.
mmddyy - Month, day, and year.
* (Asterisk) - Current Control-O or CMEM working date.

The requested table order fails.

Corrective Action: Correct the date, then reorder the rule table.

LDT521S ERROR IN RULE DATA: INVALID 'EXIT' TYPE. VALUES ALLOWED MESSAGE OR WHILE

Explanation: A logical check performed during rule loading detected an invalid DO EXIT statement.
The rule is not loaded.

Corrective Action: Correct the rule definition and reload the table.

LDT522S ERROR IN RULE DATA: EXIT WHILE NOT IN WHILE BLOCK

Explanation: A logical check performed during rule loading detected a DO EXIT WHILE statement that was not in a DO WHILE block. A DO EXIT WHILE statement is only valid if it is located within a DO WHILE block.
The rule is not loaded.

Corrective Action: Correct the rule definition and reload the table.

LDT523S ERROR IN RULE DATA: INVALID IF-THEN-ELSE NESTING

Explanation: This message is issued during the ordering of the rule. The rule definition contains an invalid IF-ELSE-ENDIF nesting.
The rule is not ordered.

Corrective Action: Correct the rule definition and order it again.

LDT524S func RULE TABLE(S) ENDED WITH ERRORS

Explanation: The indicated function of the CTOLDT program ended with errors. This program loads rule tables when a new Control-O or CMEM monitor is activated, and performs order/force of rule tables.
The IOA Log should contain prior messages concerning the errors.
Depending on when it fails, either the Control-O or CMEM monitor shuts down, or the table is not ordered.

Corrective Action: No action is required.

LDT525I func RULE TABLE(S) ENDED

Explanation: This information message is a normal message issued when the indicated function of the CTOLDT program has terminated successfully. This program loads rule tables when a new Control-O or CMEM monitor is activated, or performs order/force of rule tables.

Corrective Action: No action is required.
LDT526S **** ERROR IN RULE CARDS. CHECK THE FOLLOWING CARDS  

**Explanation:** The rule definition has been corrupted and the data do not conform to a valid Control-O or CMEM format.

This message is followed by one or more LDT527S messages describing all statements belonging to the damaged rule order. An asterisk (*) appears in the line under the erroneous data.

The rule is not ordered.

**Corrective Action:** Using the Online Viewing Facility, or by editing the member, restore the table to its original state, and reorder the rule table.

LDT527S CARD = stmt 

**Explanation:** The rule definition has been corrupted.

This message follows message LDT526, and displays each statement in the damaged rule in the scheduling table. An asterisk * appears in the line under a damaged statement.

**Corrective Action:** Restore the table to its original state.

LDT528I RULE ruleName rule_type TABLE tableName LIBRARY lib ODATE  

**Explanation:** This information message is a normal message when a rule order is successfully loaded by the Control-O or CMEM monitor.

The rule is now in Control-O or CMEM memory.

**Corrective Action:** No action is required.

LDT529I TABLE tableName LIBRARY lib DELETED 

**Explanation:** This information message indicates that rule table tableName has been deleted from the Control-O or CMEM monitor as a result of an F CONTROLO,D=... operator command.

**Corrective Action:** No action is required.

LDT530E DELETE OF TABLE tableName LIBRARY lib FAILED, TABLE NOT FOUND 

**Explanation:** A request to delete a rule table from the Control-O or CMEM monitor has failed. Table tableName has not been found under Control-O or CMEM.

The table may be specified incorrectly or it may never have been ordered.

The table is not deleted.

**Corrective Action:** If the table specification incorrect, check and correct the table specification and issue the delete request again. If the table was never ordered, there is no reason to attempt to delete it.
LDT531I NO RULE WAS LOADED - TABLE tableName LIBRARY lib

Explanation: This information message indicates that the Control-O monitor did not load new rules from table tableName in library lib.

While ordering or forcing a rule library, Control-O found no rules that matched the Basic Scheduling parameters.

No rule is loaded.

Corrective Action: No action is required.

LDT532E MASK mask DOES NOT MATCH IN DSN= dsn

Explanation: The specified mask does not match any members in the rule library.

During rule ordering, the Control-O monitor found no members matching the specified mask.

No rule is loaded.

Corrective Action: Check and correct the parameters specified in the ORDER/FORCE command or in the rule list.

LDT536S SEVERE ERROR IN RULE DATA CARDS

Explanation: Severe error was found in the rule definition data statements. It is followed with additional messages regarding the error.

The rule table is not ordered.

Corrective Action: Check for additional messages concerning the errors in the systems and IOA Log and Control-O or CTMCMEM sysprint; correct the error and reorder the table.

LDT537S INSUFFICIENT STORAGE IN (EXTENDED) CSA. CANNOT LOAD TABLE

Explanation: Insufficient storage in the Extended Common Service Area (CSA) to load the rule table.

If any rules have been previously loaded, the Control-O or CMEM monitor proceeds without loading the table. If no rules were previously loaded, the Control-O or CMEM monitor shuts down.

Corrective Action: Check why there is insufficient CSA. You may need to contact your systems programmer. After correcting the problem, reload the table, or restart Control-O or CMEM, as necessary.

LDT539W ORDER CANCELLED BY USER EXIT: RULE ruleName TABLE tableName LIBRARY lib

Explanation: The specified rule order failed as a result of a user exit check.

The IOA Log should contain prior messages concerning the reason for failure.

The rule order is not ordered/loaded by the Control-O or CMEM monitor.

Corrective Action: Check the IOA Log for further information.
LDT545E DO-MISSION NOT SUPPORTED WITHOUT CONTROL-D INSTALLED

**Explanation:** An attempt was made to order a rule specifying DO MISSION, but Control-D is not installed. DO MISSION is supported only if Control-D is installed.

The rule is not ordered.

**Corrective Action:** Either remove this statement from the rule or install Control-D.

LDT548E SEVERE ERROR IN CALENDAR calName OR YEAR NOT FOUND IN CALENDAR

**Explanation:** Severe error in the IOA calendar calName, or the year was not found in the calendar. Either the year is not defined in the calendar or the calendar has been incorrectly modified.

The rule is not ordered.

**Corrective Action:** Check the contents of the rule order and the calendar. Correct and reorder the rule.

LDT549E DO FORCEJOB/RESOURCE NOT SUPPORTED WITHOUT CONTROL-M INSTALLED

**Explanation:** An attempt was made to order a rule specifying DO FORCEJOB or DO RESOURCE, but Control-M is not installed.

These statements are not supported if Control-M is not installed.

The rule is not ordered.

**Corrective Action:** Remove these statements from the rule or install Control-M.

LDT54AE INVALID "ON" STATEMENT FOR CMEM RULE

**Explanation:** An attempt was made to load a CMEM table containing a rule with an invalid “ON” statement.

The table is loaded without the erroneous rule.

**Corrective Action:** Delete the rule from the table, or load the table as a Control-O table (if Control-O is installed).

LDT54BE INVALID "DO" STATEMENT FOR CMEM RULE

**Explanation:** An attempt was made to load a CMEM table containing a rule with an invalid “DO” statement.

The table is loaded without the erroneous rule.

**Corrective Action:** If the rule is required, load the table as a Control-O table. If the rule is not required, delete it from the table.
LDT54CW LOAD REQUEST IGNORED. TABLE tableName LIBRARY lib ALREADY LOADED

Explanation: During monitor startup or REBUILD/NEWCONLIST command, Control-O tried to load a certain table more than once.

This problem can be caused by one of the following:

- Duplicate statements appear in the same list, for example, DACTMLST, DARULLST.
- The same statement appears in different lists, for example, DACTMLST, DARULLST.
- Different generic statements appear in the same or different lists, producing one or more duplicate statements, for example, CTO* and C*.

Only the first appearance of the table is loaded.

Corrective Action: Check the lists for duplicate statements and correct if necessary.

LDT54DE RULE TYPE IS INCORRECT. TABLE tableName LIBRARY lib

Explanation: The user attempted to order or force a CMEM rule table from Control-O screen OR, or a Control-O rule table from CMEM screen C.

Control-O rules can only be ordered or forced from Control-O screen OR. CMEM rules can only be ordered or forced from CMEM screen C.

The table specified in the message is not loaded.

Corrective Action: If you issued the command from screen OR, issue it from screen C, or vice versa.

LDT54EW RULE WAS NOT LOADED: SCHEDULING DATE WAS NOT SATISFIED

Explanation: Control-O did not load a rule because the scheduling date for that rule does not match the current date.

When Control-O loads a rule during startup or as a result of an order, it does not load rules whose scheduling date does not match the current one.

The Control-O monitor sends this message to SYSPRINT and to the IOALOG, and does not load the rule.

Corrective Action: To load the rule, make the scheduling date match the current date and reload the table containing the rule.

LDT54FW RULE WAS NOT LOADED: {SYSTEM | SMF ID} { rul_sysname|rul_smfid} DOES NOT MATCH { cur_sysname|cur_smfid}

Explanation: Control-O did not load a rule because the environment specified for that rule does not match the current environment.

When Control-O loads a table of rules during startup or as a result of an order, it does not load rules whose specified environment does not match the current one.

The Control-O monitor sends this message to SYSPRINT and to the IOALOG, and does not load the rule.

Corrective Action: To load a rule, make the environment specified for it match the current one and reload the table containing the rule.
LGC messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages LGC900 through LGC9xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

LGC988S DATE SHOULD NOT BE GREATER THAN YESTERDAY

Explanation: Invalid date specified for archival or backup (the CTMLGC utility).
The archive date should not be greater than yesterday's date.
The utility stops execution with a condition code of 08.
Corrective Action: Correct the date field.

LGC989S OPEN OF DDNAME "DALOGHIS" FAILED. LOG ARCHIVAL NOT PERFORMED

Explanation: Open of log archival data set failed (the CTMLGC utility).
Possible causes are:
- the DALOGHIS DD statement missing.
- The DALOGHIS DD statement describes a file which is not in the format of the IOA Log.
The utility stops execution with a condition code of 08.
Corrective Action: Correct JCL for the job. You should run the CTMFRLOG utility to allocate and format an archival file in exactly the same format as the IOA Log.

LGC990I action OF IOA LOG STARTED

Explanation: This information message is a normal message which is issued when starting to backup the IOA Log (the CTMLGC utility).
Corrective Action: No action is required.

LGC991I action OF IOA LOG ENDED

Explanation: This information message is a normal message which is issued when the backup of the IOA Log ends (the CTMLGC utility).
Corrective Action: No action is required.
LGC992W OPEN OF DDNAME "DALOGBKP" FAILED, BACKUP OF IOA LOG NOT TAKEN

**Explanation:** Open of data set described by the DALOGBKP DD statement failed.

Possible causes are:
- The DALOGBKP DD statement missing.
- The data set described by the DALOGBKP DD statement cannot be opened for sequential write.

Backup of IOA Log not taken. Processing continues.

**Corrective Action:** If you want to backup the entire Log file, correct the JCL for the job.

LGC993S OPEN OF DDNAME "DALGCIN" FAILED. LOG ARCHIVAL NOT PERFORMED

**Explanation:** Open of the data set described by the DALGCIN DD statement.

Possible causes are:
- The DALGCIN DD statement is missing.
- Data set described by the DALGCIN DD statement cannot be opened for sequential read.

Log archival is not performed.

**Corrective Action:** Correct the JCL for the job.

LGC994S FILE CONNECTED TO DDNAME "DALGCIN" IS EMPTY

**Explanation:** The data set described by the DALGCIN DD statement is empty.

Log archival is not performed.

**Corrective Action:** Correct the JCL for the job.

LGC995S RECORD LENGTH OF DDNAME "DALGCIN" IS NOT 80

**Explanation:** Record length of the data set described by the DALGCIN DD statement must be 80 bytes.

Log archival is not performed.

**Corrective Action:** Check the contents of the data set described by the DALGCIN DD statement.

LGC996S "UNTIL DATE" OF LOG ARCHIVAL IS NOT A VALID DATE

**Explanation:** A parameter for the UNTIL date is invalid.

**Corrective Action:** Correct the UNTIL date parameter of the Log archival utility.

LGC997S NUMBER OF DAYS TO KEEP IN LOG FILE IS NOT NUMERIC

**Explanation:** Invalid number of days to keep in the Log file.

The number of days to keep in the Log file must be numeric.

**Corrective Action:** Correct the number of days.
INCONTROL for z/OS Messages Manual

LGC998S ARCHIVAL FILE ALLOCATED TO "DALOGHIS" IS FULL

Explanation: The archival file allocated to the DALOGHIS DD statement is full. Archival will not be executed.

Corrective Action: No action is required.

LGC999S NOTHING TO DO. NEITHER BACKUP NOR ARCHIVAL IS NEEDED

Explanation: Neither file DALOGHIS nor file DALOGBKP has been opened by the CTMLGC utility. The utility terminates with a return code of 12.

Corrective Action: No action is necessary.

LGP messages

This group includes messages for the IOA (infrastructure) product.

Messages LGP900 through LGP9xx

This group includes messages for the IOA (infrastructure) product.

LGP9A0I action OF IOA LOG STARTED

Explanation: This information message is a normal start message of the IOACPLOG utility. IOACPLOG is used to copy the contents of the IOA Log to another IOA Log file or to a sequential file. The actions COPYTOSEQ and COPYTOLOG are currently supported.

Corrective Action: No action is required.

LGP9A1I action OF IOA LOG ENDED

Explanation: This information message is a normal termination message of the IOACPLOG utility. IOACPLOG is used to copy the contents of the IOA Log to another IOA Log file or to a sequential file. The actions COPYTOSEQ and COPYTOLOG are currently supported.

Corrective Action: No action is required.

LGP9A2S action OF IOA LOG ENDED WITH ERRORS.

Explanation: The IOACPLOG utility failed to copy the IOA Log file. IOACPLOG is used to copy the contents of the IOA Log to another IOA Log file or to a sequential file. The actions COPYTOSEQ and COPYTOLOG are currently supported. The IOACPLOG utility ended with a condition code of 08 or 12.

Corrective Action: Check the preceding error messages in the job log or in the SYSPRINT sysout, correct the problem, and rerun the job.
LNR messages

This group includes messages for the IOA (infrastructure) product.

Messages LNR0 through LNR0xx

This group includes messages for the IOA (infrastructure) product.

LNR051S OPEN OF IOA LOG FILE FAILED

Explanation: Open of IOA Log file failed. This error message is issued by the IOALDNRS utility, which is used to load or create the Manual Conditions list. Possible causes are:

- The DALOG DD statement is missing.
- The file allocated to the DALOG DD statement is not the IOA Log file.
- The file allocated to the DALOG DD statement is the IOA Log file, but it is of a different version of IOA or of a different IOA monitor.

The IOALDNRS utility is not performed. The IOA Manual Conditions file is not loaded.

Corrective Action: Correct the JCL for the job.

LNR052S OPEN OF IOA MANUAL SYNC FILE FAILED

Explanation: Open of the IOA Manual Conditions Synchronization file failed. This error message is issued by the IOALDNRS utility, which loads or creates the Manual Conditions list. Possible causes are:

- The DANSINC DD statement is missing.
- The file allocated to the DANSINC DD statement is not the IOA Manual Conditions Synchronization file.
- The file allocated to the DANSINC DD statement is the IOA Manual Conditions Synchronization file, but it is of a different version or of a different IOA monitor.

The IOALDNRS utility terminates with a condition code of 08. The IOA Manual Conditions file is not loaded.

Corrective Action: Correct the JCL for the job.

LNR054I LOADING OF IOA MANUAL CONDITIONS FILE STARTED

Explanation: This information message indicates that loading of the IOA Manual Conditions file has started. The IOALDNRS utility will start collecting the Manual Conditions from the job orders on the Active Jobs file. These are all the prerequisite conditions which are suspected of requiring manual confirmation.

Corrective Action: No action is required.

LNR055I LOADING OF IOA MANUAL CONDITIONS FILE ENDED

Explanation: This information message indicates that the IOA Manual Conditions file has finished loading. The Manual Conditions file currently contains all the missing conditions for the job orders on the Active Jobs file.
Corrective Action: No action is required.

LNR056S IOA MANUAL CONDITIONS FILE WAS NOT LOADED

Explanation: The IOA Manual Conditions file was not loaded (the IOALDNRS utility). The utility output should contain a prior message which describes the cause of the problem.

Corrective Action: Correct the problem and rerun the utility.

LNR057S OPEN OF CONTROL-M ACTIVE JOBS FILE FAILED - DDNAME "DACKPT"

Explanation: Open of Control-M Active Jobs file failed (the DACKPT DD statement). The error message is issued by the IOALDNRS utility, which is used to load or create the Manual Conditions List, and is due to one of the following:

- The DACKPT DD statement is missing.
- The data set described by the DACKPT DD statement is not the Control-M Active Jobs file. The data set described by the DACKPT DD statement is the Control-M Active Jobs file, but of another Control-M monitor, or of a different version of Control-M.

The IOALDNRS utility will terminate with a condition code of 08. The IOA Manual Conditions file is not loaded.

Corrective Action: Correct the JCL for the job.

LNR058E FILE ALLOCATED TO DDNAME "DACKPT" IS NOT CONTROL-M ACTIVE JOBS FILE

Explanation: The file allocated to the DACKPT DD statement is not the Control-M Active Jobs file. This error message is issued by the IOALDNRS utility which is used to load/create the Manual Conditions List and may be due to one of the following:

- The file allocated to the DACKPT DD statement is not the Control-M Active Jobs file.
- The file allocated to the DACKPT DD statement is the Control-M Active Jobs file, but it is of a different version or of a different Control-M monitor.

The IOALDNRS utility will terminate with a condition code of 08. The IOA Manual Conditions file will not be loaded.

Corrective Action: Correct the JCL for the job.

LNR059E ACTIVE JOBS FILE IS BEING FORMATTED. PLEASE TRY AGAIN LATER

Explanation: The Active Jobs file is currently being formatted, which indicates that the New Day procedure is running. This error message is issued by the IOALDNRS utility (used to load or create the Manual Conditions List), which terminates with a condition code of 08. The IOA Manual Conditions file is not be loaded.

Corrective Action: Try again later. If the Control-D and Control-M New Day procedures start at the same time, you need to ensure that both procedures finish before running the IOALDNRS utility or the CTDLDNRS step. Use one of the following options:
Set Control-D New Day time (DAYTIMED) long enough after Control-M New Day time (DAYTIME) to ensure that Control-M New Day is ended.

Remove the CTDLDNRS step from the CTDNDAY procedure. Run the IOALDNRS utility after both Control-M and Control-D New Day procedures have finished.

LNR060W ACTIVE JOBS FILE IS EMPTY

**Explanation:** The IOA Manual Conditions file is not built. The Active Jobs file is empty. This error message is issued by the IOALDNRS utility which loads or creates the Manual Conditions List. No manual conditions are found because there are no job orders. The IOA Manual Conditions file will not be loaded.

**Corrective Action:** No action is required.

LNR061E FILE ALLOCATED TO DDNAME "DASINC" IS NOT THE IOA SYNCHRONIZATION FILE

**Explanation:** The data set described by the DASINC DD statement is not the IOA Conditions Synchronization file. This error message is issued by the IOALDNRS utility, which loads or creates the Manual Conditions List. Possible causes are:

- The file allocated to the DASINC DD statement is not the IOA Conditions Synchronization file.
- The file allocated to the DASINC DD statement is the IOA Conditions Synchronization file, but it is of a different version or of a different IOA monitor.

The IOALDNRS utility terminates with a condition code of 08. The IOA Manual Conditions file is not loaded.

**Corrective Action:** Correct the JCL for the job.

LNR062E FILE ALLOCATED TO DDNAME "DANSINC" IS NOT THE IOA MANUAL CONDS SYNC FILE

**Explanation:** The data set described by the DANSINC DD statement is not the IOA Manual Conditions Synchronization file. This error message is issued by the IOALDNRS utility, which loads or creates the Manual Conditions List. Possible causes are:

- The file allocated to the DANSINC DD statement is not the IOA Manual Conditions Synchronization file.
- The file allocated to the DANSINC DD statement is the IOA Manual Conditions Synchronization file, but it is of a different version or of a different IOA monitor.

The IOALDNRS utility terminates with a condition code of 08. The IOA Manual Conditions file is not loaded.

**Corrective Action:** Correct the JCL for the job.

LNR063E NO MORE PLACE IN MANUAL CONDS FILE FOR COND cond ODATE odate

**Explanation:** The Manual Conditions file is full. This error message is issued by the IOALDNRS utility which loads or creates the Manual Conditions List. No more conditions are added to the Manual Conditions List.
Corrective Action: The IOALDNRS utility reads the complete NRS file and processes it in memory. When processing completes successfully, the records are written to the file itself. Thus, message LNR063E indicates that no more space was available in the record in memory. Even though the IOAVERFY utility may show that there is still sufficient room in the file, this is because IOAVERFY only displays the initial status of the file. Increasing the size of the NRS file resolves the problem. See the NRSREC# parameter in the IOAPARM member of the IOA PARM library for details.

LNR064E INVALID PARAMETER:- parm
Explanation: Invalid parameter for the IOALDNRS utility. This error message is issued by the IOALDNRS utility, which is used to load or create the Manual Conditions List. For more details, please refer to the IOALDNRS utility in the INCONTROL for z/OS Utilities Guide. The IOALDNRS utility terminates with a condition code of 08. The IOA Manual Conditions file is not loaded.
Corrective Action: Correct the parameter syntax (the IOALDNRS utility).

LNR065E MISSING PARAMETER AFTER:- parm
Explanation: Missing subparameter after parm. This error message is issued by the IOALDNRS utility which is used to load or create the Manual Conditions List. For more details, please refer to the IOALDNRS utility in the INCONTROL for z/OS Utilities Guide. The IOALDNRS utility terminates with a condition code of 08. The IOA Manual Conditions file is not loaded.
Corrective Action: Correct the parameter syntax (the IOALDNRS utility).

LNR066E REDUNDANT PARAMETER: - parm
Explanation: Redundant parameter for the IOALDNRS utility. This error message is issued by the IOALDNRS utility which loads or creates the Manual Conditions List. For more details, please refer to the IOALDNRS utility in the INCONTROL for z/OS Utilities Guide. The IOALDNRS utility will terminate with a condition code of 08. The IOA Manual Conditions file is not loaded.
Corrective Action: Correct the parameter syntax (the IOALDNRS utility).

LNR067W CONTROLM YES PARAMETER WILL BE IGNORED.
Explanation: The CONTROLM YES parameter has been specified, but the indication in the IOAPARM Installation Parameters is that Control-M is not installed.
Corrective Action: No action is required.

LNR069E OPEN OF ACTIVE MISSIONS FILE FAILED - DDNAME "DAAMF"
Explanation: Open of Control-D Active Missions file failed (the DAAMF DD statement). This error message is issued by the IOALDNRS utility which is used to load/create the Manual Conditions List and is due to one of the following:
The DAAMF DD statement is missing.

- Data set described by the DAAMF DD statement is not the Control-D Active Missions file.
- Data set described by the DAAMF DD statement is the Control-D Active Missions file, but of another Control-D monitor, or of a different version of Control-D.

The IOALDNRS utility terminates with a condition code of 08. The IOA Manual Conditions file is not loaded.

**Corrective Action:** Correct the JCL for the job.

LNR070E FILE ALLOCATED TO DDNAME "DAAMF" IS NOT THE EXPECTED ACTIVE MISSIONS FILE

**Explanation:** The file allocated to the DAAMF DD statement is not the Control-D Active Missions file. This error message is issued by the IOALDNRS utility which is used to load or create the Manual Conditions List and may be due to one of the following:

- The file allocated to the DAAMF DD statement is not the Control-D Active Missions file.
- The file allocated to the DAAMF DD statement is the Control-D Active Missions file, but of another Control-D monitor, or of a different version of Control-D.

The IOALDNRS utility terminates with a condition code of 08. The IOA Manual Conditions file is not loaded.

**Corrective Action:** Correct the JCL for the job.

LNR071E ACTIVE MISSIONS FILE IS FORMATTING NOW

**Explanation:** The Control-M Active Missions file is currently formatting, meaning that the Control-D New Day procedure is running. This error message is issued by the IOALDNRS utility which is used to load or create the Manual Conditions List. The IOALDNRS utility terminates with a condition code of 08. The IOA Manual Conditions file will not be loaded.

**Corrective Action:** Try again later.

LNR072E ACTIVE MISSIONS FILE IS DAMAGED - NOTIFY THE IOA ADMINISTRATOR

**Explanation:** The Active Missions file is probably damaged. The program stops executing with a condition code of 08.

**Corrective Action:** Check whether the file allocated to the DAAMF DD statement is the Control-D Active Missions file. If it is, it has been damaged - consult your IOA administrator or BMC Software Customer Support.

LNR073S OPEN DDNAME "SORTIN" FAILED

**Explanation:** Open of work file failed (the SORTIN DD statement) -- the IOALDNRS utility. This is due to one of the following:
The SORTIN DD statement is missing.
Data set described by the SORTIN DD statement cannot be opened for sequential read.
The program stops executing with a condition code of 08.

**Corrective Action:** Correct the JCL for the job.

LNR074S OPEN OF DDNAME "SORTOUT" FAILED

**Explanation:** Open of work file failed (the SORTOUT DD statement) - the IOALDNRS utility. This is due to one of the following:
- The SORTOUT DD statement is missing.
- The data set described by the SORTOUT DD statement cannot be opened for sequential read.
The program stops executing with a condition code of 08.

**Corrective Action:** Correct the JCL for the job.

**LOG messages**

This group includes messages for the Control-O product.

**Messages LOG0 through LOG0xx**

This group includes messages for the Control-O product.

LOG001I UTILITY IOALOGI STARTED

**Explanation:** This information message indicates that the IOALOGI utility has started creating an IOA Log Index file based on an existing IOA Log file.

**Corrective Action:** No action is required.

LOG002I UTILITY ENDED: num KEYS { BUILT | DELETED }

**Explanation:** This information message indicates the normal termination of the IOALOGI utility. In this message, num is the count of built or deleted keys.

**Corrective Action:** No action is required.

LOG003I INDEX FILE IS VALID

**Explanation:** This information message indicates that the current IOA Log Index file corresponds to information contained in the IOA Log file.

**Corrective Action:** No action is required.
LOG004E ERROR  errorNumber  AT LINE  lineNumber.  CURRENT STATEMENT:  stmt

Explanation:  The IOALOGI utility failed while reading the indicated input statement from the data set referenced by the SYSIN DD statement.

The variables in this message are:

- errorNumber - the error number
- lineNumber - the line number in the data set referenced by the SYSIN statement
- stmt - the statement of the incorrect line

The utility stops executing.

Corrective Action: Notify your INCONTROL administrator.

LOG005S INTERNAL ERROR WHILE PROCESSING DDNAME  ddName

Explanation: The IOALOGI utility failed while processing of the data set referenced by the ddName DD statement.

The utility stops executing.

Corrective Action: Notify your INCONTROL administrator.

LOG007S INSUFFICIENT STORAGE TO RUN UTILITY

Explanation: The IOALOGI utility requires more storage to rebuild an Index file.

The utility stops executing.

Corrective Action: Increase the REGION size, and rerun the job.

LOG008E NO INPUT PARAMETERS. PROGRAM STOPPED

Explanation: The input file for the IOALOGI utility is empty.

The utility stops executing.

Corrective Action: Fill in the input statements, and rerun the job.

LOG009S ERROR OPENING SYSPRINT

Explanation: An error was detected during an attempt to open the file referenced by the SYSPRINT DD statement.

The file referenced by the SYSPRINT DD statement is not opened.

Corrective Action: Check the system job log, and correct the problem accordingly. Rerun the job.

LOG00AS INDEX FILE IS FULL. UNABLE TO ADD A KEY.

Explanation: The IOALOGI utility was not able to add an index element to the IOA Log Index file because it was full.

The utility stops executing.
**Corrective Action:** Allocate a new index file with more space than the original, and rerun the IOALOGI utility.

**LOG00BI DELETE ENDED: num KEYS DELETED**

**Explanation:** This information message indicates that during rebuilding, the IOA Log Index file deleted num index elements.

**Corrective Action:** No action is required.

Messages LOG900 through LOG9xx

This group includes messages for the Control-O product.

**LOG951S RELEASE OF LOG FILE NOT SUPPORTED BY THIS RELEASE OF IOA.**

**Explanation:** Release of Log file is not supported by this release of IOA. This could be due to one of the following reasons:
- The release of IOA has been changed, and you are working on a file of a different release.
- Your Log file has been corrupted.

Access to the IOA Log is prevented. An “OPEN OF LOG FILE FAILED” message will appear.

**Corrective Action:** Correct the allocation of your Log file (the DALOG DD statement).

**LOG952S OPEN OF IOA LOG FILE FAILED**

**Explanation:** Open of IOA Log file failed (the DALOG DD statement). Possible causes are:
- The DALOG DD statement is missing.
- The file allocated to the DALOG DD statement is not the IOA Log file.
- The file allocated to the DALOG DD statement is the IOA Log file, but it is of a different version or of a different IOA installation.

Termination of the requested function.

**Corrective Action:** Look on the computer log or job log SYSOUT for additional messages that clarify the reason for the failure. Then, correct the JCL for the job, or the allocations of the CLIST.

**LOG954S IOA LOG FILE - WRITE ERROR**

**Explanation:** I/O error while writing to an IOA Log file. Possible causes are:
- The file allocated to the DALOG DD statement is not the IOA Log file.
- Real I/O error on the Log file.

**Corrective Action:** Check the contents of the computer log for additional messages which may clarify the situation, or logon again.
LOG957S FILE ALLOCATED TO DDNAME "ddName" IS NOT YOUR IOA LOG

Explanation: The data set described by the specified DD statement is not the IOA Log file of this IOA installation. It is an IOA Log file, but it is of a different QNAME. It belongs to another IOA installation.

Corrective Action: Correct the JCL for the job or CLIST.

LOG958S FILE ALLOCATED TO DDNAME "ddname" IS NOT AN IOA LOG

Explanation: The data set described by the specified DD statement is not an IOA Log file.

Corrective Action: Correct the JCL for the job or CLIST.

LOG959S IOA LOG FILE IS FORMATTED. IOABLG PROBABLY ABENDED

Explanation: The IOABLG program, which formats the IOA Log file, probably abended.

Corrective Action: Check the IOA Log format job output to see why the IOABLG program abended. Delete the file and recreate it using the INCONTROL Installation and Customization Engine (ICE).

LOG95AE UNABLE TO SYNCRONIZE THE LOG FILE

Explanation: Internal synchronization of the Log file failed, probably because another process in the same address space has been holding the Log file for a long time. A record might be missing in the IOA Log file.

The Log operation fails.

Corrective Action: Take a dump of the failing address space. When the dump completes, stop and restart it to release the internal lock. Have your system programmer call your IOA representative for assistance.

LOG95BS INVALID FUNCTION

Explanation: An invalid function was passed to the IOALOGXC utility.

Valid functions are:

- ACT
- DACT

The utility stops executing with a return code of 16.

Corrective Action: Correct the parameter syntax and reactivate.

LOG9A1E AT LEAST ONE TYPE MUST BE "Y"

Explanation: At least one type of record must be included in the Automation Log display, but show criteria have been used to eliminate all records from the display.

Y (Yes) must be specified for at least one record type (MSG or CMD). The user specified N (No) for both of these fields in the Show Option Window.

The Show Option Window remains displayed.

Corrective Action: Specify Y for MSG or CMD or both.
LOG9A2E AT LEAST ONE WORK TYPE MUST BE "Y"

Explanation: At least one JTYPE value must be included in the Automation Log display, but show criteria have been used to eliminate all records from the display.

Y (Yes) must be specified for at least one JTYPE (JOB, STC, or TSO). The user specified N (No) for all of these fields in the Show Option Window.

The Show Option Window remains displayed.

Corrective Action: Specify Y for at least one option (JOB, STC, or TSO).

LOG9A3E AT LEAST ONE SUPPRESS FLAG MUST BE "Y"

Explanation: At least one type of record must be included in the Automation Log display, but show criteria have been used to eliminate all records from the display.

Y (Yes) must be specified for at least one record type (SUPPRESSED or NOT SUPPRESSED). The user specified N (No) for both of these fields in the Show Option Window.

The Show Option Window remains displayed.

Corrective Action: Specify Y for SUPPRESSED and/or NOT SUPPRESSED.

LOG9A4E AT LEAST ONE HANDLE FLAG MUST BE "Y"

Explanation: At least one type of record must be included in the Automation Log display, but show criteria have been used to eliminate all records from the display.

Y (Yes) must be specified for at least one record type (HANDLED or NOT HANDLED). The user specified N (No) for both of these fields in the Show Option Window.

The Show Option Window remains displayed.

Corrective Action: Specify Y for HANDLED and/or NOT HANDLED.

LOG9A5E AT LEAST ONE ENVIRONMENT MUST BE "Y"

Explanation: Records for at least one environment must be included in the Automation Log display, but show criteria have been used to eliminate all records from the display.

Y (Yes) must be specified for at least one environment field (MVS, CICS, or IMS). The user specified N (No) for all of these fields in the Show Option Window.

The Show Option Window remains displayed.

Corrective Action: Specify Y for at least one of the environment fields (MVS, CICS, or IMS).

LOG9A6E AT LEAST ONE JES3 FLAG MUST BE "Y"

Explanation: At least one type of record must be included in the Automation Log display, but show criteria have been used to eliminate all records from the display.

If N (No) is specified for both these fields and N is specified for the CMD field, all records are eliminated from the Automation Log display. To avoid this problem the user must specify Y (Yes) for at least one field (REISSUED or NOT REISSUED). The above message is issued when the user specifies N for both fields.

The Show Option Window remains displayed.
Corrective Action: Specify Y for REISSUED and/or NOT REISSUED.

LOG9A7E AT LEAST ONE RECORD TYPE MUST BE "Y"

Explanation: At least one type of record must be included in the Automation Log display, but show criteria have been used to eliminate all records from the display.

Y (Yes) must be specified for at least one record type (LOG, SHOUT, or TRACE). The user specified N (No) for all of these fields in the Show Option Window.

The Show Option Window remains displayed.

Corrective Action: Specify Y in at least one field (LOG, SHOUT, or TRACE).

LOG9A8E LEFT/RIGHT IS NOT ALLOWED WHEN IN WRAP MODE

Explanation: The user attempted to use command LEFT or command RIGHT while in wrap mode.

In wrap mode, information that normally continues beyond the screen display appears within the screen display. The LEFT and RIGHT commands are unnecessary and are therefore disabled until return to default mode.

The LEFT/RIGHT command is ignored.

Corrective Action: If you wish to return to default mode and enable the LEFT/RIGHT commands, reenter command WRAP.

LOG9A9E INVALID LOCATE ARGUMENT

Explanation: An invalid time or an invalid time prefix was specified for command LOCATE.

The format for the time specified for command LOCATE is hhmmss. When a time value (a time prefix) is specified for command LOCATE, it is interpreted in the following manner:

- If there is an even number of digits in the specified value, the first two digits are interpreted as the hour, the second two (if they exist) are interpreted as the minutes, and the last two (if they exist) are interpreted as the seconds.
- If there is an odd number of digits in the specified value, the first digit only is interpreted as the hour, the next two digits (if they exist) as the minutes, and the last two (if they exist) are interpreted as the seconds.

Command LOCATE is ignored.

Corrective Action: Specify a valid time or time prefix for command LOCATE.

LOG9B0E INVALID LIMIT ARGUMENT

Explanation: An invalid parameter was specified for command LIMIT.

Command LIMIT is ignored.

Corrective Action: Specify valid parameters for command LIMIT.

LOG9B1W DRIVER RETURNED RC=8 - NO DATA TO DISPLAY

Explanation: The IOATLOG program received an unexpected return code.
This message indicates the presence of an internal error.
The Automation Log display is terminated.
**Corrective Action:** Contact BMC Software Customer Support.

**LOG9B3E UNABLE TO OPEN THIS DATASET**

**Explanation:** The IOATLOG program is unable to open the Automation Log file. The IOATLOG program detected an error while executing a SWAP command. The SWAP window remains displayed.

**Corrective Action:** Check and correct the name of the Automation Log file specified in the SWAP window.

**LOG9B4E INVALID TRACE ARGUMENT**

**Explanation:** An invalid parameter was specified for command TRACE. Command TRACE is ignored.

**Corrective Action:** Specify valid parameters for command TRACE.

**LOG9WRI LOG WRAP AROUND number HAS BEEN DETECTED J=jobName (jobID)**

**Explanation:** This information message indicates that the IOA Log file is full, a wraparound has been performed, and new records are being written starting at the top line of the Log.
The variables of this message are:

- `number` - number of wraparounds.
- `jobName` - name of the job or user ID that issues a message the moment the Log file is full.
- `jobID` - ID of the job that issues a message the moment the LOG file is full.

**Corrective Action:** No action is required.

**MAN messages**

This group includes messages for the IOA (infrastructure) product.

**Messages MAN800 through MAN8xx**

This group includes messages for the IOA (infrastructure) product.

**MAN850S modName BLDL FAILED FOR MODULE**

**Explanation:** BLDL for the `modName` module failed.

This is due to one of the following:
The module is not in one of the load module libraries used by the IOA Online Facility (Linklist, STEPLIB or invoked CALL library).

There is insufficient memory to load the program.

The requested module is not activated. Control is returned to the calling program. The IOA Online Facilities may abend on initialization.

**Corrective Action:** Verify whether the module appears in IOA Load library or any other concatenated load module library.

**MAN851S ONLY ONE PROGRAM CAN BE SELECTED**

**Explanation:** More than one program has been marked for selection.

Only one program may be selected at a time.

**Corrective Action:** Select one program only.

**MAN852S NO PROGRAM SELECTION**

**Explanation:** No program selection specified.

**Corrective Action:** Mark S near the program name for selection of program.

**MAN853S pgm PROGRAM ACTIVE, CANNOT BE CANCELLED**

**Explanation:** This entry is in use by a program which is currently active.

Enter the active program, and terminate its execution normally, so that the entry can be used for another program.

**Corrective Action:** Exit the program using the END command or use a new entry.

**MAN855S INVALID PARAMETER SUPPLIED TO MODULE modName - parm**

**Explanation:** An invalid input parameter (parm), was supplied to the main IOA online module (modName).

The modName module expects a series of parameters to be input, which describe the environment in which it is to be activated.

The expected parameters are:

```
APPLTYPE=type,APPLID=id,
```

where

- **type** is S (for TSO), R (for KSL), I (for ISPF) or X (for OMEGAMON)
- **id** is the user application ID

However, these parameters were missing or invalid.

The IOA online environment is not built.

**Corrective Action:** Check for errors in the CLIST which activates the IOA online interface.
MAN856S DDNAME ddName NOT ALLOCATED

Explanation: Highlighted, unrollable message.
The DD name specified in the error message was not allocated before the user entered IOA.
The IOA Online facility terminates.
Corrective Action: Allocate the specified DD name and reenter IOA.

MAN857S PRODUCT productName NOT RECOGNIZED

Explanation: Highlighted, unrollable message.
A user tried to enter IOA using a user-defined transaction member which contained a definition of a product not recognized by IOA.
The IOA Online facility stops.
Corrective Action: Correct the product definition in the transaction member and reenter IOA.

MAN858S MEMBER NAME - memName IN TRANID transMem NOT FOUND IN PARM LIBRARY

Explanation: Highlighted, unrollable message.
A user tried to enter IOA using a user-defined transaction.
In this message, transMem is a member that pointed to a PGM member name that did not exist in the parameter library referenced by the DD name DAONLPRM.
The Online facility terminates.
Corrective Action: Check that the PGM member is correctly specified in the transaction member. If it is correctly specified in this member, add it to the parameter library. Reenter IOA.

MAN859S TRANID MEMBER NOT FOUND - transMem

Explanation: The user tried to enter IOA using a user-defined transaction.
In this message, transMem is a member that does not exist in the parameter library referenced by the DAONLPRM DD name.
The IOA Online facility stops.
Corrective Action: Add the transaction member identified in the message to the parameter library and reenter IOA.

MAN85AS INVALID KEYWORD FOUND IN - transMem

Explanation: The user tried to enter IOA using a user-defined transaction.
In this message, transMem is the member that contained an invalid keyword.
The Online facility stops.
Corrective Action: Check the keywords in the transaction member and correct them accordingly. See the section on Transaction Members in the INCONTROL for z/OS Administrator Guide. Reenter the IOA Online facility.
**MAN85BS PLEASE CHECK THE TRAN ID MEMBER - transMem**

**Explanation:** An internal error occurred when a user tried to enter IOA using a user-defined transaction. The internal error occurred when the IOA Online facility tried to initiate the IOA session using the `transMem` transaction member.

The IOA Online facility stops.

**Corrective Action:** Supply BMC Software Customer Support with a printout of the `transMem` member.

**MAN85CS ERROR OCCURRED DURING ALLOCATION PROCESS. PLEASE CHECK THE ALC MEMBERS**

**Explanation:** IOA online system failed to allocate a file.

When the IOA Online facility starts up, it allocates all the files needed for the current session. At least one of these files could not be allocated.

Preceding messages detail the files that could not be allocated.

The IOA Online system stops.

**Corrective Action:** Correct the ALCxxx members according to information from the preceding messages and reenter IOA.

**MAN85DS ddName DDNAME IS ALLOCATED. PLEASE FREE IT AND TRY AGAIN**

**Explanation:** The file whose DD name is specified in the error message was already allocated to the IOA Online environment when the IOA Online facility started up.

When the IOA Online facility starts up, certain files are dynamically allocated by it to the IOA environment. In this case, the file identified in the message was already allocated to the IOA environment when IOA started up.

The Online facility terminates.

**Corrective Action:** Deallocate this DD name from the IOA environment.

**MAN85ES MODULE modName RETURNED WITH RC= rc**

**Explanation:** This is one of two messages with the same ID, but different text.

A severe error occurred in the `modName` module when the user tried to enter an IOA option. In most cases, the called program could not issue an error message.

Valid values for `rc` are:

<table>
<thead>
<tr>
<th>rc</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>There is no region below the line for the application</td>
</tr>
<tr>
<td>12</td>
<td>There is no region above the line for the application</td>
</tr>
</tbody>
</table>
### rc | Explanation
---|---
16 | A severe error occurred. The called program issued an error message. The called program abends.
The correct action is as follows, according to the return code:
- 08, 12--In case of TSO, log off and log on again. In case of IOAOMON, stop and restart IOAOMON. If this doesn't help, reduce the number of IOAOMON users by modifying the MAXSESS parameter in the IOAXPRM member.
- 16--Follow the instructions in the error message issued by the called program.
- 20--Contact BMC Software Customer Support.

#### MAN85ES MESSAGE msgId WAS NOT FOUND OR MEMBER memName DOES NOT EXIST IN THE MESSAGE LIBRARY.
**Explanation:** This is one of two messages with the same ID, but different text.
Either the `msgId` message is missing from the `memName` member, or the `msgId` message member is missing from the IOA MSG library.
**Corrective Action:** No action is required.

#### MAN85FS MAXIMUM NUMBER OF IOA SESSIONS REACHED
**Explanation:** TSO user tried to activate a fifth IOA session in his TSO address space.
In the TSO environment, the user can activate IOA sessions by executing the IOATSO or IOAISPF CLISTs. IOA allows a maximum of 4 sessions to be activated. If the user tries to activate a fifth session, this error message is generated.
The fifth session is not established.
**Corrective Action:** Terminate one of the previous sessions in order to initiate a new session.

#### MAN85GS USER PROFILE MEMBER CANNOT BE ACCESSED
**Explanation:** IOA could not access the user profile member during IOA online initialization.
The IOA online session terminates.
**Corrective Action:** Call your INCONTROL administrator.
MAN85HS UNABLE TO LOCATE MESSAGE msgId, CALL TECHNICAL SUPPORT FOR HELP

Explanation: The msgId message is missing from the IOA MSG library.
Corrective Action: No action is required.

MAN85HS THE MESSAGE PROCESSING FACILITY WAS NOT INITIALIZED PROPERLY

Explanation: The message processing facility was not initialized properly. It is therefore impossible to issue any messages.
The IOA session is ended.
Corrective Action: No action is required.

MAN85HS UNABLE TO OBTAIN ENQ FOR THE MESSAGES or UNABLE TO OBTAIN LOCK FOR THE MESSAGES

Explanation: The message processing facility encountered a problem while trying to obtain an exclusive lock in order to issue a message.
The IOA session is ended.
Corrective Action: No action is required.

MAN85HS OPEN FAILED FOR MESSAGE LIBRARY

Explanation: The message processing facility is unable to open the IOA MSG library.
The IOA session is ended.
Corrective Action: No action is required.

MAN85HS TOO MANY MESSAGE MEMBERS WERE LOADED

Explanation: The message processing facility is unable to process any more messages because of a storage shortage.
The IOA session is ended.
Corrective Action: No action is required.

MAN85HS UNABLE TO OBTAIN STORAGE FOR MESSAGE

Explanation: The message processing facility is unable to process any more messages because of a storage shortage.
The IOA session is ended.
Corrective Action: No action is required.
MAN85I S GLOBAL PROFILE VARIABLES ($PROFILE) COULD NOT BE ACCESSED

**Explanation:** An attempt to access the $PROFILE member in the IOAENV library failed.
The most common cause is that the member is held by another user or program.  
The IOA Online facility is not entered.

**Corrective Action:** Determine which user or program is holding the member, and try to obtain its release.

MAN85J S TRANID MEMBER *memName* CONTAINS IRRELEVANT OPTIONS

**Explanation:** An irrelevant option was specified in the *memName* transaction member.  
The IOA online session terminates.

**Corrective Action:** Change the *memName* transaction member and log on again to the IOA online session.

MAN85KE AN ERROR OCCURRED WHILE THE PROFILE MEMBER WAS BEING UPDATED

**Explanation:** IOA was unable to write the user profile member.  
The write process is ignored.

**Corrective Action:** Check whether or not there is enough space in the profile library.

MCI messages

This group includes messages for the IOA (infrastructure) product.

Messages MCI A00 through MCI Axx

This group includes messages for the IOA (infrastructure) product.

MCI A20E PROGRAM CTMCIOC DISABLED OR NOT DEFINED IN CI CS

**Explanation:** The CTMICUS program failed to link to the CTMCIOC program because the program was disabled or was not defined in the CICS tables.
The CTMICUS program scans the open/close status of CICS files defined for Control-M, and updates any changed status in the IOA Conditions file.  Updating is accomplished by means of a link to the CTMCIOC program.  
The CTMICUS program stops executing.

**Corrective Action:** Check that the CTMCIOC program is enabled, and that it is correctly defined in the CICS PPT. For more information, please refer to the installation instructions in the IOA CI CSSAMP library.
MCIA21E CTMCIUS PROCESSING ERROR: EIBFN= func EIBRCODE= err ABEND= abCode

**Explanation:** The CTMCIUS program failed due to an internal error.

The CTMCIUS program scans the open/close status of CICS files defined for Control-M, and updates any changed status in the IOA Conditions file.

Where the error occurred as a result of an EXEC CICS command, func indicates the function code, and err indicates the error code.

In the case of a program check, abCode indicates the CICS abend code.

The CTMCIUS program stops executing and a CICS transaction dump is produced.

**Corrective Action:** Check the dump and any relevant messages in the system log. If the problem is related to CICS customization, or to storage violations as a result of user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

MCIA22E I/O ERROR ON TEMPORARY STORAGE FILE

**Explanation:** An I/O error occurred while attempting to read the CICS Temporary Storage file.

This error message is issued by the CTMCIUS program, which scans the open/close status of CICS files defined for Control-M, and updates any changed status in the IOA Conditions file. Possible causes are:

- Invalid record size.
- CICS customization error.
- File corruption.

The CTMCIUS program stops executing.

**Corrective Action:** Check the status of the Temporary Storage file and if possible, correct the problem. If the error persists, contact BMC Software Customer Support.

MCIA23E TRANSACTION transid NOT DEFINED IN CICS

**Explanation:** The CTMCIUS program failed to start the transid transaction because the transaction was disabled or was not defined in the CICS tables.

The transid transaction invokes the CTMCIUS program, which scans the open/close status of CICS files defined for Control-M, and updates any changed status in the IOA Conditions file. If the program ends due to an error, it issues a start command to restart itself after a given time interval. This error message is issued if the start is unsuccessful.

The CTMCIUS program stops executing.

**Corrective Action:** Check that transaction transid is enabled, and that it is correctly defined in the CICS PPT. For more information, please refer to the installation instructions in the IOA CICSSAMP library.

MCIA24I CONTROL-M FILE STATUS SCANNING STARTED

**Explanation:** This information message is a normal start message of the CTMCIUS program. CTMCIUS scans the status of CICS files defined for Control-M, and updates any changed status in the IOA Conditions file.
The CTMCIUS program scans the open/close status of CICS files for which conditions have been defined in the Control-M file table CTMCITB. The program updates the open/close status for files whose status was changed outside the IOA/CICS Interface.

**Corrective Action:** No action is required.

**MCIA25I CONTROL-M FILE STATUS SCANNING ENDED**

**Explanation:** This information message is a normal end message of the CTMCIUS program. CTMCIUS scans the status of CICS files defined for Control-M, and updates any changed status in the IOA Conditions file.

The CTMCIUS program usually stops executing as a result of transaction CTMP issuing a shut request. However, this message is also issued when the program stops executing as a result of an error.

If the program stopped executing due to an error, an attempt will be made to restart it automatically after a set time interval.

**Corrective Action:** No action is required.

**MCIA27E CTMCISP PROCESSING ERROR: EIBFN= func EIBRCODE= err ABEND= abCode**

**Explanation:** The CTMCISP program failed due to an internal error.

The CTMCISP program is invoked by transaction CTMP to terminate the file status scanning the CTMCIUS program.

Where the error occurred as a result of an EXEC CICS command, func indicates the function code, and err indicates the error code.

In the case of a program check, abCode indicates the CICS abend code.

A CICS transaction dump is produced.

**Corrective Action:** Check the dump and any relevant messages in the system log. If the problem is related to CICS customization, or to storage violations as a result of user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

**MCIA28E I/O ERROR ON TEMPORARY STORAGE FILE**

**Explanation:** An I/O error occurred while attempting to write to the CICS Temporary Storage file.

This error message is issued by the CTMCISP program, which is invoked by the CTMP transaction to terminate the CTMCIUS file status scanning program.

The error may be due to one of the following:

- Invalid record size.
- CICS customization error.
- File corruption.

The CTMCISP program stops executing.

**Corrective Action:** Check the status of the Temporary Storage file and if possible, correct the problem. If the error persists, contact BMC Software Customer Support.
**MCIA29E NO SPACE ON TEMPORARY STORAGE FILE**

**Explanation:** A NOSPACE condition was detected while attempting to write to the CICS Temporary Storage file.

This error message is issued by the CTMCISP program, which is invoked by CTMP transaction to terminate the CTMCIUS file status scanning program.

The CTMCISP program stops executing.

**Corrective Action:** Delete unnecessary records from the Temporary Storage file or increase the file size.

**MCIA30I FILE SCANNING SHUT REQUEST HAS BEEN ISSUED**

**Explanation:** This information message indicates that transaction CTMP, which requests termination of file scanning the CTMCIUS program, has been entered.

The CTMCIUS program will detect the shut request and will stop executing.

**Corrective Action:** No action is required.

**MCIA31E TRANSACTION transid NOT DEFINED IN CICS**

**Explanation:** The CTMCIUP program could not start the transid transaction because the transaction is not defined in the CICS tables.

The CTMCIUP program starts the transid transaction (the CTMCIST program) in order to add a CICS-UP condition to the IOA Conditions file.

The CTMCIUP program stops executing, and the CICS-UP condition is not added.

**Corrective Action:** Check that the transid transaction is enabled, and that it is correctly defined in the CICS PPT. For more information, please refer to the installation instructions in the IOA CICSSAMP library.

**MCIA32E SECURITY CHECK FAILED FOR TRANSACTION START transid**

**Explanation:** The CTMCIUP program could not start the transid transaction because the necessary security authorization was not available.

The CTMCIUP program starts the transid transaction (the CTMCIST program) in order to add a CICS-UP condition to the IOA Conditions file.

The CTMCIUP program stops executing and the CICS-UP condition is not added.

**Corrective Action:** Contact your CICS system programmer to define the correct security level in the CICS PCT entry of the started transaction, using the RSL parameter.

**MCIA33E CTMCIUP PROCESSING ERROR: EIBFN= func EIBRCODE= rc ABEND= abCode**

**Explanation:** The CTMCIUP program failed due to an internal error.

The CTMCIUP program starts the transid transaction (the CTMCIST program) in order to add a CICS-UP condition to the IOA Conditions file.

Where the error occurred as a result of an EXEC CICS command, func indicates the function code, and rc indicates the error code.
In the case of a program check, \textit{abCode} indicates the CICS abend code.

A CICS transaction dump is produced.

**Corrective Action:** Check the dump and any relevant messages in the system log. If the problem is related to CICS customization, or to storage violations as a result of user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

**MCIA34E PROGRAM CTMCIOC DISABLED OR NOT DEFINED IN CICS**

**Explanation:** The CTMCISS program, which is invoked at CICS startup, failed to link to the CTMCIOC program because the program was disabled or was not defined in the CICS tables.

The CTMCISS program builds the Temporary Storage Queue, which consists of Control-M files defined in the CTMCITB module. It does so by linking to the CTMCIOC program with an initialization request.

The CTMCISS program stops executing and the Temporary Storage Queue is not built.

**Corrective Action:** Check that the CTMCIOC program is enabled, and that it is correctly defined in the CICS PPT. For more information, please refer to the installation instructions in the IOA CICSSAMP library.

**MCIA35E CTMCISS PROCESSING ERROR: EIBFN= func EIBRCODE= err ABEND= abCode**

**Explanation:** The CTMCISS program, which is invoked at CICS startup, failed due to an internal error.

Where the error occurred as a result of an EXEC CICS command, \textit{func} indicates the function code, and \textit{err} indicates the error code.

In the case of a program check, \textit{abCode} indicates the CICS abend code.

The CTMCISS program stops executing.

**Corrective Action:** Check the system log for any relevant messages. If the problem is related to CICS customization, or to storage violations as a result of user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

**MCIA36E I/O ERROR ON TEMPORARY STORAGE FILE**

**Explanation:** An I/O error occurred while attempting to read the CICS Temporary Storage file.

This error message is issued by the CTMCISS program, which reads the Temporary Storage file in order to obtain the list of CICS files defined for Control-M in the CTMCITB table. The error may be due to one of the following:

- invalid record size.
- CICS customization error.
- file corruption.

The CTMCISS program stops executing.

**Corrective Action:** Check the status of the Temporary Storage file and if possible, correct the problem. If the error persists, contact BMC Software Customer Support.
MCIA37E TRANSACTION *transid* NOT DEFINED IN CICS

**Explanation:** The CTMCISS program failed to start transaction *transid* because the transaction was not defined in the CICS tables.

Transaction *transid* invokes CICS file scanning the CTMCIUS program. The CTMCISS program stops executing.

**Corrective Action:** Check that transaction *transid* is enabled, and that it is correctly defined in the CICS PPT. For more information, please refer to the installation instructions in the IOA CICSSAMP library.

MCIA38I CONTROL-M PLT FILE STATUS SCANNING STARTED

**Explanation:** This information message is a normal start message of the CTMCISS program. CTMCISS scans files defined in table CTMCITB to determine if the open/close status of the files has been altered.

**Corrective Action:** No action is required.

MCIA39I CONTROL-M PLT FILE STATUS SCANNING ENDED

**Explanation:** This information message is a normal end message of the CTMCISS program. The CTMCISS program initialized the Temporary Storage Queue and issued a start command to transaction CTM2, which will invoke the CTMCIUS program after termination of the scanning interval.

**Corrective Action:** No action is required.

Messages MCID00 through MCIDxx

This group includes messages for the IOA (infrastructure) product.

MCID01I CTMAJO SUCCESSFUL COMPLETION

**Explanation:** This information message notifies that the CTMAJO program, which is invoked by the CTMCIJO program, successfully placed a job order in the Active Jobs file.

**Corrective Action:** No action is required.

MCID02E INVALID OR NO COMMAREA SUPPLIED TO CTMCIJO ROUTINE

**Explanation:** Either no COMMAREA was supplied to job order submission the CTMCIJO program, or the length of the COMMAREA supplied was less than that expected by the program.

The COMMAREA must be defined according to DSECT CTMCIAJO, or COPY the CTMCICJO member. The CTMCIJO program stops executing with a condition code of 04.

**Corrective Action:** Check that the length of the COMMAREA is not less than the length of DSECT CTMCIAJO or COPY the CTMCICJO member. Contact your CICS system programmer for assistance if necessary.

MCID03E CTMCIJO PROCESSING ERROR: EIBFN= *func* EIBRCODE= *err* ABEND= *abCode*

**Explanation:** The CTMCIJO job order submission program, failed due to an internal error.
Where the error occurred as a result of an EXEC CICS command, `func` indicates the function code, and `err` indicates the error code.

In the case of a program check, `abCode` indicates the CICS abend code.

A CICS transaction dump is produced and the program stops executing with a condition code of 52.

**Corrective Action:** Check the dump and any relevant messages in the system log. If the problem is related to CICS customization, or to storage violations as a result of user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

**MCID04E STORAGE NOT AVAILABLE TO PROCESS REQUEST**

**Explanation:** Insufficient storage was available in CICS to process the user request.

This error message is issued by the CTMCIJO job order submission program, which requires CICS storage to build parameters for the CTMAJO program, which places the job on the Active Jobs file.

The CTMCIJO program stops executing with a condition code of 08.

**Corrective Action:** Retry the transaction, and if the error persists, contact your CICS system programmer.

**MCID05E KEYWORD PARAMETER MISSING: `keyName`**

**Explanation:** Missing `//*CONTROLM JCL` statement with keyword `keyName` in the input parameter list passed to the CTMCIJO job order submission program.

The input parameter list must contain two `//*CONTROLM` statements, with keywords TABLE and JCL respectively. For details, refer to the section on the Control-M Quick Submit Command in the Control-M for z/OS User Guide.

The CTMCIJO program stops executing with a condition code of 12.

**Corrective Action:** Correct the input and re-invoke the CTMCIJO program. Contact your CICS system programmer for assistance if necessary.

**MCID06E INVALID KEYWORD FOUND: `keyName`**

**Explanation:** Invalid keyword `keyName`, found in a `//*CONTROLM JCL` statement in the input parameter list passed to the CTMCIJO job order submission program.

The only valid keywords for `//*CONTROLM` statements are TABLE and JCL, and a statement with each must be included in the input parameter list. For more details see the Control-M Quick Submit Command in the Control-M for z/OS User Guide.

The CTMCIJO program stops executing with a condition code of 16.

**Corrective Action:** Correct the input and re-invoke the CTMCIJO program. Contact your CICS system programmer for assistance if necessary.

**MCID07E KEYWORD TABLE ERROR FOUND**

**Explanation:** The CTMCIJO job order submission program failed due to an internal error while scanning the JCL statements specified in the input parameter list.

The CTMCIJO program stops executing with a condition code of 60.
Corrective Action: Save the CICS job log and have your INCONTROL administrator contact BMC Software Customer Support.

MCID08E VALUE MISSING FOR parm

Explanation: No value was specified for the parm parameter in a //CONTROLM JCL statement in the input parameter list that was passed to the CTMCIJO job order submission program.

The //CONTROLM statement contained a valid keyword (TABLE or JCL), but it was not followed by the expected data. For details, refer to the Control-M Quick Submit Command in the Control-M for z/OS User Guide.

The CTMCIJO program stops executing with a condition code of 20.

Corrective Action: Correct the input and re-invoke the CTMCIJO program. Contact your CICS system programmer for assistance if necessary.

MCID09E INVALID VALUE FOUND: val

Explanation: An invalid value val was specified for a parameter in a //CONTROLM JCL statement in the input parameter list passed to the CTMCIJO job order submission program.

The //CONTROLM statement contains a valid keyword (TABLE or JCL), but the data following it is invalid for that keyword. For more information, see the Control-M for z/OS User Guide.

The CTMCIJO program stops executing with a condition code of 24.

Corrective Action: Correct the input and re-invoke the CTMCIJO program. Contact your CICS system programmer for assistance if necessary.

MCID10E NUMBER OF JCL STATEMENTS NOT SPECIFIED

Explanation: The COMMAREA passed to the CTMCIJO job order submission program did not indicate the number of JCL statements included in the input parameter list.

The number of JCL statements must be indicated in the fixed part of the COMMAREA passed to the CTMCIJO program.

The CTMCIJO program stops executing with a condition code of 28.

Corrective Action: Contact your CICS system programmer for assistance.

MCID11E TABLE LIBRARY NOT SPECIFIED

Explanation: No scheduling table library was specified in a //CONTROLM JCL statement in the input parameter list passed to the CTMCIJO job order submission program.

The job order request cannot be processed unless keyword TABLE is followed by a valid scheduling library name. For more details please refer to the Control-M for z/OS User Guide.

The CTMCIJO program stops executing with a condition code of 32.

Corrective Action: Correct the input and re-invoke the CTMCIJO program. Contact your CICS system programmer for assistance if necessary.
MCID12E JCL LIBRARY NOT SPECIFIED

**Explanation:** No JCL library was specified in the //**CONTROLM** JCL statement in the input parameter list passed to the CTMCIJO job order submission program.

Keyword JCL must be followed by a valid JCL library name in order for the JCL defined in the COMMAREA to be saved for subsequent processing by Control-M.

The CTMCIJO program stops executing with a condition code of 36.

**Corrective Action:** Correct the input and re-invoke the CTMCIJO program. Contact your CICS system programmer for assistance if necessary.

MCID13E TABLE LIBRARY MEMBER NOT SPECIFIED

**Explanation:** No scheduling table library member was specified in a //**CONTROLM** JCL statement in the input parameter list passed to the CTMCIJO job order submission program.

The job order request cannot be processed unless the MEMBER keyword is followed by a valid scheduling library member name. For more details please refer to the Control-M for z/OS User Guide.

The CTMCIJO program stops executing with a condition code of 40.

**Corrective Action:** Correct the input and re-invoke the CTMCIJO program. Contact your CICS system programmer for assistance if necessary.

MCID14E INVALID DATA FOUND IN AUTOEDIT PARAMETERS

**Explanation:** Invalid data was found in the AutoEdit parameter string passed to the CTMCIJO job order submission program.

The error may be due to one of the following:

- An AutoEdit variable is not preceded by %%
- The statements are not separated by commas.
- The number of AutoEdit parameters specified in the COMMAREA header does not match the number of AutoEdit statements in the parameter string.

The CTMCIJO program stops executing with a condition code of 44.

**Corrective Action:** Correct the input and re-invoke the CTMCIJO program. Contact your CICS system programmer for assistance if necessary.

MCID15E ERROR IN CTMAJO ATTACH. RC= rc

**Explanation:** Execution of a MVS ATTACH macro ended with return code rc.

This error message is issued by the CTMCIJO job order submission program, which processes job order requests by passing parameters to the CTMAJO program by means of an MVS ATTACH macro.

The subtask for executing CTMAJO is not created and the CTMCIJO program stops executing with a condition code of 48.

**Corrective Action:** Refer to the relevant IBM manual for an explanation of the return code. If the problem cannot be resolved, contact BMC Software Customer Support.
MCID16E ERROR IN CTMAJO PROCESSING. RC= rc

Explanation: The CTMCJ O job order submission program invoked the CTMAJO program to process the job order specified by the input parameter list. Processing of the request ended with return code rc. The CTMCJ O program stops executing with a condition code of 52.

Corrective Action: For an explanation of the return code returned by the CTMAJO program, refer to the ROSORDER sample program in the IOA SAMPLE library. If the problem cannot be resolved, contact BMC Software Customer Support.

MCID17E ROUTINE CTMAJO ABENDED abCode

Explanation: The CTMCJ O job order submission program invoked the CTMAJO program to process the job order specified by the input parameter list. The CTMAJO program abended with code abCode. The CTMCJ O program stops executing with a condition code of 56.

Corrective Action: For an explanation of the abend code, refer to the relevant IBM manual. If the problem cannot be resolved, contact BMC Software Customer Support.

Messages MCIF00 through MCIFxx

This group includes messages for the IOA (infrastructure) product.

MCIF01E COMMAREA LENGTH INVALID

Explanation: The length of the CICS COMMAREA supplied to the CTMCICN prerequisite condition processing program was less than that expected by the program. The parameter list is passed to the program by means of a CICS COMMAREA which must be defined according to DSECT CTMCIACN or COPY the CTMCICCN member. The CTMCICN program stops executing.

Corrective Action: If the program which links to CTMCICN is user-written, check that the length of the COMMAREA specified in the LINKD statement is not less than the length of DSECT CTMCIACN or COPY the CTMCICCN member. Contact your CICS system programmer for assistance if necessary. If the program linking to CTMCICN is part of the IOA/CICS Interface and has not been altered, have your INCONTROL administrator contact BMC Software Customer Support.

MCIF02E CONDITION ALREADY FOUND OR MISSING

Explanation: The condition specified in an ADD request already exists in the IOA Conditions file, or the condition specified in a DELETE or CHECK request could not be found. This message is issued by prerequisite processing the CTMCICN program. The CTMCICN program stops executing.

Corrective Action: No action is required.
MCIF03E ONE OR MORE PARAMETERS PASSED TO PROGRAM "CTMCICN" ARE INVALID

Explanation: An invalid parameter was passed to the CTMCICN prerequisite condition processing program.

The CTMCICN program stops executing.

Corrective Action: If the program which links to CTMCICN is user-written, check that the parameters passed to the program conform to DSECT CTMCIACN or COPY the CTMCICCN member. If the program linking to CTMCICN is part of the IOA/CICS Interface and has not been altered, have your INCONTROL administrator contact BMC Software Customer Support.

MCIF04E ROUTINE routineName ABENDED abCode

Explanation: An internal error occurred in routine routineName, and processing abends with code abCode.

This error message is issued by prerequisite condition processing the CTMCICN program, which accesses the IOA Conditions files by means of subtask IOACND.

The CTMCICN program stops executing.

Corrective Action: Have your INCONTROL administrator inform BMC Software Customer Support of the abend code.

MCIF05E ERROR IN IOACND ATTACH. RC= rc

Explanation: Execution of an MVS ATTACH macro ended with return code rc.

This error message is issued by prerequisite condition processing the CTMCICN program, which accesses the IOA Conditions files by means of an ATTACH to subtask IOACND.

The CTMCICN program stops executing.

Corrective Action: Refer to the relevant IBM manual for an explanation of the return code. If the problem cannot be resolved, contact BMC Software Customer Support.

MCIF06I "func" SUCCESSFUL. CONDITION: cond

Explanation: This information message is issued by prerequisite condition processing the CTMCICN program, and indicates that function func was successfully executed for prerequisite condition cond.

Corrective Action: No action is required.

MCIF11E PROGRAM CTMCICN NOT DEFINED IN CICS

Explanation: The CTMCIST program failed to link to the CTMCICN program because the program was disabled, or was not defined in the CICS tables.

The CTMCIST program attempted to link to the CTMCICN program in order to set a CICS-UP or CICS-DOWN condition in the IOA Conditions file.

The CICS-UP or CICS-DOWN condition is not added to the IOA Conditions file.
Corrective Action: Check that the CTMCICN program is enabled, and that it is correctly defined in the CICS tables. For more information, please refer to the installation instructions in the IOA CI CSSAMP library.

MCI F12E NO INPUT PARAMETER RECEIVED

Explanation: The CTMCIST program did not receive an UP or DOWN input parameter. The CTMCIST program is invoked by means of a START command from CTMCIUP or CTMCIDN during CICS startup and shutdown respectively. Include the UP or DOWN parameter with the START command, to indicate whether to add CICS-UP or a CICS-DOWN condition to the IOA Conditions file. The CTMCIST program stops executing.

Corrective Action: Supply the correct parameter with the START command. Contact your CICS system programmer for assistance if necessary.

MCI F13I CICS STATUS SET SUCCESSFULLY

Explanation: This information message indicates that a CICS-UP or CICS-DOWN condition was successfully added to the IOA Conditions file. This message is issued when the CTMCIST program is invoked by means of a START command from CTMCIUP or CTMCIDN.

Corrective Action: No action is required.

MCI F14E CTMCIST PROCESSING ERROR: EIBFN= func EIBRCODE= err ABEND= abCode

Explanation: The CTMCIST program, which sets CICS-UP and CICS-DOWN conditions in the IOA Conditions file, failed due to an internal error. Where the error occurred as a result of an EXEC CICS command, func indicates the function code, and err indicates the error code. In the case of a program check, abCode indicates the CICS abend code. The program stops executing, and a CICS transaction dump is produced.

Corrective Action: Check the dump and any relevant messages in the system log. If the problem is related to CICS customization, or to storage violations as a result of user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

MCI F21E INVALID OR NO COMMAREA SUPPLIED TO CTMCIOC ROUTINE

Explanation: The length of the CICS COMMAREA supplied to the CTMCIOC program was less than that expected by the program. The CTMCIOC program is called to open or close Control-M files defined in table CTMCITB. Parameters are passed to the program by means of a CICS COMMAREA which must be defined according to DSECT CTMCIIOC, or COPY the CTMCIOC member. The CTMCIOC program stops executing with a condition code of 04.
Corrective Action: If the program which links to CTMCIOC is user-written, check that the length of the COMMAREA specified in the LINK statement is not less than the length of DSECT CTMCIOAC or COPY the CTMCIOAC member. Contact your CICS system programmer for assistance if necessary.

If the program linking to CTMCIOC is part of the IOA/CICS Interface and has not been altered, have your INCONTROL administrator contact BMC Software Customer Support.

MCIF22E FUNCTION NOT SPECIFIED OR INVALID

Explanation: The parameter list passed to the CTMCIOC program contained either no function or an invalid function.

The CTMCIOC program is called to open or close Control-M files defined in table CTMCITB. Valid functions are O (open) and C (close).

The CTMCIOC program stops executing with a condition code of 08.

Corrective Action: Supply a valid function.

MCIF23E GROUP NOT SPECIFIED OR NOT FOUND ON FILE

Explanation: The parameter list passed to the CTMCIOC program contained either no group, or a group which could not be found on the Temporary Storage Queue of Control-M files.

This error message is issued by the CTMCIOC program, which is called to open or close Control-M files defined in table CTMCITB.

The CTMCIOC program stops executing with a condition code of 12.

Corrective Action: Supply a valid value for the GROUP parameter.

MCIF24E DATASET NOT SPECIFIED OR NOT FOUND ON FILE

Explanation: The parameter list passed to the CTMCIOC program contained either no data set name, or a data set name which could not be found on the Temporary Storage Queue of Control-M files.

This error message is issued by the CTMCIOC program, which is called to open or close Control-M files defined in table CTMCITB.

The CTMCIOC program stops executing with a condition code of 16.

Corrective Action: Supply a valid value for the DSN parameter.

MCIF25E DDNAME NOT SPECIFIED OR NOT FOUND ON FILE

Explanation: The parameter list passed to the CTMCIOC program contained either no DD name, or a DD name which could not be found on the Temporary Storage Queue of Control-M files.

This error message is issued by the CTMCIOC program, which is called to open or close Control-M files defined in table CTMCITB.

The CTMCIOC program stops executing with a condition code of 20.

Corrective Action: Supply a valid value for the DD parameter.

MCIF26E STORAGE NOT AVAILABLE TO PROCESS REQUEST

Explanation: Insufficient CICS DSA storage was available to process the user request.
This message is issued by the CTMCIOC program, which is called to open or close Control-M files defined in table CTMCITB. The program failed during a CICS GETMAIN command.

The CTMCIOC program stops executing with a condition code of 08.

**Corrective Action:** Retry the transaction, and if the error persists, contact your CICS system programmer.

**MCIF27I** DDNAME= ddName ALLOCATED TO CICS cics_version DSNAME= dsn

**Explanation:** This information message is issued by the CTMCIOC program, and indicates that a Control-M file defined in table CTMCITB was successfully allocated to CICS as a result of a request to open it.

**Corrective Action:** No action is required.

**MCIF28I** DDNAME= ddName DEALLOCATED FROM CICS cics DSNAME= dsn

**Explanation:** This information message is issued by the CTMCIOC program, and indicates that a Control-M file defined in table CTMCITB was successfully deallocated from CICS as a result of a request to close it.

**Corrective Action:** No action is required.

**MCIF29I** DDNAME= ddName OPEN SUCCESSFUL

**Explanation:** This information message is issued by the CTMCIOC program, and indicates that a request to open a Control-M file defined in table CTMCITB was successfully performed.

**Corrective Action:** No action is required.

**MCIF30I** DDNAME= ddName CLOSE SUCCESSFUL

**Explanation:** This information message is issued by the CTMCIOC program, and indicates that a request to close a Control-M file defined in table CTMCITB was successfully performed.

**Corrective Action:** No action is required.

**MCIF31E** DDNAME= ddName ERROR= rc rsn info_code msg

**Explanation:** The CTMCIOC program was called to open or close Control-M files defined in the CTMCITB table. However, an error occurred during file allocation or deallocation processing.

The variables in this message are:
- **rc** - the return code produced by the dynamic allocation routine
- **rsn** - the reason code produced by the dynamic allocation routine
- **info_code** - the information code produced by the dynamic allocation routine
- **msg** - the meaning of the return codes

For further explanation of the return codes, see the IBM manual *MVS Programming: Authorized Assembler Services Guide*.

The CTMCIOC program stops executing with a condition code of 28.

**Corrective Action:** Contact your CICS system programmer for assistance if necessary.

**MCI F32E DDNAME= ddName NOT DEFINED IN FCT**

**Explanation:** The CTMCIOC program was called to open or close Control-M files defined in the CTMCITB table, but the DD name specified in the Control-M files table is not defined in the FCT of the specific CICS. The DD name is ignored and processing either continues with the next member of the group (if group processing was specified), or the program stops executing.

**Corrective Action:** No action is required.

**MCI F33E DDNAME= ddName AUTHORIZATION REQUIRED TO PROCESS REQUEST**

**Explanation:** The CTMCIOC program was called to open or close Control-M files defined in table CTMCITB. However, the file referenced by the *ddName* DD statement could not be opened because the necessary security authorization was not available.

The CTMCIOC program stops executing with a condition code of 40.

**Corrective Action:** Contact your CICS system programmer to define the correct security level for the transaction, both for the SET command to perform file open/close, and for access to the specific data set.

**MCI F34E DDNAME= ddName I/O ERROR IN ACCESSING DATASET**

**Explanation:** The CTMCIOC program was called to open or close Control-M files defined in table CTMCITB, but the open/close failed for a VSAM file.

The CTMCIOC program stops executing with a condition code of 44.

**Corrective Action:** Check that the data set is properly defined and that the definition conforms to the FCT definition for the data set.

**MCI F35E PROGRAM "pgm" DISABLED OR NOT DEFINED IN CICS**

**Explanation:** The CTMCIOC program was called to open or close Control-M files defined in table CTMCITB. However, its attempt to link or load program *pgm* failed.

The CTMCIOC program stops executing with a condition code of 52.

**Corrective Action:** Check that all programs for the IOA/CICS Interface are enabled and correctly defined in the CICS PPT/PCT. For more information, please refer to the installation instructions in the IOA CICSSAMP library.
MCIF36E DDNAME= ddName UNABLE TO CLOSE DATASET

**Explanation:** The file referenced by the DD name identified in the message could not be closed.

The CTMCIOC program was called to close Control-M files defined in table CTMCITB. The program made the maximum number of attempts permissible to close the data set, but was unsuccessful. The maximum number of close attempts is set in installation modifiable variable &TRYLIM, in the CTMICGLC member, and has a default value of three.

The CTMCIOC program stops executing with a condition code of 48.

**Corrective Action:** Check that all transactions holding the file have terminated and then re-enter the CLOSE request. If necessary, have your CICS system programmer increase the value of variable &RTRYLIM.

MCIF37E CTMCIOC PROCESSING ERROR: EIBFN= func EIBRCODE= error ABEND= abend

**Explanation:** The CTMCIOC program failed due to an internal error.

Where the error occurred as a result of an EXEC CICS command, func indicates the function code, and error indicates the error code.

In the case of a program check, abend indicates the CICS abend code.

The program stops executing with a condition code of 64 and a CICS transaction dump is produced.

**Corrective Action:** Check the dump and any relevant messages in the system log. If the problem is related to CICS customization, or to storage violations as a result of user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

MCIF38E I/O ERROR ON TEMPORARY STORAGE FILE

**Explanation:** An I/O error occurred while attempting to access records in the CICS Temporary Storage file.

This error message is issued by the CTMCIOC program, which was called to open or close Control-M files defined in table CTMCITB.

The error may be due to one of the following:

- invalid record size
- CICS customization error
- file corruption

The CTMCIOC program stops executing with a condition code of 60.

**Corrective Action:** Check the status of the Temporary Storage file and if possible correct the problem. If the error persists, contact BMC Software Customer Support.

MCIF39E NO SPACE ON TEMPORARY STORAGE FILE

**Explanation:** A NOSPACE condition was detected while attempting to write or update records on the Temporary Storage file.
INCONTROL for z/OS Messages Manual

This error message is issued by the CTMCIOC program, which was called to open or close Control-M files defined in table CTMCITB.
The CTMCIOC program stops executing with a condition code of 56.
**Corrective Action:** Delete unnecessary records from the Temporary Storage file or increase the file size.

**MCIF40I num1 OF num2 FILES PROCESSED SUCCESSFULLY**

**Explanation:** This information message is issued by the CTMCIOC program, which is invoked to open or close Control-M files defined in table CTMCITB, and indicates that number1 files were processed successfully from a group containing number2 files.
This summary message is issued following processing of a file group, and follows messages MCIF29I or MCIF30I which are issued to indicate the successful processing of the individual files.
**Corrective Action:** No action is required.

**MCIF41I TEMPORARY STORAGE FILE SUCCESSFULLY INITIALIZED**

**Explanation:** This information message indicates that the CTMCIOC program has successfully built the Temporary Storage Queue containing the Control-M files defined in table CTMCITB.
**Corrective Action:** No action is required.

**MCIF42E ERROR INVOKING DYNAMIC ALLOCATION SUBTASK. INLINE SVC WILL BE USED**

**Explanation:** An error occurred during an ATTACH of a dynamic allocation subtask.
This error message is issued by the CTMCIOC program, which is called to open or close Control-M files defined in table CTMCITB.
The dynamic allocation SVC will be invoked from the CTMCIOC mainline program.
**Corrective Action:** Check the CICS job log for any additional messages. Verify that OSCORE is sufficiently large for the IOACND program. For details of the CICS OSCORE requirements for the product, please refer to the installation instructions in the IOA CICSSAMP library. Contact your CICS system programmer for assistance if necessary.

**MCIF43E DDNAME= ddName ALLOCATED DSNAME DOES NOT MATCH TABLE SPECIFICATION**

**Explanation:** The CTMCIOC program was called to open a Control-M file defined in table CTMCITB. However, the data set name specified in table CTMCITB for the identified DD name did not match the data set name currently allocated in CICS for this DD name.
The CTMCIOC program stops executing with a condition code of 68.
**Corrective Action:** Correct the data set name in table CTMCITB so that it matches the data set name currently allocated to the DD name in CICS.
MCIF44E DDNAME= ddName DISPOSITION CANNOT BE ALTERED FOR AN OPEN FILE

Explanation: An attempt was made to change the disposition of an open file.
This message is issued by the CTMCIOC program, which was invoked in order to process a Control-M file defined in table CTMCITB.
The CTMCIOC program stops executing with a condition code of 72.
Corrective Action: Close the file before specifying a different disposition.

MCIF45E INVALID CONTROL-M FILE TABLE LENGTH

Explanation: The total length of the Control-M file table CTMCITB is not a multiple of the length of a file entry.
This message is issued by the CTMCIOC program, which is invoked to build the Temporary Storage Queue containing a list of Control-M files as defined in table CTMCITB. The program performs a validity check on file table CTMCITB in order to calculate the number of entries in the table. The problem may have been caused by assembly of the table using the CICS command level assembly procedure, instead of a standard assembly procedure, as is required.
The CTMCIOC program stops executing with a condition code of 76.
Corrective Action: Ensure that the length of the CTMCITB module is correct. Reassemble the table using a standard assembly procedure if it was incorrectly assembled originally. Contact your CICS system programmer for assistance if necessary.

MCIF46I ALL CONTROL-M FILES ALREADY CLOSED

Explanation: This information message is issued by the CTMCIOC program during CICS shutdown processing.
The CTMCIDN program invoked the CTMCIOC program with a request to close all Control-M files defined in table CTMCITB. However, all Control-M files were already closed.
Corrective Action: No action is required.

MCIF50E PROGRAM CTMCIOC DISABLED OR NOT DEFINED IN CICS

Explanation: The CTMCIOC program failed to link to the CTMCIOC program because the program was disabled or was not defined in the CICS tables.
The CTMCIOC program is invoked by transactions CTMO/CTMC in order to process open/close requests for files defined in the Control-M file table CTMCITB. The program attempted to link to the CTMCIOC program to process the requests.
The CTMCIOC program stops executing.
Corrective Action: Check that the CTMCIOC program is enabled, and that it is correctly defined in the CICS PPT. For more information, please refer to the installation instructions in the IOA CICSSAMP library.
MCIF51E INVALID DATA RETURNED IN COMMAREA OF LINK TO ROUTINE CTMCIOC

**Explanation:**
An invalid table address was returned to the CTMCICT program.

The CTMCICT program, which processes open/close requests for files defined in the Control-M file table CTMCITB, links to the CTMCIOC program in order to process the request. When processing is requested for more than one file, diagnostic messages for each file are returned to the CTMCICT program in a table pointed to by an address in the COMMAREA.

The CTMCICT program stops executing.

**Corrective Action:**
Check the CICS job log for additional messages which may indicate the cause of the problem. If necessary, contact BMC Software Customer Support.

MCIF52E INVALID INPUT DATA LENGTH FOUND

**Explanation:**
The CTMCICT program failed due to an internal error.

The error occurred while processing input data for transaction CTMO/CTMC, following a CICS RECEIVE command.

The CTMCICT program stops executing.

**Corrective Action:**
Check the CICS job log for any relevant CICS error messages, and contact BMC Software Customer Support with the information.

MCIF53E INVALID INPUT DATA ADDRESS FOUND

**Explanation:**
The CTMCICT program failed due to an internal error.

The error occurred while processing input data for transaction CTMO/CTMC, following a CICS RECEIVE command.

The CTMCICT program stops executing.

**Corrective Action:**
Check the CICS job log for any relevant CICS error messages, and contact BMC Software Customer Support with the information.

MCIF54E KEYWORD PARAMETER MISSING: `keyName`

**Explanation:**
The data entered with transaction CTMO/CTMC do not contain any of the following keywords: DD, DSN, GROUP, DISP, or COND.

At least one of the keywords must be entered following the transaction name.

The CTMCICT program, which is invoked by transaction CTMO/CTMC, stops executing.

**Corrective Action:**
correct the input data and re-enter the transaction.

MCIF55E INVALID KEYWORD FOUND: `keyName`

**Explanation:**
The data entered with transaction CTMO/CTMC contain the invalid keyword `keyName`.

Valid keywords are:
The CTMCICT program, which is invoked by transaction CTMO/CTMC, stops executing.

**Corrective Action:** Correct the input data and reenter the transaction.

**MCIF56E VALUE MISSING FOR KEYWORD keyName**

**Explanation:** The data entered with transaction CTMO/CTMC contain keyword `keyName` with no following value.

The CTMCICT program, which is invoked by transaction CTMO/CTMC, stops executing.

**Corrective Action:** Correct the input data and re-enter the transaction.

**MCIF57E INVALID VALUE FOUND: keyName= val**

**Explanation:** The data entered with transaction CTMO/CTMC contain an invalid value, following keyword `keyName`.

The value found was invalid for the keyword for which it was specified.

The CTMCICT program, which is invoked by transaction CTMO/CTMC, stops executing.

**Corrective Action:** Correct the input data and re-enter the transaction.

**MCIF59E CTMCICT PROCESSING ERROR: EIBFN= func EIBRCODE= err ABEND= abCode**

**Explanation:** The CTMCICT program failed due to an internal error.

The CTMCICT program is invoked by transactions CTMO/CTMC to perform open/close functions.

Where the error occurred as a result of an EXEC CICS command, `func` indicates the function code, and `err` indicates the error code.

In the case of a program check, `abCode` indicates the CICS abend code.

A CICS transaction dump is produced.

**Corrective Action:** Check the dump and any relevant messages in the system log. If the problem is related to CICS customization, or to storage violations as a result of user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

**MCIF60I FILE PROCESSING COMPLETE**

**Explanation:** This information message indicates that the CTMCICT program, which is invoked by transactions CTMO/CTMC to perform open/close functions, completed processing successfully.

**Corrective Action:** No action is required.
MCI F66E COMMAND INVALID

**Explanation:** The command specified was not recognized by the CTMCIDS program, which is invoked by transaction CTM3.

Valid commands are:
- M (List Commands)
- K (Keys)
- U (Up)
- D (Down)
- P (Process)
- R (Reset)

**Corrective Action:** Enter a valid command.

MCI F67E DISP "SHR" OR "OLD" MAY BE SPECIFIED

**Explanation:** An invalid value was entered in the disposition field of the file menu displayed by transaction CTM3.

Valid values are:
- SHR
- OLD

**Corrective Action:** Enter a valid value.

MCI F68I PROCESSING REQUEST CANCELLED

**Explanation:** This information message indicates that a processing request was cancelled as a result of a user entering the R (Reset) command or pressing PF06.

A request was entered in the file menu displayed by transaction CTM3, to open or close a Control-M file. However, the request was subsequently cancelled by the user.

All processing requests are cancelled, and the display is cleared of any outstanding file commands.

**Corrective Action:** No action is required.

MCI F69I COMMANDS: U UP, D DOWN, P PROCESS, R RESET

**Explanation:** This information message is displayed in the Control-M CICS file Management Facility Menu, as the result of the M (List Commands) command being entered by the user to request a list of valid commands.

**Corrective Action:** No action is required.

MCI F70E PROGRAM CTMCIOC DISABLED OR NOT DEFINED IN CICS

**Explanation:** The CTMCIDS program failed to link to the CTMCIOC program because the program was disabled or was not defined in the CICS tables.
The CTMCIUS program processes open/close requests for Control-M files defined in table CTMCITB by means of a link to the CTMCIOC program.

The CTMCIUS program stops executing.

**Corrective Action:** Check that the CTMCIOC program is enabled, and that it is correctly defined in the CICS PPT. For more information, please refer to the installation instructions in the IOA CICSSAMP library.

**MCIF71E CTMCIDS PROCESSING ERROR:** EIBFN= func EIBRCODE= err ABEND= abCode

**Explanation:** The CTMCIUS program failed due to an internal error.

The CTMCIUS program scans the open or close status of CICS files defined for Control-M, and updates any changed status in the IOA Conditions file.

Where the error occurred as a result of an EXEC CICS command, func indicates the function code, and err indicates the error code.

In the case of a program check, abCode indicates the CICS abend code.

The CTMCIUS program stops executing and a CICS transaction dump is produced.

**Corrective Action:** Check the dump and any relevant messages in the system log. If the problem is related to CICS customization, or to storage violations as a result of user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

**MCIF72E PROGRAM CTMCIDS INITIALIZATION ERROR**

**Explanation:** The CTMCIUS program failed due to an internal error.

The CTMCIUS program failed to calculate the number of entries per display due to invalid data in the Temporary Storage Queue containing the Control-M file information.

The CTMCIUS program stops executing.

**Corrective Action:** Delete the Control-M files Temporary Storage Queue and re-enter the transaction. If the problem persists, contact BMC Software Customer Support.

**MCIF73I ENTRIES TO BE PROCESSED:** num. PRESS PF5 TO PROCESS ENTRIES

**Explanation:** This information message indicates that as a result of one or more requests to open/close Control-M files being entered in the file menu displayed by transaction CTM3, the num entries indicated in the message are to be processed.

The message indicates the total number of files to be processed, which may be greater than the number of individual entries selected as a result of groups being specified for processing.

**Corrective Action:** Press PF05 to continue processing or PF06 to cancel the request.

**MCIF74E INVALID OPTION SPECIFIED**

**Explanation:** An invalid line command was entered in the Control-M CICS file Management Facility Menu.

Valid line commands consist of two characters as follows:
INCONTROL for z/OS Messages Manual

- First character O (open) or C (close).
- Second character D (DD name), S (data set name), or G (group).

**Corrective Action:** Enter a valid line command.

**MCIF76E CONFLICTING OPTIONS SPECIFIED**

**Explanation:** The CTMCI DS program, which is invoked by transaction CTM3, detected that conflicting line commands were entered in the Control-M CICS file Management Facility Menu.

Both C (close) and O (open) commands were specified for a number of entries using the group option. Two or more files were found to have conflicting processing requests.

**Corrective Action:** Remove the conflicting commands and re-enter the request.

**MCIF77E FILE LIST HAS BEEN ALTERED - RE-ENTER TRANSACTION**

**Explanation:** The Temporary Storage Queue containing the Control-M file list has been updated since the last time ENTER was pressed in the Control-M CICS file Management Facility Menu.

The menu displayed is no longer up-to-date and therefore user requests cannot be processed.

The current user requests will not be processed.

**Corrective Action:** End the current transaction and re-enter the transaction in order to display the updated file status.

**MCIF78I TOP OF DATA**

**Explanation:** This information message appears in the Control-M CICS file Management Facility Menu to indicate that the beginning of the file list has been reached as a result of scrolling up using PF7.

**Corrective Action:** No action is required.

**MCIF79I BOTTOM OF DATA**

**Explanation:** This information message appears in the Control-M CICS file Management Facility Menu to indicate that the end of the file list has been reached as a result of scrolling down using PF8.

**Corrective Action:** No action is required.

**MCIF80I CONTROL-M FILE DISPLAY PROCESSING ENDED**

**Explanation:** This information message indicates that PF03 has been pressed in the Control-M CICS file Management Facility Menu, in order to end the CTM3 transaction.

**Corrective Action:** No action is required.

**MCIF81E I/O ERROR ON TEMPORARY STORAGE FILE**

**Explanation:** An I/O error occurred while attempting to read the CICS Temporary Storage file.

This error message is issued by the CTMCI DS program, which is invoked by transaction CTM3, and which reads the Temporary Storage file in order to obtain the list of CICS files defined for Control-M in table CTMCITB.

The error may be due to one of the following:
INCONTROL for z/OS Messages Manual

- invalid record size
- CICS customization error
- file corruption

The CTMCIDS program stops executing.

**Corrective Action:** Check the status of the Temporary Storage file and, if possible, correct the problem. If the error persists, contact BMC Software Customer Support.

**MCIF82E STORAGE NOT AVAILABLE TO PROCESS REQUEST**

**Explanation:** Insufficient DSA storage was available for the CTMCIDS program to process the user request.

This error message is issued by the CTMCIDS program, which is invoked by transaction CTM3. The CTMCIDS program stops executing.

**Corrective Action:** Retry the transaction, and if the error persists, contact your CICS system programmer.

**MCIF83I NO ENTRIES FOUND TO PROCESS**

**Explanation:** This information message indicates that PF05 was pressed in the Control-M CICS file Management Facility Menu, in order to request processing of files, but no O (open) or C (close) line commands were found.

**Corrective Action:** No action is required.

**MCIF84I FILE PROCESSING COMPLETE**

**Explanation:** This information message indicates that all requests for open or close of files, as specified in the Control-M CICS file Management Facility Menu, have been processed. Each file entry contains a message indicating whether or not processing was successful.

**Corrective Action:** No action is required.

**MCIF85I ENTRY SELECTED FOR PROCESSING**

**Explanation:** This information message appears in the Control-M CICS file Management Facility to indicate entries which were selected for processing.

The entries may have been selected either by specification of O (Open) or C (Close) next to the entry, or as a result of a specification being made for the file group to which the entry belongs.

**Corrective Action:** No action is required.

**MCIF86I PFKEYS: PF03 END, PF05 PROCESS, PF06 CANCEL, PF07 UP, PF08 DOWN**

**Explanation:** This information message is displayed in the Control-M CICS file Management Facility Menu, as a result of the K (Keys) command being entered by the user to request a list of PF key functions.

**Corrective Action:** No action is required.
Messages MCIJ 00 through MCIJ xx

This group includes messages for the IOA (infrastructure) product.

MCIJ 61E TRANSACTION \textit{transid} NOT DEFINED IN CICS

\textbf{Explanation}: The CTMCIDN program failed to start transaction \textit{transid} because the transaction was disabled or was not defined in the CICS tables.

The CTMCIDN program starts transaction \textit{transid} (the CTMCIST program) in order to add a CICS-DOWN condition to the IOA Conditions file.

The CTMCIDN program stops executing.

\textbf{Corrective Action}: Check that transaction \textit{transid} is enabled, and that it is correctly defined in the CICS PPT. For more information, refer to the installation instructions in the IOA CLCSSAMP library.

MCIJ 62E SECURITY CHECK FAILED FOR TRANSACTION START \textit{transid}

\textbf{Explanation}: The CTMCIDN program could not start transaction \textit{transid} because the necessary security authorization was not available.

The CTMCIDN program starts transaction \textit{transid} (the CTMCIST program) to write a CICS-DOWN condition in the IOA Conditions file.

The CTMCIDN program stops executing, and the CICS-DOWN condition is not added.

\textbf{Corrective Action}: Contact your CICS system programmer to define the correct security level in the CICS PCT entry of the started transaction using the RSL parameter.

MCIJ 63E CTMCIDN PROCESSING ERROR: EIBFN= \textit{func} EI BRCODE= \textit{err} ABEND= \textit{abCode}

\textbf{Explanation}: The CTMCIDN program failed due to an internal error.

The CTMCIDN program is invoked in order to add a CICS-DOWN condition to the IOA Conditions file.

Where the error occurred as a result of an EXEC CICS command, \textit{func} indicates the function code, and \textit{error} indicates the error code.

In the case of a program check, \textit{abend} indicates the CICS abend code.

The CTMCIDN program stops executing.

\textbf{Corrective Action}: Check the abend code specified in the message and any relevant messages in the system log. If the problem is related to CICS customization, or to storage violations as a result of user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

MCIJ 64E PROGRAM CTMCIOC DISABLED OR NOT DEFINED IN CICS

\textbf{Explanation}: The CTMCIDN program failed to link to the CTMCIOC program because the program was disabled or was not defined in the CICS tables.

The CTMCIDN program is optionally invoked during CICS shutdown processing in order to close all Control-M files defined in table CTMCITB. The program attempted to link to the CTMCIOC program in order to process the requests.
The CTMCIDN program stops executing.

**Corrective Action:** Check that the CTMCIOC program is enabled, and that it is correctly defined in the CICS PPT. For more information, please refer to the installation instructions in the IOA CI CSSAMP library.

MCIJ65E INVALID DATA RETURNED IN COMMAREA OF LINK TO ROUTINE CTMCIOC

**Explanation:** An invalid table address was returned to the CTMCIDN program.

The CTMCIDN program, which is optionally invoked during CICS shutdown processing to close all Control-M files defined in table CTMCITB, links to the CTMCIOC program to process the request. When processing is requested for more than one file, diagnostic messages for each file are returned to the CTMCICT program in a table pointed to by an address in COMMAREA.

The CTMCIDN program stops.

**Corrective Action:** Check the CICS job log for additional messages which may indicate the cause of the problem. If necessary, contact BMC Software Customer Support for assistance.

MDT messages

This group includes messages for the IOA (infrastructure) product.

Messages MDT100 through MDT1xx

This group includes messages for the IOA (infrastructure) product.

**MDT130E modName - REASON: DEVICE deviceId IS NOT ASSIGNED TO THIS MEDIA**

**Explanation:** An attempt was made to reference device deviceId, which currently is not assigned to media mediaName. This message follows message IOA137E or MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

**Corrective Action:** For more details, refer to the section that describes the IOA Archive Server in the Control-D and Control-V User Guide. Issue a DISPLAY command to obtain information about each media and its resources that are known to the IOA Archive Server. Reissue the MODIFY operator command with the correct deviceId number.

**MDT131E mediaName - REASON: DEVICE deviceId ALREADY INACTIVE**

**Explanation:** An attempt was made to stop device deviceId, which is currently inactive. This message follows message IOA137E or MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

**Corrective Action:** No action is required.
MDT132E mediaName - REASON: DEVICE deviceId ALREADY ACTIVE

Explanation: An attempt was made to start device deviceId, which is currently active.

This message follows message IOA137E or MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

Corrective Action: No action is required.

MDT133W mediaName - nn CYCLES PERFORMED WHILE WAITING FOR DEVICE INITIALIZATION TO BE COMPLETED

Explanation: Highlighted, unrollable message.

Media mediaName cannot complete the initialization phase.

During initialization, the media waits for devices which have been started to complete their initialization process. No responses were received from these devices. Each “cycle” is one IOA Archive Server sleeping interval whose value (in hundredths of a second) is defined in the INTERVAL parameter in the IOASPRM member in the IOA Archive Server Installation Parameters.

The initialization of media mediaName is not completed.

Corrective Action: Check the IOA Log file and the system log for the cause of the problem. If media mediaName waits a long time for devices to complete initialization and the reason for the delay cannot be determined, issue a CANCEL operator command to stop the IOA Archive Server. Start the IOA Archive Server again. If the problem is not resolved, contact BMC Software Customer Support.

MDT134E mediaName - MEDIA SHUT DOWN - INITIALIZATION OF ALL DEVICES FAILED

Explanation: The initialization process for all devices assigned to media mediaName failed.

Media mediaName is terminated and becomes unavailable for use by the IOA Archive Server.

Corrective Action: Check the IOA Log file and system log for messages about the initialization failure. Issue an operator command to restart media mediaName. If the problem is not resolved, contact BMC Software Customer Support.

MDT135W mediaName - nn CYCLES PERFORMED WHILE WAITING FOR DEVICE TO TERMINATE

Explanation: Highlighted, unrollable message.

Media mediaName cannot complete the termination phase.

During termination, media mediaName waits for devices to terminate. Each “cycle” is one IOA Archive Server sleeping interval whose value (in hundredths of a second) is defined in the INTERVAL parameter in the IOASPRM member in the IOA Archive Server Installation Parameters.

The termination of media mediaName is not completed.
Corrective Action: Check the IOA Log file and the system log for the cause of the problem. If media mediaName waits a long time for devices to complete termination and the reason for the delay cannot be determined, issue a CANCEL operator command stop the IOA Archive Server. If the problem is not resolved, contact BMC Software Customer Support.

MDT136E mediaName - REASON: LENGTH OF DEVICE NUMBER IN DEVICE= deviceId IS INCORRECT

Explanation: The DEVICE parameter was specified with an invalid length. The length of the DEVICE parameter in the MODIFY operator command should be:

- Three digits for MVS/SP4 and below
- Four digits for MVS/SP5 and above

This message follows message IOA137E or MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

Corrective Action: Reissue the MODIFY command with a correct DEVICE parameter.

MDT137E mediaName - COMMAND FAILED cmdText

Explanation: An invalid command or parameter was passed to media mediaName by a MODIFY operator command. This message is followed by other messages that clarify why the operator command failed.

The MODIFY command is not executed.

Corrective Action: Check the system log for a message that indicates why the command failed. Correct the problem, and reissue the MODIFY operator command.

MDT138E mediaName - REASON: PARAMETER IS INVALID

Explanation: An invalid parameter was passed to media mediaName by the MODIFY operator command. This message follows message IOA137E or MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

Corrective Action: For more information, refer to the section on the IOA Archive Server in the Control-D and Control-V User Guide. Enter a MODIFY command with valid parameters.

MDT139I mediaName - MEDIA SHUT DOWN UPON REQUEST FROM OPERATOR

Explanation: This information message indicates that media mediaName is shutting down upon the operator’s request.

Corrective Action: No action is required.
MDT13AI mediaName - MEDIA SHUT DOWN UPON REQUEST OF MAIN TASK

Explanation: This information message indicates that media mediaName is shutting down upon the IOA Archive Server’s request.

Possible causes are:

- The IOA Archive Server is shutting down due to operator request.
- The IOA Archive Server encountered an unrecoverable error.

The IOA Archive Server shuts down the media before it shuts down. The IOA Log file and system log should contain additional messages concerning the situation.

Media mediaName shuts down.

Corrective Action: Check the IOA Log file and system log for messages explaining the situation. Contact the system programmer for assistance, if needed.

MDT13BE mediaName - REASON: VALUE SPECIFIED IN DEVICE= PARAMETER IS INVALID

Explanation: The DEVICE parameter was specified in a MODIFY operator command without specifying its value. This message follows message IOA137E or MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command.

MODIFY is not executed.

Corrective Action: For more information, refer to the section on the IOA Archive Server in the Control-D and Control-V User Guide. Reissue the MODIFY command with a valid DEVICE parameter.

MDT13DE mediaName - REASON: DEVICE= PARAMETER IS INVALID FOR DYNAMIC DEVICES

Explanation: An attempt to start a specific device by operator command failed because the devices used by the IOA Archive Server are allocated dynamically. This message follows message IOA137E/MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command.

MODIFY is not executed.

Corrective Action: For more information about how to control the device, refer to the section on media and resource management in the Control-D and Control-V User Guide. Reissue the MODIFY command with appropriate parameters.

MDT13FW mediaName - REASON: ALL DEVICES ARE ALREADY ACTIVE

Explanation: An attempt to start one or more devices by issuing a MODIFY operator command failed, because all devices were already active.

This message follows message IOA137E or MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command. The operator cannot increase the number of devices the IOA Archive Server can use to more than the maximum quantity defined in the IOASPRM member in the IOA Archive Server Installation Parameters.

The MODIFY command is not executed.
Corrective Action: Issue a DISPLAY command to get information about each media and its resources that are allocated to the IOA Archive Server. For more information about how to control devices, refer to the section on media and resource management in the Control-D and Control-V User Guide.

MDT140S mediaName - BLDL/ATTACH/LOAD FAILED FOR THE MODULE modName

Explanation: Initialization of the mediaName media failed. Possible causes are:

- The Control-V LOAD library is not in the load modules search list (STEPLIB + LinkList).
- Insufficient memory is available to attach the task.
- The modName module is not in the LOAD library.

The IOA Archive Server shuts down.

Corrective Action: Check the system log for additional messages which clarify the situation. Try one of the following:

- If the attach failed because of lack of memory, increase the REGION size in the IOA Archive Server procedure.
- If the modName module does not exist in the IOA LOAD library, contact BMC Software Customer Support.

MDT141I mediaName - INITIALIZATION STARTED

Explanation: This information message indicates that media mediaName has started and is building the required internal environment.

Corrective Action: No action is required.

MDT142I mediaName - INITIALIZATION SUCCESSFULLY COMPLETED

Explanation: This information message indicates that media mediaName was successfully initialized.

Corrective Action: No action is required.

MDT143W mediaName - REASON: ALL DEVICES ARE ALREADY INACTIVE

Explanation: An attempt to stop one or more devices by issuing a MODIFY operator command failed, because all the devices were already inactive. This message follows message IOA137E, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

Corrective Action: For more information, refer to the section on the IOA Archive Server in the Control-D and Control-V User Guide. Issue a DISPLAY command to get information about each media and its resources that are allocated to the IOA Archive Server.

MDT144S mediaName - INSUFFICIENT STORAGE FOR INITIALIZATION

Explanation: Highlighted, unrollable message.
Insufficient memory is available to initiate media *mediaName*. Media *mediaName* shuts down. The IOA Archive Server shuts down.

**Corrective Action:** Increase the IOA Archive Server REGION size.

**MDT145E mediaName** - FREEMAIN ERROR ENCONERRED

**Explanation:** Highlighted, unrollable message.

Media *mediaName* encountered an internal error.

The media *mediaName* task terminates with user abend 0007. The IOA Archive Server terminates with user abend code 0006. The output includes a dump of the abend.

**Corrective Action:** Contact your system programmer for assistance. If the problem is not resolved, contact BMC Software Customer Support.

**MDT146E mediaName** - MEDIA INITIALIZATION FAILED

**Explanation:** Highlighted, unrollable message.

Media *mediaName* encountered an internal error.

This message is preceded by other messages which clarify the situation.

Media *mediaName* shuts down.

**Corrective Action:** Check the IOA Log file and the system log for messages describing the error. Contact your system programmer for assistance, if needed. If the problem is not resolved, contact BMC Software Customer Support.

**MDT147S mediaName** - INTERNAL ERROR DURING INITIALIZATION - MEDIA INITIALIZATION FAILED

**Explanation:** Highlighted, unrollable message.

Media *mediaName* encountered an internal error.

Media *mediaName* abends with user abend 0007. The IOA Archive Server shuts down with User Abend 0006. The output includes a dump of the abend.

**Corrective Action:** Contact your system programmer for assistance. If the problem is not resolved, contact BMC Software Customer Support.

**MDT148S mediaName** - INTERNAL ERROR RC=rc

**Explanation:** Media *mediaName* encountered an internal error.

One of the following actions occurs, depending on severity of the internal error:
- Media `mediaName` terminates and IOA Archive Server continues processing.
- Media `mediaName` abends with user abend 0007. The IOA Archive Server terminates with User Abend 0006. The output includes a dump of the abend.

**Corrective Action:** Check the IOA Log file and system log for messages describing the error. Contact your system programmer for assistance. If the problem is not resolved, report the value of `rc` to BMC Software Customer Support.

**MDT149E** `mediaName` - REASON: COMMAND IS INVALID

**Explanation:** An invalid command was passed to media `mediaName` by the MODIFY operator command. This message follows message IOA137E or MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

**Corrective Action:** For more information, refer to the section on the IOA Archive Server in the Control-D and Control-V User Guide. Enter a valid MODIFY command.

**MDT14AE** `mediaName` - REASON: VALUE SPECIFIED IN DEVQTY= PARAMETER IS INVALID

**Explanation:** An invalid value was specified for the DEVQTY parameter. This message follows message IOA137E or MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command. Possible causes are:

- The value for the DEVQTY parameter is missing in the MODIFY operator command.
- The length of the DEVQTY parameter exceeds the maximum allowable length.
- The value of the DEVQTY parameter is invalid. Valid values are numeric or the character string ALL.
- The value of the DEVQTY parameter is greater than the maximum quantity defined in the IOASPRM member in the IOA Archive Server Installation Parameters.
- The value of the DEVQTY parameter is greater than the number of active devices allocated to the IOA Archive Server.

The MODIFY command is not executed.

**Corrective Action:** For more information, refer to the section on the IOA Archive Server in the Control-D and Control-V User Guide. Issue a DISPLAY command to get information about each media and its resources that are allocated the IOA Archive Server. Reissue the MODIFY command with a valid DEVQTY parameter.

**MDT14BE** `mediaName` - LOCATE ERROR FOR `dsn` RC= `rc`

**Explanation:** A CDAM data set cannot be found in the catalog.

The user requested a report which resides on a CDAM file which is uncataloged or does not exist. The request is ignored.

**Corrective Action:** Catalog the file or take other corrective action and try again.
MDT14CI mediaName - MEDIA SHUTTING DOWN

Explanation: This information message indicates that media mediaName is shutting down.
Corrective Action: No action is required.

MDT14DS mediaName - DEVICE deviceId ABENDED

Explanation: A media internal subtask abended.
Media mediaName issues an implicit start command for device deviceId. Attempts are made to initialize this device and continue normal processing. If these attempts fail, media mediaName sets the status of the designated device to never active and this device becomes unavailable for use by the IOA Archive Server.
Corrective Action: Check the IOA Log file and system log for additional messages which indicate why device deviceId abended.

MDT14ES mediaName - PARAMETER DEVADDR NUMBER num DEFINED IN IOASPRM INSTALLATION PARAMETERS IS INVALID

Explanation: The DEVADDR parameter contains an invalid value.
The format of the device number specified in the DEVADDR parameter in the IOASPRM member (IOA Archive Server Installation Parameters) must be:
- three digits for MVS/SP4 and below
- four digits for MVS/SP5 and above
Initialization of media mediaName fails. The IOA Archive Server shuts down with a return code of 08.
Corrective Action: Set the DEVADDR parameter to a valid numeric value and restart the IOA Archive Server.

MDT14FI mediaName - ALL DEVICES WERE DEFINED AS INACTIVE IN IOASPRM INSTALLATION PARAMETERS

Explanation: This information message indicates that media mediaName is inactive because all devices which belong to it are defined as inactive in the IOASPRM member (IOA Archive Server Installation Parameters).
Corrective Action: If necessary, issue operator MODIFY commands to start the media and the devices.

MIG messages

This group includes messages for the Control-M/Tape product.

Messages MIG500 through MIG5xx

This group includes messages for the Control-M/Tape product.
MIG5ABW DSNLENF= dsnLength TAPELENF= tapeLength TAPELEFT= unusedLength

**Explanation:** This message is generated in the event of an unexpected tape switch or a short cartridge. This message follows message MIG5B7W and provides the information listed below:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>dsnLength</td>
<td>Length in feet of the data set being written when the unexpected tape switch occurred.</td>
</tr>
<tr>
<td>tapeLength</td>
<td>Length of the tape in feet (taken from IOASPRM).</td>
</tr>
<tr>
<td>unusedLength</td>
<td>Estimated free space on the tape in feet when the unexpected tape switch occurred.</td>
</tr>
</tbody>
</table>

The file is continued on the next tape and becomes a multivolume file. Subsequent files of this migration job will be written to a new scratch volume.

**Corrective Action:** Check the values provided in this message and determine a new value for tape length in the IOASPRM member.

MIG5ACE ERROR INITIALIZING INPUT MEDIA mediaName

**Explanation:** Initializing an input media for multistage migration failed. The attempt to initialize media `mediaName`, in order to copy files from it to the target media, failed. Files that should have been copied from this input media to the target media are skipped. Subsequent files are processed.

**Corrective Action:** Check other messages received in the migration job to determine the cause for the failure. Fix the problem and reorder or rerun the migration mission.

MIG5ADE ERROR TERMINATING INPUT MEDIA mediaName

**Explanation:** The process of terminating media `mediaName` for multistage migration failed. This media is the input media for the migration job. Subsequent files in the migration job are processed.

**Corrective Action:** Check other messages received in the migration job to determine the cause for the failure. Fix the problem and reorder or rerun the migration mission.

MIG5AEE ERROR ALLOCATING MIGRATED FILE fileName

**Explanation:** A file that should be moved to another media could not be allocated. A failure occurred while attempting to allocate an input media file. Subsequent files in the migration job are processed.

**Corrective Action:** Check other messages generated by the migration job to determine the cause for the failure. Fix the problem and reorder or rerun the migration mission.
INCONTROL for z/OS Messages Manual

MIG5AFE ERROR OPENING MIGRATED FILE fileName

Explanation: A file that should be moved to another media could not be opened.
A failure occurred while attempting to open an input media file.
Subsequent files in the migration job are processed.

Corrective Action: Check other messages generated by the migration job to determine the cause for the failure. Fix the problem and reorder or rerun the migration mission.

MIG5AGE ERROR CLOSING MIGRATED FILE fileName

Explanation: A file that should be moved to another media could not be closed.
A failure occurred while attempting to close an input media file.
Subsequent files in the migration job are processed.

Corrective Action: Check other messages generated by the migration job to determine the cause for the failure. Fix the problem and reorder or rerun the migration mission.

MIG5AHE ERROR READING MIGRATED FILE fileName

Explanation: A file that should be moved to another media could not be read.
A failure occurred while reading an input media file.
The migration of file filename is stopped. Subsequent files in the migration job are processed.

Corrective Action: Check other messages generated by the migration job to determine the cause for the failure. Fix the problem and reorder or rerun the migration mission.

MIG5AJE ERROR CALLING CTVFNM - MI GDSNAME dsn, RC: rc

Explanation: A failure occurred in a routine used for scanning migrated file names.
This message indicates that an internal error has occurred.
The file to be migrated, dsn, is skipped and subsequent files are processed.

Corrective Action: Record the return code and notify BMC Software Customer Support.

MIG5ALE INVALID FUNCTION CODE SPECIFIED FOR CTVAMIG

Explanation: Routine CTVAMIG received an invalid function code.
This message indicates that an internal error has occurred.
The migration job continues processing but does not use “continuous migration”. A scratch volume is used for files migrated in this migration job.

Corrective Action: Notify BMC Software Customer Support. Reorder or rerun the migration mission.

MIG5AME CTVAMIG TERMINATED WITH ERROR. RC: rc

Explanation: A failure occurred in routine CTVAMIG.
Routine CTVAMIG reads and updates migration stages in sequence without skipping a stage.
The migration job continues processing but does not use “continuous migration”. A scratch volume is used for files migrated in this migration job.

**Corrective Action:** Check other messages generated by the migration job to determine the cause for the failure. Fix the problem and rerun or reorder the migration mission.

**MIG5ANI UNABLE TO ALLOCATE TAPE VOLUME volser; SCRATCH TAPE WILL BE USED INSTEAD**

**Explanation:** This information message indicates that an attempt to allocate a tape volume in order to perform continuous migration failed.

The migration job attempted to allocate a specific volume that was used in a previous migration job in order to add files migrated by the current migration job after the last file on the volume.

A scratch volume is allocated for the files migrated by current migration job.

**Corrective Action:** Check other messages to determine the cause for the failure.

**MIG5API DAMIG DD STATEMENT MISSING - FOR OLD MIG SKELETONS - A NEW VOLUME WILL BE USED FOR EACH MIG RUN**

**Explanation:** This information message indicates that a DD statement for the migrated user file is missing.

For each migration mission, a record that specifies information about continuous migration is saved in the migrated user file. This information enables files migrated by the current migration job to be written in the same volume used by a previous migration job for the same migration mission.

Continuous migration is not performed. Files migrated by the current migration job are written to a new scratch volume.

**Corrective Action:** Add DAMIG and DAMIGI DD statements for the migrated user file in migration job step MIGRAT.

**MIG5B0E OPTFILE= dsn - FDB REWRITE FAILED**

**Explanation:** The migration process failed while rewriting the File Description Block (FDB).

During the migrate-to-disk process, several extents may be written. After writing the last extent, the FDB is rewritten to the first extent.

All migrated file extents are deleted. The migration for this CDAM terminates with an error.

**Corrective Action:** Determine the cause of the rewrite failure and rerun the migration job.

**MIG5B1I INDEX= dsn - MIGRATION ENDED OK VOL= vol PLTID= platterId**

**Explanation:** This information message indicates that the dsn index migrated successfully.

The message identifies the volume serial number and, for OSS migration, the platter ID to which the index migrated. This message is issued for each index file.

**Corrective Action:** No action is required.
**INCONTROL for z/OS Messages Manual**

**MIG5B2I INDEX= dsn - HAS ALREADY BEEN MIGRATED VOL= volser PLTID= platterId**

**Explanation:** This information message indicates that the dsn index has previously migrated to the same target media.

This message identifies the volume serial number and, for OSS migration, the platter ID to which the index migrated.

Any previously unfinished action relating to this index migration is performed now.

**Corrective Action:** No action is required.

**MIG5B3S DEVTYPE FAILED FOR DDNAME ddName, RC = rc**

**Explanation:** A tape migration job failed to obtain the device type of the file.

The macro DEVTYPE for the DDOPT DD statement failed. This macro is used after a file is written to tape so that the device type can be used for cataloging the file. The return code is the hexadecimal return code in register 15 from the DEVTYPE macro.

The migration process is terminated.

**Corrective Action:** Record the return code. Consult your system programmer. If necessary, contact BMC Software Customer Support.

**MIG5B4E CATALOGING dsn FAILED, RC: rc**

**Explanation:** Tape migration failed to catalog the migrated file. The return code is the hexadecimal return code in register 15 from the CATALOG macro.

This CDAM data set is not migrated. The migration process continues to migrate other CDAM files.

**Corrective Action:** Record the values of dsn and rc. Contact BMC Software Customer Support.

**MIG5B5S IOAT2A FAILED IN JFCBEXAD TRANSLATION - RC: rc**

**Explanation:** Tape migration failed to get the J FCB extension.

Routine IOAT2A, which translates JBCBEXAD from token to address, received return code rc.

This CDAM data set is not migrated. The migration process continues to migrate other CDAM files.

**Corrective Action:** Record the return code. Contact BMC Software Customer Support.

**MIG5B6S IOASLOS - SORT ENDED WITH RC OTHER THAN 0**

**Explanation:** OSS migration failed to build platter and volume tables using routine IOASLOS.

Routine IOASLOS failed to sort platter and volume tables.

The migration process is terminated.

**Corrective Action:** Check the migration skeleton job. If you cannot resolve the problem, contact BMC Software Customer Support.
MI G5B7W AN UNEXPECTED TAPE SWITCH HAS OCCURRED - CHECK LENGTH OF TAPE DEFINITION IN IOASPRM

**Explanation:** The migrated file expanded to another tape volume.

A file that was expected to fit on one volume, or in the space available on the current volume, has expanded to another volume.

**Corrective Action:** Check the tape length definition in the IOASPRM member. If it is too short, specify the correct length. If hardware compression is utilized, the actual compression factor may be lower than the estimated compression factor.

MI G5B8S INVALID RC FROM CTVTPCP - UNABLE TO CALCULATE DATASET LENGTH IN FEET

**Explanation:** Routine CTVTPCP, which calculates tape lengths, returned a non-zero return code.

Tape migration failed to calculate the data set’s length on tape.

The migration process is terminated.

**Corrective Action:** Record the return code. Contact BMC Software Customer Support.

MI G5B9E UNABLE TO MIGRATE dsn - HAS MORE THAN 32767 BLOCKS

**Explanation:** The number of CDAM blocks exceeds 32767.

The OSS migration process cannot migrate files which contain more than 32767 blocks.

This CDAM data set is not migrated. The migration process continues to migrate other CDAM files.

**Corrective Action:** Reduce the report size or divide the report so that the number of CDAM blocks required does not exceed 32767.

MI G5BAS PARM IS OMITTED - PLEASE SPECIFY REQUIRED PARAMETERS

**Explanation:** The PARM parameter is not specified in the migration job.

The user must specify a media name and prefix or the keyword “NOCHECK”.

The migration process is terminated.

**Corrective Action:** Add the PARM parameter and specify a media name and prefix or the keyword NOCHECK.

MI G5BB5 INVALID MEDIA = mediaName WAS SPECIFIED IN PARM - CALL ADMINISTRATOR

**Explanation:** The migration process received an invalid media name in the PARM field.

The media name should be specified in the NAME parameter of the IOASPRM member in the IOA PARM library.

The migration process is terminated.

**Corrective Action:** Change the IOASPRM member or the migration skeleton job so a valid media name is specified in the migration job.
MIG5BCI MIGRATION STARTED FOR MEDIA = mediaName

Explanation: This information message indicates that the migration process has started.
Corrective Action: No action is required.

MIG5BDE AN INVALID TAPE WAS ALLOCATED FOR MIGRATION

Explanation: The OPT file was successfully allocated and opened, but RDJ FCB for a migrated file failed or no volumes were found in the J FCB.
This CDAM data set is not migrated. The migration process continues to migrate other CDAM files.
Corrective Action: Ask your system programmer to contact BMC Software Customer Support.

MIG5BEE AN ERROR OCCURRED FOR ONE OR MORE OF THE CDAM EXTENTS OR AN INDEX FILE

Explanation: An error occurred while writing a CDAM extent or an index file.
Possible causes include:
- A failure to dynamically allocate the CDAM extent or index file for a read.
- A failure to write an optical file.
This CDAM data set or index is not migrated. The migration process continues to migrate other CDAM files and indexes.
Corrective Action: Check the job’s system log and SYSPRINT for error messages. Correct the problem and resubmit the migration job.

MIG5BFI PLATTER platterId SIDE x HAS AVAILABLE SPACE, BUT NO VOLUME IS AVAILABLE - PLEASE DEFINE MORE VOLS

Explanation: This information message indicates that OSS migration found a platter side with enough space for the CDAM file but no volume was available.
The migration process could not allocate the file on platter platterId because no empty volume was available.
Another platter or side is used.
Corrective Action: Define more volumes for platter platterId side x so that it can be used for migration.

MIG5C0S CANNOT ALLOCATE DEVICE: deviceId

Explanation: The OSS device could not be obtained for OSS migration, or the tape drive could not be allocated for tape migration.
The CTVSRVD program must execute before OSS migration to ensure that the IOA Archive Server releases the first device defined for OSS. A tape drive must be allocated for tape migration.
The migration process is terminated.
**Corrective Action:** For OSS migration, ensure the CTVSRVD program executes before the migration step. For tape migration, check if the device is available for allocation. If no error is discovered, contact BMC Software Customer Support.

**MIG5C1E INVALID INPUT - FILE NAME MUST BE FOLLOWED BY BLANK**

**Explanation:** The migration process did not identify the file name. A blank is expected at the end of the file name on the SYSIN DD statement. The migration process is terminated.

**Corrective Action:** Check the migration skeleton job for an error in the SYSIN data set definition. If no error is found, contact BMC Software Customer Support.

**MIG5C2E LOCATE ERROR FOR FILE dsn - FILE SKIPPED**

**Explanation:** The migration process encountered a data set that could not be located. A CDAM extent or index file was not cataloged. The entire CDAM data set or index file is not migrated. Other data sets continue to migrate.

**Corrective Action:** Correct the problem and rerun the Migration Mission.

**MIG5C3E OBTAIN FAILED FOR FILE dsn - FILE SKIPPED**

**Explanation:** A file could not be obtained on the device to which it was cataloged. The migration process uses LOCATE and OBTAIN macros to get file attributes. The OBTAIN macro failed. The entire CDAM data set or index file is not migrated. Other data sets continue to migrate.

**Corrective Action:** Correct the problem and rerun the Migration Mission.

**MIG5C4E MIGRATION IS NOT ALLOWED FOR MORE THAN 5 TAPES - CDAM=dsn**

**Explanation:** The CDAM file for the dsn data set spans more than five tape volumes. Before writing each file, the migration process determines if the file will fit on a volume, based on the media capacity specified in the IOASPRM member. If the file is larger than the specified volume capacity, the migration process uses as many volumes as needed (up to a maximum of five). The CDAM file is not migrated.

**Corrective Action:** Modify the report (for example, by subdividing it into two or more reports) or the decollating mission (for example, by specifying migration to a different media) so that the migrated file will not require more than five tape volumes.

**MIG5C5E INVALID BLKSIZE OF FILE=dsn - FILE SKIPPED**

**Explanation:** The file block size is larger than 100K bytes. BLKSIZE must not exceed 100K bytes. This data set is not migrated.

**Corrective Action:** Redefine the block size and rerun the Migration Mission.
MI G5C6E TTR TO BBB CONVERSION FAILED

Explanation: A CDAM TTR could not be converted to BBB.
IOASTBT calculates the BBB of the CDAM. The conversion failed for this CDAM file.
This CDAM file is not migrated. Other CDAM files continue to migrate.
Corrective Action: Correct the problem and rerun the Migration Mission. If the problem cannot be resolved, contact BMC Software Customer Support.

MI G5C7S INVALID UNIT NAME DEFINED IN IOASPRM: unitName

Explanation: The unit name of the target media is unknown to the migration process. The TYPE parameter in the IOASPRM member contains an invalid value.
The migration process is terminated.
Corrective Action: Correct the TYPE parameter. Rerun the Migration Mission.

MI G5C8S DEVICE deviceId IS OUT OF SPACE

Explanation: No more space is available on the deviceId device.
There is no volume with enough space for this migration.
The migration process is terminated.
Corrective Action: Free space on the volumes available to the migrated files allocation. Rerun the migration mission.

MI G5C9S IOASLOS RETURNED NON-ZERO RC: rc

Explanation: The IOASLOS module failed.
OSS migration uses the IOASLOS module to load OSS platter and volume tables to memory.
The migration process is terminated.
Corrective Action: Check the OSS migration skeleton for errors and rerun the Migration Mission. If the problem persists, contact BMC Software Customer Support.

MI G5CAI CDAM= dsn - MI GRATION ENDED OK VOL= volser PLTID= platterId

Explanation: This information message indicates that a Migration Mission completed successfully.
The message identifies the volume serial number and, for OSS migration, the platter ID to which the CDAM data set migrated. This message is issued once for each CDAM extent.
Corrective Action: No action is required.

MI G5CBS OPEN OF DDNAME ddName FAILED

Explanation: The data set referenced by the ddName DD statement could not be opened.
Possible causes are:
The ddName DD statement is missing.

The data set referenced by the ddName DD statement does not exist.

The migration process is terminated.

Corrective Action: Check the migration skeleton job for errors and rerun the Migration Mission.

MIG5CCI MIGRATION OF dsn HAS STARTED

Explanation: This information message indicates that a Migration Mission started processing the CDAM data set whose name is dsn.

Corrective Action: No action is required.

MIG5CDI MIGRATION OF dsn HAS ENDED

Explanation: This information message indicates that a Migration Mission finished processing the CDAM data set whose name is dsn.

The CDAM data set migrated successfully. This message is issued once after all extents of the CDAM file have migrated.

Corrective Action: No action is required.

MIG5CEI CDAM dsn HAS ALREADY BEEN MIGRATED VOL= volser PLTID= platterId

Explanation: This information message indicates that CDAM data set dsn has already migrated to the same target media.

The message identifies the volume serial number and, for OSS migration, the platter ID to which the CDAM data set migrated. This message is issued once for each CDAM extent.

Any previously unfinished action relating to this CDAM migration is performed now.

Corrective Action: No action is required.

MIG5CFI STOP TIME FOR MIGRATION PROCESS WAS REACHED - EXITING

Explanation: This information message indicates that the time for ending the migration process has passed. The stop time defined in the MIGENDTM parameter in the IOASPRM member in the IOAPARM library prevents the migration process from interfering with online work during the day.

The migration process is terminated when the currently migrating CDAM data set finishes migrating.

Corrective Action: In the future, start the migration process earlier, or change the MIGENDTM parameter to a later time. Order the migration mission again the next night to complete the migration.

MIG5CGS ERROR IN routineName. RC IN R15: rc

Explanation: Internal routine routineName failed.

The migration process terminates with a return code of 16 in register 15.

Corrective Action: Contact BMC Software Customer Support.
MIG5CHS NO MORE ROOM ON DISKS WITH PREFIX: prefix

Explanation: An attempt to write a data set on disk failed because the data set requires more space than is available on any disk with the specified prefix.
The data set is not written or cataloged.
Corrective Action: Do one or more of the following:
- Assign the specified prefix to one or more additional disks.
- Delete unneeded data sets from disks with the specified prefix.
- Specify a different disk prefix for the data set that was not written.

MIG5CIE ERROR DELETING FILE dsn - FILE SKIPPED

Explanation: The migration job has encountered a file which could not be deleted.
The migration job could not delete a file during cleanup after an error occurred while writing a migrated file to DASD.
The file is not deleted.
Corrective Action: Determine why the delete failed. Delete the file before rerunning the migration process.

MIG5CKW MIGRATION TO ANOTHER DISK TYPE CAUSES A WASTE OF X'nnnnnnn' BYTES IN EACH TRACK

Explanation: This warning message is issued when a BLKSIZE definition causes disk space to be wasted.
The CDAM file’s BLKSIZE becomes the BLKSIZE of the migrated file. The disk migration process discovered that the migrated file BLKSIZE wastes a large number of bytes on each track.
The file is migrated.
Corrective Action: Consider redefining the CDAM file’s BLKSIZE to minimize wasted disk space after migration.

MIG5CNE ERROR WRITING FDB, RC: rc

Explanation: The Filetek storage machine WRITE function that is activated by a migration job failed.
In this message, rc is the return code from the WRITE function.
The migration job skips the problematic file and continues with the next file.
Corrective Action: Check the return code of the WRITE function against the Filetek documentation, and correct the problem accordingly.

MIG5CPE ERROR WRITING BLOCK, RC: rc

Explanation: The Filetek storage machine WRITE function that is activated by a migration job failed.
In this message, rc is the return code from the WRITE function.
The migration job skips the problematic file and continues with the next file.
**Corrective Action:** Check the return code of the `WRITE` function against the Filetek documentation, and correct the problem accordingly.

**MI G5CUE** **ERROR IN LOCATE PROCESSING IN FTK** **OPT = fileName.** **RC: rc**

**Explanation:** The migration job failed to locate a file in the Filetek storage machine.

The variables in this message are:
- `fileName` - the name of the file that the migration job is unable to locate
- `rc` - the return code from the migration job `LOCATE` function

The migration job skips the problematic file and continues with the next file.

**Corrective Action:** Check the messages the migration job issues for the locate failure, and correct accordingly.

**MI G5CVE** **START-SEARCH PROCESSING FAILED.** **OPT = fileName, RC: rc**

**Explanation:** The Filetek storage machine `START_SEARCH` function that was activated by a migration job failed.

The variables in this message are:
- `fileName` - the name of the file searched for by the migration job
- `rc` - the return code from the `START_SEARCH` function

The migration job skips the problematic file and continues with the next file.

**Corrective Action:** Check the return code of the `START_SEARCH` function against the Filetek documentation, and correct the problem accordingly.

**MI G5CWE** **END-SEARCH PROCESSING FAILED, OPT = fileName, RC: rc**

**Explanation:** The Filetek storage machine `END_SEARCH` function that was activated by a migration job failed.

The variables in this message are:
- `fileName` - the name of the file searched for by the migration job
- `rc` - the return code from the `END_SEARCH` function

The migration job skips the problematic file and continues with the next file.

**Corrective Action:** Check the return code of the `END_SEARCH` function against the Filetek documentation, and correct the problem accordingly.

**MI G5DAW** **NO. OF BLOCKS IN OBJECT = obj_num IS TOO LARGE FOR BLOCKSIZE = blksize. USE MAXIMUM OBJECT SIZE**

**Explanation:** OAM MEDIA issued a warning that the total size of the object exceeds the maximum.

The user-defined number of blocks in an object was multiplied by the block size. The result exceeded the maximum allowed size. The maximum size allowed by Control-D is 3,000,000 bytes.
- **obj_num** - the number of blocks (specified by the user) for the object
- **blksize** - the size of each block

The object size is automatically set to be the maximum possible size. This value is both a multiple of blocksize and a number less than 3,000,000.

**Corrective Action:** Consider reducing the value of the OBJSIZ parameter in IOASPRM.

**MIG5DHW IN LOCATE PROCESSING, OBJECT 0 - NOT FOUND collName**

**Explanation:** During LOCATE processing in OAM, Control-D found a collection without a first object.

IBM macro OSREQ was issued with a QUERY request to OAM on the first object in the collection. This object was not found. However, the reason code returned was other than x2C01 ("DIRECTORY ENTRY NOT FOUND").

In this message, *collName* is the name of the collection with the missing first object.

The system treats the file as an empty file. The migration attempts to re-migrate file *collName* to OAM.

**Corrective Action:** See the OAM Programmer’s Reference or the DFSMSdfp Diagnosis Reference for an explanation of this warning.

**MIG5DIS FAILED TO LOAD DSNALI MODULE OF DB2**

**Explanation:** Control-V was unable to load the DSNALI module.

The DSNALI module verifies updates to OAM files. There are two responses to an attempt to update an OAM file:

- If an OAM file is successfully updated, the migration program performs a DB2 COMMIT action.
- If an OAM file fails to update, the migration program performs an ABORT (terminates) and does not load the DSNALI module.

The migration program terminates.

**Corrective Action:** Make the DSNALI module available to Control-V. Note the error message and consult your DB2 administrator.

**MIG5E01 text**

**Explanation:** This information message is an internal message that Control-V uses to transfer information from one program to another.

**Corrective Action:** No action is required.

**MIG5E3I CLIP_ID= clipId**

**Explanation:** This information message is issued for each Centera clip created during Control-V migration to the EMC Centera storage system.

In this message, *clipId* is the name of the clip.

**Corrective Action:** No action is required.
MI G5E4E CENTERA INIT ERROR: RC= \textit{rc}, REASON CODE= \textit{rsn}

**Explanation:** Connection to EMC Centera cannot be established. This message is followed by message MI G5E9I, which issues the Centera pool value used for connection.

The variables in this message are:
- \textit{rc} - return code from the EMC Centera API.
- \textit{rsn} - reason code from the EMC Centera API.

The job terminates with a nonzero return code.

**Corrective Action:** Refer to EMC Centera documentation for a description of the received reason code.

Check the pool value printed in the accompanying MI G5E9I message. If the IP addresses are not correct, update them in parameters POOL1-POOL4 in the IOASPRM member. Then rerun the migration mission or the utility that issued this message.

---

MI G5E5E CENTERA CLIP CREATE ERROR: RC= \textit{rc}, REASON CODE= \textit{rsn}, DSN= \textit{dsn}

**Explanation:** An error was detected during creation of a new EMC Centera clip for a migrated CDAM or index file.

The variables in this message are:
- \textit{rc} - return code from the EMC Centera API
- \textit{rsn} - reason code from the EMC Centera API
- \textit{dsn} - the name of the migrated dataset

The \textit{dsn} dataset is not migrated.

**Corrective Action:** Refer to the EMC Centera documentation for a description of the received reason code. If you cannot resolve the problem, contact the EMC Centera experts.

---

MI G5E6E CENTERA BLOCK WRITE ERROR: RC= \textit{rc}, REASON CODE= \textit{rsn}, DSN= \textit{dsn}

**Explanation:** An error was detected while writing a block of the migrated dataset to the EMC Centera clip.

The variables in this message are:
- \textit{rc} - return code from the EMC Centera API
- \textit{rsn} - reason code from the EMC Centera API
- \textit{dsn} - the name of the migrated dataset

The \textit{dsn} dataset is not migrated.

**Corrective Action:** Refer to the EMC Centera documentation for a description of the received reason code. If you cannot resolve the problem, contact the EMC Centera experts.
INCONTROL for z/OS Messages Manual

MIG5E7E CENTERA CLIP CLOSE ERROR: RC= rc, REASON CODE= rsn, DSN= dsn

Explanation: An error was detected while closing an EMC Centera clip.
The variables in this message are:
- rc - return code from the EMC Centera API
- rsn - reason code from the EMC Centera API
- dsn - the name of the migrated dataset

The dsn dataset is not migrated.

Corrective Action: Refer to the EMC Centera documentation for a description of the received reason code. If you cannot resolve the problem, contact the EMC Centera experts.

MIG5E8E CENTERA TERMINATE ERROR- RC= rc, REASON CODE= rsn

Explanation: An error was detected during termination of the EMC Centera device.
The variables in this message are:
- rc - return code from the EMC Centera API
- rsn - reason code from the EMC Centera API

The EMC Centera connection is not terminated.

Corrective Action: Refer to the EMC Centera documentation for a description of the received reason code. If you cannot resolve the problem, contact the EMC Centera experts.

MIG5E9I POOL= pool

Explanation: This information message follows message MIG5E4E.
In this message, pool is the pool value specified in parameters POOL1-POOL4 in the IOASPRM member.

Corrective Action: No action is required.

MIG5EAI DELETE CENTERA CLIP: RC= rc, REASON CODE= rsn

Explanation: This information message is issued for each Centera clip deleted by the CTVCLMIG utility. This message is followed by message MIG5E3I, which contains the deleted clip name.
The variables in this message are:
- rc - return code from the EMC Centera API
- rsn - reason code from the EMC Centera API

Corrective Action: No action is required.
**MIG5EBE CENTERA RETENTION CLASS** `className` **READ ERROR, RC= rc, REASON CODE= rsn**

**Explanation:** A `className` error was detected while retrieving the retention period for the specified retention class. Usually this message is issued when the specified retention class does not exist in the EMC Centera definitions.

- `className` - Class name.
- `rc` - Return code from the EMC Centera API.
- `rsn` - Reason code from the EMC Centera API.

The migration job stops with a return code of 12. Files are not migrated.

**Corrective Action:** Check the specified `className` in the migration mission definition CENTERA RETENTION CLASS field. If the specified `className` is incorrect, correct it and reorder the migration mission. Otherwise contact EMC Centera technical support.

**MIG5ECE MEDIA NAME** `mediaName` **NOT FOUND IN IOASPRM**

**Explanation:** This message is issued by the CTVCLMIG utility if the media name kept in the $SYSDATA record is not found in the IOASPRM member.

- `mediaName` - media name of the migrated report

The CTVCLMIG utility stops with a return code of 8.

**Corrective Action:** Add the specified `mediaName` in the message media to the IOASPRM member and rerun the CTVCLMIG utility.

**MOF messages**

This group includes messages for the Control-O product.

**Messages MOF100 through MOF1xx**

This group includes messages for the Control-O product.

**MOF15BE ORDER/FORCE FAILED. CONTROL-O MONITOR IS INACTIVE**

**Explanation:** An O/F (Order/Force) command was specified, but cannot be executed because the Control-O monitor is not active.

The Order/Force command is not executed.

**Corrective Action:** Start the Control-O monitor before ordering rules.

**MOF15CI TABLE** `tableName` **ODATE** `date` **WILL BE ORDERED BY CONTROL-O**

**Explanation:** This information message indicates that an ORDER or FORCE request was made for rule table `tableName` odate `date`. Control-O will order or force the table.
Corrective Action: No action is required.

MOF15EE FORCE ORDER REJECTED BY USER EXIT

Explanation: An ORDER or FORCE command was specified but was rejected by security exit CTOSE01. Security exit CTOSE01 has determined that you are not authorized to perform ORDER or FORCE commands. The ORDER or FORCE command is not executed.

Corrective Action: If you think you should be authorized to perform these commands, please contact your INCONTROL administrator.

MON messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages MON100 through MON1xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

MON100I CONTROL-D MONITOR STARTED

Explanation: This is a general information message which is issued when the Control-D monitor is started.

Corrective Action: No action is required.

MON102E INVALID PARM GIVEN TO MONITOR. PARM CAN BE " " OR "1" FOR PRIMARY MONITOR AND "2-9" FOR SECONDARY MONITORS

Explanation: Highlighted, unrollable message.

The value of the PARM field in the Control-D monitor procedure or the secondary monitor procedure is invalid. The Control-D monitor or the secondary monitor shuts down.

Corrective Action: Check the value defined in the CTDMON# field in CTDPARM. Change the PARM field in the appropriate procedure to correspond to this value and start Control-D.

For example, for the CONTROL2 procedure: 

```
//CONTROLD EXEC PGM=CTMMON,PARM='2'
```

MON103E INVALID MODIFY PARAMETER. VALID PARAMETERS ARE:

Explanation: An invalid parameter was passed to the File Transfer monitor by an operator modify command. A list of valid modify parameters is displayed on the operator console following this message. The operator modify command is rejected.

Corrective Action: Enter an operator modify command with valid parameters.
MON104S BLDL/ATTACH FAILED FOR TASK *taskName*

**Explanation:** Initialization of one of the Control-D monitor internal tasks failed. Possible causes are:
- The task is not found in the IOA Load library.
- Insufficient memory for Control-D monitor.

The exact reason (system code) can be found on the computer log.

Control-D monitor shuts down.

**Corrective Action:** Call your system programmer for assistance. If necessary, increase the Control-D monitor REGION size.

MON105S UNRECOVERABLE ERROR ENCOUNTERED

**Explanation:** Unrecoverable error in the operation of the Control-D monitor.

The IOA Log should contain a previous message concerning the error.

The Control-D monitor will shut down with user abend 0006.

**Corrective Action:** Call your system programmer for assistance. If the problem is not resolved, call BMC Software Customer Support for assistance.

MON106S ONE OF THE SUBTASKS HAS ABENDED

**Explanation:** One of the Control-D monitor internal subtasks has abended.

The Control-D monitor will shut down with user abend 0006. A dump of the abending task which is needed for problem resolution will also be included in the output.

**Corrective Action:** Call your system programmer for assistance. If the problem is not resolved, call BMC Software Customer Support for assistance.

MON107I SHUT DOWN UPON REQUEST FROM OPERATOR

**Explanation:** This information message is a Control-D monitor shut down message when the shut down was requested by the operator.

Control-D monitor shuts down.

**Corrective Action:** No action is required.

MON109W CONTROL-D PASSWORD WILL EXPIRE IN *n* DAYS. NOTIFY THE IOA ADMINISTRATOR

**Explanation:** The password for testing Control-D will expire in *n* days.

In *n* days, the Control-D monitor will stop operating.

**Corrective Action:** Please contact your IOA administrator.

MON110S PASSWORD HAS EXPIRED. NOTIFY THE IOA ADMINISTRATOR

**Explanation:** The password for testing Control-D has expired.
The Control-D monitor no longer operates.  
**Corrective Action:** Please contact your IOA administrator.

**MON111W NO MORE WORK LEFT**  
**Explanation:** Internal Control-D error.  
**Corrective Action:** Have your system programmer call BMC Software Customer Support immediately.

**MON112W MISSIONS LEFT IN ACTIVE MISSIONS FILE CANNOT BE DONE**  
**Explanation:** Internal Control-D error.  
**Corrective Action:** Have your system programmer call BMC Software Customer Support immediately.

**MON113W CONTROL-D MONITOR SHUTTING DOWN FOR A NEW DAY**  
**Explanation:** Highlighted, unrollable message.  
Normal message of Control-D monitor shutting down for the New Day procedure.  
The Control-D monitor shuts down once a day at a specific time for the New Day procedure. For more information on the New Day procedure, see the Control-D and Control-V User Guide.  
Control-D monitor will shut down and start the New Day procedure (CTDNDAY). When it finishes executing, it will start the Control-D monitor again.  
**Corrective Action:** No action is required.

**MON116S OPEN OF ACTIVE MISSIONS FILE FAILED - DDNAME "DAAMF"**  
**Explanation:** Highlighted, unrollable message.  
Open of Control-D Active Missions file failed (the DAAMF DD statement). Possible causes are:  
- The DAAMF DD statement is missing.  
- The data set described by the DAAMF DD statement is not the Control-D Active Missions file.  
- The data set described by the DAAMF DD statement is the Control-D Active Missions file, but it is of another Control-D monitor, or of a different Control-D version.  
The Control-D monitor will shut down.  
**Corrective Action:** Correct the JCL for the Control-D monitor.

**MON117S ACTIVE MISSIONS FILE IS BEING FORMATTED NOW**  
**Explanation:** Highlighted, unrollable message.  
The New Day monitor has been brought up while the Active Missions file is under formatting.  
The New Day procedure did not finish formatting the file, either because it was still working, or because it abended. It is impossible to start the Control-D monitor until the New Day procedure finishes executing successfully.  
The Control-D monitor shuts down.
Corrective Action: Check how the New Day procedure finished executing. All the problems of the New Day procedure must be corrected before restarting the Control-D monitor. Note, however, that if an IPL occurred during the previous run of the New Day procedure, it will correct itself when restarted. Therefore, it can be restarted without correction.

MON118S FILE ALLOCATED TO DDNAME "DAAMF" IS NOT THE EXPECTED ACTIVE MISSIONS FILE

Explanation: Highlighted, unrollable message.
The data set described by the DAAMF DD statement is not the expected Control-D Active Missions file. This could be due to one of the following:
- The file allocated to the DAAMF DD statement is not the Control-D Active Missions file.
- The file allocated to the DAAMF DD statement is the Control-D Active Missions file, but it is of a different version or of a different Control-D monitor.

Control-D monitor will shut down.

Corrective Action: Correct JCL for the Control-D monitor.

MON119S ACTIVE MISSIONS FILE IS DAMAGED - NOTIFY THE IOA ADMINISTRATOR

Explanation: Highlighted, unrollable message.
The contents of the Active Missions file have been corrupted. The Active Missions file is marked as FORMAT during New Day procedure processing, and marked as FREE at successful completion. Currently, the file is not marked as FORMAT, nor as FREE.

Control-D monitor will shut down.

Corrective Action: Call your system programmer for assistance. Examine messages issued during the NEWDAY procedure, take appropriate corrective action, and then rerun the NEWDAY procedure. If the problem recurs, take appropriate action on the Active Mission file: To compress or copy the Active Mission file, use the CTDCAMF utility. To reformat the Active Mission file use the CTDFRAMF utility.

MON120I CONTROL-D MONITOR SHUTTING DOWN

Explanation: Highlighted, unrollable message.

This information message is a general Control-D message issued when shutting down the Control-D monitor by a P command, or on certain internal Control-D events. The IOA Log should contain additional messages concerning the reason for shutting down.

Control-D monitor shuts down.

Corrective Action: No action is required.

MON121S CONTROL-D MONITOR ENDED WITH ERROR

Explanation: Highlighted, unrollable message.
Control-D monitor ended with an error. The IOA Log should contain additional messages concerning the specific error.

Control-D monitor shuts down.

**Corrective Action:** Check the IOA Log or the computer log for the reason. Call the system programmer for assistance if needed. Try to start the Control-D monitor again as soon as possible.

**MON122W YOUR CONTROL-D IS ALREADY ACTIVE. QNAME q/Name**

**Explanation:** Highlighted, unrollable message.

**Corrective Action:** No action is required.

**MON123I CONTROL-D INTERVAL IS SET TO \( nn \) SECONDS**

**Explanation:** This information message is produced as a result of setting a Control-D sleeping interval by an operator command.

For more details refer to the *INCONTROL for z/OS Administrator Guide*.

Control-D monitor will “wake up” every \( nn \) seconds and check what it has to do.

**Corrective Action:** No action is required.

**MON124E INTERVAL MUST BE A TWO DIGIT NUMBER BETWEEN 03-99 SECONDS**

**Explanation:** An invalid Control-D sleeping interval was specified in an operator modify command. The Control-D sleeping interval must be a 2-digit number from 03 through 99 seconds. For more details, see the *INCONTROL for z/OS Administrator Guide*.

**Corrective Action:** Enter a valid interval.

**MON125I validModifyParm**

**Explanation:** This message displays a valid parameter that can be used in MODIFY.

**Corrective Action:** No action is required.

**MON126I NEW EXIT exitName LOADED**

**Explanation:** This information message indicates a successful execution of the “exit refresh” operator modify command.

A new copy of a Control-D user exit was loaded successfully.

For more information, see the *INCONTROL for z/OS Administrator Guide*.

**Corrective Action:** No action is required.

**MON127I NEWDEST COMMAND ACCEPTED**

**Explanation:** This information message is the result of acceptance of an operator NEWDEST command passed to the Control-D monitor.
The next time that the Control-D monitor tries to SHOUT a message, it will load a new dynamic destination table.

**Corrective Action:** No action is required.

**MON128S RECIPIENT TREE WAS NOT LOADED BECAUSE OF ERROR - CONTROL-D IS TERMINATING**

**Explanation:** The loading of the Control-D Recipient Tree was unsuccessful.

As part of its initialization processing, the Control-D monitor attempts to load the Recipient Tree. However, the loading of the Recipient Tree was not successful.

The Control-D monitor will shut down.

**Corrective Action:** There are additional messages describing the problem on the IOA Log and the system log.

**MON129I ERROR WHILE LOADING EXIT exitName. EXIT NOT LOADED**

**Explanation:** This information message indicates that the Control-D monitor failed to load the exitName user exit.

Common reasons for failure include:

- The IOA Load library is in the Linklist, and someone has updated the library without performing a refresh for the LLA.
- The last assembly or linkage of exitName failed.
- There is insufficient memory to load this exit.

The Control-D monitor will continue to run. However, the exitName user exit will not be activated.

**Corrective Action:** Check the system log for the reason for the failure.

**MON12AI CONTROL-D MONITOR IS SUSPENDING FOR A NEW DAY**

**Explanation:** Highlighted, unrollable message.

This information message indicates that the Control-D monitor is being suspending while the New Day procedure is running in internal mode.

The Control-D monitor is suspended once a day at a specific time for the New Day procedure when it runs in internal mode. For more information on the New Day procedure, see the *INCONTROL for z/OS Administrator Guide*.

The Control-D monitor suspends all mission processes. When it finishes, message MON12CI is issued.

**Corrective Action:** No action is required.

**MON12BI CONTROL-D MONITOR IS SUSPENDING BY OPERATOR REQUEST**

**Explanation:** Highlighted, unrollable message.

This information message indicates that the Control-D monitor is being suspending due to an operator request.

The Control-D monitor suspends all mission processes. When it finishes, message MON12CI is issued.
**Corrective Action:** No action is required.

**MON12CI CONTROL-D MONITOR SUSPENDED**

**Explanation:** Highlighted, unrollable message.

This information message indicates that the Control-D monitor is being suspended while the New Day procedure is running in internal mode.

The Control-D monitor has started the New Day subtask. When it finishes executing, the monitor will resume and start the New Day procedure (CTDNDAY).

**Corrective Action:** No action is required.

**MON12DI CONTROL-D MONITOR RESUMED**

**Explanation:** Highlighted, unrollable message.

This information message indicates that the Control-D monitor has resumed after being suspended for the New Day procedure or by operator request.

The Control-D monitor resumes all mission processes.

**Corrective Action:** No action is required.

**MON12EI CONTROL-D NEW DAY TIME STAMP IS timeStamp**

**Explanation:** This information message indicates that the New Day process has set the timeStamp time stamp as the time of a new day.

The timeStamp timestamp is a hexadecimal representation of the time-of-day clock value used for synchronization for the CTDDELRP utility and for backup missions. It is displayed for tracking and debugging purposes.

For an explanation of the synchronization process, see message MONA59I.

**Corrective Action:** No action is required.

**MON12FE UNABLE TO UPDATE THE MISSION STATUS**

**Explanation:** The Control-D monitor is unable to update the status of a decollation mission, which was suspended during a New Day procedure that was executing in internal mode. The monitor begins to process such a mission before the New Day procedure begins, but only finishes after the procedure ends. The reason is that the mission was updated outside of the Control-D monitor.

The Control-D monitor continues to run. However, the mission status is not updated.

**Corrective Action:** Restart the Control-D monitor.

**MON12GS NEWDAY SUBTASK ENDED WITH ERROR**

**Explanation:** A New Day subtask ended with an error or abended.

The Control-D monitor shuts down with user abend 0006.

A dump of the abending task which is needed for problem resolution is also included in the output.

**Corrective Action:** No action is required.
MON12HS INVALID NEWDAY MODE

**Explanation:** The incorrect NDAYMODE parameter was specified in the start command for the Control-D monitor or the CTDNDAY procedure.

Valid values are:

- **INT** - internal mode. The Control-D or Control-V monitors execute simultaneously with the New Day procedure.
- **EXT** - external mode. The Control-D monitor starts the New Day procedure, and then shuts down the Control-D monitor or the CTDNDAY procedure.

The Control-D monitor or the CTDNDAY procedure shuts down.

**Corrective Action:** Restart the Control-D monitor or the CTDNDAY procedure with the correct parameter.

MON130I COMMAND "cmd" ACCEPTED FOR PRINTER prtr

**Explanation:** This information message indicates acceptance of an operator STARTPRT or STOPPRT command passed to the Control-D monitor.

The requested printer is opened (started) or closed (stopped).

**Corrective Action:** No action is required.

MON131I TREE WAS NOT LOADED BECAUSE IT IS IN USE BY ONE OF THE SUBTASKS - TRY AGAIN LATER

**Explanation:** This information message is a result of an operator LOADTREE command passed to the Control-D monitor.

The Recipient Tree is used by several subtasks of the Control-D monitor. One of the subtasks had exclusive control of the Recipient Tree for a short period of time.

The new Recipient Tree is not loaded. Control-D continues using the old Recipient Tree.

**Corrective Action:** Try to load a new Recipient Tree later.

MON132E PRINTER prtr IS NOT DEFINED TO CONTROL-D

**Explanation:** Result of an operator STARTPRT or STOPPRT command passed to the Control-D monitor.

The PRINTER Control-D Installation Parameter defines the logical printers on which Control-D can print. However, the printer name prtr is not defined in the PRINTER Installation Parameter.

The requested STARTPRT or STOPPRT function is not performed.

**Corrective Action:** Enter the correct printer name in the STARTPRT or STOPPRT command.

MON133I STARTING THE CONTROL-D PRINTERS CONTROL MONITOR - prtr

**Explanation:** This information message is issued during normal initialization processing in the Control-D monitor.

The Control-D monitor activates the Printers Control monitor prtr as an independent started task.
The Control-D monitor invokes the started task prtr. This name is taken from the PRTSTC Control-D Installation Parameter.

**Corrective Action:** No action is required.

**MON134I** WAITING FOR THE CONTROL-D PRINTERS CONTROL STC *(name)* TO START

**Explanation:** This information message indicates that the Printers Control monitor has been activated by the Control-D monitor.

The Control-D monitor waits for the Printers Control started task to start executing. This message can appear more than once. If, after a number of times, the Control-D monitor cannot find the Printers Control monitor, it assumes that it has failed and the Control-D monitor shuts down.

**Corrective Action:** No action is required.

**MON135E** CONTROL-D PRINTERS CONTROL MONITOR *monName* ENDED ABNORMALLY. CONTROL-D SHUTTING DOWN

**Explanation:** Highlighted, unrollable message.

The Printers Control monitor *monName* was shut down due to errors.

The Control-D monitor will shut down.

**Corrective Action:** Check the IOA Log for additional clarification messages on the reason for the shutdown.

**MON136I** STOPPING THE PRINTERS CONTROL MONITOR

**Explanation:** This information message indicates that a shutdown process has been issued from the Control-D monitor.

Before the Control-D monitor shuts itself down, it will shut down the Printers Control monitor first.

Control-D will shut down.

**Corrective Action:** No action is required.

**MON137I** WAITING FOR THE PRINTERS CONTROL STC *(name)* TO TERMINATE

**Explanation:** This information message indicates that a shutdown process has been issued from the Control-D monitor.

The Control-D monitor has issued the command to shut down the Printers Control monitor, and is now waiting for a response. This message can appear more than once, but not more than 10 times.

**Corrective Action:** No action is required.

**MON138E** WAITING TOO LONG FOR THE PRINTERS CONTROL STC *(name)*. STC BEING CANCELLED

**Explanation:** Highlighted, unrollable message.
A shutdown process issued from the Control-D monitor.
The Control-D monitor has issued the command to the Printers Control monitor to shut itself down, but there was no response from the Printers Control monitor.
The Printers Control monitor is cancelled (operator command C name).

**Corrective Action:** Check the system log, the IOA Log, and the JCL of the Control-D monitor and the Printers Control monitor.

**MON139I GENERIC JOB DECOLLATION IS ACTIVE ON CLASSES (classList)**

**Explanation:** This information message indicates that the Generic decollation from the classList Generic classes is now active. The Control-D monitor issues this message when starting, after new day processing and after successfully executing the STARTGEN command.

Control-D will start decollating syouts from the classList Generic classes. For more information, see the description of generic processing in the INCONTROL for z/OS Administrator Guide.

**Corrective Action:** No action is required.

**MON13AE GENERIC DECOLLATION CANNOT BE ACTIVATED. GENCLAS IS NOT DEFINED IN CTDPARM**

**Explanation:** The operator issued the command ‘F CONTROLD,STARTGEN’ but no generic classes were defined in CTDPARM.

The command is ignored.

**Corrective Action:** For information on specifying generic classes in CTDPARM, see the Control-D chapter of the INCONTROL for z/OS Installation Guide, and proceed accordingly.

**MON13BI PRINTER prtrId DEST dest TYPE type IS OPEN**

**Explanation:** This information message indicates that the prtr_id logical printer has opened following a STARTPRT command issued by the operator.

The variables in this message are:
- **prtrId** - the identity of the logical printer that has opened
- **dest** - the value of the Dest Printer Definition parameter
- **type** - the value of the Type Printer Definition parameter

For more information on these Printer Definition parameters, see the Control-D chapter of the INCONTROL for z/OS Installation Guide.

**Corrective Action:** No action is required.

**MON13CI STOPPING THE MONITOR monName**

**Explanation:** This information message is issued when the monitor stops as a result of receiving the modify command /F CONTROLD,STOP=monName.

**Corrective Action:** No action is required.
INCONTROL for z/OS Messages Manual

MON13DE THE MONITOR monName WAS NOT ORIGINALLY ACTIVE.

Explanation: The modify command /F CONTROLD,STOP=monName was issued, but the monName monitor was not activated when Control-D started.
Control-D cannot start a new monitor that was not activated when Control-D started.
The new monitor is not started.
Corrective Action: Correct the value of monName in the modify command.

MON13EI MQ DECOLLATION IS ACTIVE

Explanation: This information message indicates a successful execution of the STARTMQ operator modify command.
MQ decollation for MQ Queues is now active.
Control-D will start decollating messages from MQ Queues.
Corrective Action: No action is required.

MON140I GENERIC JOB DECOLLATION IS BEING DEACTIVATED

Explanation: This information message indicates a successful execution of the STOPGEN operator modify command.
Deactivation of Generic decollation from all Generic classes is in process.
Control-D will not start new decollations from Generic classes. Currently executing (decollating) missions will finish the processing of jobs whose output processing has already started.
Corrective Action: No action is required.

MON141I STARTING THE SECONDARY CONTROL-D MONITOR monName

Explanation: This information message is a normal start message for initialization processing of the Control-D monitor monName.
The Control-D monitor activates the secondary monitor as an independent started task.
The Control-D monitor invokes the started task name, CONTROL ?, where ? indicates the number of the monitor.
Corrective Action: No action is required.

MON142I WAITING FOR THE SECONDARY CONTROL-D MONITOR monName TO START

Explanation: This information message indicates that although a start command has been issued by the Control-D monitor, the Control-D secondary monitor monName has not yet started.
This is due to one of the following:
JES queues are busy.

The secondary monitor procedure does not exist in the procedure library (PROCLIB).

There is a JCL error in the secondary monitor procedure.

If this situation is not corrected, the Control-D monitor makes up to eight (8) attempts to initialize. After eight (8) unsuccessful attempts, the Control-D monitor shuts down.

**Corrective Action:**

- If JES queues are busy, no action is required.
- If there is a problem with the secondary monitor procedure, correct it, and start Control-D.

**MON143E SECONDARY CONTROL-D MONITOR monName ENDED ABNORMALLY. CONTROL-D SHUTTING DOWN**

**Explanation:** Highlighted, unrollable message.

Secondary Control-D monitor monName ended with errors. The IOA Log should contain additional messages concerning specific errors.

The Control-D monitor and the secondary monitor monName shut down.

**Corrective Action:** Check the IOA Log and the system log for the cause of the problem. If necessary, call the system programmer for assistance. Try to start the Control-D monitor again as soon as possible.

**MON144I WAITING FOR CONTROL-D SECONDARY MONITOR monName TO TERMINATE**

**Explanation:** This information message indicates that a shutdown process command was issued from the Control-D monitor.

The Control-D monitor has issued a shutdown command to the secondary monitor monName, and is now waiting for the secondary monitor to shut down. This message may appear more than once. The secondary monitor will shut down at the end of the currently executing decollation.

**Corrective Action:** No action is required.

**MON145I UNABLE TO READ THE MEMBER CTDPLEX FROM THE CTD PARM LIBRARY. RC=rc. THE SYSPLEX OPTION IS NOT ACTIVE.**

**Explanation:** The CTDPLEX member was not found in the Control-D PARM library.

In this message, rc is the error return code. For more information on these codes, see the description of IOAMEM in the INCONTROL for z/OS Administrator Guide.

The use of multiple monitors using SYSPLEX support is not activated.

**Corrective Action:** Ensure that the CTDPLEX member is present in the Control-D PARM library.

**MON146I MQ DECOLLATION IS BEING DEACTIVATED**

**Explanation:** This information message indicates a successful execution of the STOPMQ operator modify command.
Deactivation of MQ decollation from all MQ QUEUES is in process.
Control-D will not start new decollations from MQ QUEUES, although currently existing decollating missions will finish the processing of messages whose output processing has already begun.

**Corrective Action:** No action is required.

**Messages MON700 through MON7xx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**MON778I CONTROL-D MAIN MONITOR ONLY**

**Explanation:**
This information message indicates that the user tried to issue a MODIFY or STOP command to either the Control-D Printers Control monitor or to a Control-D secondary monitor. A MODIFY or STOP command to the Control-D Printers Control monitor or a Control-D secondary monitor can only be issued by the Control-D primary monitor.

The MODIFY or STOP command is ignored.

**Corrective Action:** No action is required.

**Messages MONA00 through MONAxx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**MONA59I SYNCHRONIZATION WITH BACKUP/CTDDELRP STARTED**

**Explanation:** This information message is the normal message which is issued when the Control-D monitor receives a synchronization request from a Backup Mission or from the CTDDELRP utility.

Before starting synchronization, the CTDDELRP utility or a Backup Mission issues a synchronization request to the decollation task on each Control-D monitor (if more than one is active) to ensure that the report deletion/backup process is coordinated with each decollation task.

Upon receiving a request, each decollation task finishes its current decollation and closes all multijob CDAM data sets. It then issues a timestamp to the requesting utility or mission and waits for a response from that utility or mission.

The utility or mission waits until all monitors have responded. It selects a timestamp returned by the monitors and notifies Control-D decollation tasks of the timestamp selected. Synchronization is then complete and processing continues.

Coordination of the processes is achieved using an algorithm based on the timestamp.

**Corrective Action:** No action is required.
MPR messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages MPR700 through MPR7xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

MPR775I  monName CONTROL-D PRINTERS CONTROL MONITOR STARTED

Explanation: This information message indicates that Control-D Printers Control monitor monName started.

Corrective Action: No action is required.

MPR776E  monName CONTROL-D PRINTERS CONTROL MONITOR ALREADY ACTIVE

Explanation: Highlighted, unrollable message.
Someone tried to start Control-D Printers Control monitor monName, which is already active. The Control-D Printers Control monitor is automatically activated from the Control-D monitor. It should not be activated manually.
The newly-started Control-D Printers Control monitor will shut down.

Corrective Action: No action is required.

MPR777S  monName CONTROL-D PRINTERS CONTROL MONITOR ENDED WITH ERRORS

Explanation: Highlighted, unrollable message.
Control-D Printers Control monitor monName ended with errors. The IOA Log should contain additional messages concerning each specific error.
The Control-D Printers Control monitor and the Control-D monitor will shut down.

Corrective Action: Check the IOA Log and the system log for the reason. Call the system programmer for assistance if needed. Try to start the Control-D monitor again as soon as possible.

MPR778I  monName ALL MODIFY/STOP COMMANDS MUST BE ISSUED BY CONTROL-D MAIN MONITOR ONLY

Explanation: This information message indicates that the user tried to issue a MODIFY or STOP command to either the Control-D Printers Control monitor or to a Control-D secondary monitor. A MODIFY or STOP command to the Control-D Printers Control monitor or a Control-D secondary monitor can only be issued by the Control-D primary monitor.
The MODIFY or STOP command is ignored.
INCONTROL for z/OS Messages Manual

Corrective Action: No action is required.

MPR779I monName CONTROL-D PRINTERS CONTROL MONITOR ENDED
Explanation: Highlighted, unrollable message.
This information message is the general message which is issued when the Control-D Printers Control monitor monName ends.
Corrective Action: No action is required.

MPR77AE INCORRECT PARM FIELD IN PRINT JOB jobName
Explanation: The print mission running as a batch job received an invalid PARM field value from the EXEC statement, or the PARM field is missing from the EXEC statement.
The value PARM is the COM record number. This value must be 4 digits long. If it is not, or if the PARM field is not in the EXEC statement, this message is issued.
The job ends abnormally with a return code of 116, and the print mission ends NOT OK.
Corrective Action: Correct the EXEC statement in the print skeleton, and rerun the print mission.

Messages MPR900 through MPR9xx
This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

MPR980S monName LOAD OF CONTROL-D SPECIAL ROUTINES FAILED
Explanation: Highlighted, unrollable message.
Initialization of the monName Printers Control monitor failed because of missing modules.
The Control-D Printers Control monitor and the Control-D monitor will shut down.
Corrective Action: Determine who deleted the missing load modules and why. Restore these modules from a backup tape of the IOA Load library, and bring up the Control-D monitor.

MPR981S proc RECIPIENT TREE WAS NOT LOADED BECAUSE OF ERROR – CONTROL-D PRINTERS CONTROL MONITOR IS TERMINATING
Explanation: Highlighted, unrollable message.
The Recipient Tree was not loaded because of an error.
The Control-D Printers Control monitor and the Control-D monitor will shut down.
Corrective Action: Look at the IOA Log and the computer log for additional error messages. These additional messages pinpoint the specific problem encountered while loading the Recipient Tree.
MPR982I *monName* CONTROL-D PRINTER MONITOR IS WAITING FOR ONE OR MORE PRINT SUBTASKS TO TERMINATE

**Explanation:** This information message indicates that a shutdown process command was issued from the Control-D monitor, but the Control-D Printers Control monitor is still printing.

The Printing Mission that is still printing can be found in the Active Missions Status screen.

If the Printers Control monitor is still printing when a shutdown request is issued, it continues to print. The Control-D monitor does not shut down until printing is finished.

**Corrective Action:** If you allow the Printing Mission to finish printing, no action is required.

To shut down the Control-D monitor immediately, change the status of the active Printing Mission in the Active Missions Status screen (AMS) to HOLD. Free it after the Control-D monitor has restarted.

MPR983E *monName* CONTROL-D PRINTER MONITOR IS TERMINATING EVEN THOUGH ONE OR MORE PRINT SUBTASKS HAS NOT TERMINATED

**Explanation:** Highlighted, unrollable message.

The Control-D monitor is shutting down the Control-D Printers Control monitor *monName*.

The Control-D monitor issued a command to shut down the Printers Control monitor *monName*. The Printers Control monitor was not shut down because one or more print subtasks were awaiting completion. Under certain circumstances, the Control-D monitor forces shutdown of the Printers Control monitor after a default site-specific length of time.

The Control-D Printers Control monitor *monName* shuts down.

**Corrective Action:** No action is required.

MPR98AI PRINT MISSION POSTPONED. MAX NUMBER OF SUBTASKS IS REACHED IN THE CURRENT MONITOR

**Explanation:** This information message indicates that the current print mission cannot be processed because the print monitor is already processing the maximum number of missions as defined in optional wish WD2618.

The print mission is delayed until one of the missions being processed terminates.

**Corrective Action:** If this message appears frequently, it is recommended to increase the maximum number of print missions the print monitor can process concurrently.

MPR98BI PRINT MISSION CONTINUES PROCESSING

**Explanation:** This information message indicates that the print monitor resumed processing a mission that was postponed (see message MPR98AI)

**Corrective Action:** No action is required.
MRG messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages MRG100 through MRG1xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

MRG100I MERGE PROCESSING STARTED

Explanation: This information message indicates that the Merge utility began executing a MERGE command, requesting that either two Active Job files or two History files be merged.

Corrective Action: No action is required.

MRG101I MERGE PROCESSING ENDED

Explanation: This information message indicates that the Merge utility has completed execution.

Corrective Action: No action is required.

MRG102I {JOB | GROUP} name ODATE odate ORDERID oldOrderId MERGED - NEW ORDERID newOrderId

Explanation: This information message indicates that the name job or group, with order date odate and order ID oldOrderId, was successfully copied into the target (merged) Active Jobs file.

If the parameter UPDORDID was specified, the job will have a new orderid (newOrderId) in the merged file. If the parameter UPDORDID was not specified, the original order ID is not changed. In this case, the values of oldOrderId and newOrderId in the message will be identical.

Corrective Action: No action is required.

MRG103S OPEN OF SOURCE/TARGET FILE FAILED

Explanation: An attempt to open a Control-M Active Jobs file or History file failed. This may be due to a missing DD statement referencing the file.

The program terminates with a non-zero return code.

Corrective Action: Correct the JCL and submit the job again.

MRG104S SOURCE/TARGET FILE IS NOT 'AJF' OR 'HST'

Explanation: One of the files used as input or output to the Merge utility is not recognized as an Active Jobs file or History file.

The program terminates with a non-zero return code.

Corrective Action: Correct the JCL and submit the job again.
MRG105S OPEN OF PARAMATER FILE FAILED

**Explanation:** The file containing the command input to the Merge utility, referenced by the DAMRGIN DD name, could not be opened.

The program terminates with a non-zero return code.

**Corrective Action:** Correct the JCL and submit the job again.

MRG106E COPY TO MERGED FILE FAILED: *cause* REASON CODE: *rsn*

**Explanation:** An error occurred while copying records from the source Active Jobs file or History file to the target Active Jobs file or History file.

The variables in this message are:

- *cause* - the cause of the error
- *rsn* - the reason code, which may contain additional information

The program terminates with a non-zero return code.

**Corrective Action:** No action is required.

MRG107E MERGE PROCESSING MODULE NOT FOUND

**Explanation:** An attempt to load the CTMHCP module failed. The load may have failed because the module does not exist in the IOA Load library.

The program terminates with a non-zero return code.

**Corrective Action:** Verify that the IOA Load library contains the required module.

MRG108S SOURCE/TARGET FILE RELEASE LEVEL NOT SUPPORTED

**Explanation:** The source or target file specified for the Merge utility was created under an unsupported version. The Merge utility cannot process such a file, and terminates with a non-zero return code.

**Corrective Action:** Verify that both the source and target files are of supported versions. (The version can be found in record 0 of each file.)

MRG109S SOURCE AND TARGET FILE TYPE MISMATCH

**Explanation:** The source and target file types are not identical. They must both be either Active Job files or History files.

The program terminates with a non-zero return code.

**Corrective Action:** Verify that the file types are identical. The file type can be found in record 0 of each file.

MRG110I MERGE PROCESSING FOR FILE TYPE: AJF/HST

**Explanation:** This information message indicates the type of merge being processed by the Merge utility. Merging of either two Active Job files or two History files is supported.

**Corrective Action:** No action is required.
MRG111I SOURCE FILE CONTAINS NO JOBS

**Explanation:** This information message indicates that no jobs were found in the file used as input to the Merge utility.

The program terminates with a non-zero return code.

**Corrective Action:** No action is required.

MSG messages

This group includes messages for the Control-O product.

Messages MSGI 00 through MSGI xx

This group includes messages for the Control-O product.

MSGI 18I *text*

**Explanation:** This information message is an echo message showing the /CTO command as received by the DFSAOE00 interface module from IMS.

**Corrective Action:** No action is required.

MTO messages

This group includes messages for the Control-O product.

Messages MTO100 through MTO1 xx

This group includes messages for the Control-O product.

MTO100I \{CONTROL-O | CTMCMMEM\} RELEASE \(x.x.xx\)- MONITOR STARTED

**Explanation:** This information message is a normal message issued when the Control-O or CMEM monitor is started. The version of the monitor that is starting \(x.x.xx\) is indicated in the message text.

**Corrective Action:** No action is required.

MTO101S MONITOR STARTED WITH INCORRECT STORAGE KEY. CHECK PPT DEFINITION

**Explanation:** During initialization self-checks, the Control-O or CMEM monitor discovered that a storage key was specified that was not in the range from 1 through 7. The Control-O or CMEM monitor only works using storage keys 1 through 7.

The monitor terminates.

**Corrective Action:** Perform the following steps:
1. Define the CTOMTO7 in SYS1.PARMLIB(SCHED xx) with a key in the range from 1 through 7.
2. Refresh the SCHED xx using the MVS SET command.
3. Stop the Control-D subsystem by means of the command S IOASTERM,TYPE=D
4. Disconnect the IOA subsystem by means of the command S IOASDISC,SSNAME=ioa_subsystem
5. Start the Control-O or CMEM monitor.
6. Start the Control-D monitor and subsystem.

**MTO102I CONTROL-D FUNCTIONS ENABLED**

**Explanation:** This information message indicates that during Control-O monitor startup, an installed Control-D was detected. Therefore, the Control-M function DO CTD REQ was enabled.

**Corrective Action:** No action is required.

**MTO103W CONTROL-D FUNCTIONS DISABLED. "DO CTD REQ." WILL BE REJECTED**

**Explanation:** During Control-O monitor startup, no installed Control-D was detected. Therefore, the Control-M function DO CTD REQ was disabled.

Monitor startup continues.

**Corrective Action:** Notify your INCONTROL administrator.

**MTO104S BLDL / ATTACH FAILED FOR TASK taskName**

**Explanation:** Initialization of one of the Control-O or CMEM monitor internal tasks failed.

Possible causes are:
- The task is not found in the IOA Load library.
- There is insufficient storage for the Control-O or CMEM monitor.

The Control-O or CMEM monitor shuts down.

**Corrective Action:** Call your systems programmer for assistance. If necessary, increase the Control-O or CMEM REGION size.

**MTO105S UNRECOVERABLE ERROR ENCOUNTERED**

**Explanation:** An unrecoverable error occurred in the operation of the Control-O or CMEM monitor.

The IOA Log usually contains a previous message concerning the error.

The Control-O or CMEM monitor shuts down with User Abend 0006.

**Corrective Action:** Call your systems programmer for assistance. If the problem is not resolved, call BMC Software Customer Support for assistance.

**MTO106S SUBTASK subtask ABENDED abCode**

**Explanation:** The identified Control-O or CMEM monitor internal subtask has abended.
The Control-O or CMEM monitor shuts down.

**Corrective Action:** Call your system programmer for assistance. If the problem is not resolved, contact BMC Software Customer Support for assistance.

**MTO107I SHUT DOWN UPON REQUEST FROM OPERATOR**

**Explanation:** This information message indicates that the Control-O or CMEM monitor is shutting down upon operator request.

The Control-O or CMEM monitor is shut down.

**Corrective Action:** No action is required.

**MTO108S UNABLE TO ESTABLISH THE CROSS MEMORY ENVIRONMENT. STEP stepName**

**Explanation:** Control-O or CMEM monitor could not establish the cross memory environment required for its operation.

**Corrective Action:** Call your systems programmer for assistance. If the problem is not resolved, call BMC Software Customer Support for assistance and provide the step name indicated in the message.

**MTO109I {CONTROL-O | CTMCMEM} MONITOR IS SHUTTING DOWN. A NEW MONITOR WAS STARTED**

**Explanation:** This information message indicates that a new Control-O or CMEM monitor has been started. This message is issued by the previous Control-O or CMEM monitor to indicate that it is shutting down.

The Control-O or CMEM monitor that was operating previously shuts down.

**Corrective Action:** No action is required.

**MTO10AI CONTROL-M FUNCTIONS ENABLED**

**Explanation:** This information message indicates that during Control-O or CMEM monitor startup, Control-M was detected, and therefore, Control-M functions DO FORCEJOB and DO RESOURCE were enabled.

**Corrective Action:** No action is required.

**MTO10BW CONTROL-M FUNCTIONS DISABLED. "DO FORCEJOB / RESOURCE" WILL BE REJECTED**

**Explanation:** During Control-O or CMEM monitor startup, because no installed Control-M was detected, the Control-M functions DO FORCEJOB and DO RESOURCE were disabled.

Monitor startup continues.

**Corrective Action:** Notify the INCONTROL administrator.
MTO10DW CTOPARM PARAMETER DAYTIMEO (cto_time) SHOULD BE EQUAL TO DAYTIMEM (ctm_time) OF CTMPARM.

Explanation: During the startup of the Control-O monitor, it was found that the value of the DAYTIMEO Control-O parameter was not identical with the value of the DAYTIMEM Control-M parameter.

The DAYTIMEO Control-O parameter sets the start of the work day for Control-O. The DAYTIMEM Control-M parameter sets the start of the work day for Control-M. Any discrepancy between these two parameters may result in the same time being interpreted differently by Control-O and Control-M.

The variables in this message are:
- cto_time - the value of the DAYTIMEO Control-O parameter
- ctm_time - the value of the DAYTIMEM Control-M parameter

Monitor startup continues.

Corrective Action: Contact your INCONTROL administrator.

MTO120I {CONTROL-O | CTMCMEM} MONITOR SHUTTING DOWN

Explanation: This information message is produced by Control-O or CMEM when shutting down the Control-O or CMEM monitor by a P command, or on certain internal Control-O or CMEM events.

The IOA Log usually contains additional messages concerning the reason for the Control-O or CMEM shutdown.

Control-O or CMEM monitor shuts down.

Corrective Action: No action is required.

MTO121S {CONTROL-O | CTMCMEM} MONITOR ENDED WITH ERROR

Explanation: Highlighted, unrollable message.

A severe error has occurred. Control-O or CMEM monitor is shutting down.

The IOA and systems logs usually contain additional messages concerning the reason for the Control-O or CMEM shutdown.

Control-O or CMEM monitor shuts down. Before shutting down, the Control-O or CMEM monitor attempts to start a new CONTROLO or CMEM monitor to replace itself. If it cannot start after a few attempts, Control-O or CMEM gives up.

Corrective Action: Check the IOA and systems logs for additional messages, and take appropriate corrective action.

MTO122S NOT ENOUGH STORAGE IN EXTENDED CSA FOR blockname.
RETURN CODE= rc

Explanation: Control-O or CMEM was unable to acquire enough storage in ECSA for the specified control block (blockname).

Control-O acquires storage in ECSA for its working areas (WSC), and for wait elements (PND). The number of wait elements is specified by the WAITPR# parameter in the CTOPARM member.

CMEM acquires storage in ECSA for its working areas (WSC).
In this message, \( rc \) is the return code issued by the failed GETMAIN call.

Control-O or CMEM terminates.

**Corrective Action:** Check ECSA utilization of the system. For Control-O, if necessary, reduce the number of wait elements specified by the WAITPR# parameter in the CTOPARM member.

**MTO123I \{CONTROL-O | CTMCMEM\} INTERVAL IS SET TO \( nn \) SECONDS**

**Explanation:** This information message is a result of setting a Control-O or CMEM sleeping interval by an operator command.

For more information, see the section on modifying the Control-O or CMEM sleeping interval in the *INCONTROL for z/OS Administrator Guide.*

Control-O or CMEM monitor will “wake up” every \( nn \) seconds and check on time-related events.

**Corrective Action:** No action is required.

**MTO124W CONTROL-O PARAMETER \( parmName = parmValue \{ > | < \} parmDefault \) - USING DEFAULT VALUE**

**Explanation:** When the Control-O monitor starts, it checks to ensure that the values of the parameters in CTOPARM are within the valid range. One of the parameters (\( parmName \)) is set to a value (\( parmValue \)) that is either too high (\( > \)) or too low (\( < \)).

Control-O resets the value of \( parmName \) to the default value for that parameter, and the monitor continues its startup.

Correct the value of \( parmName \) in CTOPARM. If required, stop and restart the Control-O monitor.

**Corrective Action:** No action is required.

**MTO126W LOAD OF IOADEST TABLE FAILED: DO SHOUT WILL NOT BE SUPPORTED**

**Explanation:** During the startup of the Control-O monitor or the execution of a NEWDEST command, the Dynamic Destination table was not successfully loaded or renewed.

Monitor startup or operation continues. The Dynamic Destination table is not loaded or renewed. DO SHOUT requests will not be performed.

**Corrective Action:** Contact your INCONTROL administrator.

**MTO127I NEWDEST COMMAND ACCEPTED**

**Explanation:** This information message is a result of the acceptance of an operator NEWDEST command passed to the Control-O or CMEM monitor.

A new dynamic destination table is loaded. The next time that the Control-O or CMEM monitor sends a message using the SHOUT facility, it will use the new destination table.

**Corrective Action:** No action is required.
MTO128I  RULE TYPE TABLE STATUS LIBRARY PRIORITY

**Explanation:** Normal response of the Control-O or CMEM monitor after the DISPLAY command is issued. This information message is the header of the list of rules shown in response to the DISPLAY command.

**Corrective Action:** No action is required.

MTO129I  ruleName type tableName status lib priority

**Explanation:** Messages sent by the Control-O or CMEM monitor to the console in response to the DISPLAY command. Each message describes a rule. These information messages are preceded by the MTO128I or CTO128I message, which supplies the header for each field.

**Corrective Action:** No action is required.

MTO12BI  WISH WO0949 IS {ENABLED | DISABLED} - CICS LONG MESSAGES SUPPORT

**Explanation:** This information message is issued by the Control-O monitor when it enables or disables optional wish WO0949.

**Corrective Action:** No action is required.

MTO12CI  WISH WO0975 IS ENABLED - MONITOR WILL WAIT UNTIL MIGRATED LIBRARIES WILL BE RESTORED

**Explanation:** This information message is issued by the Control-O monitor when it enables optional wish WO0975.

**Corrective Action:** No action is required.

MTO12DI  WISH WO0975 IS DISABLED - MONITOR WILL IGNORE MIGRATED LIBRARIES

**Explanation:** This information message is issued by the Control-O monitor when it disables optional wish WO0975.

**Corrective Action:** No action is required.

MTO12EI  WISH WO0976 IS ENABLED - MESSAGES HANDLED AS IS

**Explanation:** This information message is issued by the Control-O monitor when it enables optional wish WO0976.

**Corrective Action:** No action is required.

MTO12FI  WISH WO0976 IS DISABLED - MESSAGES HANDLED IN UPPER CASE

**Explanation:** This information message is issued by the Control-O monitor when it disables optional wish WO0976.

**Corrective Action:** No action is required.
MTO130I  IN  condName date

**Explanation:** Messages sent by the Control-O monitor to the console in response to the DISPLAY command. The message describes the prerequisite conditions necessary for the rule to become eligible.

**Corrective Action:** No action is required.

MTO131I  TIME FROM hhmm UNTIL hhmm INTERVAL interval

**Explanation:** Messages sent by the Control-O monitor to the console in response to the DISPLAY command. This information message describes the time dependencies required by the specific rule in order to become eligible.

**Corrective Action:** No action is required.

MTO132I  REQUEST TO STOP THE CONTROL-M API ACCEPTED

**Explanation:** The Control-O monitor accepted an F CONTROLO,CTMAPISTOP command. The monitor confirms it received the command for execution.

**Corrective Action:** No action is required.

MTO133I  CONTROL-M API STOPPED

**Explanation:** The Control-O monitor successfully processed an F CONTROLO,CTMAPISTOP command. The monitor confirms it executed the command.

**Corrective Action:** No action is required.

MTO134I  {CONTROL-O | CTMCMEM} WORKING DATE HAS CHANGED FROM old_date TO new_date

**Explanation:** This information message is displayed when Control-O or CMEM changes the working date. In Control-O, the time is set according to the DAYTIMEO parameter in the CTOPARM member. In CMEM, the time is set according to the DAYTIMEO parameter in the CMMPARM member, which must be the same as the DAYTIMEM parameter in the CTMPARM member.

Control-O or CMEM monitor displays the new date.

**Corrective Action:** No action is required.

MTO135I  REQUEST TO STOP THE CONTROL-M API NOT ACCEPTED. API NOT ACTIVE

**Explanation:** The Control-O monitor attempted to process an F CONTROLO,CTMAPISTOP command, but the API could not be stopped because it is not active.

The monitor indicates that it cannot execute the requested command, because the API is not active. Note that the API is started with the first API request, such as a DO FORCEJOB statement with ODAT set to ?.

**Corrective Action:** No action is required.
MTO136I THE CONTROL-M API WILL BE RESTARTED WITH THE FIRST API REQUEST

Explanation: The Control-O monitor successfully processed an F CONTROLO, CTMAPISTART command. The monitor confirms that it executed the command, and that the next API request will reallocate the API resources (such as the Control-M Active Job File or Control-M Resources file).

Corrective Action: No action is required.

MTO137I CANNOT START THE CONTROL-M API - ALREADY WAITING FOR FIRST REQUEST

Explanation: The Control-O monitor attempted to process an F CONTROLO, CTMAPISTART command, but failed. Either the monitor has already processed this command and is therefore waiting for the first API request to allocate the files, or the monitor has not processed an API request since it was started.

Corrective Action: No action is required.

MTO138I CANNOT START THE CONTROL-M API - FIRST REQUEST ALREADY PROCESSED

Explanation: The Control-O monitor successfully processed an F CONTROLO, CTMAPISTART command, but failed. Either the monitor has already processed this command and also processed its first API request, or the monitor processed a CTMAPISTOP command since it was started, and it already has processed API requests.

Corrective Action: No action is required.

MTO142S {CONTROL-O | CTMCMEM} MONITOR DETECTED AN INTERNAL abCode ABEND

Explanation: This message is issued when Control-O or CMEM detects certain internal system abend codes during operation.

The Control-O or CMEM monitor shuts down. Before shutting down, the Control-O or CMEM monitor attempts to start a new Control-O or CMEM monitor to replace itself. If it cannot start after a few attempts, Control-O or CMEM ceases trying.

Corrective Action: Call your systems programmer for assistance. If the problem is not resolved, call BMC Software Customer Support for assistance.

MTO145S AUTOEDIT FAILED, RC= rc, REASON= rsn

Explanation: The Control-O or CMEM monitor failed to perform an AutoEdit function.

The problem was probably caused by a failure to read or write the global AutoEdit member, or invalid data in the global AutoEdit member.

The AutoEdit function is not performed.
**Corrective Action:** Consult the table of return codes and reason codes in the following table to determine the cause of the error, and correct accordingly. If the return code or reason code is not in the table, the cause of failure is an internal error. In this case, contact BMC Software Customer Support.

(HIDDEN TXT - from WTO283S)

MTO146W MISSING GLOBAL AUTOEDIT LIBRARY/MEMBER

**Explanation:** During Control-O initialization, a Global AutoEdit member or its library was not found.

When Control-O is started, it reads the $GLOBAL member. A different Global library (in which a $GLOBAL AutoEdit member resides) is used for each computer (SMF ID) on which Control-O operates. Each unique library name is composed of the prefix defined in the GLBPREF parameter of the Control-O Installation Parameters, and as the last data set name qualifier, the letters CPU followed by the SMF ID of the specified computer.

Although Control-O will process Global variables, it will not read or write to this particular Global member or library.

**Corrective Action:** Check the designation of the GLBPREF parameter in the Control-O Installation Parameters. You must allocate a Global AutoEdit library for every computer in which Control-O runs. See “Control-O Operational Parameters” in the Control-O chapter of the *INCONTROL for z/OS Installation Guide*.

MTO147I CONTROL-O INITIALIZATION COMPLETE. TYPE= type SUB= subsys RUN#= nnnn

**Explanation:** This information message indicates that Control-O or CMEM initialization has completed successfully and Control-O or CMEM facilities are active.

The variables in this message are:

- **type** - the type of the startup which was passed to Control-O or CMEM as a parameter in the START command. If no TYPE value was passed to Control-O or CMEM, the default is TYPE=REGULAR.
- **subsys** - the name of the subsystem that started Control-O or CMEM (JES2, JES3, MSTR, and so on)
- **nnnn** - the number of times Control-O was replaced by a new Control-O or CMEM

Control-O or CMEM facilities are now active.

**Corrective Action:** No action is required.

MTO148W CONTROL-O STATISTICS ALREADY ACTIVE

**Explanation:** Control-O received the F CONTROLO,STARTSTAT command to start the Message Statistics facility, but the facility was already active.

The STARTSTAT command is ignored.

**Corrective Action:** No action is required.
**MTO149W CONTROL-O STATISTICS NOT ACTIVE**

**Explanation:** Control-O received the F CONTROLO,STOPSTAT command to stop the Message Statistics Facility, but the facility was not active. The STOPSTAT command is ignored.

**Corrective Action:** No action is required.

**MTO14AE INVALID modifyCommand COMMAND KEYWORD = keyword**

**Explanation:** Control-O or the CMEM monitor received the modifyCommand command with an invalid keyword. The modifyCommand command is rejected.

**Corrective Action:** Correct the invalid command and reissue it.

**MTO14BI SVC DUMP keyword NOW ENABLED**

**Explanation:** This information message is in response to the modify SVCDUMP command, and indicates that a valid keyword has been enabled.

**Corrective Action:** No action is required.

**MTO14CI SVC DUMP keyword NOW DISABLED**

**Explanation:** This information message is in response to the modify SVCDUMP command, and indicates that a valid keyword has been disabled.

**Corrective Action:** No action is required.

**MTO14DW SHUTDOWN IS DELAYED DUE TO XES SYSTEM-MANAGED REBUILD PROCESS. TO CANCEL THE DELAY REPLY "FORCE"**

**Explanation:** Control-O or CMEM cannot shut down when an XAE structure is unavailable due to system-managed rebuild. Control-O will resume its termination process when the system-managed process finishes and the structure becomes available again. When FORCE is replied, Control-O or CMEM will continue termination without waiting for the system-managed process to finish and the XAE structures to become available. Beware that after forcing immediate termination, the following may occur:

- Abends in processes accessing the IOA Global variables (subsystem environment, online, and so on.).
- Further delays in Control-O termination due to requests issued to the XAE structures when writing the IOA Global pools to the databases as part of the termination process may be deferred by the system-managed process in progress.

**Corrective Action:** None, unless immediate termination is required. If immediate termination is required, reply FORCE.

See System action for considerations before replying FORCE.
MTO14EW  monitor INITIALIZATION IS CANCELLED. START monitor WHEN XAE STRUCTURES ARE AVAILABLE

**Explanation:** The operator replied CANCEL to message IOAFBCW to cancel Control-O or CMEM initialization, after connection to an XAE structure was prevented.

Control-O or CMEM terminates.

**Corrective Action:** Start Control-O or CMEM after making sure that:

- The coupling facility required for XAE structures is available.
- XAE structures, if already allocated, are available.

MTO150I  SNAP COMMAND WAS PERFORMED. SNAP ID= id

**Explanation:** This information message indicates that Control-O or CMEM successfully executed the F CONTROLO,SNAP or F CMEM,SNAP command.

In this message, id is the snap ID as shown in the snap title.

A set of diagnostic snapshots is printed.

**Corrective Action:** No action is required.

MTO151W  IOA LOG UPDATE FAILED. SOME MESSAGES MAY BE LOST

**Explanation:** Control-O or CMEM was unable to write messages to the IOA Log file. This message follows other messages indicating the cause of the error.

Processing continues. Some messages to the IOA Log file may be lost.

**Corrective Action:** Check the preceding messages and act accordingly.

MTO152I  STANDALONE FACILITY ENABLED. rsn

**Explanation:** This information message indicates that Control-O is now entering standalone mode and will now update the IOA Log file.

When Control-M is active, update of the IOA Log file is performed by Control-M. When Control-M is not installed or inactive, update of the IOA Log file is performed by Control-O.

Control-O enters standalone mode and updates the IOA Log file.

**Corrective Action:** No action is required.

MTO153I  STANDALONE FACILITY DISABLED. rsn

**Explanation:** This information message indicates that Control-O is exiting standalone mode.

When Control-O is in standalone mode, it updates the IOA Log file. When Control-M becomes active, Control-M takes over the updating of the IOA Log file.

Control-O exits standalone mode and Control-M takes over the updating of the IOA Log file.

**Corrective Action:** No action is required.
MTO154E CONTROL-O CANNOT START. CONTROL-M IS NOT INSTALLED

**Explanation:** Control-O was set to run with SMODE set to N, but Control-M, which must execute some activities on behalf of Control-O, is not installed. If the SMODE (Stand Alone mode) installation parameter is set to N, Control-M must be installed. If Control-M is not installed, SMODE must be set to Y. Control-O terminates.

**Corrective Action:** Either install Control-M, or set the SMODE installation parameter to Y.

MTO155W SWAP OF add CHAIN ERROR. TYPE= type RC= rc

**Explanation:** Control-O is unable to pass internal request blocks to the new Control-O monitor. This message indicates an internal error.

The old Control-O monitor terminates with an error. The new monitor, however, will continue processing. Some requests may be lost.

**Corrective Action:** Contact BMC Software Customer Support.

MTO156W AUTOMATION LOG STATUS UNCHANGED

**Explanation:** This warning message is issued in response to an invalid AUTOLOG MODIFY command. Either the specified parameter is invalid, or the user specified a MODIFY command (F CONTROLO,AUTOLOG=YES/NO) designed to set the Automation Log status to a status that it already had.

The status of writing to the Automation Log is unchanged.

**Corrective Action:** Verify the command and retry if necessary.

MTO157I action SERVER serverId REQUESTED

**Explanation:** This information message indicates that Control-O has begun performing the action requested in a SERVER MODIFY command.

**Corrective Action:** No action is required.

MTO158W action SERVER serverId FAILED - rsn

**Explanation:** Control-O was unable to execute the requested SERVER MODIFY command (action). Processing continues. The status of the server remains unchanged.

**Corrective Action:** Check the reason specified in the message and proceed accordingly.

MTO159E INVALID SERVER MODIFY COMMAND - cmd

**Explanation:** This message is issued in response to a SERVER MODIFY command with invalid parameters. Processing continues. The command is ignored.

**Corrective Action:** Specify the MODIFY command with valid parameters.
MTO15AE INVALID SNAP KEYWORD = keyName

Explanation: The operator specified an invalid SNAP keyword in an F CONTROLO,SNAP/F CTMCMEM,SNAP command.

The CTOMTO program ignores this keyword. If there was only one keyword, no SNAP request is performed.

Corrective Action: Specify an F CONTROLO,SNAP/F CTMCMEM,SNAP command with valid keywords. For more information, see the SNAP command in the INCONTROL for z/OS Administrator Guide.

MTO15BE INVALID LOG KEYWORD = keyName

Explanation: The CTOMTO program detected an invalid keyword for the LOG request. Valid keywords are:

- ALL
- DEFAULT
- TRIGGER

The CTOMTO program ignores this LOG command request.

Corrective Action: Resubmit the F CONTROLO,LOG/F CTMCMEM,LOG command with a valid keyword.

MTO15CI RULE LOGGING MODE WAS SET TO modeType

Explanation: This information message indicates that Control-O or CMEM have successfully executed the F CONTROLO,LOG command.

Rules will be traced according to the new log mode.

Corrective Action: No action is required.

MTO15DI WATERMARK INFORMATION: FREE= freeNum PND= waitNum EVC= execNum WSC= wscNum

Explanation: This Control-O or CMEM message displays statistics in response to a WATERMARKS command.

The variables in this message are:
- **freeNum** - the lowest number of RQC blocks that have been free simultaneously since the monitor was started. RQC blocks are used when information is being transferred from various address spaces to the address space of the monitor. A total of 20,000 RQC blocks are available.

- **waitNum** - the highest number of PND blocks that have been in use simultaneously since the monitor was started. PND blocks store information about rules that are in Wait mode, meaning rules that are in execution and waiting to be redispached. The allocation of PND blocks is controlled by the WAITPR# parameter.

- **execNum** - the number of events (meaning messages, commands, and so on) that have been handled by the monitor since it was started. This number is reset to zero each time it reaches 1,000,000.

- **wscNum** - the number of WSC blocks that are allocated for use by the monitor. WSC blocks store temporary information while handling events. The allocation of WSC blocks is controlled by the WSC# parameter.

**Note:**

The WATERMARKS command is currently supported for compatibility reasons only. More detailed statistical information about the usage of internal resources is available by means of the USAGESTATS command. For more information, see the INCONTROL for z/OS Administrator Guide.

**Corrective Action:** No action is required.

**MTO15EI type USAGE: CURRENTLY curr%, HIGHEST high% (curr AND high OUT OF total)**

**Explanation:** This message displays usage statistics relating to internal Control-O or CMEM resources in response to a USAGESTATS command.

The variables in this message are:

- **type** - the type of resource to which the usage statistics displayed relate. Valid values for **type** are:

<table>
<thead>
<tr>
<th>type</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>PND</td>
<td>PND blocks, also known as “wait elements” PND blocks store information about rules that are in Wait mode, meaning rules that are in execution and waiting to be redispached. The allocation of PND blocks is controlled by the WAITPR# parameter.</td>
</tr>
<tr>
<td>RQC</td>
<td>RQC blocks, also known as “request elements” RQC blocks are used when information is being transferred from various address spaces to the address space of the monitor. A total of 20,000 RQC blocks are available.</td>
</tr>
<tr>
<td>WSC</td>
<td>WSC blocks, also known as “work buffers” WSC blocks store temporary information while handling events. The allocation of WSC blocks is controlled by the WSC# parameter.</td>
</tr>
</tbody>
</table>
INCONTROL for z/OS Messages Manual

- **curr%** - the percentage of the allocated *type* resources that are currently in use
- **high%** - the highest percentage of *type* resources that have been in use at one time since the monitor was started
- **curr** - the amount of *type* resources currently in use
- **high** - the highest amount of *type* resources that have been in use at one time since the monitor was started
- **total** - the total amount of *type* resources currently allocated

**Corrective Action:** In normal circumstances, the highp percentage figure should remain below 50%. If you notice high usage percentages, contact your INCONTROL administrator. Possible causes are:

- There are rules in the system that consume excessive amounts of internal resources.
- Some parameters require adjustment to accommodate the workload of the system.

**MTO15FE INVALID USAGESTATS KEYWORD = type**

**Explanation:** A request was made for usage statistics relating to internal Control-O or CMEM resources, by means of a USAGESTATS command. However, the request referred to an invalid type of resources.

In this message, *type* is the invalid resource type. Valid values for the resource type keyword are:

Valid values for *type* are:

<table>
<thead>
<tr>
<th>Resource Type Keyword</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL</td>
<td>All resource types supported by the USAGESTAT command. Default.</td>
</tr>
<tr>
<td>PND</td>
<td>PND blocks, also known as “wait elements”. The allocation of PND blocks is controlled by the WAITPR# parameter.</td>
</tr>
<tr>
<td>RQC</td>
<td>RQC blocks, also known as “request elements”. A total of 20,000 RQC blocks are available.</td>
</tr>
<tr>
<td>WSC</td>
<td>WSC blocks, also known as “work buffers”. The allocation of WSC blocks is controlled by the WSC# parameter.</td>
</tr>
</tbody>
</table>

For more information on the USAGESTATS command, see the *INCONTROL for z/OS Administrator Guide*.

**Corrective Action:** Reissue the command with a valid *type* value, or with no value for *type* (which defaults to ALL).

**Messages MTO200 through MTO2xx**

This group includes messages for the Control-O product.
MTO272I  CTOJ FRQ EXIT POINT SUCCESSFULLY REMOVED

**Explanation:** This information message indicates that as part of its termination process, the Control-O monitor successfully disabled and removed the dynamic exit IEFJ FRQ that uses the CTOJ FRQ module. Control-O uses the CTOJ FRQ module for ON SYSOUT and JES2 command suppression functions.

**Corrective Action:** No action is required.

MTO273W  CTOJ FRQ EXIT POINT NOT REMOVED RC = rc REASON CODE = rsn

**Explanation:** Upon termination, the Control-O monitor has failed to disable and remove the dynamic exit IEFJ FRQ that uses the CTOJ FRQ module. Control-O uses the CTOJ FRQ module for ON SYSOUT and JES2 command suppression function.

Control-O terminates without removing the dynamic exit IEFJ FRQ that uses the CTOJ FRQ module. This may cause an SOC4 code in various jobs under the subsystem interface. In this case, MVS automatically disables the dynamic exit IEFJ FRQ that uses the CTOJ FRQ module.

**Corrective Action:** Inform the system programmer, and check the return code and reason code of the CSVDYNEX macro in the IBM manual *MVS Programming: Authorized Assembler Services Reference*.

MTO274E  ERROR WHILE LOADING CTOJ FRQ EXIT POINT

**Explanation:** When Control-O monitor started, it failed to load and enable the dynamic exit IEFJ FRQ that uses the CTOJ FRQ module. Control-O uses the CTOJ FRQ module for ON SYSOUT and JES2 command suppression function.

Control-O starts without enabling the dynamic exit IEFJ FRQ that uses the CTOJ FRQ module. As a result, ON SYSOUT and JES2 command suppression functions will not be active.

**Corrective Action:** Inform your system programmer.

MTO275E  CTOJ FRQ EXIT POINT NOT INSTALLED RC = rc REASON CODE = rsn

**Explanation:** When the Control-O monitor started, it failed to load and activate the IEFJ FRQ dynamic exit, which uses the CTOJ FRQ module. Control-O uses the CTOJ FRQ module for ON SYSOUT and JES2 command suppression function.

Control-O starts without enabling the IEFJ FRQ dynamic exit that uses the CTOJ FRQ module. As a result, ON SYSOUT and JES2 command suppression functions will not be active.

**Corrective Action:** Inform your system programmer and check the RC and REASON CODE of the CSVDYNEX macro in the *IBM OS/390 Authorized Macros and Services Guide*.

MTO276I  CTOJ FRQ EXIT POINT SUCCESSFULLY INSTALLED

**Explanation:** This information message indicates that when the Control-O monitor started, it successfully enabled the dynamic exit IEFJ FRQ that uses the CTOJ FRQ module. Control-O uses the CTOJ FRQ module for ON SYSOUT and JES2 command suppression function.

**Corrective Action:** No action is required.
Messages MTO300 through MTO3xx

This group includes messages for the Control-O product.

MTO350E ERROR FREEING STORAGE. ADDR= \textit{addr} LEN= \textit{length} SP= \textit{subpool} RELATED = \textit{rel}

**Explanation:** An internal error was detected.
During termination, Control-O or CMEM frees internal control blocks and work areas. An error occurred while this was being done.
Control-O or CMEM continues termination.

**Corrective Action:** Contact BMC Software Customer Support.

MTO351I SERVER \textit{serverId} WAS \textit{action}

**Explanation:** This information message indicates that a requested SERVER MODIFY command was performed successfully.

**Corrective Action:** No action is required.

MTO352W SERVER \textit{serverId} DID NOT RESPOND TO STOP REQUESTS. SERVER STATUS OVERRIDDEN

**Explanation:** Server \textit{serverId} did not respond to a STOP request.
When Control-O executes a server STOP request, it waits for acknowledgment from the server. If the server does not respond within thirty seconds, this message is displayed.
The specified server is given the status ENDED WITH AN ERROR.

**Corrective Action:** Check output and messages issued by the problem server. If necessary, bring down the server and start a new one.

MTO353I \textit{mod} RELOADED. OLD: \textit{datetime1} NEW: \textit{datetime2}

**Explanation:** This information message indicates that the RELOAD command completed execution successfully.
This message provides the installation date and time of the old and newly-replaced modules in mm/dd/yy hh.mm format.
The variables in this message are:
- \textit{mod} - the name of the module that was successfully reloaded
- \textit{datetime1} - the assembly date of the old module
- \textit{datetime2} - the assembly date of the newly installed module

**Corrective Action:** No action is required.
MTO354I SERVER STCID TYP QLN STIME STATUS

Explanation: This information message is the normal response of the Control-O monitor to the \texttt{F CONTROLO,SERVER=serverid,DISPLAY} operator command.

This message is the header for information in messages CTO355I and MTO355I.

Corrective Action: No action is required.

MTO355I serverId jobId type queueLength statusTime status

Explanation: The Control-O monitor sends this information message to the console in response to the command \texttt{F CONTROLO,SERVER=serverId,DISPLAY}.

Each occurrence of this message describes a server defined to Control-O. These messages are preceded by message CTO354I or MTO354I that provides the header. The information in this message is in the same format as the Option SERVERS screen of the Automation Options facility.

For more information, see the online facilities chapter of the \textit{Control-O User Guide}.

Corrective Action: No action is required.

MTO356I modifyCmdText

Explanation: This information message displays the text of the submitted modify command.

Corrective Action: No action is required.

MTO357I COMMAND ENDED SUCCESSFULLY

Explanation: This information message indicates that the last modify command ended successfully.

Corrective Action: No action is required.

MTO358W LIMIT OF LINES REACHED. FURTHER LINES NOT DISPLAYED

Explanation: More than 1,000 lines were issued in response to a modify command specified with the \texttt{DISPLAY} parameter.

When more than 1,000 lines are issued to the operator's console, Control-O terminates the command which is creating the lines, to avoid a shortage of space in the console's buffer.

Only the first 1,000 lines are displayed.

Corrective Action: No action is required.

MTO359W CONTROL-O COSMOS IS NOT ACTIVE

Explanation: The user attempted to stop COSMOS while it was not active.

The COSMOSSTOP command is ignored.

Corrective Action: No action is required.

MTO35AW CONTROL-O COSMOS IS ALREADY ACTIVE

Explanation: The user attempted to start COSMOS while it was active.
INCONTROL for z/OS Messages Manual

The COSMOSSTART command is ignored.

Corrective Action: No action is required.

MTO35BI OBJECTDB METHODDB MODE

Explanation: This information message is the header for data provided in message CTO35CI.

This message is the normal response of Control-O to the F CONTROLO,COSMOS=cosmosdb,DISPLAY operator command.

This command displays general information about COSMOS Object databases.

Corrective Action: No action is required.

MTO35CI objectDb methodDb mode

Explanation: This information message is the normal response of Control-O to the F CONTROLO,COSMOS=cosmosdb,DISPLAY operator command.

Each occurrence of this message describes an Object database under COSMOS control. Message CTO35BI generates the message header.

The variables in this message are:

- objectDb - Working COSMOS object database.
- methodDb - COSMOS Method databases.
- mode - Current COSMOS database mode.

Corrective Action: The COSMOS commands are explained in the Control-O/COSMOS User Guide.

MTO35DW INVALID COSMOS MODIFY COMMAND - errorText

Explanation: The user issued a COSMOS command with invalid parameters.

In this message, errorText describes the error.

The command is ignored. Processing continues.

Corrective Action: Specify the COSMOS command with valid parameters. For more information on COSMOS commands, see the Control-O/COSMOS User Guide.

MTO35EW action COSMOS id FAILED - text

Explanation: The specified action (action) on the id COSMOS ID failed.

An invalid syntax, action or ID was specified.

The system ignores the command.

Corrective Action: Correct the syntax, action, or ID and reissue the command.

MTO35FW MODIFY COMMAND REJECTED

Explanation: The user attempted to issue an invalid modify command to the Control-O monitor.

The system rejects the command.
**Corrective Action:** Correct the command syntax and reenter the command

**MTO360E ERROR IN RELOAD INITIALIZATION**

**Explanation:** The RELOAD modify command encountered a problem with the Control-O SSVT or one of its function routines.
The internal control block structure has been corrupted.
The RELOAD modify command is terminated.

**Corrective Action:** Bring down and restart Control-O. RELOAD is not necessary.

**MTO361E ERROR IN RELOAD PRELIMINARY PHASE**

**Explanation:** The RELOAD modify command encountered a problem with an MVS macro instruction.
The user tried to reload the CTOWTO Control-O module in storage but this module was not found in the Control-O STEPLIB libraries.
The RELOAD modify command is terminated.

**Corrective Action:** Bring down and restart Control-O. RELOAD is not necessary.

**MTO362E ERROR IN RELOAD PROCESSING**

**Explanation:** The RELOAD modify command encountered a problem with an MVS macro instruction.
There may not be enough CSA (Common Service Area) storage available to load the new CTOWTO module.
The RELOAD modify command is terminated.

**Corrective Action:** Bring down and restart Control-O. RELOAD is not necessary.

**MTO363E ERROR IN RELOAD BACK-END PROCESSING**

**Explanation:** In response to the RELOAD modify command, Control-O encountered a problem when attempting to deallocate a routine.
The internal control block structure has been corrupted.
The RELOAD modify command is completed, but cleanup processing is aborted.

**Corrective Action:** No action is required.

**MTO364E ALTERNATE SUBSYSTEM SSCT ENTRY NOT FOUND**

**Explanation:** The alternate subsystem SSCT entry specified in ALTSSN CTOPARM parameter is not in the system.
Control-O monitor failed to find the SSCT prior to activating the alternate subsystem.
Control-O monitor routine continues without activating the alternate subsystem.

**Corrective Action:** Add the alternate subsystem name to the IEFSSNxx member in the SYS1.PARMLIB library and then IPL the system. The alternate subsystem cannot be activated until after the IPL.
MTO366E CONTROL-O COSMOS IS NOT INSTALLED

**Explanation:** The user attempted to enter a COSMOS command. However, Control-O COSMOS was not installed.

Control-O ignores the command and processing continues.

**Corrective Action:** Install Control-O COSMOS.

MTO367E SMODE VALID VALUES ARE F, Y, AND N

**Explanation:** An invalid value was specified for the SMODE parameter in an operator command.

Valid values for SMODE (stand alone mode) are:

- **F (Forced)** - Each Control-O copy is responsible for updating the IOA Log file. Default. BMC Software recommends that you do not change this default.
- **Y (Yes)** - Each Control-O copy passes requests to write to the IOA Log file to Control-M by means of the communications file, except for requests initiated by the New Day procedure (which are treated as if SMODE is set to F). Setting SMODE to Y causes less ENQ contention for the IOA Log file but increases pressure on the Control-M monitor.
- **N (No)** - Control-O always passes requests to write to the IOA Log file to Control-M by means of the communications file.

The operator command is ignored.

**Corrective Action:** Specify a valid value for the SMODE parameter and reissue the command. For more information, see SMODE in the *INCONTROL for z/OS Administrator Guide*.

MTO36GW CTOWTO CANNOT BE RELOADED BECAUSE XES SYSTEM-MANAGED REBUILD IS IN PROGRESS. TRY TO RELOAD LATER.

**Explanation:** CTOWTO cannot be reloaded until the system-managed process ends.

The RELOAD command is rejected.

**Corrective Action:** Wait for the system-managed process to end and reissue the RELOAD command.

MTO36HE INVALID MODULE NAME SPECIFIED IN RELOAD COMMAND.

**Explanation:** A REALOD modify command has been issued for an invalid module name. The module name is either not a module or not a reloadable module. The invalid module name appears in the previous MTO356I message, which echoed the modify command.

The command is ignored.

**Corrective Action:** Issue the command again with the correct reloadable module name.

Messages MTO600 through MTO6xx

This group includes messages for the Control-O product.
MTO600E ERROR RUNNING CTOCMCK RC= rc

Explanation: The CTOGATE communication facility failed to initialize.
CTOMTO called the CTOCMCK module and then ended with an error. This message follows a CTOGATE error message generated by the CTOCMCK module.
CTOGATE aborts.
Corrective Action: Correct and re-initialize CTOGATE.

MTO614I COMMUNICATION STOPPED

Explanation: This information message indicates that communication stopped due to an operator request.
Control-O communication stops.
Corrective Action: No action is required.

MTO615I COMMUNICATION STARTED.

Explanation: This information message indicates that communication started due to an operator request.
Control-O communication starts.
Corrective Action: No action is required.

MTO616I COMMUNICATION WAS ALREADY STARTED.

Explanation: The user attempted to start communication. However, it was already operating.
Corrective Action: No action is required.

MTO617I COMMUNICATION WAS ALREADY STOPPED.

Explanation: The user attempted to stop communication. However, it had already been stopped.
Corrective Action: No action is required.

MTO619I COMMUNICATION CANNOT BE ACTIVATED.

Explanation: This information message indicates that the user was unable to activate Control-O communication.
STARTCOMM modify command cannot be performed. Control-O was started with the CTOGATE parameter set to NO.
Control-O communication is not activated.
Corrective Action: Start Control-O with the CTOGATE parameter set to YES in the CTOPARM member.

MTO61FI CONTROL-O COMMUNICATION IS ACTIVE. NETWORK NAME= sysname, NETWORK MAP= memName'

Explanation: This information message indicates that Control-O communication initialization is complete.
Communication is operating using system name sysname and communication network map memName.

**Corrective Action:** No action is required.

**Messages MTO700 through MTO7xx**

This group includes messages for the Control-O product.

**MTO780I Initialization of OpenEdition Environment Started**

**Explanation:** This information message is the normal start message issued during initialization of Control-O or the CMEM monitor when using OS/390 version 2.4 or later.

Control-O or the CMEM monitor detected an environment which supports the MVS OpenEdition interface with Control-O and began initializing the OpenEdition environment.

**Corrective Action:** No action is required.

**MTO781I OpenEdition Interface Module Successfully Loaded**

**Explanation:** This information message is the normal start message issued during initialization of Control-O or the CMEM monitor when using OS/390 version 2.4 or later.

Control-O or the CMEM monitor loaded the OpenEdition interface module into storage. This message is issued only for the first Control-O or CMEM monitor in the system.

**Corrective Action:** No action is required.

**MTO782I Subsystem Registered with OpenEdition Interface**

**Explanation:** This information message is the normal start message issued during initialization of Control-O or the CMEM monitor when using OS/390 version 2.4 or later.

The current Control-O or CMEM subsystem has registered itself (meaning, recorded its name) with the OpenEdition interface in order to receive OpenEdition events from the interface.

**Corrective Action:** No action is required.

**MTO783I Initialization of OpenEdition Environment Ended Successfully**

**Explanation:** This information message is the normal start message issued during initialization of Control-O or the CMEM monitor when using OS/390 version 2.4 or later.

OpenEdition support for the current Control-O or CMEM monitor is successfully installed. Control-O or CMEM will trigger rules based on OpenEdition events.

**Corrective Action:** No action is required.

**MTO784W OS/390 Version Is 2.4 or Higher But PTF Level Is Too Low**

**Explanation:** Control-O or CMEM tried to install OpenEdition support but found an incompatible PTF level.
Control-O or CMEM support for OpenEdition events is required for OS/390 version 2.4 and later. The PTF level in MVS is too low to install the OpenEdition interface.

The following system actions occur:

- Initialization of the OpenEdition interface fails.
- Initialization of Control-O or the CMEM monitor continues.
- Control-O or the CMEM monitor will not be able to handle OpenEdition events such as data set triggering based on FTP transmissions.

**Corrective Action:** Install IBM PTF for APAR OW36163, which enables Control-O or CMEM support for OpenEdition.

**MTO785W UNABLE TO REGISTER WITH OPENEDITION INTERFACE: rsn**

**Explanation:** The Control-O or CMEM subsystem could not register with the OpenEdition interface during initialization.

Possible values for *rsn* are:

- TOO MANY SUBSYSTEMS - The OpenEdition interface already registered the maximum number of subsystems.
- LOCK CANNOT BE OBTAINED - Control-O or the CMEM monitor cannot acquire the OpenEdition interface lock, which is needed for registration.
- NO SUPPORT FOR DYNAMIC CTOSSI - The fixes (PTFs) that are required to support Control-O or CMEM interface for USS (UNIX Services for OS/390) where Control-O or CMEM is installed are missing.

Initialization of the OpenEdition interface fails. Initialization of Control-O or the CMEM monitor continues. Control-O or the CMEM monitor will not be able to handle OpenEdition events, such as data set triggering based on FTP transmissions. If the value of *rsn* is NO SUPPORT FOR DYNAMIC CTOSSI, the Control-O or CMEM interface for USS is disabled.

**Corrective Action:** If the value of *rsn* is TOO MANY SUBSYSTEMS, shut down a different Control-O or CMEM monitor and restart the current monitor.

If the value of *rsn* is LOCK CANNOT BE OBTAINED, restart the current monitor. If the problem persists, call your INCONTROL administrator.

(version 6.1.00) If the value of *rsn* is NO SUPPORT FOR DYNAMIC CTOSSI, apply the following fixes to all environments: PA01142, PA01143, PA01144 and PA01147.

**MTO786W LOAD OF OPENEDITION INTERFACE MODULE FAILED: rsn**

**Explanation:** During initialization of the OpenEdition interface, Control-O or CMEM could not load the OpenEdition support module.

In this message, *rsn* is one of the following:
LOAD TO PRIVATE REGION FAILED
CSA GETMAIN FAILED
LOAD TO CSA FAILED

If the value of \texttt{rsn} is LOAD TO PRIVATE REGION FAILED: Control-O or CMEM monitor could not load the OpenEdition support module in its own private region.

If the value of \texttt{rsn} is CSA GETMAIN FAILED: Control-O or the CMEM monitor could not acquire storage in the Common Service Area (CSA) for the OpenEdition support module.

If the value of \texttt{rsn} is LOAD TO CSA FAILED: Control-O or the CMEM monitor could not load the OpenEdition support module to the Common Service Area (CSA).

The following system actions occur:

- Initialization of the OpenEdition interface fails.
- Initialization of Control-O or the CMEM monitor continues.
- Control-O or the CMEM monitor will not be able to handle OpenEdition events such as data set triggering based on FTP transmissions.

Corrective Action: If the value of \texttt{rsn} is LOAD TO PRIVATE REGION FAILED: determine the cause of the failure using previous messages. Possible causes are:

- The Control-O or CMEM region is too small.
- The CTOAODT module is not in the Control-O CMEM STEPLIB.

If the value of \texttt{rsn} is CSA GETMAIN FAILED, make sure that the CSA has at least 8K of free storage, then restart the Control-O or CMEM monitor.

If the value of \texttt{rsn} is LOAD TO CSA FAILED, use the contents of previous messages to determine the cause of the failure.

\textbf{MTO787E \textit{INITIALIZATION OF OPENEDITION ENVIRONMENT FAILED}}

\textbf{Explanation:} Control-O or CMEM tried to install the OpenEdition interface but an error occurred during initialization of the interface.

The following system actions occur:

- Initialization of the OpenEdition interface fails.
- Initialization of Control-O or the CMEM monitor continues.
- Control-O or the CMEM monitor will not be able to handle OpenEdition events such as data set triggering based on FTP transmissions.

Corrective Action: Look for previous messages which explain the cause of the failure. Call your INCONTROL administrator.

\textbf{MTO788I \textit{SUBSYSTEM ALREADY REGISTERED WITH OPENEDITION INTERFACE}}

\textbf{Explanation:} This information message indicates that Control-O or the CMEM monitor tried to register with the OpenEdition interface but found the subsystem was already registered.
A possible cause is a previous uncompleted termination of CMEM or Control-O.

**Corrective Action:** No action is required.

**MTO789W OPENEDITIION ADDRESS SPACE HAS NOT COMPLETED INITIALIZATION**

**Explanation:** During Control-O startup, Control-O tried to activate OPENEDITIION (UNIX for MVS) support. The attempt failed for one of the following reasons:

- The system is earlier than OS/390 version 2.4.
- IBM APAR OW36163 is missing.

The preconditions for using Control-O/OPENEDITIION (UNIX for MVS) are:

- The system must be at OS/390 version 2.4 or later.
- IBM APAR OW36163 must be applied.

The Control-O startup process completes but does not support OPENEDITIION.

**Corrective Action:** If the system is earlier than OS/390 version 2.4, ignore this message. Otherwise, apply IBM APAR OW36163.

**MTO790I DEACTIVATION OF OPENEDITIION ENVIRONMENT STARTED**

**Explanation:** This information message is the normal message issued during termination of Control-O or the CMEM monitor when using OS/390 version 2.4 or later.

Control-O or the CMEM monitor detected an active OpenEdition interface environment and started its termination procedure.

**Corrective Action:** No action is required.

**MTO791I SUBSYSTEM REMOVED FROM OPENEDITIION INTERFACE**

**Explanation:** This information message is the normal message generated during termination of Control-O or the CMEM monitor when using OS/390 version 2.4 or later.

The current Control-O or CMEM subsystem removed itself from the OpenEdition interface in order to stop receiving OpenEdition events.

**Corrective Action:** No action is required.

**MTO792I OPENEDITIION INTERFACE MODULE REMOVED**

**Explanation:** This information message is the normal message issued during termination of Control-O or the CMEM monitor when using OS/390 version 2.4 or later.

Control-O or the CMEM monitor removed the OpenEdition support module from storage. This message is displayed only during termination of the last Control-O or the CMEM monitor in the system.

**Corrective Action:** No action is required.
MTO793I DEACTIVATION OF OPENEDITION ENVIRONMENT ENDED SUCCESSFULLY

Explanation: This information message is the normal message issued during termination of the CMEM monitor or Control-O when using OS/390 version 2.4 or later.

The OpenEdition interface for the current Control-O or CMEM monitor has been successfully removed.

Corrective Action: No action is required.

MTO794W DEACTIVATION OF OPENEDITION ENVIRONMENT FAILED

Explanation: Control-O or CMEM tried to remove OpenEdition support but encountered an error.

An error occurred during termination of the OpenEdition interface.

Termination of Control-O or the CMEM monitor continues. Warnings may be issued the next time Control-O or CMEM is activated.

Corrective Action: Look for previous messages which explain the cause of the failure. Verify successful initialization the next time Control-O or CMEM is activated.

MTO795W OPENEDITION INTERFACE MODULE NOT INSTALLED

Explanation: Control-O or the CMEM monitor could not find the OpenEdition interface module during termination.

During termination Control-O or CMEM detected an environment which supports the OpenEdition interface but could not find the OpenEdition support module which should have been installed during initialization.

Termination of Control-O or the CMEM monitor continues. Warnings may be issued the next time Control-O or CMEM is activated.

Corrective Action: Look for previous messages which explain the cause of the failure. Verify successful initialization the next time Control-O or CMEM is activated.

MTO796W SUBSYSTEM NOT REMOVED FROM OPENEDITION INTERFACE: rsn

Explanation: Control-O or CMEM could not remove its subsystem name from the OpenEdition interface during termination.

If the value of rsn is SUBSYSTEM NOT FOUND, Control-O or CMEM could not find its subsystem name registered with the OpenEdition interface.

If the value of rsn is LOCK CANNOT BE OBTAINED, Control-O or the CMEM monitor could not get the OpenEdition interface lock it needs to remove its name.

Termination of Control-O or the CMEM monitor continues. Warnings may be issued the next time Control-O or CMEM is activated.

Corrective Action: Look for previous messages which explain the cause of the failure. Verify successful initialization the next time Control-O or CMEM is activated.
MTO797E INVALID MODIFY-REFRESH SUBPARAMETERS. VALID PARAMETERS ARE: XCF

**Explanation:** The user issued the command F Control-O, REFRESH=\(parm\) to refresh the Control-O communication definitions, but the value of \(parm\) was invalid.

The valid value of the subparameter is XCF.
Refesh of the Control-O communication definition fails.

**Corrective Action:** Correct and reenter the command.

MTO798E ERROR IN MODIFY-REFRESH PROCESSING

**Explanation:** An error was detected while attempting to refresh the XCF configuration map of Control-O, which defines the MVS image names with which Control-O can work.
Refresh of the Control-O communication definition by the REFRESH command fails.

**Corrective Action:** Refer to the earlier accompanying messages in the Control-O JOBLOG or SYSLOG.

Messages MTO800 through MTO8xx

This group includes messages for the Control-O product.

MTO820I INITIALIZATION OF SMS SUPPORT STARTED

**Explanation:** This information message indicates that Control-O started initializing SMS support.

**Corrective Action:** No action is required.

MTO821I SMS INTERFACE MODULE SUCCESSFULLY LOADED

**Explanation:** This information message indicates that a Control-O subsystem loaded the SMS interface module into storage.

The first Control-O subsystem to initialize itself loads the SMS interface.

**Corrective Action:** No action is required.

MTO822I SUBSYSTEM REGISTERED WITH SMS INTERFACE

**Explanation:** This information message indicates that the current Control-O subsystem registered itself with the SMS interface.

Control-O subsystems must be registered with the SMS interface to receive SMS events from it.

**Corrective Action:** No action is required.

MTO823I INITIALIZATION OF SMS SUPPORT ENDED SUCCESSFULLY

**Explanation:** This information message indicates that SMS support for the current Control-O subsystem was installed successfully.

Control-O requires SMS ACS exit routines to trigger rules based on SMS events.
**Corrective Action:** No action is required.

**MTO824W LOAD OF CAB ALLOCATOR MODULE FAILED**

**Explanation:** Control-O could not load IOACAB. Control-O needs the IOACAB program to install the SMS interface module. The following system actions occur:

- SMS interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle SMS events.

**Corrective Action:** Check the IOA load library.

**MTO825W UNABLE TO REGISTER WITH SMS INTERFACE rsn**

**Explanation:** Control-O could not register with the SMS interface during initialization. Valid values for rsn are:

<table>
<thead>
<tr>
<th>rsn</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOO MANY SUBSYSTEMS</td>
<td>The SMS interface had already registered the maximum number of subsystems.</td>
</tr>
<tr>
<td>LOCK CANNOT BE OBTAINED</td>
<td>Control-O could not get the SMS interface lock that it needs for registration.</td>
</tr>
</tbody>
</table>

The following system actions occur:

- SMS interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle SMS events.

**Corrective Action:** Do one of the following:

- If the value of rsn is TOO MANY SUBSYSTEMS, shut down a different Control-O monitor and restart the current one.
- If the value of rsn is LOCK CANNOT BE OBTAINED, restart the current Control-O monitor.

If the problem persists, call your INCONTROL administrator.

**MTO826W LOAD OF SMS INTERFACE FAILED: rsn**

**Explanation:** Control-O could not load the SMS interface module. In this message, rsn may be one of the following:
LOAD TO PRIVATE REGION FAILED - Control-O could not load the SMS interface module into its own private region.

CSA GETMAIN FAILED - Control-O could not get the storage in the Common Service Area (CSA) that it needs for the SMS interface module.

LOAD TO CSA FAILED - Control-O could not load the SMS interface module into the CSA.

The following system actions occur:

- SMS interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle SMS events.

**Corrective Action:** Do one of the following:

- If the value of `rsn` is LOAD TO PRIVATE REGION FAILED, check earlier messages to determine the cause of failure. The following are possible causes:
  - The region allocated for Control-O is too small.
  - The CTOACS module is not in the Control-O STEPLLIB library.
- If the value of `rsn` is CSA GETMAIN FAILED, make sure that at least 8KB are allocated for the CSA and restart Control-O.
- If the value of `rsn` is LOAD TO CSA FAILED, check earlier messages to determine the cause of failure.

**MTO827E** **INITIALIZATION OF SMS SUPPORT FAILED**

**Explanation:** An initialization error occurred when Control-O tried to install the SMS interface.

The following system actions occur:

- SMS interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle SMS events.

**Corrective Action:** Check earlier messages to determine the cause of failure. If necessary, call your INCONTROL administrator.

**MTO828I** **SUBSYSTEM ALREADY REGISTERED WITH SMS INTERFACE**

**Explanation:** This information message indicates that the current Control-O subsystem did not register with the SMS interface because it was already registered.

This may be because a previous Control-O subsystem did not end correctly.

SMS interface initialization continues.

**Corrective Action:** No action is required.
MTO829E ALLOCATION OF CVT CUSTOMER ANCHORED BLOCK FAILED

**Explanation:** Control-O could not allocate a block of storage anchored to the z/OS communication vector table (CVT).

Even though the block of storage has not yet been allocated, Control-O could not allocate it.

The following system actions occur:
- MAINVIEW interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle MAINVIEW events.

**Corrective Action:** Check earlier messages to determine the cause of failure. If necessary, call your INCONTROL administrator.

MTO82AW LOAD OF SMS INTERFACE MODULE FAILED: CSA GETMAIN FAILED

**Explanation:** During the Control-O monitor initialization, Control-O failed to GETMAIN the storage in E/CSA, which is required for the CTOACS module, and as a result the Control-O/DFSMS interface is disabled.

**Corrective Action:** Contact your systems programmer for assistance. Control-O requires about 1024 bytes. If the problem is not resolved, call BMC Software Customer Support for assistance and provide the step name indicated in the message.

MTO82BW LOAD OF SMS INTERFACE MODULE FAILED: LOAD TO CSA FAILED

**Explanation:** During the Control-O monitor initialization, Control-O failed to load the CTOACS module into E/CSA, and as a result the Control-O/DFSMS interface is disabled.

**Corrective Action:** Contact your systems programmer for assistance. If the problem is not resolved, contact BMC Software Customer Support.

MTO82CW UNABLE TO REGISTER WITH SMS INTERFACE: NO PROPER ENTRY IN SSTABLE

**Explanation:** This warning message indicates that Control-O detected an internal problem. The Control-O/DFSMS interface is disabled.

**Corrective Action:** Contact BMC Software Customer Support.

MTO830I DEACTIVATION OF SMS SUPPORT STARTED

**Explanation:** This information message indicates that Control-O started deactivating an SMS interface.

**Corrective Action:** No action is required.
MTO831I  SUBSYSTEM REGISTRATION REMOVED FROM SMS INTERFACE

Explanation: This information message indicates that Control-O removed its registration from the SMS interface.

When a Control-O subsystem is not registered with the SMS interface, it cannot receive SMS events from the SMS interface.

Corrective Action: No action is required.

MTO832I  SMS INTERFACE MODULE REMOVED

Explanation: This information message indicates that Control-O removed the SMS interface module from storage.

The last Control-O subsystem removed unloads the SMS interface module.

Corrective Action: No action is required.

MTO833I  DEACTIVATION OF SMS SUPPORT ENDED SUCCESSFULLY

Explanation: This information message indicates that SMS support for the current Control-O subsystem was removed successfully.

Corrective Action: No action is required.

MTO834W  DEACTIVATION OF SMS SUPPORT FAILED

Explanation: An error occurred when Control-O tried to remove the SMS interface module.

The following system actions occur:
- Control-O termination continues.
- The next attempt to activate Control-O may produce warnings.

Corrective Action: Do both of the following:
- Check earlier messages to determine the cause of the error.
- Check that the next Control-O initialization succeeds.

MTO835W  SMS INTERFACE MODULE NOT INSTALLED

Explanation: Control-O could not find the SMS interface module to delete it.

Control-O detected an environment that supports the SMS interface. However, it could not find the SMS interface module that should have been installed during initialization.

The following system actions occur:
- Control-O termination continues.
- The next attempt to activate Control-O may produce warnings.

Corrective Action: Do both of the following:
- Check earlier messages to determine the cause of the error.
- Check that the next Control-O initialization succeeds.

**MTO836W SUBSYSTEM NOT REMOVED FROM SMS INTERFACE: \textit{rsn}**

\textbf{Explanation:} Control-O could not remove its subsystem name from the SMS interface.

The value of \textit{rsn} may be one of the following:
- \textbf{SUBSYSTEM NOT FOUND} - The name of the current Control-O subsystem is not registered in the SMS interface.
- \textbf{LOCK CANNOT BE OBTAINED} - Control-O could not get the SMS interface lock that it needs to remove its registration.

The following system actions occur:
- Control-O termination continues.
- The next attempt to activate Control-O may produce warnings.

\textbf{Corrective Action:} Do both of the following:
- Check earlier messages to determine the cause of the error.
- Check that the next Control-O initialization succeeds.

**MTO837W SUBSYSTEM NOT REMOVED FROM SMS INTERFACE:**

\textbf{SUBSYSTEM NOT FOUND}

\textbf{Explanation:} Control-O could not remove its subsystem name from the SMS interface because the name of the current Control-O subsystem is not registered in the SMS interface.

The following system actions occur:
- Control-O termination continues.
- The next attempt to activate Control-O might produce warnings.

\textbf{Corrective Action:} Do both of the following:
- Check earlier messages to determine the cause of the error.
- Check that the next Control-O initialization succeeds.

**MTO83AI INITIALIZATION OF AUTOOPERATOR SUPPORT STARTED**

\textbf{Explanation:} This information message indicates that Control-O started initializing AutoOPERATOR support.

\textbf{Corrective Action:} No action is required.

**MTO83BW UNABLE TO REGISTER WITH AUTOOPERATOR INTERFACE:**

\textbf{LOCK CANNOT BE OBTAINED}

\textbf{Explanation:} Control-O could not register with the AutoOPERATOR interface during initialization because Control-O could not obtain the AutoOPERATOR interface lock that it needs for registration.
The following system actions occur:

- **AUTOOPERATOR interface initialization fails.**
- Control-O initialization continues.
- Control-O does not handle AutoOPERATOR events.

**Corrective Action:** Restart the current Control-O monitor. If the problem persists, call your INCONTROL administrator.

**MTO83CI AUTOOPERATOR INTERFACE MODULE SUCCESSFULLY LOADED**

**Explanation:** This information message indicates that Control-O successfully loaded the AutoOPERATOR interface module.

**Corrective Action:** No action is required.

**MTO83DW UNABLE TO REGISTER WITH AUTOOPERATOR INTERFACE: NO PROPER ENTRY IN SSTABLE**

**Explanation:** Control-O could not register with the AutoOPERATOR interface during initialization because Control-O could not locate its entry in the INCONTROL internal subsystems table.

The following system actions occur:

- AutoOPERATOR interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle AutoOPERATOR events.

**Corrective Action:** Restart the current Control-O monitor. If the problem persists, call your INCONTROL administrator.

**MTO83EI SUBSYSTEM REGISTERED WITH AUTOOPERATOR INTERFACE**

**Explanation:** This information message indicates that the current Control-O subsystem registered itself with the AutoOPERATOR interface.

**Corrective Action:** No action is required.

**MTO83FI INITIALIZATION OF AUTOOPERATOR SUPPORT ENDED SUCCESSFULLY**

**Explanation:** This information message indicates that Control-O initialization of the AutoOPERATOR support ended successfully.

**Corrective Action:** No action is required.

**MTO83GE INITIALIZATION OF AUTOOPERATOR SUPPORT FAILED**

**Explanation:** An initialization error occurred when Control-O tried to initialize the AutoOPERATOR interface.

The following system actions occur:
AutoOPERATOR interface initialization fails.
Control-O initialization continues.
Control-O does not handle AutoOPERATOR events.

Corrective Action: Check earlier messages to determine the cause of failure. If necessary, call your INCONTROL administrator.

**MTO83HW LOAD OF AUTOOPERATOR INTERFACE MODULE FAILED: LOAD TO PRIVATE FAILED**

**Explanation:** Control-O could not load the AutoOPERATOR interface module because it could not load the module into its own private region.

The following system actions occur:
- AutoOPERATOR interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle AutoOPERATOR events.

**Corrective Action:** Check earlier messages to determine the cause of failure. The following are possible causes:
- The region allocated for Control-O is too small.
- The CTOAAO module is not in the Control-O STEPLIB library.

**MTO83IW LOAD OF AUTOOPERATOR INTERFACE MODULE FAILED: CSA GETMAIN FAILED**

**Explanation:** Control-O could not load the AutoOPERATOR interface module because it could not get the storage in the Common Service Area (CSA) that it needs for the AutoOPERATOR interface module.

The following system actions occur:
- AutoOPERATOR interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle AutoOPERATOR events.

**Corrective Action:** Check earlier messages to determine the cause of failure.

**MTO83JW LOAD OF AUTOOPERATOR INTERFACE MODULE FAILED: LOAD TO CSA FAILED**

**Explanation:** Control-O could not load the AutoOPERATOR interface module because it could not load the AutoOPERATOR interface module to the Common Service Area (CSA).

The following system actions occur:
AutoOPERATOR interface initialization fails.
Control-O initialization continues.
Control-O does not handle AutoOPERATOR events.

Corrective Action: Check earlier messages to determine the cause of failure.

MTO83KI DEACTIVATION OF AUTOOPERATOR SUPPORT STARTED

Explanation: This information message indicates that Control-O started deactivating the AutoOPERATOR interface.

Corrective Action: No action is required.

MTO83LW AUTOOPERATOR INTERFACE MODULE NOT INSTALLED

Explanation: Control-O could not find the AutoOPERATOR interface module to delete it. Control-O detected an environment that supports the AutoOPERATOR interface. However, it could not find the AutoOPERATOR interface module that is usually installed during initialization.

The following system actions occur:

- Control-O termination continues.
- The next attempt to activate Control-O might produce warnings.

Corrective Action: Do both of the following:

- Check earlier messages to determine the cause of the error.
- Check that the next Control-O initialization succeeds.

MTO83MW SUBSYSTEM NOT REMOVED FROM AUTOOPERATOR INTERFACE: LOCK CANNOT BE OBTAINED

Explanation: Control-O could not remove its subsystem name from the AutoOPERATOR interface because Control-O could not get the AutoOPERATOR interface lock that it needs to remove its registration.

The following system actions occur:

- Control-O termination continues.
- The next attempt to activate Control-O might produce warnings.

Corrective Action: Do both of the following:

- Check earlier messages to determine the cause of the error.
- Check that the next Control-O initialization succeeds.

MTO83NW SUBSYSTEM NOT REMOVED FROM AUTOOPERATOR INTERFACE: NO PROPER ENTRY IN SSTABLE

Explanation: When Control-O tried to remove the AutoOPERATOR interface module it could not find its entry in the internal INCONTROL subsystem table.

Control-O termination continues.
Corrective Action: Check earlier messages to determine the cause of the error.

MTO830I SUBSYSTEM REGISTRATION REMOVED FROM AUTOOPERATOR INTERFACE

Explanation: This information message indicates that Control-O unregistered the AutoOPERATOR interface.

Corrective Action: No action is required.

MTO83PI AUTOOPERATOR INTERFACE MODULE REMOVED

Explanation: This information message indicates that Control-O removed the AutoOPERATOR interface module from Common Service Area (CSA).

Corrective Action: No action is required.

MTO83QI DEACTIVATION OF AUTOOPERATOR SUPPORT ENDED SUCCESSFULLY

Explanation: This information message indicates that the Control-O deactivation of the AutoOPERATOR support ended successfully.

Corrective Action: No action is required.

MTO83RW DEACTIVATION OF AUTOOPERATOR SUPPORT FAILED

Explanation: An error occurred when Control-O tried to remove the AutoOPERATOR interface module. The following system actions occur:

- Control-O termination continues.
- The next attempt to activate Control-O might produce warnings.

Corrective Action: Do both of the following:

- Check earlier messages to determine the cause of the error.
- Check that the next Control-O initialization succeeds.

MTO840E INITIALIZATION OF SUBSYSTEM TABLE FAILED:  text

Explanation: When Control-O starts, it defines the IOA and Control-O subsystems if they were not already defined. During the definition process, an error occurred.

In this message,  text  identifies the nature of the error. Valid values for  text  are:

<table>
<thead>
<tr>
<th>text</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOAD OF CTOSSI FAILED</td>
<td>The Control-O interface was not successfully loaded.</td>
</tr>
<tr>
<td>CSA GETMAIN FAILED</td>
<td>Control-O failed to GETMAIN in CSA.</td>
</tr>
</tbody>
</table>
### Explanation

<table>
<thead>
<tr>
<th>text</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCK CANNOT BE OBTAINED</td>
<td>Control-O failed to obtain LOCK.</td>
</tr>
<tr>
<td>TOO MANY SUBSYSTEMS</td>
<td>Control-O failed to define the subsystem, because the SSVT subsystem table already contained the maximum permitted number of subsystems.</td>
</tr>
</tbody>
</table>

Control-O terminates with a return code of 8.

**Corrective Action:** The necessary action depends on the value of `text`.

- If the value of `text` is LOAD OF CTOSSI FAILED, ensure that the Control-O STC is using the correct STEPLIB library, then restart Control-O.
- If the value of `text` is CSA GETMAIN FAILED, ensure that Control-O has sufficient storage. Control-O requires about 50K in CSA. It may be necessary to restart the system.
- If the value of `text` is LOCK CANNOT BE OBTAINED, the error may be a Control-O internal error. Try again to start Control-O. If the same error occurs, contact BMC Software Customer Support.
- If the value of `text` is TOO MANY SUBSYSTEMS, reduce the number of subsystems that are active, and try again to start Control-O. It may be necessary to deactivate one or more active subsystems, or to restart the system, before trying to restart Control-O.

**MTO841I MAINVIEW INTERFACE MODULE SUCCESSFULLY LOADED**

**Explanation:** This information message indicates that a Control-O subsystem loaded the MAINVIEW interface module into storage.

The first Control-O subsystem to initialize itself loads the MAINVIEW interface.

**Corrective Action:** No action is required.

**MTO842I SUBSYSTEM REGISTERED WITH MAINVIEW INTERFACE**

**Explanation:** This information message indicates that the current Control-O subsystem registered itself with the MAINVIEW interface.

Control-O subsystems must be registered with the MAINVIEW interface to receive MAINVIEW events from it.

**Corrective Action:** No action is required.

**MTO843I INITIALIZATION OF MAINVIEW SUPPORT ENDED SUCCESSFULLY**

**Explanation:** This information message indicates that MAINVIEW support for the current Control-O subsystem was installed successfully.

Control-O requires MAINVIEW ACS exit routines to trigger rules based on MAINVIEW events.

**Corrective Action:** No action is required.
MTO844W LOAD OF CAB ALLOCATOR MODULE FAILED

**Explanation:** Control-O could not load IOACAB.

Control-O needs the IOACAB program to install the MAINVIEW interface module.

The following system actions occur:

- MAINVIEW interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle MAINVIEW events.

**Corrective Action:** Check the IOA load library.

MTO845W UNABLE TO REGISTER WITH MAINVIEW INTERFACE *rsn*

**Explanation:** Control-O could not register with the MAINVIEW interface during initialization.

Valid values for *rsn* are:

<table>
<thead>
<tr>
<th><em>rsn</em></th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOO MANY SUBSYSTEMS</td>
<td>The MAINVIEW interface had already registered the maximum number of subsystems.</td>
</tr>
<tr>
<td>LOCK CANNOT BE OBTAINED</td>
<td>Control-O could not get the MAINVIEW interface lock that it needs for registration.</td>
</tr>
</tbody>
</table>

The following system actions occur:

- MAINVIEW interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle MAINVIEW events.

**Corrective Action:** Do one of the following:

- If the value of *rsn* is TOO MANY SUBSYSTEMS, shut down a different Control-O monitor and restart the current one.
- If the value of *rsn* is LOCK CANNOT BE OBTAINED, restart the current Control-O monitor.

If the problem persists, call your INCONTROL administrator.

MTO846W LOAD OF MAINVIEW INTERFACE FAILED: *rsn*

**Explanation:** Control-O could not load the MAINVIEW interface module.
Valid values for $rsn$ are:

<table>
<thead>
<tr>
<th>$rsn$</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOAD TO PRIVATE REGION FAILED</td>
<td>Control-O could not load the MAINVIEW interface module into its own private region.</td>
</tr>
<tr>
<td>CSA GETMAIN FAILED</td>
<td>Control-O could not get the storage in the Common Service Area (CSA) that it needs for the MAINVIEW interface module.</td>
</tr>
<tr>
<td>LOAD TO CSA FAILED</td>
<td>Control-O could not load the MAINVIEW interface module into the CSA.</td>
</tr>
</tbody>
</table>

The following system actions occur:

- MAINVIEW interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle MAINVIEW events.

**Corrective Action:** Do one of the following:

- If the value of $rsn$ is LOAD TO PRIVATE REGION FAILED, check earlier messages to determine the cause of failure. The following are possible causes:
  - The region allocated for Control-O is too small.
  - The CTOACS module is not in the Control-O STEPLIB library.
- If the value of $rsn$ is CSA GETMAIN FAILED, make sure that at least 8KB are allocated for the CSA and restart Control-O.
- If the value of $rsn$ is LOAD TO CSA FAILED, check earlier messages to determine the cause of failure.

**MTO847E** INITIALIZATION OF MAINVIEW SUPPORT FAILED

**Explanation:** An initialization error occurred when Control-O tried to install the MAINVIEW interface.

The following system actions occur:

- MAINVIEW interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle MAINVIEW events.

**Corrective Action:** Check earlier messages to determine the cause of failure. If necessary, call your INCONTROL administrator.

**MTO848I** SUBSYSTEM ALREADY REGISTERED WITH MAINVIEW INTERFACE

**Explanation:** This information message indicates that the current Control-O subsystem did not register with the MAINVIEW interface because it was already registered.
A possible cause is that a previous Control-O subsystem did not end correctly.

**Corrective Action:** No action is required.

**MTO84AI INITIALIZATION OF MAINVIEW SUPPORT STARTED**

**Explanation:** This information message indicates that Control-O started initializing MAINVIEW support.

**Corrective Action:** No action is required.

**MTO84BI DEACTIVATION OF MAINVIEW SUPPORT STARTED**

**Explanation:** This information message indicates that Control-O started deactivating an MAINVIEW interface.

**Corrective Action:** No action is required.

**MTO84CI SUBSYSTEM REGISTRATION REMOVED FROM MAINVIEW INTERFACE**

**Explanation:** This information message indicates that Control-O removed its registration from the MAINVIEW interface.

When a Control-O subsystem is not registered with the MAINVIEW interface, it cannot receive MAINVIEW events from the MAINVIEW interface.

**Corrective Action:** No action is required.

**MTO84DI MAINVIEW INTERFACE MODULE REMOVED**

**Explanation:** This information message indicates that Control-O removed the MAINVIEW interface module from storage.

The last Control-O subsystem removed unloads the MAINVIEW interface module.

**Corrective Action:** No action is required.

**MTO84EI DEACTIVATION OF MAINVIEW SUPPORT ENDED SUCCESSFULLY**

**Explanation:** This information message indicates that MAINVIEW support for the current Control-O subsystem was removed successfully.

**Corrective Action:** No action is required.

**MTO84FW DEACTIVATION OF MAINVIEW SUPPORT FAILED**

**Explanation:** An error occurred when Control-O tried to remove the MAINVIEW interface module.

The following system actions occur:

- Control-O termination continues.
- The next attempt to activate Control-O may produce warnings.

**Corrective Action:** Do both of the following:
Check earlier messages to determine the cause of the error.
Check that the next Control-O initialization succeeds.

**MTO84GW MAINVIEW INTERFACE MODULE NOT INSTALLED**

**Explanation:** Control-O could not find the MAINVIEW interface module to delete it.
Control-O detected an environment that supports the MAINVIEW interface. However, it could not find the MAINVIEW interface module that should have been installed during initialization.

The following system actions occur:
- Control-O termination continues.
- The next attempt to activate Control-O may produce warnings.

**Corrective Action:** Do both of the following:
- Check earlier messages to determine the cause of the error.
- Check that the next Control-O initialization succeeds.

**MTO84HW SUBSYSTEM NOT REMOVED FROM MAINVIEW INTERFACE: rsn**

**Explanation:** Control-O could not remove its subsystem name from the MAINVIEW interface.

Valid values of *rsn* are:

<table>
<thead>
<tr>
<th>rsn</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUBSYSTEM NOT FOUND</td>
<td>The name of the current Control-O subsystem is not registered in the MAINVIEW interface.</td>
</tr>
<tr>
<td>LOCK CANNOT BE OBTAINED</td>
<td>Control-O could not get the MAINVIEW interface lock that it needs to remove its registration.</td>
</tr>
</tbody>
</table>

The following system actions occur:
- Control-O termination continues.
- The next attempt to activate Control-O may produce warnings.

**Corrective Action:** Do both of the following:
- Check earlier messages to determine the cause of the error.
- Check that the next Control-O initialization succeeds.

**MTO84IE INITIALIZATION OF SUBSYSTEM TABLE FAILED: CSA GETMAIN FAILED**

**Explanation:** When Control-O starts, it defines the IOA and Control-O subsystems if they were not already defined. During the definition process, the Control-O failed to GETMAIN in CSA.
Control-O terminates with a return code of 8.

**Corrective Action:** Ensure that Control-O has sufficient storage. Control-O requires about 50K in CSA. It might be necessary to restart the system.

**MTO84JE INITIALIZATION OF SUBSYSTEM TABLE FAILED: LOCK CANNOT BE OBTAINED**

**Explanation:** When Control-O starts, it defines the IOA and Control-O subsystems if they were not already defined. During the definition process, the Control-O failed to obtain LOCK.

Control-O terminates with a return code of 8.

**Corrective Action:** The error might be a Control-O internal error. Try to start Control-O again. If the same error occurs, contact BMC Software Customer Support.

**MTO84KE INITIALIZATION OF SUBSYSTEM TABLE FAILED: TOO MANY SUBSYSTEMS**

**Explanation:** When Control-O starts, it defines the IOA and Control-O subsystems, if they were not defined previously. During the definition process, the Control-O failed to define the subsystem, because the number of Control-O and Control-M Event Manager (CMEM) environments defined on the LPAR exceeded the maximum of 20.

Control-O terminates with a return code of 8.

**Corrective Action:** Stop all active Control-O and CMEM monitors, run the IOACABPR (Emergency CAB Control Block Disconnect) utility, and then restart the Control-O and CMEM monitors.

**MTO84LW UNABLE TO REGISTER WITH MAINVIEW INTERFACE: NO PROPER ENTRY IN SSTABLE**

**Explanation:** Control-O could not register with the MAINVIEW interface during initialization because Control-O could not locate its entry in the INCONTROL internal subsystems table.

The following system actions occur:
- MAINVIEW interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle MAINVIEW events.

**Corrective Action:** Restart the current Control-O monitor. If the problem persists, call your INCONTROL administrator.

**MTO84MW LOAD OF MAINVIEW INTERFACE FAILED: CSA GETMAIN FAILED**

**Explanation:** Control-O could not load the MAINVIEW interface module because Control-O could not get the storage in the Common Service Area (CSA) that it needs for the MAINVIEW interface module.

The following system actions occur:
- MAINVIEW interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle MAINVIEW events.

Corrective Action: Make sure that at least 8KB are allocated for the CSA and restart Control-O.

**MTO84NW LOAD OF MAINVIEW INTERFACE FAILED: LOAD TO CSA FAILED**

Explanation: Control-O could not load the MAINVIEW interface module because Control-O could not load the MAINVIEW interface module into the Common Service Area (CSA).

The following system actions occur:
- MAINVIEW interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle MAINVIEW events.

Corrective Action: Check earlier messages to determine the cause of failure.

**MTO84OW SUBSYSTEM NOT REMOVED FROM MAINVIEW INTERFACE: NO PROPER ENTRY IN SSTABL**

Explanation: When Control-O tried to remove the MAINVIEW interface module it could not find its entry in the internal INCONTROL subsystem table.

Control-O termination continues.

Corrective Action: Check earlier messages to determine the cause of failure.

Messages **MTO900 through MTO9xx**

This group includes messages for the Control-O product.

**MTO910W PARAMETER NUMCONS IN CTOPARM FORCED TO '0', DUE TO OPERATING SYSTEM RESTRICTIONS**

Explanation: Control-O changes the NUMCONS parameter, in the CTOPARM member, to zero in z/OS 1.8 or later.

The Control-O startup process continues.

Corrective Action: If the CTOPARM member is only used for Control-O in z/OS 1.8 or later, set NUMCONS=0 in the CTOPARM member.

**MTO915S ERROR IN CONTROL-O INSTALLATION PARAMETERS**

Explanation: During the startup of the Control-O monitor, an error is encountered in the Control-O installation parameters. The nature of the error is detailed in an accompanying message or messages.

The Control-O monitor terminates.

Corrective Action: Contact your INCONTROL administrator.
MTO916S ERROR OCCURRED DURING CONTROL-O INITIALIZATION

**Explanation:** During the startup of the Control-O monitor, an error occurred during Control-O initialization. The nature of the error is detailed in an accompanying message or messages. The Control-O monitor terminates.

**Corrective Action:** Contact your INCONTROL administrator.

MTO917W PARAMETER JCMDSSN SHOULD DIFFER FROM SSNAME; REPLACED WITH BLANKS

**Explanation:** During the startup of the Control-O monitor, the values of the JCMDSSN and the SSNAME parameters were found to be identical.

The JCMDSSN parameter identifies the JES2 command suppression subsystem name, and is in the CTOPARM member.

The SSNAME parameter identifies the IOA subsystem, and is in the IOAPARM parameter.

The value of the JCMDSSN parameter is replaced with blanks. Monitor startup continues.

**Corrective Action:** Contact your INCONTROL administrator.

MTO918S INSUFFICIENT MEMORY TO RUN CONTROL-O. COMPONENT: component LENGTH=getmain_length

**Explanation:** The Control-O component could not be initialized because the getmain in length getmain_length failed.

The specified monitor will shut down.

**Corrective Action:** Increase the REGION size of the specified monitor.

MTO919E monitor_type name FROM VERSION version IS USING SUBSYSTEM subsys. BRING IT DOWN BEFORE STARTING THIS MONITOR

**Explanation:** During Control-O or CMEM monitor initialization, it was discovered that the existing subsys subsystem is already activated for the version version of the monitor. The active monitor is shut down.

**Corrective Action:** Determine which monitor (the active one or the newly started) should use the subsystem and act accordingly.
This group includes messages for the Control-M/Analyzer, Control-D (including Control-D/Image and
Control-D/Page on Demand), Control-M for z/OS (including Control-M/Assist, Control-M/Links for z/OS and
Control-M/Restart), Control-O, Control-V and IOA (infrastructure) products.

NRC messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand
products.

Messages NRC900 through NRC9xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand
products.

NRC930I NOTE AND RULER CONVERSION STARTED.

Explanation: This information message is issued routinely when the CTDNRC utility started.
Corrective Action: No action is required.

NRC931I WD1164 IS SET TO status

Explanation: This information message shows the current WD1164 optional wish status.
Possible values are:
- JOBNAME
- REPORT
- CATEGORY

Corrective Action: No action is required.

NRC932I NOTE AND RULER CONVERSION ENDED

Explanation: This information message indicates that the CTDNRC utility finished successfully.
Corrective Action: No action is required.

NRC933E NOTE AND RULER CONVERSION ENDED WITH ERROR

Explanation: This information message indicates that the CTDNRC utility finished with errors.
Corrective Action: Examine other messages relating to the CTDNRC utility to identify and fix the
problem, and then rerun the utility.
NRC934I record_type RECORDS: n

Explanation: This information message issue displays the number of records read and processed by the CTDNRC utility.
Possible record_type values are:
- READ
- NOT UPDATED NOTE
- NOT UPDATED RULER
- UPDATED NOTE
- UPDATED RULER

Corrective Action: No action is required.

NRC935S SORT ERROR RC=rc

Explanation: During execution of the CTDNRC utility, a sort program was activated internally, but the sort program ended with an unexpected internal return code.
In this message, rc is the unexpected internal return code.
The CTDNRC utility ends with a condition code of 08.
Corrective Action: Examine the messages issued by the sort program and the documentation relating to that program to determine the cause of the error, and take appropriate corrective action.

NRC936S OPEN FILE ddname ERROR

Explanation: During execution of the CTDNRC utility, the opening of a file failed.
Possible causes are:
- The ddname DD statement is missing.
- The data set described by the ddname DD statement contains incorrect DCB parameters.
- The data set described by the ddname DD statement cannot be opened for sequential read or write operations.
In this message, ddname is the name of the problematic DD statement.
The CTDNRC utility ends with a condition code of 08.
Corrective Action: Correct the JCL of the CTDDIP utility and rerun the job.

NRC937S INSUFFICIENT STORAGE

Explanation: There is insufficient available storage to run the CTDNRC utility.
The CTDNRC utility ends with a condition code of 08.
Corrective Action: Increase the REGION size of the utility, and rerun the utility.
NSC messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages NSC300 through NSC3xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

NSC391I NIGHT SCHEDULE REPORT STARTED

**Explanation:** This information message is the regular start message of the Night Schedule Report.

**Corrective Action:** No action is required.

NSC392S MAXIMUM NUMBER OF INCLUDE PARAMETERS EXCEEDED

**Explanation:** Too many INCLUDE statements have been specified for the current run of the utility.

Up to ten INCLUDE statements may be specified for each individual run of the utility.

The report cannot be produced for the specified number of groups. Processing is terminated.

**Corrective Action:** Decrease the number of INCLUDE statements. To produce the report for more than ten groups, use multiple runs of the utility with each run having less than ten INCLUDE statements.

NSC393I NIGHT SCHEDULE REPORT ENDED

**Explanation:** This information message is the regular termination message of the Night Schedule Report.

**Corrective Action:** No action is required.

NTP messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages NTP0 through NTP0xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

NTP001E SECURITY VIOLATION. YOU ARE NOT AUTHORIZED TO EDIT THE NOTE

**Explanation:** The user attempted to add or change a note without security authorization, but was prevented from doing so by Control-D security exit CTDX004.
**Corrective Action:** If you think you should be authorized to add or change this note, contact your INCONTROL administrator.

**NTP002E PLEASE FILL IN A VALID OPTION - "Y" OR "N"**

**Explanation:** An invalid SAVE option was specified for the note.

Valid SAVE options are:
- **Y** - Save the changes.
- **N** - Do not save the changes.

**Corrective Action:** Specify a valid SAVE option.

**NTP003E NOTE PAD FILE IS IN USE, TRY AGAIN LATER**

**Explanation:** The user tried to edit a note that is currently in use by another user.

A note that is currently in use by a user can only be browsed by other users.

The requested action is not performed.

**Corrective Action:** Try again later.

**OGR messages**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**Messages OGR0 through OGR0xx**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**OGR004E NO MATCHING RECORDS FOUND IN THE LOG FILE**

**Explanation:** No records which match the specified parameters were found in the Log file.

The specified log file is either the IOA Log file or the Simulation Log file. No executions were found in the file for the specified groups during the specified time range (and intervals).

**Corrective Action:** Check the specified group, time range and interval parameters. Correct if necessary, and run the report again.

**Messages OGR300 through OGR3xx**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.
OGR391I OVERNIGHT EXECUTION REPORT STARTED

Explanation: This information message indicates that processing of the Overnight Execution Report has begun.

Corrective Action: No action is required.

OGR393I OVERNIGHT EXECUTION REPORT ENDED

Explanation: This information message indicates that processing of the Overnight Execution Report has ended.

Corrective Action: No action is required.

OGR394S MAXIMUM NUMBER OF INTERVALS EXCEEDED

Explanation: There are too many intervals for the report to be run.

Within the specified time range, job executions are checked periodically at the interval determined by the specified interval parameter. The total number of intervals in which a check is to be made depends on the length of the time range and the size of the interval. However, the maximum number of intervals may occur within a specified time range is 210 intervals.

The report is not run.

Corrective Action: Either decrease the allotted time in the time range, or increase the interval value, so that the total number of intervals does not exceed 210.

OPL messages

This group includes messages for the Control-O product.

Messages OPL300 through OPL3xx

This group includes messages for the Control-O product.

OPL341S OPERLOG NOT AVAILABLE UNDER MVS/ESA 5.2

Explanation: The user tried to access the MVS OPERLOG with a system level lower than MVS/ESA 5.2. The system rejects the request and continues.

Corrective Action: Update the system to MVS/ESA 5.2 or higher.

OPL342S ERROR OPENING OPERLOG FILE

Explanation: The user tried to access the OPERLOG in a SYSPLEX environment. However, the OPERLOG could not be opened.

The system rejects the request and continues.

Corrective Action: Record the message and contact your system programmer.
OPL346S ABEND abCode INTERCEPTED WHILE PROCESSING THE OPERLOG

Explanation: The user tried to access the OPERLOG in a SYSPLEX environment but an abend was generated.

For information about abCode, see the IBM Abend Codes manual.

The system terminates the requested action.

Corrective Action: Take appropriate corrective action.

OPL347S ERROR RETURN CODE FROM A SYSTEM LOGGER REQUEST rc

Explanation: The user issued the OPER command in the OL screen to access the OPERLOG in a SYSPLEX environment. However, the request failed and the rc SYSTEM LOGGER return code was issued.

The system rejects the request.

Corrective Action: For information about the error, note the value of rc and refer to IBM LOGGER services (IXGxxx macros) in the Sysplex service manual.

OPL348S OPERLOG IS EMPTY

Explanation: The user issued the command OPER in the OL screen to access the OPERLOG in a SYSPLEX environment. In response, the system logger informed Control-O that the OPERLOG was empty.

The system rejects the request.

Corrective Action: For more information about the error, note the message and contact your system programmer.

OPL349S OPERLOG END OF FILE IS REACHED

Explanation: The user attempted to access the OPERLOG in a SYSPLEX environment and reached the end of the OPERLOG. However, no more data was available in the OPERLOG.

The system rejects the request.

Corrective Action: Reattempt access to the OPERLOG.

OSM messages

This group includes messages for the IOA (infrastructure) product.

Messages OSM100 through OSM1xx
This group includes messages for the IOA (infrastructure) product.

OSM150E mediaName - DYNAMIC ALLOCATION ERROR FOR DDNAME=SORTIN RC= rc, REASON CODE= rsn

Explanation: An error occurred while trying to allocate an OSS Extract Database file.
This error causes the dynamic allocation of the SORTIN DD statement to fail.

For a description of the return code received, see the IBM manual *MVS Programming: Authorized Assembler Services Guide*.

The *mediaName* media is terminated.

**Corrective Action:** Use the return code (*rc*) and reason code (*rsn*) to determine the problem and correct it. If you cannot resolve the problem, record the DD statement, return code and reason code, and contact BMC Software Customer Support.

**OSM151E mediaName - SORT OF OSS EXTRACT DATABASE FILE FAILED.**

**Explanation:** The internal sort of the OSS Extract Database file failed.

The *mediaName* media activates the regular sort program at the site. The system log should contain additional messages about specific errors.

The *mediaName* media is terminated.

**Corrective Action:** Check the system log for messages describing the error. Contact the system programmer for assistance, if needed. If the problem is not resolved, contact BMC Software Customer Support.

**OSM152E mediaName - VOLSER volser NOT FOUND IN OSS EXTRACT DATABASE FILE**

**Explanation:** An attempt was made to view a report but the *mediaName* media was not able to find the *volser* volume serial number on which this report resides.

When *mediaName* media detects a user request to view a report, it searches the OSS Extract Database to find the volume on which the requested report resides. The OSS Extract Database does not contain an entry for volume *volser*.

The user request is not executed.

**Corrective Action:** Check the OSS Extract Database and make any appropriate corrections. Contact the system programmer for assistance, if needed.

**OSM153E mediaName - PLATTER platterId NOT FOUND FOR VOLSER volser**

**Explanation:** The *mediaName* media was not able to find the *platterId* for the *volser* volume on which this report resides.

When the *mediaName* media detects a user request to view a report, it searches the OSS Extract Database to find the *volser* and *platterId* on which this report resides. The OSS Extract Database does not contain an entry for the required *volser* and *platterId*.

The user request is not executed.

**Corrective Action:** Check the OSS Extract Database and make appropriate corrections. Contact the system programmer for assistance, if needed.
OSM154E mediaName - INTERNAL ERROR RC = rc

**Explanation:** Media mediaName encountered an internal error.

The user request is not executed. Depending on internal error severity, one of the following actions occurs:

- Media mediaName terminates. The IOA Archive Server continues processing.
- Media mediaName abends with user abend 0007. The IOA Archive Server terminates with user abend 0006. The output includes a dump of the abend.

**Corrective Action:** Check the IOA Log file and system log for messages describing the error. Contact the system programmer for assistance, if needed. If the problem is not resolved, record the return code and contact BMC Software Customer Support.

**PAS messages**

This group includes messages for the IOA (infrastructure) product.

**Messages PAS0 through PAS0xx**

This group includes messages for the IOA (infrastructure) product.

**PAS046S BLDL/LOAD FAILED FOR THE MODULE modName**

**Explanation:** Loading of the modName module failed.

Possible causes are:

- The IOA Load library is not in the load modules search list (STEPLIB + Linklist).
- There is insufficient memory.
- There is some other system-oriented reason, which may be found in the syslog.

Execution might stop.

**Corrective Action:** Prepare the Control-M monitor full output and contact BMC Customer Support.

**Messages PASF00 through PASFx x**

This group includes messages for the IOA (infrastructure) product.

**PASF90I THE PASSWORD OF CONTROL-x IS AUTHORIZED**

**Explanation:** This information message indicates that the password for Control-x has been authorized.

**Corrective Action:** No action is required.

**PASF90S OPEN OF DDCARD ddName FAILED**

**Explanation:** The ddName DD statement pointing to the password member failed to open.
Possible causes are:

- The \textit{ddName} DD statement is missing.
- The file allocated to the \textit{ddName} DD statement is not a sequential file nor a member in a PDS.

\textbf{Authorization to access the product is denied.}

\textbf{Corrective Action:} Correct the JCL statement for the procedure or the allocations for the CLIST.

\textbf{PASF91S PASSWORD MEMBER TOO LARGE (DD \textit{ddName})}

\textbf{Explanation:} The password member (or sequential data set) has too many lines.

In this message, \textit{ddName} is the identity of the DD statement that points to the password member. 

\textbf{Authorization to access the product is denied.}

\textbf{Corrective Action:} Remove unnecessary lines from the member.

\textbf{PASF91W Control- \textit{x} IS NOT INSTALLED !}

\textbf{Explanation:} Control-\textit{x} has not been installed.

\textbf{Corrective Action:} No action is required.

\textbf{PASF92S SYNTAX ERROR IN PASSWORD MEMBER (DD \textit{ddName})}

\textbf{Explanation:} A syntax error was found in the password member. When this message is issued by the monitor, it is generally followed by message PASF9DS, which describes the erroneous line in the member.

In this message, \textit{ddName} is the identity of the DD statement that points to the password member.

\textbf{Authorization to access the product is denied.}

\textbf{Corrective Action:} Correct the text in the password member.

\textbf{PASF93S VALUE ERROR IN PASSWORD MEMBER (DD \textit{ddName})}

\textbf{Explanation:} A field in the password member contains invalid data. When this message is issued by the monitor, it is generally followed by message PASF9DS, which describes the erroneous line in the member.

In this message, \textit{ddName} is the identity of the DD statement that points to the password member.

\textbf{Authorization to access the product is denied.}

\textbf{Corrective Action:} Correct the text in the password member.

\textbf{PASF94S PASSWORD INVALID, PLEASE RECHECK PASSWORD MEMBER (DD \textit{ddName})}

\textbf{Explanation:} Data in the password member was not consistent with the specified password.

In this message, \textit{ddName} is the identity of the DD statement that points to the password member.

\textbf{Authorization to access the product is denied.}

\textbf{Corrective Action:} Check the contents of the password member against the text received from BMC Software Customer Support. If it checks, contact the representative.
INCONTROL for z/OS Messages Manual

PASF95S PASSWORD FOR CONTROL- x IS ABOUT TO EXPIRE IN n DAYS

Explanation: Highlighted, unrollable message.
Password expiration period is about to end.
An expiration date is specified in the password member for the product.
Corrective Action: Contact BMC Software Customer Support for a new password.

PASF96S PASSWORD FOR CONTROL- x HAS EXPIRED

Explanation: Highlighted, unrollable message.
Password expiration period has ended.
An expiration date is specified in the password member for the product.
Authorization to access the product is denied.
Corrective Action: Contact BMC Software Customer Support for a new password.

PASF97S INTERNAL ERROR OCCURRED ON DD ddName, PLEASE NOTIFY THE IOA ADMINISTRATOR

Explanation: An internal error has occurred while analyzing the password member pointed to by the ddName DD statement.
Authorization to access the product is denied.
Corrective Action: Notify the IOA administrator.

PASF98S OBLIGATORY FIELD MISSING FROM PASSWORD MEMBER (DD ddName)

Explanation: An obligatory field is missing from the password member.
The ddName DD statement points to the password member. The PROD, START, CPUID, PASS, and TYPE fields should appear at least once in a password member. For Control-D/WebAccess Server, the CTD_PC_USERS field is also obligatory.
Authorization to access the product is denied.
Corrective Action: Check the contents of the password member against the text received from your INCONTROL administrator.

PASF9AS PASSWORD FOR CONTROL- x NOT DEFINED IN MEMBER (DD ddName)

Explanation: The member pointed to by the ddName DD statement does not contain the password for the appropriate product.
In this message, ddName is the identity of the DD statement that points to the password member.
Authorization to access the product is denied.
Corrective Action: Check that the specified password member is the correct member for this product.
INCONTROL for z/OS Messages Manual

PASF9BS AUTHORIZATION PERIOD HAS NOT STARTED YET (DD ddName)

Explanation: The start date of the password has not yet arrived.
In this message, ddName is the identity of the DD statement that points to the password member. The START field contains the starting date of the password.
Authorization to access the product is denied.
Corrective Action: Check that the specified password member is the correct member for this period.

PASF9CS CPUID/MODEL NOT FOUND IN AUTHORIZED CPU LIST (DD xxxxxxxxx)

Explanation: The current CPU is not defined in the CPU list.
In this message, ddName is the identity of the DD statement that points to the password member. Each entry in the CPU list in the password member contains the CPUID of the CPU and its model.
Authorization to access the product is denied.
Corrective Action: Check that the specified password member is the correct member for this CPU.

PASF9DS CARD = text

Explanation: This message supplies additional information for a previous error message.
This message may appear after message PASF92S or PASF93S which indicates an error has occurred in one of the lines of the password member. Message PASF9DS displays the erroneous line.
Corrective Action: See messages PASF92S or PASF93S.

PASF9ES PASSWORD DDCARD ddName POINTS TO A NON EXISTING MEMBER (ABEND S013-18)

Explanation: The ddName DD statement is allocated to a nonexisting member in a PDS file.
In this message, ddName is the identity of the DD statement that points to the password member.
Authorization to access the product is denied.
Corrective Action: Correct the name of the member in the DD statement or create a member with the specified name.

PASF9FS PASSWORD FOR CONTROL- x EXPIRED, TEMPORARY AUTHORIZATION GRANTED

Explanation: The password for Control-x has expired. Nonetheless, Control- x can be run on the current date.
Despite password expiration, Control- x can be run on the 28th, 29th, 30th, 31st, 1st, 2nd, and 3rd days of each month for special purposes.
Control- x processing continues.
Corrective Action: Contact BMC Software Customer Support to obtain password renewal.
PDA messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages PDA400 through PDA4xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

PDA482S OPEN OF USER DATE CONTROL RECORD FAILED. DDNAME "DACHK"

Explanation: Opening of the file containing the User Dates Control record failed (the DACHK DD statement). This message is issued by the New Day procedure.

This is due to one of the following:
- The DACHK DD statement is missing.
- The data set (member) described by the DACHK DD statement does not exist.

The New Day procedure stops executing.

Corrective Action: Correct the JCL for the job/CLIST.

PDA483S OPEN OF IOA LOG FILE FAILED

Explanation: Open of IOA Log file failed (the DALOG DD statement).

This is due to one of the following:
- Data set described by the DALOG DD statement is not the IOA Log file.
- Data set described by the DALOG DD statement is the IOA Log file, but is of a different version or of a different IOA Installation. See the syslog of the job/TSO user for additional messages.

The New Day procedure stops executing.

Corrective Action: Correct the JCL for the job/CLIST.

PDA484I POST DAILY CHECKPOINT WRITTEN

Explanation: This information message indicates that Post-daily checkpoint was written. Indicates that the New Day procedure ended normally.

Corrective Action: No action is required.

PLN messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.
Messages PLN0 through PLN0xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

PLN020I THE MEMBER memName IS NOT SCHEDULED ACCORDING TO DATE-CRITERIA, AND WILL BE EXCLUDED

**Explanation:** This information message indicates that the following situation has occurred. The scheduling table member was scheduled with MINIMUM and PDS parameter specifications. The table is therefore not scheduled according to date and will not be taken into account by the CTMRPLN utility.

The CTMRPLN utility assists in planning scheduling according to date. Jobs whose scheduling does not depend on date are not relevant to this utility.

The table is ignored.

**Corrective Action:** No action is required.

PLN021E ACCESS OR ANALYZING OF CALENDAR calName FOR MEMNAME memName FAILED

**Explanation:** Either the CTMRPLN utility could not access calendar calName, or the format of the calendar member is invalid.

The job scheduling definition included a reference to a calendar member in the DCAL or WCAL or CONFCAL parameter. However, the calendar member could not be accessed, or it has an invalid format.

The job scheduling definition is ignored in the plan.

**Corrective Action:** Please check that CTMRPLN has access authority to the calendar library. If there is access authority, try to access the calendar by means of the IOA online interface and check its validity. If the format is invalid, define a new calendar.

PMM messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages PMM300 through PMM3xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

PMM350I PRINTING MISSIONS MANAGER STARTED

**Explanation:** This information message indicates that the Control-D monitor internal Printing Missions Manager task has started.

Normal message when a Printing Missions Manager task is started.

**Corrective Action:** No action is required.
PMM351S INCORRECT NUMBER OF EXPECTED SUBTASKS

**Explanation:** Control-D monitor internal Printing Missions Manager task has determined that one of the print tasks under its control has abended.
The Control-D monitor is shut down.

**Corrective Action:** Contact BMC Software Customer Support.

PMM352S GETMAIN ERROR FOR PRINTING MISSIONS MANAGER INTERNAL WORK VECTOR

**Explanation:** Internal error.
An internal error has occurred in the Control-D monitor internal Printing Missions Manager task.
The Control-D monitor is shut down.

**Corrective Action:** Contact BMC Software Customer Support.

PMM354S INTERNAL ERROR - CS FAILED IN ADD OF PRINT MISSIONS MANAGER VECTOR

**Explanation:** Internal error.
An internal error has occurred in the Control-D monitor internal Printing Missions Manager task.
The Control-D monitor is shut down.

**Corrective Action:** Contact BMC Software Customer Support.

PMM355S INTERNAL ERROR - CS FAILED IN MOVE OF PRINT MISSIONS MANAGER VECTOR

**Explanation:** Internal error.
An internal error has occurred in the Control-D monitor internal Printing Missions Manager task.
The Control-D monitor is shut down.

**Corrective Action:** Contact BMC Software Customer Support.

PMM357S INTERNAL ERROR - ATTACH FOR CTDPMS FAILED

**Explanation:** Internal error.
An internal error has occurred in the Control-D monitor internal Printing Missions Manager task.
The Control-D monitor is shut down.

**Corrective Action:** Contact BMC Software Customer Support.

PMM358S INTERNAL ERROR - PRINT MISSION ALREADY POSTED

**Explanation:** An internal error has occurred in the Control-D monitor internal Printing Missions Manager task.
The Control-D monitor is shut down.
Corrective Action: Contact BMC Software Customer Support.

PMM359S INTERNAL ERROR - WAIT LIST HAS BEEN EXCEEDED
Explanation: An internal error has occurred in a Control-D monitor internal Printing Missions Manager task.
The Control-D monitor shuts down.
Corrective Action: Contact your INCONTROL representative.

PMM360S ONE OF THE PRINT MISSION SUBTASKS HAS ABENDED
Explanation: Control-D monitor internal Printing Missions Manager task has determined that one of the print tasks under its control has abended.
The Control-D monitor is shut down.
Corrective Action: Contact BMC Software Customer Support.

PMM361S INTERNAL ERROR - PMV
Explanation: Internal error in the operation of the Control-D monitor.
The Control-D monitor is shut down.
Corrective Action: Call BMC Software Customer Support for assistance. Keep the dump.

PMM362W MAX NUMBER OF LOGICAL PRINTERS IS REACHED. ONLY FIRST 100 ARE USED
Explanation: During the processing of a PRINT mission, the maximum number of logical print monitors has been reached. This occurs in either of the following circumstances:
- The number of logical printers defined in a PRINT mission exceeds 100.
- No printer is defined in the PRINT mission itself, but the number of logical printers defined in CTDPARM exceeds 100.
The PRINT mission continues using the first 100 logical printers.
Corrective Action: Correct the PRINT mission definition.

PMM363I SHUT DOWN UPON REQUEST OF MAIN TASK
Explanation: This information message indicates that Control-D monitor has shut down.
Shut down of Control-D internal Printing Missions Manager task by request of the Control-D main task.
The Control-D monitor is shut down.
Corrective Action: No action is required.

PMM364I WAITING FOR ACTIVE PRINTING MISSION(S) IN ORDER TO SHUT DOWN
Explanation: Highlighted, unrollable message.
This information message indicates that the Control-D monitor was shut down, but is waiting for print tasks to finish in order to complete the shut down.

The Control-D internal Printing Missions Manager task received a request from the Control-D monitor to shut down. However, one or more of the print tasks under the control of the Printing Missions Manager is still printing. As soon as all the print tasks are completed, the Printing Missions Manager task will shut itself down.

**Corrective Action:** No action is required.

**PMM365E PRINTING MISSION ENDED NOT OK**

**Explanation:** The Control-D internal Printing Missions Manager task has determined that the Printing Mission ended NOTOK.

This is a general message which is produced when a Printing Mission finished executing NOTOK. The IOA Log should contain prior messages detailing the reasons.

**Corrective Action:** No action is required.

**PMM397S INTERNAL ERROR - PRINTER IS BUSY**

**Explanation:** Internal error in the operation of the Control-D monitor.

The Control-D monitor will shut down.

**Corrective Action:** Call BMC Software Customer Support for assistance. Keep the dump.

**PMM398I PRINTING MISSION ENDED OK**

**Explanation:** This information message indicates that the Printing Mission ended OK.

**Corrective Action:** No action is required.

**PMM399I PRINTING MISSION SUSPENDED - PUT ON HOLD**

**Explanation:** This information message indicates that a HOLD request, issued in the Active Missions screen, has been accepted by Control-D.

The status of the Printing Mission is changed from REQUESTED HELD to HOLD.

The Printing Mission will stop printing at the end of the current report and will enter a HELD status.

**Corrective Action:** In order to resume printing of the Printing Mission remove it from the HOLD status by issuing the F (FREE) command in the Active screen. The mission will resume printing after the last printed report.

**Messages PMM400 through PMM4xx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.
PMM400E HOLD NOT PERFORMED - ERROR IN CTDCIO

Explanation: An internal error has occurred in the Control-D monitor internal Printing Missions Manager task. A HOLD request, issued in the Active Missions screen, has been rejected by the CTDCIO internal Control-D module.

The status of the Printing Mission remains unchanged.

Corrective Action: Contact BMC Software Customer Support. There should be additional error messages on the IOA Log and system log.

PMS messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages PMS400 through PMS4xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

PMS401I PRINTING MISSION STARTED

Explanation: This information message is the normal start message of a Printing Mission.

Corrective Action: No action is required.

PMS402I PRINTING MISSION ENDED

Explanation: This information message is the normal end message of a Printing Mission.

Corrective Action: No action is required.

PMS403E PRINT MISSION HAS NOT STARTED DURING APPROPRIATE TIME FRAME.

Explanation: Highlighted, unrollable message.

The Control-D monitor issued a MODIFY command for a Printing monitor to start processing a Printing Mission. The Printing monitor did not answer during the time frame defined by optional wish WD2344 (whose default is five minutes).

The problem can occur because the Printing monitor has a low priority and the computer is heavily loaded. Therefore, the Printing monitor does not get control during the time allowed for a response.

The Control-D monitor terminates the mission NOT-OK.

Corrective Action: Assign a higher priority and/or change the performance group of the Printing monitor to provide better response time from this address space. In case of a batch printing mission, make sure that enough initiators are available for handling batch printing jobs. If this is impossible or undesirable, define a higher value for the time frame defined by optional wish WD2344 in the IOADFLTS member in the DOC library or specify an appropriate time-out in the Printing Mission Definition screen (screen M.S).
PMS404I SHUTDOWN IN PROGRESS

**Explanation:** This information message indicates that the Control-D monitor has requested all the subtasks under its control to shut down.

The IOA Log should contain additional messages concerning the reason for the shutdown.

Control-D monitor shuts down.

**Corrective Action:** No action is required.

PMS405I NO REPORTS ARE WAITING TO BE PRINTED BY THIS PRINTING MISSION

**Explanation:** This information message indicates that a Printing Mission has executed. However, there are no reports waiting to be printed by the mission.

No reports were found in the Active User Report List file to which all the following apply:

- They were decollated by a decollating mission which specified this Printing Mission name in its DO PRINT parameter.
- They belong to the users specified in the Printing Mission’s INCLUDE USER parameters.
- They are in WAIT (RE)PRINT status.
- The decollating mission which has processed them is in the Active Missions file and is not HELD.
- They are not currently selected by another Printing Mission.

This Printing Mission will not print any reports, and will end with a NOTOK status.

**Corrective Action:** No action is required.

PMS406E RECIPIENT *recipName* IGNORED. RECIPIENT NOT FOUND IN THE TREE

**Explanation:** The recipient *recipName* specified in the Printing Mission’s INCLUDE USER parameter is not found in the Recipient Tree; or the Printing Mission tried to select a user (from the Active User Report file) who is not in the tree.

No reports will be printed for this recipient.

**Corrective Action:** Add the recipient to the Recipient Tree or delete the recipient from the INCLUDE USER parameter of the Printing Mission.

PMS408E PRINTING PLAN FILE ALLOCATION ERROR. RC= *rc*, ERROR= *errCode*

**Explanation:** An error occurred in allocating a Print Plan file for this Printing Mission.

One of the following probably occurred during dynamic allocation of the Print Plan file:
The Printing Mission was restarted, but the Print Plan file was manually erased.

- An attempt to allocate a new Print Plan file failed, for a reason such as lack of space, security.
- An attempt to delete a Print Plan file failed.

The expressions \( RC = rc \) and \( ERROR = error\_code \) indicate the return and reason codes from the dynamic allocation. For an explanation of these codes, see the IBM manual *MVS Programming: Authorized Assembler Services Guide*.

This Printing Mission will not print any reports and will end with a NOTOK status.

**Corrective Action:** Check the IOA Log, the Control-D monitor syslog, and system log for additional clarification messages.

**PMS409E PRINTING PLAN FILE CRITICAL ALLOCATION ERROR**

**Explanation:** Internal error. In attempting to allocate a Print Plan file, an unknown return code was received from the CTDALC Control-D utility module.

This Printing Mission will not print any reports, and will end with a NOTOK status.

**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

**PMS40AW SOME REPORTS ARE LOCKED BY ANOTHER PRINT MISSION**

**Explanation:** The current print mission did not place one or more reports in the print plan although these reports have status WAIT PRINT and should be printed by this mission.

Each print mission checks each report to be included into the print plan against print plans of other print missions (excluding missions ended OK/NOTOK). If this report is included into another print plan, the current mission will not print it in order to avoid duplicate printouts.

The print mission continues processing.

**Corrective Action:** If the skipped reports will be printed by another mission, no action is needed. If these reports should be printed by the current mission, find the other active missions whose print plan includes these reports. Delete the other missions or allow them to terminate.

**PMS40BW SOME REPORTS ARE SUPPRESSED BY USER EXIT 20**

**Explanation:** The printing mission did not include some reports in the print plan because user exit **CTDX020** suppressed them.

Function PUT is used to call user exit **CTDX020**. This exit creates the print plan for each report that is eligible for printing. If this exit returns a return code of 4, the report is not included in the print plan.

The printing mission continues.

**Corrective Action:** If the suppressed report should have been added to the print plan, determine why the report was suppressed.

**PMS40CW SOME REPORTS ARE NOT SET FOR THE CURRENT PRINTING MISSION**

**Explanation:** The printing mission found some reports originally set for the current mission. However, they were later reset for another mission.
This can occur if the user manually changes the printing mission name in the report entry in the U screen. The printing mission continues normal work flow. Invalid reports are skipped.

**Corrective Action:** No action is required.

**PMS40DW SOME REPORTS ARE NOT SET FOR CONTROL-D/PC**

**Explanation:** DEST=CTDPC was specified for the printing mission. However, some reports were found to be ineligible for this mission.

The reports were not eligible because they did not specify either DEST=CTDPC[PRT] or a corresponding recipient authorized to use Control-D/PC.

When DEST=CTDPC is specified for a printing mission, all reports selected by this mission must specify DEST=CTDPC or DEST=CTDPCPRT. Recipients for these reports must be authorized to use Control-D/PC by means of the recipient tree.

The printing mission continues normal work flow. Reports that are not eligible are skipped.

**Corrective Action:** For reports to be transferred to Control-D/PC, do the following:

1. Specify DEST=CTDPC or DEST=CTDPCPRT during decollation. See the section on specifying report destinations in the Control-D and Control-V User Guide.
2. Verify that report recipients are authorized to use Control-D/PC.

**PMS40EW INDEX REPORT IS NOT SET FOR STORE=YES MISSION**

**Explanation:** A printing mission specifying STORE=YES did not select Control-V index report setting for Deferred printing. Printing missions specifying STORE=YES select only whole reports. Control-V index reports are not selected by a printing mission with parameter STORE=YES.

**Corrective Action:** Do not specify a name of a printing mission when STORE=YES is specified in the PRINT statement in DO INDEX.

**PMS40GW REPARTITION COPY STAGE IS IN PROCESS**

**Explanation:** This warning message indicates that the repartition utility CTDUFMPR is running with the COPY function when print mission tries to print a migrated report. The print mission continues normal work flow but the migrated reports are not printed and remain in WAIT PRINT status.

**Corrective Action:** Submit the CTDBLXRP utility after the CTDUFMPR repartition utility with the COPY function ends. Then rerun the Print mission.

**PMS40HW CTDBLXRP WAS NOT SUBMITTED AFTER REPARTITION COPY STAGE ENDED**

**Explanation:** This warning message is issued when a print mission printing migrated reports is started after the CTDUFMPR with COPY function is ended, but the CTDBLXRP utility was not submitted previously. The print mission continues normal work flow but the migrated reports are not printed and remain in WAIT PRINT status.

**Corrective Action:** Submit the CTDBLXRP utility and then rerun the print mission.
PMS40IW MIGRATED REPORTS ARE NOT PRINTED

**Explanation:** This warning message follows the PMS40GW and PMS40HW messages and indicates that the migrated reports are not printed.

**Corrective Action:** Perform actions described for the previous message.

PMS410E OPEN OF PRINTING PLAN FILE FAILED

**Explanation:** Internal error. The open of the Print Plan file failed.
The dynamic allocation of the Print Plan file was successful, but the open of the file failed.
This Printing Mission will not print any reports, and will end with a NOTOK status.

**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

PMS411E PRINTING PLAN FILE - WRITE ERROR

**Explanation:** Internal error. An error occurred in writing to the Print Plan file.
The dynamic allocation and open of the Print Plan file were successful, but an error occurred while writing to the file.
This Printing Mission will not print any reports, and will end with a NOTOK status.

**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

PMS412E INTERNAL ERROR - INVALID RC FROM CTDWTF

**Explanation:** Internal error. Invalid return code from the internal program CTDWTF while writing the Print Plan file.
This Printing Mission will not print any reports, and will end with a NOTOK status.

**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

PMS413E SYSOUT ALLOCATION ERROR (INVALID DEST) PRINTING STOPPED

**Explanation:** The DEST (destination) parameter for this Printing Mission is incorrect (meaning, not recognized by MVS/JES).
The DEST parameter specifies the JES destination for printing the report. See also remarks about JES3 in the PRINTER parameter in the Control-D and Control-V User Guide, and in “Set Control-D Installation Parameters” in the Control-D chapter in the INCONTROL for z/OS Installation Guide. If this parameter is omitted, the DEST is assumed to be the main computer printer. Specify the DEST parameter in one of the following ways:

This Printing Mission will not print any reports, and will end with a NOTOK status.

Corrective Action: Correct the DEST parameter, and rerun the Printing Mission.

PMS414E PRINTING PLAN FILE - CANNOT BE OPENED BY THE PRINTERS CONTROL MONITOR

Explanation: Internal error. The Printers Control monitor could not open the Print Plan file.

The Print Plan file was successfully created by the Control-D monitor, and passed the name of the Print Plan file to the Printers Control monitor. However, the Printers Control monitor was unable to open the file.

This Printing Mission will not print any reports, and will end with a NOTOK status.

Corrective Action: Have your system programmer call BMC Software Customer Support for assistance.

PMS415E OPEN OF SYSOUT FOR PRINT FAILED

Explanation: Internal error. The Printers Control monitor could not open the sysout file for printing.

This Printing Mission will not print any reports, and will end with a NOTOK status.

Corrective Action: Look for additional messages on the system log. If you cannot find the problem, have your system programmer call BMC Software Customer Support for assistance.

PMS416E PRINT - UNKNOWN INTERNAL ERROR

Explanation: Internal error in Printers Control monitor. An unknown return code was received from the CTDPRT module.

This Printing Mission will not print any reports, and will end with a NOTOK status.

Corrective Action: Have your system programmer call BMC Software Customer Support for assistance.

PMS417E MEMORY SHORTAGE OR INTERNAL ERROR MAY CAUSE DUPLICATE PRINT OF SOME REPORTS

Explanation: An error occurred in main memory during the building of the Print Plan List.

The Print Plan List is checked during the building of a Print Plan file to verify that the same report is not included for printing by other Printing Missions that may be processing in parallel.

The Printing Mission continues processing; however, another Printing Mission may possibly process the same reports.

Corrective Action: Enlarge the REGION size for the Control-D monitor. If this does not solve the problem, contact BMC Software Customer Support.
PMS418S PRINT - INTERNAL ERROR WHILE READING ACTIVE REPORTS FILE INDEX

**Explanation:** Internal error in the CTDCLS module.
This Printing Mission will not print any reports, and will end with a NOTOK status.
**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

PMS419S INTERNAL ERROR WHILE PREPARING USER LIST FOR THE PRINT PLAN

**Explanation:** Internal error in the CTDPM2 module.
This Printing Mission will not print any reports, and will end with a NOTOK status.
**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

PMS420S INSUFFICIENT STORAGE TO BUILD PRINTING PLAN

**Explanation:** There is insufficient storage to build the Print Plan file.
This Printing Mission will not print any reports, and will end with a NOTOK status.
**Corrective Action:** Increase the REGION size of the Control-D monitor, and rerun this Printing Mission.

PMS421S PRINT - INTERNAL ERROR IN CTDPM1

**Explanation:** Internal error in the CTDPM1 module.
This Printing Mission will not print any reports, and will end with a NOTOK status.
**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

PMS422I START COMMAND HAS BEEN ISSUED FOR PROCEDURE

`procName`, `COM number`

**Explanation:** This information message indicates that a batch print mission has been started as a started task.

A batch print mission runs as a started task when its skeleton member does not contain a JCL statement (starts with //) but an operator command.
**Corrective Action:** No action is required.

PMS423S PRINT - INTERNAL ERROR IN CTDCOL

**Explanation:** Internal error in the CTDCOL module.
This Printing Mission will not print any reports, and will end with a NOTOK status.
**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.
PMS424S ERROR WHILE READING THE ACTIVE USER FILE FOR PRINTING PARAMETERS

Explanation: An error occurred while accessing the Active User file during a print mission run. Message CTD908S preceding this message contains the reason code of the error and other information. The current print mission terminates NOT-OK.

Corrective Action: Using the information in message CTD908S, correct the problem, and reprint the corresponding reports.

PMS425S SYSOUT ALLOCATION ERROR - PRINTING STOPPED

Explanation: Internal error in the Printers Control monitor. The CTDSYS module was unable to allocate a sysout file. This Printing Mission will not print any reports, and will end with a NOTOK status.

Corrective Action: Look for additional messages on the System Log. If you cannot find the problem, have your system programmer call BMC Software Customer Support for assistance.

PMS426E OPEN OF DAINTRDR FAILED

Explanation: An error occurred during the dynamic allocation of the INTRDR internal reader while a batch printing mission was starting a batch print job as a started task. No reports are printed by this batch printing mission. The mission ends with the status NOT OK.

Corrective Action: Examine the system log for further error messages that may help identify the problem. If the problem persists, ask your system programmer to contact BMC Software Customer Support.

PMS427S PRINTING PLAN FILE CANNOT BE ALLOCATED - NO SPACE ON DISK

Explanation: There is no disk space for allocating the Print Plan file.

The Installation Parameters WRKUNIT and WRKVOL, described in “Set Control-D Installation Parameters” in the Control-D chapter of the INCONTROL for z/OS Installation Guide, specify the unit and volume serial number for the printing plan file. The WRKVOL disk does not have disk space for allocating the printing plan file.

This Printing Mission does not print any reports, and ends with a NOTOK status.

Corrective Action:
Delete unneeded files from the WRKVOL disk, or change the WRKUNIT/WRKVOL parameters on CTD Parm.
- Bring Control-D down.
- Start the Control-D monitor.
- The Printing Mission can then be rerun.

**PMS428S INSUFFICIENT STORAGE FOR INCLUDE/EXCLUDE LIST**

**Explaination:** There is insufficient storage for Control-D to handle all the INCLUDE/EXCLUDE USER statements in the Printing Missions Definition.

This Printing Mission will not print any reports, and will end with a NOTOK status.

**Corrective Action:**
1. Remove some INCLUDE/EXCLUDE USER statements from this Printing Mission Definition and create new Printing Missions to put them in, or (preferably)
2. Increase the REGION size of the Control-D monitor.
3. Bring Control-D down, then up.
4. The Printing Mission can then be rerun.

**PMS429S ABEND IN THE PRINTERS CONTROL MONITOR**

**Explaination:** Print mission failed with an abend. A detailed description of the failure appears in the preceding message.

The current print mission ends NOT-OK.

**Corrective Action:** Check the dump and any relevant messages in the system log. For an explanation of the abend code, refer to the relevant IBM manual. Correct the problem and restart the problematic PRINT mission.

**PMS42AE PRINT JOB IS NOT SUBMITTED DUE TO ERROR**

**Explaination:** Print mission failed to submit print job.

A detailed description of the failure appears in the preceding message.

The current print mission ends NOT-OK.

**Corrective Action:** Proceed according to the description of the failure in the preceding message.

**PMS42BE ERROR READING SKELETON. CTMMEM RC= rc**

**Explaination:** Print mission skeleton cannot be read from the SKL library.

The current print mission ends NOT-OK.

**Corrective Action:** Proceed according to the CTMMEM return code identified in the message. A description of the CTMMEM return codes can be found in the DOCIMEM member in the IOA DOC library. Rerun the print mission.
PMS42CE MESSAGE=MEMBER memName IS NOT FOUND IN THE SKELETON LIBRARY

Explanation: The SKELETON parameter specified in the Print mission definition does not exist in the SKL library.

The current print mission ends NOT-OK.

Corrective Action: Correct the SKELETON parameter in the print mission definition, or if it is correct, add it to the SKL library. Rerun the print mission.

PMS42DE CTDX009 REJECTED PRINT JOB SUBMISSION

Explanation: Exit 9 (CTDX009) rejected submitting a print job.

The current print mission ends NOT-OK.

Corrective Action: If it is required that the job be submitted, check Exit 9 for a return code of 8 and modify the exit accordingly. Rerun the print mission.

PMS42EI PRINT JOB name / jobId HAS BEEN SUBMITTED

Explanation: This information message indicates that the print job name has been successfully submitted.

Corrective Action: No action is required.

PMS42FE PRINT MISSION CANNOT BE STARTED. PRTMON#=0 IS DEFINED IN CTDPARM

Explanation: No print monitors are defined in CTDPARM.

The PRTMON# field must be defined in CTDPARM so that a print mission can be executed as a subtask of the print monitor.

The current print mission terminates NOT-OK.

Corrective Action: Specify PRTMON# parameter in CTDPARM, or define the SKELETON field in the print mission definition to run the mission as a batch job.

PMS430S PRINT - INTERNAL ERROR IN CTDCIO

Explanation: An error occurred in the CTDCIO Control-D communication file I/O module.

This Printing Mission will not print any reports, and will end with a NOTOK status.

Corrective Action: Bring down Control-D, then follow these steps:

1. Check the DACOM DD statement in the Control-D monitor and Printers Control monitor JCL, and correct the JCL if required.
2. Check the COMSIZE Installation Parameter. For more information, see the Control-D chapter of the INCONTROL for z/OS Installation Guide.
3. If this parameter is modified, then the CTDFRCOM Control-D utility will have to be run in order to create a new communications file.
4. Bring up Control-D, and rerun this Printing Mission.
If following the steps specified above does not solve the problem, have your system programmer call BMC Software Customer Support for assistance.

PMS431S INTERNAL SYNCHRONIZATION ERROR - SHUTTING DOWN

Explanation: An internal error has occurred in the Printers Control monitor.
An error occurred in the CTDPMS module--the synchronization with the Printers Control monitor failed.
Control-D monitor shuts down.

Corrective Action: Have your system programmer call BMC Software Customer Support for assistance.

PMS432I NOTHING LEFT TO PRINT (THERE ARE USERS, BUT COP=0 OR REPORTS DELETED)

Explanation: This information message indicates that there are no reports for this Printing Mission to print.
There are a few possibilities:
- All the SYSDATA entries to be printed were deleted.
- All the CDAM files to be printed were deleted.
- The copy count of all reports to be printed was set to 0 in the Active User Reports file.
- The relevant decollation entries in the Active Missions file were deleted or are in HOLD status.
The Printing Mission will not print any reports, and will end up with a NOTOK status.

Corrective Action: Change the copy count to a value other then zero and/or free the Active Missions file report entries and/or rerun the Report decollating mission if the reports were accidentally deleted. The Printing Mission can then be rerun.

PMS433S ALLOC OF dd_stmt FAILED ON rsn

Explanation: An internal error has occurred in the Control-D monitor.
An error occurred in the CTDPSR utility module that sorts the printing plan file. The dynamic allocation of dd_stmt failed because of the reason identified in the message.
This Printing Mission will not print any reports, and will end with a NOTOK status.

Corrective Action: Have your system programmer call BMC Software Customer Support for assistance.

PMS434S FREE OF dd_stmt FAILED ON rsn

Explanation: An internal error has occurred in the Control-D monitor.
An error occurred in the CTDPSR utility module that sorts the printing plan file. The dynamic allocation and read/write to dd_stmt was successful. However, the attempt to free dd_stmt failed because of the reason identified in the message.
This Printing Mission will not print any reports, and will end with a NOTOK status.

Corrective Action: Have your system programmer call BMC Software Customer Support for assistance.
PMS435S SORT OF BUNDLE FAILED. RC= rc
Explanation: An internal error has occurred in the Control-D monitor.
An error occurred in the CTDPSR utility module that sorts the printing plan file. The installation sort routine returned a condition code of rc to the CTDPSR module.
This Printing Mission will not print any reports, and will end with a NOTOK status.
Corrective Action: Check the system log and the Control-D monitor sysout in order to determine why the installation sort routine returned a condition code of rc. RC is the SORT RC, so check it in the SORT manual. If you cannot resolve the problem, have your system programmer call BMC Software Customer Support for assistance.

PMS437E SORT OF BUNDLE FAILED. PRINTING MISSION ENDED NOTOK
Explanation: The sort of the Printing Plan file failed.
Corrective Action: Check the IOA Log for additional clarification messages.

PMS438E RESTART OF PRINTING MISSION FAILED. COMMUNICATION FILE WAS FORMATTED
Explanation: Restart of Printing Mission failed.
The Control-D Communication file was formatted, making automatic restart impossible.
This Printing Mission will not print any reports, and will end with a NOTOK status.
Corrective Action: Rerun the Printing Mission without rebuilding the Printing Plan file.

PMS439I ONLY (number) FREE ENTRIES ARE LEFT ON THE COMMUNICATION FILE - PLEASE INCREASE ITS SIZE
Explanation: The Control-D Communication file is almost full.
The printing of the reports will continue.
Corrective Action: At the earliest possible time, bring down Control-D, then follow these steps:
1. Increase the COMSIZE Installation Parameter. For more information, see the Control-D chapter of the INCONTROL for z/OS Installation Guide.
2. Run the CTDFRCOM utility in order to create a new communication file.
3. Bring up Control-D.

PMS43AE NO FREE RECORDS IN COM FILE. PRINT MISSION TERMINATES ABNORMALLY
Explanation: The current print mission cannot obtain a free record in the communications file.
Each print mission requires one record in the COM file for communicating between the Control-D monitor and the print task. A free record is obtained before the print task is started released when it ends.
The print mission terminates NOTOK.
Corrective Action: Increase the size of the COM file by increasing the value of the COMSIZE parameter in CTDPARM. You can do this using ICE, as follows:

1. In the IOA Installation Menu, select Customization.
2. Select the environment to customize.
3. In the Customization screen, set Product ID to CTD and select Product Customization.
4. Select Major Step 6, Customize Control-D Dataset Parameters.
5. Select Minor Step 2, Control-D Dataset Parameters.
6. Increase the size of the COMSIZE parameter.
7. Return to the Minor Steps Selection screen, and select Minor Step 3, Save Parameters into Product Libraries.
8. Select Minor Step 5, Format the Communication File.

You can now rerun the print mission.

PMS43BE ERROR STORING REPORTS IN DATASETS

Explanation: Control-D detected an error while processing a printing mission with the STORE parameter set to YES.

This message is usually preceded by other messages that describe the problem. These other messages may be issued to the IOA Log file and/or the job log of the Control-D Printers monitor.

The printing mission ends with a status of NOTOK and a reason code of 56.

Corrective Action: Check the IOA Log file for other printing mission errors. Check the job log in the Control-D Printers monitor. If you cannot resolve the problem, call BMC Software Customer Support.

PMS440I MISSION RESTARTED. PRINTING WILL START FROM NEXT REPORT

Explanation: A stopped Printing Mission has been restarted

The user has previously put this Printing Mission on HOLD (while printing), and has now FREEd this mission.

Printing will start again from the next report.

Corrective Action: No action is required.

PMS441I MISSION RESTARTED (FROM START OF PRINT PLAN)

Explanation: This information message indicates that a stopped Printing Mission was restarted using the printing plan built during the previous run of the mission

Corrective Action: No action is required.

PMS442I PRINTING MISSION RESTARTED

Explanation: Normal message when a stopped Printing Mission has been restarted.

The user had previously put this Printing Mission on HOLD (while printing), and has now freed this mission.
The printing of the reports continues.

**Corrective Action:** No action is required.

**PMS443E SOME REPORTS WERE NOT PRINTED**

**Explanation:** The print mission processed all the reports in the print plan, but some of them were not successfully printed.

Detailed messages appear during this print mission execution.

The problematic reports are marked as NOT-PRINTED in the Active User File.

**Corrective Action:**
1. Correct the cause of the problem that prevented the printing of the reports, using the messages that appear during the execution of the print mission.
2. Reprint the reports by ordering Deferred Print in the User Reports screen (U Screen).
3. Rerun the print mission with a rebuild of the print plan.

**PMS443S INSUFFICIENT STORAGE TO LOAD PRINT PLAN MODULE**

**Explanation:** There is insufficient storage to load the CTDPLN print plan module.

The Printing Mission will not print any reports, and will end with a NOTOK status.

**Corrective Action:** Increase the REGION size for the Control-D monitor.

**Messages PMS700 through PMS7xx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**PMS79BI THE SPECIFIED PRINTER MONITOR DOES NOT EXIST. PARAMETER "MONITOR" IS IGNORED**

**Explanation:** This information message indicates that an executing Printing Mission’s MONITOR parameter is set to more than the maximum number of existing Printing monitor address spaces. The invalid parameter specifies a Printing monitor address space that does not exist.

The MONITOR Printing Mission parameter specifies the number of the Control-D Printing monitor to which the mission will be directed for printing.

The Printing Mission’s MONITOR parameter is ignored. Control-D will direct the Printing Mission to the next available Printing monitor.

**Corrective Action:** Change the Printing Mission MONITOR parameter to a value not exceeding the number of available Printing monitors and save the Printing Mission Definition. If necessary, reorder the Printing Mission.
PTS messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages PTS900 through PTS9xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

PTS990I PRINTER MISSION mission_nam STARTED PRINTING CATEGORY category_num

Explanation: This information message indicates that the Control-D Printers Control monitor started printing for mission mission_nam.

Corrective Action: No action is required.

PTS991I PRINTER MISSION mission_nam FINISHED PRINTING CATEGORY category_num

Explanation: This information message indicates that the Control-D Printers Control monitor completed printing mission mission_nam successfully.

Corrective Action: No action is required.

PTS992S DEST dest in FOR USER user IS INVALID - PRINTING ON MAIN PRINTER

Explanation: A dynamic allocation error for a sysout data set was encountered during Printing Mission execution due to an invalid destination in the Active List screen.

Invalid destination may have been specified in the Recipient Tree or in the decollating mission Definition. The Printing Mission attempts to allocate a sysout file with a default destination (from the Printing Mission definition or from the logical printer definition in CTDParm). If this attempt fails, the Printing Mission terminates with a status of NOTOK.

Corrective Action: Find the source of the invalid destination and correct it.

PTS993E ERROR IN CTDCIO FUNCTION func RC rc - PRINTING STOPPED

Explanation: Internal error.

An internal error occurred in the CTDCIO internal module. The error occurred within the Control-D Printers Control monitor.

The printing for this mission will stop. The status of this Printing Mission is changed to NOTOK.

Corrective Action: Contact BMC Software Customer Support. Please provide the values of FUNCTION and RC.
PTS994E ERROR IN CTDRSV FUNCTION func RC rc - PRINTING STOPPED

**Explanation:** Internal error.

An internal error occurred in the CTDRSV internal module. The error occurred within the Control-D Printers Control monitor.

The printing for this mission will stop. The status of this Printing Mission is changed to NOTOK.

**Corrective Action:** Contact BMC Software Customer Support. Please provide the values of FUNCTION and RC.

PTS995E ERROR IN CTDALC RC rc S99RC s99rc FUNCTION func - PRINTING STOPPED

**Explanation:** Internal error. The allocation of the PLAN file failed.

An internal error occurred in the CTDALC internal module. The error occurred within the Control-D Printers Control monitor.

The printing for this mission will stop. The status of this Printing Mission is changed to NOTOK.

**Corrective Action:** Contact BMC Software Customer Support. Please provide the values of RC, S99RC, and FUNCTION.

PTS996I PRINTING ENDED. INTERNAL RC rc

**Explanation:** The printing for this mission has finished.

This is a general message when the printing for a mission finished. If rc is not 0, the IOA Log should contain prior messages detailing the reasons.

**Corrective Action:** No action is required.

PTS997E ERROR IN UPDATE OF PRINTED USERS, STATUS OF USER REPORTS MAY BE INVALID

**Explanation:** Internal error.

After printing a bundle, Control-D updates the status of all printed user reports in the Active User Report List file from WAIT PRINT to PRINTED. This message is produced if an error occurs in this update process.

The status of this Printing Mission is changed to NOTOK. All the reports are printed, but the entries in the Active Report List file have not been updated. This could result in duplicate printing.

**Corrective Action:** Look for VSAM related messages on the system log or on the syslog of the Control-D monitor. Contact BMC Software Customer Support.

PTS998E ALLOC FAILED FOR fileName - FILE WAS NOT FOUND

**Explanation:** Internal error.

The Control-D Printers Control monitor was unable to dynamically allocate file fileName.

The status of this Printing Mission is changed to NOTOK.

**Corrective Action:** Contact BMC Software Customer Support. Please provide the value of file.
PTS999E ERROR READING COMPRESSED DSN. RC= rc

Explanation: An error occurred while attempting to read a compressed data set.
In the process of printing a report, an error occurred while attempting to read a compressed data set.
The report is not printed. The status of the Printing Mission will be set to NOTOK.
Corrective Action: Please notify the INCONTROL administrator. Additional messages are present on the system log.

Messages PTSB00 through PTSBxx
This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

PTSB01S SYSOUT ALLOCATION FAILED, RC= rc, ERROR= errCode

Explanation: Dynamic allocation of a sysout during a Printing Mission failed.
RC and error codes are the standard system return codes returned when dynamic allocation of a sysout chunk occurs.
The Printing Mission stops printing and ends NOTOK.
Corrective Action: For information regarding the diagnostics of dynamic allocation error codes, see to the IBM manual MVS Programming: Authorized Assembler Services Guide.

PTSB02E CANNOT PRINT WITH MIXED AFP PARAMETERS WHILE CHUNKSIZE IS SET TO ZERO OR ONE

Explanation: The PAGEDEF and/or FORMDEF printing parameters were specified for reports which are printed with a Printing Mission having a CHUNKSIZE of 0 or 1.
The PAGEDEF and/or FORMDEF printing parameters can only be used in a bundle that uses the chunking mechanism. When CHUNKSIZE is specified with a value of 0 or 1, the chunking mechanism is not active.
Printing continues without processing the PAGEDEF and FORMDEF printing parameters.
Corrective Action: To print reports that require the special printing parameters PAGEDEF and FORMDEF, either change the CHUNKSIZE parameter in the Printing Mission definition to a value other than 0 or 1, or use a different Printing Mission which uses the chunking mechanism.

PTSB03E PRINTING MISSION mission_nam FAILED WHILE TRYING TO LOAD PAGEDEF pagedef OR FORMDEF formdef. DEFAULTS ARE USED INSTEAD

Explanation: An error was encountered while trying to read a PAGEDEF or FORMDEF value from the corresponding library.
Either the PAGEDEF or FORMDEF specified does not exist in the libraries defined for Control-D, or the CHUNKSIZE parameter was specified as 0 or 1. The PAGEDEF and/or FORMDEF printing parameters must print in a bundle using the chunking mechanism. When CHUNKSIZE is specified with a value of 0 or 1, the chunking mechanism is not active.
Printing continues without processing the PAGEDEF and FORMDEF printing parameters.

**Corrective Action:** To print reports that require the special printing parameters PAGEDEF and FORMDEF, either change the CHUNKSIZE parameter in the Printing Mission definition to a value other than 0 or 1, or use a different Printing Mission which uses the chunking mechanism.

**PTSB04E** THERE IS NO PC INFORMATION IN THE TREE FOR USER *user*

**Explanation:** No PC information was found for the specified user during the process of building PC files. User PC information must be defined in the Control-D Recipient Tree. If a report was assigned a destination of CTDPC but there is no PC information in the Recipient Tree for this user, it cannot be routed to the PC.

The report is not printed. Processing continues.

**Corrective Action:** Either define the user PC information in the Control-D Recipient Tree, or do not route the report to the PC.

**PTSB05E** CTDPC DEST WAS IGNORED FOR USER *user* (NO PC INFO)

**Explanation:** Destination CTDPC was specified for the user. The report should be transferred to the PC, but the user definition in the Recipient Tree does not contain PC parameters.

Only a user with PC parameters specified in the tree can receive reports on the PC.

The report will be routed to a mainframe printer instead of a PC.

**Corrective Action:** Define PC parameters for the user. The user must be authorized to access the CTDPC component.

**PTSB06E** OUTGRP INFORMATION IS UNAVAILABLE

**Explanation:** Highlighted, unrollable message.

The OUTGRP parameter is specified in CTD Parm, but the function cannot be performed. An attempt to get the GROUPID parameter failed due to one of the following:

- The OUTGROUP OUTPUT statement was not specified in the CTDPRINT procedure.
- The corresponding control blocks cannot be found in the current release of MVS.

A special snap is sent to the DADUMP DD name.

**Corrective Action:** Check that the OUTGROUP OUTPUT statement is specified in the CTDPRINT procedure. If the error persists, contact your INCONTROL administrator and supply the snaps.

**PTSB07E** OUTGRP COULD NOT BE SET

**Explanation:** Highlighted, unrollable message.

The GROUPID parameter could not be set for the current chunk according to the OUTGROUP parameter in CTD Parm.

**Corrective Action:** Notify your INCONTROL administrator.
PTSB08E ERROR ACCESSING BARCODE TRACKING FILE RC= rc

**Explanation:** A print mission failed to access the Barcode Tracking (BTR) file.
The current print mission terminates NOT OK.

**Corrective Action:** Correct the source of the problem using message IOAF70I or IOAF71I to be found in the JES log. Rerun the mission.

PTSB09E ERROR CREATING PC FILES FOR USER recipName RC= rc

**Explanation:** An error occurred in the processing of a report to be transferred to Control-D/WebAccess Server for the recipient specified in the message.

An error was encountered while Control-D attempted to create PC packet files for a report whose printing destination is CTDPC.

The report is not made available for transfer to Control-D/WebAccess Server. Certain errors allow the print mission to continue processing with the next report. Most errors, however, cause the print mission to terminate immediately. In both cases, the print mission ends with a NOTOK status.

**Corrective Action:** If the return code is 28, verify that the recipient is authorized to use Control-D/WebAccess Server. This authorization is defined in the Control-D Recipient Tree. For all other return codes, check the IOA LOG and the MVS system log for previously issued messages describing the error in detail.

PTSB0AE MISSING OUTPUT STATEMENT stmtName

**Explanation:** Control-D attempted to dynamically allocate a sysout file for printing the report. Allocation failed because the output statement displayed in the message was missing from the JCL of Control-D Print monitor’s started task.

A reference to an output statement name to be used for printing a report is defined in Control-D by one of the following:

- Decollation Mission PRINT/CDAM PARM, subsys parameter in report's job JCL, or OUTPARMS library member
- Internal output statement references assigned by Control-D, such as CONTROLD, CONTROLF and OUTGROUP

The report is not printed. The Print Mission continues with the next report to be printed, but ends with a NOTOK status.

**Corrective Action:** Define a JCL output statement for the report in the JCL of all Control-D Print monitors started tasks. Restart Control-D monitor to cause JCL changes to take effect.

PTSB0BE ERROR STORING REPORT IN DATASET. USER usernam, RC= rc

**Explanation:** Control-D detected an error while processing a printing mission in which the STORE parameter was set to YES.

This message is usually preceded by other messages that describe the problem. These other messages may be issued to the IOA Log file and/or the job log of the Control-D Printers monitor.

The variables in this message are:
The printing mission ends with the status NOTOK and the return code 56.

**Corrective Action:** Check the IOA Log file for other printing mission errors. Check the job log in the Control-D Printers Monitor. If you cannot resolve the problem, call BMC Software Customer Support.

**PTSB0CE ERROR IN CTDPRPS RC= rc**

**Explanation:** An internal error occurred during the printing of an AFP report.

In this message, rc is the internal return code of the error.

The printing mission skips the problematic report, and printing continues.

**Corrective Action:** Do the following:

1. Check the IOA and job logs for any additional messages associated with the error, and try to resolve the problem. Rerun the program.

2. If the problem persists, note the value of rc and contact BMC Software Customer Support.

**PTSB0DE OUTPUT CARD DYNAMIC ALLOCATION FAILED, RC= rc, REASON= rsn, KEY= keycode**

**Explanation:** The dynamic allocation (pursuant to optional wish WD3133) of an output statement during a printing mission failed.

The variables in this message are:

- rc - the return code
- rsn - the reason code
- keycode - the key code

These codes are the standard system return, reason, and key codes that are returned when dynamic allocation of an output statement fails. For more information on these codes, see the description of the OUTADD macro in the IBM manual MVS Programming: Authorized Assembler Services Reference.

The printing mission does not use the dynamic allocation of an output statement for the current report.

**Corrective Action:** Examine the values of the return, reason, and key codes, and take appropriate corrective action.

**PTSB10E "FE" PRINT SUPPORT ERROR. RETURN CODE rc**

**Explanation:** An executing Printing Mission failed to delete an internal Printing Mission record in the Active User Report file.

If the DO PRINT parameter is specified in a Decollation Mission Definition, the Control-D Decollation monitor writes an internal Printing Mission record to indicate that there are reports waiting to be printed by the Printing Mission specified in the DO PRINT parameter.

These records have the following key:

X‘FE’,C‘PRINTMS’,Printing-Mission-Name
In this message, \textit{rc} is the return code from the CTDXR\textit{P} routine.

Control-D encountered an error when attempting to delete the record for the current Printing Mission during Printing Mission termination processing.

The Printing Mission continues.

\textbf{Corrective Action:} If the problem persists, report the return code to BMC Software Customer Support.

Messages PTSG00 through PTSGxx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

PTSG90E OPEN FAILED FOR \textit{dsn} - RC= \textit{rc}

\textbf{Explanation:} Control-D or Control-V failed to open the (sequential) index file.

The data set \textit{dsn} cannot be accessed for reading.

Reports will be downloaded to the Control-D/WebAccess Server without index information.

\textbf{Corrective Action:} Record the data set name and return code. Contact your system administrator.

PTSG91E CLOSE FAILED FOR \textit{dsn} - RC= \textit{rc}

\textbf{Explanation:} A sequential index file failed to close.

The data set \textit{dsn} did not close successfully.

Reports will be downloaded to the Control-D/WebAccess Server without index information.

\textbf{Corrective Action:} Record the data set name and return code. Contact your system administrator.

PTSG92E SVC 99 ALLOC RC \textit{rc} RSNC \textit{rsn} DS \textit{dsn}

\textbf{Explanation:} Control-D or Control-V encountered a problem when attempting to dynamically allocate the \textit{dsn} index file.

Reports will be downloaded to the Control-D/WebAccess Server without index information.

\textbf{Corrective Action:} For a description of the return code received, see the IBM manual \textit{MVS Programming: Authorized Assembler Services Guide}. If you cannot resolve the problem, record the data set name, internal \textit{rc} and reason code \textit{rsn}. Contact BMC Software Customer Support.

PTSG93E SVC 99 UNALLOC RC \textit{rc} RSNC \textit{rsn} DS \textit{dsn}

\textbf{Explanation:} Control-D or Control-V failed to dynamically deallocate index file data set name.

Reports will be downloaded to the Control-D/WebAccess Server without index information.

\textbf{Corrective Action:} For a description of the return code received, see the IBM manual \textit{MVS Programming: Authorized Assembler Services Guide}. If you cannot resolve the problem, record the data set name, internal \textit{rc} and \textit{rsn}. Contact BMC Software Customer Support.
PTSG94S INSUFFICIENT MEMORY - GETMAIN ERROR. RC = rc

Explanation: There is insufficient memory to download index information to the PC. The Printing Mission that downloads reports to the PC terminates.
Corrective Action: Increase the REGION size of the Control-D Print monitor.

PTSG95S INTERNAL ERROR - FREEMAIN ERROR. RC = rc

Explanation: An internal error was encountered during the execution of a FREEMAIN macro. The Printing Mission that downloads reports to the PC terminates.
Corrective Action: Record the return code and contact BMC Software Customer Support.

PTSG96E INDEX index NOT FOUND IN FILE dsn - NO INDEX FOR THIS REPORT

Explanation: Index index was not found in the dsn file due to an internal error. Reports will be downloaded to the Control-D/WebAccess Server without index information.
Corrective Action: Record the index name and data set name. Contact BMC Software Customer Support.

PTSG97S INTERNAL ERROR - INCORRECT PARAMETERS PASSED TO CTVDPC

Explanation: Incorrect parameters were passed from the printing module to the routine creating Control-V indexes for the D/WebAccess Server viewer. The current print mission terminates NOT-OK.
Corrective Action: Supply BMC Software Customer Support with the sysout of the Control-D print monitor.

PTSG98S ERROR IN PROGRAM pgm FUNCTION func RC = rc INTERNAL RC = int_rc REASON CODE = rsn

Explanation: Control-V was unable to create an index file for the printed report.
If the error is in the CTVIXC program, look at message REPG01E for a complete explanation of all return codes.
If the error is in the IOATAE program, possible causes are:

<table>
<thead>
<tr>
<th>rc</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>Member with translation table from ASCII to EBCDIC was not read. A default translation table was used.</td>
</tr>
<tr>
<td>8</td>
<td>Not enough storage available. Increase region size.</td>
</tr>
</tbody>
</table>
### INCONTROL for z/OS Messages Manual

<table>
<thead>
<tr>
<th>rc</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
<td>Data is invalid. Check and correct the translation table data.</td>
</tr>
<tr>
<td>16</td>
<td>Too many data lines in the translation table. Check and correct the translation table data.</td>
</tr>
<tr>
<td>20</td>
<td>Not enough data lines in the translation table. Check and correct the translation table data.</td>
</tr>
</tbody>
</table>

The translation tables are found in the IOA PARM library referenced by the DACMDLIB DD statement.

The TRNA2E member translates from ASCII to EBCDIC. The TRNE2A member translates from EBCDIC to ASCII.

The Control-V index is not created.

**Corrective Action:** Take appropriate action to correct the problem based on the return code.

### PTSG99E DATASET NAME *dsn*

**Explanation:** Data set name *dsn* could not be created.

The data set for the Control-V index could not be allocated.

The Control-V index is not created.

**Corrective Action:** Record the data set name and contact your system administrator.

### PTSG9AE CONTROL-V INDEXES COULD NOT BE CONVERTED TO FIT THE REPORT AFTER ACIF, *num* RESOURCE PAGES

**Explanation:** The ACIF process split one or more pages of the report.

If an original report page is split into more than one AFP page during the ACIF process, the original Control-V index for the report cannot be converted to fit the AFP report.

In this message, *num* is the number of resource pages.

The Control-V indexes are not created.

**Corrective Action:** Change the ACIF parameters so that no report page will be split by the ACIF process.

### PTSG9BS INTERNAL ERROR - PAGE NUMBER *pagenum* WAS NOT FOUND IN THE REPORT PAGE TABLE

**Explanation:** An internal error occurred while creating Control-V indexes for a STORE=Y report.

In this message, *pagenum* is the page number of the page that is missing from the report page table.

Control-V indexes are not created.

**Corrective Action:** Provide the following information to the INCONTROL Administrator:
Message code and the text of the message.
Total number of pages in the report.
Number of pages in the report created after STORE=Y is specified.

PTSG9CE CONTROL-V INDEX/ES COULD NOT BE CONVERTED BECAUSE INDEX/ES WERE CREATED BEFORE RELEASE IOA 5.0.4

Explanation: Control-V attempted to convert indexes to fit a new STORE=Y report. However, the existing indexes were created in a non-supported version, and cannot be converted to fit a new STORE=Y report.

The Control-V indexes are not created.

Corrective Action: Redecollate the report using a supported version of Control-V.

PTSG9DS INTERNAL ERROR - CONTINUATION RECORD WAS NOT FOUND IN THE ACTIVE USER FILE

Explanation: The printing mission attempted to access a continuation record that did not exist in the Active User Report file.

Control-V indexes are not created.

Corrective Action: Contact your INCONTROL administrator.

PTSG9EW CTV INDEX TABLE ERROR. INDEX index CHANGED, REASON rc

Explanation: An internal error occurred during the creation of Control-V indexes for a report created by a Print Mission with STORE set to Y.

A level of the problematic Control-V index is changed.

Corrective Action: Contact BMC Software Customer Support.

PTSG9FE INDEXES NOT CONVERTED DUE TO DIFF NO OF PAGES IN ORIG/TRANSFORMED REP

Explanation: During the rendering to PDF, if an original report page is split into more than one PDF page, the original Control-V index for the report cannot be converted to fit the PDF report.

Corrective Action: If possible, change the rendering parameters (for example, CLIQUE, resources) so that no report page will be split by the rendering process.

PTSG9GW REPORT TRANSFORMATION DELAYED DUE TO LIMIT OF CONCURRENT TRANSFORMATIONS

Explanation: This information message indicates that the current print mission cannot be processed because the print monitor is already processing the maximum number of missions as defined in optional Wish WD2375. The print mission is delayed until one of the missions being processed terminates.

Corrective Action: If this message appears frequently, it is recommended to increase the maximum number of print missions the print monitor can process concurrently.
PTSG9HI REPORT TRANSFORMATION RESUMED

**Explanation:** This information message indicates that the print monitor resumed processing a mission that was postponed (see the PTSG9GW message).

**Corrective Action:** No action is required.

REP messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages REP200 through REP2xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

REP250I REPORT DECOLLATOR STARTED

**Explanation:** This information message is the normal message when the Control-D monitor internal decollating task is started.

**Corrective Action:** No action is required.

REP251I DECOLLATION ENDED "OK"

**Explanation:** This information message is the normal end message of a job decollation.

**Corrective Action:** No action is required.

REP252I DECOLLATION ENDED "NOT OK"

**Explanation:** This information message indicates that the decollation of a report/job was not successful. The status of this decollating mission is set to ENDED NOTOK.

**Corrective Action:** Look at the IOA Log for additional error messages relating to this decollating mission.

REP253E INSUFFICIENT MEMORY TO DECOLLATE THE JOB

**Explanation:** Insufficient memory to decollate the job.

**Corrective Action:** Increase the Control-D monitor REGION size, then rerun the decollating mission.

REP254E INTERNAL ERROR - INVALID FORMAT OF AMF RECORD. NOTIFY THE IOA ADMINISTRATOR

**Explanation:** Internal Control-D error.

The status of this decollating mission is set to ENDED NOTOK.
Corrective Action: This problem is caused by incompatibility between what can be defined in the Report Decollating screen, and the actual decollating mechanism under the Control-D monitor. There is no need to reformat the Active Missions file. Print the mission definition and send it to your IOA Administrator in order to solve the bug. In the meantime try to bypass the problem by modifying the mission definition (try a different ON WHEN DO combination). If you cannot bypass it, call your IOA Administrator.

REP255E INTERNAL ERROR IN AMF CONVERSION. DECOLLATION ABORTED

Explanation: Internal Control-D error.
The status of this decollating mission is set to ENDED NOTOK.
Corrective Action: Look for additional messages on the IOA Log. Call BMC Software Customer Support for assistance.

REP256E ERROR WHILE READING SYSOUT FROM SPOOL OR FROM CDAM FILES

Explanation: Internal Control-D error.
The status of this decollating mission is set to ENDED NOTOK.
Corrective Action: Look for additional messages on the IOA Log. Call BMC Software Customer Support for assistance.

REP257E INTERNAL ERROR IN RECIPIENT TREE STRUCTURE

Explanation: Internal Control-D error.
The status of this decollating mission is set to ENDED NOTOK.
Corrective Action: Look for additional messages on the system log. Call BMC Software Customer Support for assistance.

REP258E DEFAULT PRIMARY USER NOT FOUND IN TREE OR NO DEFAULT USER SPECIFIED

Explanation: The user (recipient) specified in the DEF USER parameter of the Report Decollating Definition screen is not found in the Recipient Tree or no DEF USER is specified.
A page has been found in the job’s reports which is not identified by a WHEN/DO/USER statement, and no default user is specified.
Control-D assigns the root of the tree as the default, and the mission ends NOTOK.
Corrective Action: Correct the decollation mission, and schedule it again.

REP259E DECOLLATING JOB WITHOUT ANY SUPPLIED DEFAULTS

Explanation: No defaults are supplied in this decollation mission.
A page has been found which is not identified by a WHEN/DO/USER statement. Defaults are required in order to perform the decollation.
The mission ends NOTOK.
**Corrective Action:** Correct the decollation mission, and schedule it again.

**REP25AE VARIABLE LIST ERROR IN FUNCTION** `func` **FOR VARIABLE** `varName`  

**Explanation:** An error was detected in the variable list structure. 

The variables in this message are:  
- `func` - the variable process function (GET, GETU, PUT, CONC) under which the problem occurred.  
- `varName` - the name of the variable that was being processed when the problem arose.  

The decollation mission is terminated with the status ENDED NOTOK.  

**Corrective Action:** Check all the statements in the decollation definition that contain the `varName` variable, correct them as appropriate, and run this mission again. If the problem persists, contact BMC Software Customer Support.

**REP25BE INVALID PARAMETER** `parm` **IN FUNCTION** `func` **FOR VARIABLE** `varName`  

**Explanation:** The program that handles the CTDVAR variables received control from Exit CTDX022, but the value of a parameter was invalid.  

The variables in this message are:  
- `parm` - the name of the parameter with an invalid value  
- `func` - the variable process function (GET, GETU, PUT, CONC) under which the problem occurred  
- `varName` - the name of the variable that was being processed when the problem arose  

The decollation mission is terminated with the status ENDED NOTOK.  

**Corrective Action:** Correct the User Exit CTDX022, and rerun the mission.

**REP25CE SYNTAX ERROR IN VARIABLE DEFINITION** `varDef`  

**Explanation:** The definition of the variable in the decollation mission is not correct. 

In this message, `varDef` is the invalid string in the decollation definition. 

The decollation mission is terminated with the status ENDED NOTOK.  

**Corrective Action:** Correct the decollation mission definition and rerun the mission.

**REP25DE XPATH SYNTAX ERROR FOR VARIABLE** `varName` **IN DEFINITION** `string`  

**Explanation:** The DO SET statement in the decollation mission contains an invalid definition of the variable containing the XPATH value. 

The variables in this message are:
INCONTROL for z/OS Messages Manual

- **varName** - the name of the variable that was being processed when the problem arose
- **string** - the invalid string in the decollation mission definition

The decollation mission is terminated with the status ENDED NOTOK.

**Corrective Action:** Correct the decollation mission definition and rerun the mission.

**REP25EE INVALID TAG WAS DETECTED IN XML REPORT. TAG= string**

**Explanation:** An error was detected in the XML report page.

In this message, *string* is the invalid string in the XML report.

The status of this decollating mission is set to ENDED NOTOK. Control-D continues processing. All variable values extracted from the page containing the invalid string will be treated as null.

**Corrective Action:** Correct the XML report, and decollate it again.

**REP25FE ERROR IN VARIABLE PROCESS DURING DECOLLATION IN PROGRAM progName**

**Explanation:** This message is issued after one of the following messages:

- **REP25AE**
- **REP25BE**
- **REP25CE**
- **REP25DE**

In this message, *progName* is the name of the program that was executing when the problem occurred.

The status of this decollation mission is set to ENDED NOTOK.

**Corrective Action:** Check the IOA Log for additional error messages relating to this decollation mission.

**REP260E ERROR IN ACTIVE USER REPORTS LIST FILE. USER UPDATE FAILED**

**Explanation:** The update to the Active User Report List file failed. Perhaps the Active User Report List file is full or the Index component is corrupted.

The status of this decollating mission is set to ENDED NOTOK.

**Corrective Action:** Examine relevant CTDU99E and CTD908S messages, take appropriate corrective action, and then rerun the decollating mission. Use the CTDDIG utility to check the integrity of the user file. If the problem persists, contact BMC Customer Support.

**REP261E SEVERE ERROR WHILE LOCATING SYSOUT PARAMETERS FROM JES**

**Explanation:** *Highlighted, unrollable message.*

An internal test of the JES control blocks failed.
Control-D retrieves data set characteristics from the JES2 control blocks. These blocks are release-dependent. To avoid abends, Control-D tests the blocks at the beginning of its process. If the test fails, message REP261E is displayed.

This error is often caused by MSGCLASS for started tasks being set to PURGE or DUMMY. Control-D uses the settings of MSGCLASS for started tasks for test SYSOUT.

Snaps are produced and put in the DADUMP DD statement. Control-D continues to process without retrieving characteristics from the JES Control Blocks.

Corrective Action: Do the following:

1. Ensure that the MSGCLASS output class for the started task (STC) in the JES2PARM member of the SYS1.PARMLIB library is not set to PURGE or DUMMY.
2. If MSGCLASS is set correctly, collect the relevant snaps from the DADUMP DD statement and contact BMC Software Customer Support.

REP262E ADDITIONAL USER \textit{USR} NOT FOUND IN TREE

Explanation: The Active User Report List file contains an ADDITIONAL USER that was not found on the Recipient Tree. The ADDITIONAL USER must be defined in the Recipient Tree.

The report will not be directed to that user. Processing continues.

Corrective Action: Add this ADDITIONAL USER to the Recipient Tree, or delete this ADDITIONAL USER from the Active and Permanent User Report List file.

REP263E A "DO NOTOK" HAS BEEN ACTIVATED FOR THIS JOB

Explanation: Informational message - the identifying string for a DO NOTOK statement in the decollating mission was found in the report.

The status of this decollating mission is set to ENDED NOTOK.

Corrective Action: No action is required.

REP264E NO REPORTS WERE SELECTED FROM SPOOL AND/OR FROM DSNS. CHECK THE "ON" DEFINITIONS

Explanation: No reports matched the decollating mission ON statement parameters.

If the current decollating mission contains the IN QUEUE parameter set to Y, and the job is not processed by another decollating mission, the decollation monitor takes the job ID from the last executed job with the matching job name, and accesses sysout files from the spool using this job ID.

Note:

This job ID appears in the Active Missions screen on the line corresponding to the mission. Note also that for jobs decollated from the spool, the mission always contains the IN QUEUE parameter set to Y.

One or more ON statements are defined in the decollating mission, but no reports were present that matched even one ON statement. Note that the reports can be from the spool and/or from compressed data sets.

Assume that job XYZ produces the following reports:

\texttt{REPORT CLASSAR1 ATOTAC W}
The following parameters are present in the decollating mission for this job:

ON CLASS X DO ........ ON CLASS Y DO ........

When this decollating mission is executed, none of the ON statements will work, since the job did not produce any output on class X or class Y.

If the decollating mission contains ON DSN statements, then the No CDAM data set matched the CDAM retrieval parameters which were supplied.

Note:
Control-D does not select sysouts that have the HOLD=OPER characteristic which can result in the issuing of this message as well.

The status of this decollating mission is set to ENDED NOTOK.

**Corrective Action:** No action is required.

1. Check the decollating parameters to make sure that the ON statements are correct, and match the expected outputs from the job.

2. If the ON statements are OK, check all the outputs of the job. Verify that all the expected reports were produced on the proper classes, or on the CDAM files.

After the problem has been determined and corrected, rerun the job and/or the decollating mission if necessary.

**REP265S** ERROR WHILE ALLOCATING A CDAM DATASET

**Explanation:** Internal Control-D error, or some CDAM error.

The status of this decollating mission is set to ENDED NOTOK.

**Corrective Action:** Check the IOA Log and the system log for additional clarification messages.

**REP266E** CTDPARM GENOTFND SETTING INVALID FOR CURRENT ENVIRONMENT - GENERIC DECOLLATION PROCESSING STOPPED

**Explanation:** The setting of the GENOTFND parameter in CTDPARM is not supported by the MVS/JES configuration of the computer.

Some options of the GENOTFND parameter in CTDPARM are valid only in certain MVS/JES configurations. For example, JES3 only supports GENOTFND when set to CLASS or DELETE.

The unmatched sysout file remains unchanged.

**Corrective Action:** No action is required.

1. Manually remove the problematic sysout from the generic class.

2. Correct the GENOTFND parameter in CTDPARM. For a description of the GENOTFND parameter, see the Control-D chapter of the *INCONTROL for z/OS Installation Guide*.

3. Restart the Control-D monitor after compiling CTDPARM.

**REP267I** DECOLLATION FROM SPOOL STARTED

**Explanation:** This information message is the normal start message when a decollating mission starts decollating reports from Spool.
Corrective Action: No action is required.

REP268I DECOLLATION FROM COMPRESSED DSN STARTED
Explanation: This information message is the normal start message when a decollating mission starts decollating reports from compressed data sets.
Corrective Action: No action is required.

REP269I DECOLLATION FROM MQ QUEUE STARTED
Explanation: This information message is the normal start message when a decollating mission begins decollating reports from the IBM WebSphere MQ queue.
Corrective Action: No action is required.

REP269S ERROR WHILE DECOLLATING A GENERIC MISSION
Explanation: The attempt to read sysout from the spool failed. Control-D has started to read sysout from the spool but a nonzero return code was received from JES. Control-D continues processing.
Corrective Action: Please check whether JES is up or down.

REP26AE MISSION ABENDED syscode usrcode
Explanation: Highlighted, unrollable message.
The decollation mission abended with either the system code syscode, or the user code usrcode, or both.
The decollation mission finishes NOTOK. Control-D tries to process other missions.
Corrective Action: If Control-D cannot process other missions, stop and restart the Control-D monitor. Save the job log of the Control-D decollation monitors and the output referenced by the IOADUMP DD statement of the decollation monitor which processed the problematic mission. Contact BMC Software Customer Support.

REP26BE SUBSYSTEM REQUEST FAILED FOR JOB jobName. RC15=rc, SSOBRETN=ssobretn_rc
Explanation: A “sysout processing” request caused an unexpected return code to be received from JES. JES was unable to satisfy the request.
The variables in this message are:
- jobName - the name of the job in which the request failed
- rc - the code returned in register 15
- ssobretn_rc - the contents of the SSOBRETN field of the request block
Corrective Action: Verify that JES is active and functions normally. If JES is functioning normally, save all sysouts of this execution of the Control-D monitor and contact BMC Software Customer Support. Request RESTORE of the problematic report again.
REP26DW variableTextMsg

Explanation: A text message is issued from the DAL transformer while a report is being decollated with transformation. The text, which may be information, a warning, or an error message, is directly related to the event that produced it, and provides specific information about that event.

The action that the system implements is included in the message text.

Corrective Action: The required user response is included in the message text.

Note:

For documentation of the following transformer messages listed under the current message, see, “Control-D Transformation Messages”:

- BMCDAL0009E TCL.Size : Missing resource resourceName (Type: resourceType)
- BMCDAL0614E TransformObject.ConvertObject: ConvObject_Create Create resource failed: resourceName (Type resourceType), rc= returnCode
- BMCDAL0678W Xerox warning cdpXerox returnCode : messageText
- BMCDAL0679E Xerox error cdpXerox returnCode : messageText

REP26EE ERROR IN DAL TRANSFORMER

Explanation: The DAL transformer found an error while a report was being decollated with transformation.

The decollating mission ends NOTOK.

Corrective Action: Examine the IOA Log for REP26DW messages relating to this decollating mission.

REP26FE APPROVAL approval NOT FOUND IN APPROVAL TREE

Explanation: The Approval name specified in the DO APPROV statement of the Report Decollation Definition screen is not found in the Approval Tree. The mission ends NOTOK.

Corrective Action: Correct the decollation mission and reschedule the mission.

REP270E SYSOUT PURGED. GENERIC DECOLLATING MISSION NOT FOUND FOR THE JOB

Explanation: Control-D found a non-held output on one of the Classes dedicated for Generic processing. There is a Generic decollating mission for the class, but there is no applicable decollating mission for the sysout.

Whenever a non-held output appears on the spool in one of the classes defined for Generic processing, Control-D looks for a Generic decollating mission (on the Active Missions file) which matches the job name. If a match is not found, the sysout is processed according to the Control-D installation the GENOTFND parameter. For more information, see the INCONTROL for z/OS Administrator Guide.

Control-D continues processing.

Corrective Action: No action is required.
REP271I GENERIC JOB DECOLLATION IS INACTIVE

**Explanation:** This information message indicates that Generic Processing is not active. The reason the message is issued depends in which of the following formats the message is issued.

- **regular, rollable message** - indicates that the corresponding Control-D monitor does not perform the Generic Processing. The Control-D monitor issues the message when it is started and after new day processing.

- **highlighted, unrollable message** - indicates that a job is waiting to be decollated in one of the Generic classes, but Generic Processing is not active. This message will appear every 10 minutes, until Generic Processing is activated.

Control-D continues processing, but no Generic Processing will be done.

**Corrective Action:** Use the following guidelines to resolve the problem:

- If you have Generic Missions that CTDNDAY processing should order, ensure that the GENLIST member contains the library and table name for your Generic Missions.

- If you have a Library and table names in the GENLIST member, ensure that the MEMBERS really exist in the library. Also verify that the library is the correct name.

- Check to see if CTDNDAY processing had an error during the ordering of GENLIST. If an error occurred the deactivation of Generic Processing is automatic.

- Check to see if someone issued the STOPGEN command.

Issue the following command, to activate Generic Processing:

```
F CONTROLD,STARTGEN
```

The application will respond by displaying the following message:

```
CTD139I GENERIC JOB DECOLLATION IS ACTIVE ON CLASSES (claslist)
```

To verify your classes, check the GENCLAS= parameter in the CTDPARM member.

Note:

If there are NO Generic Missions being ordered during the CTDNDAY processing, you need to manually activate Generic Processing if you are manually Forcing/Ordering Generic Missions.

For more information on activating and deactivating generic processing, see the INCONTROL for z/OS Administrator Guide.

REP272I SYSOUT REMOVED FROM QUEUE. GENERIC DECOLLATING MISSION NOT FOUND FOR JOB jobName

**Explanation:** This information message indicates that Control-D found a non-held output on one of the classes dedicated for Generic processing. There is a Generic decollating mission for the class, but there is no applicable decollating mission for the sysout.

Whenever a non-held output appears on the spool in one of the classes defined for Generic processing, Control-D looks for a Generic decollating mission (on the Active Missions file) which matches the job name. If a match is not found, the sysout is processed according to the GENOTFND Control-D installation parameter. Refer to the Control-D chapter in the INCONTROL for z/OS Administrator Guide.

Control-D continues processing.
Corrective Action: Check to see if the Generic decollating mission for this job should be on the Active Missions file. If so, order the decollating mission. If not, purge the sysout.

REP273I SYSOUT CLASS CHANGED FROM CLASS x TO ESCAPE CLASS y

Explanation: This information message indicates that Control-D found a non-held output on one of the classes dedicated for Generic processing. There is a Generic decollating mission for the class, but there is no applicable decollating mission for the sysout.

Whenever a non-held output appears on the spool in one of the classes defined for Generic processing, Control-D looks for a Generic decollating mission on the Active Missions file that matches the job name. If a match is not found under JES3, Control-D changes the sysout's class to an Escape Class as specified in the GENOTFND Control-D installation parameter and the output remains on the spool. Refer to the INCONTROL for z/OS Administrator Guide.

Control-D continues processing.

Corrective Action: Check to see if the Generic decollating mission for this job should be Active on the Active Missions file. If so, order the decollating mission. If not, purge the sysout.

REP274W MQ DECOLLATING MISSION NOT FOUND FOR THE MESSAGE FROM MQ QUEUE mqQueueName

Explanation: There is no appropriated mission with matched selection parameters for this message from the IBM WebSphere MQ queue.

This message will be moved to the IBM WebSphere MQ escape queue. The name of the escape queue must be defined in the CTDMQPRM parameter of the MQNOTFIND CTD PARM member.

Corrective Action: No action is required.

REP275E ERROR WHILE DECOLLATING FROM MQ mqQueueName

Explanation: The decollation was started, but a nonzero code was returned.

Control-D continues processing.

Corrective Action: Check any additional messages received during this IBM WebSphere MQ decollation.

REP276I MESSAGE moved to MQ ESCAPE QUEUE queueName

Explanation: This information message indicates that the message was moved to the queueName queue that was defined in the CTDMQPRM parameter of the MQNOTFIND CTD PARM member.

Corrective Action: No action is required.

REP279E MULTIPLE APPROVAL PROCESS WAS DEFINED INCORRECTLY FOR REPORT rename

Explanation: This message can be issue in the following conditions:
### Control-D Message Manual

**Control-D has detected that a report that was defined for multiple approval processing (MULTI=S) was not created. The status of the related reports created from the same SYSOUT is set to Candidate.**

- A report that was defined for multiple approval processing (MULTI=S) refers to more than one CDAM. Control-D does not expand multiple approval processing on secondary CDAMs. Reports referring to these CDAMs cannot be approved.

**Corrective Action:** Check the decollation mission or the original report to assure that all reports and corresponding approval components have been created correctly.

### REP27AE ERROR ERROR IN APPROVAL PROCESSING

**Explanation:** This message is issued after the REP279E or REP26FE message. The status of this decollation mission is set to ENDED NOTOK.

**Corrective Action:** Check the IOA log for additional error messages relating to this decollation mission.

### REP27CW jobId,jobName,ddName FROM numSpool LINES ON SPOOL
numRead LINES ARE READ

**Explanation:** During decollation of SYSOUT, Control-D checks the number of read lines and the number of lines in SSOB (SSSOLNCT or SSS2LNCT). If the number of lines read from the spool is equal to or greater than the number from SSOB, Control-D decollates the SYSOUT. This message is issued if the number of read lines is less than the number in SSOB, as Control-D considers the SYSOUT corrupted due to lost information. SYSOUT remains in the spool.

The variables in this message are:

- **jobName** - the name of the job with the sysout in which the mismatch occurred
- **jobId** - the job ID of the job with the sysout in which the mismatch occurred
- **ddName** - the name of the DD statement with the sysout in which the mismatch occurred
- **numSpool** - the number of lines of sysout on the spool
- **numRead** - the number of lines of sysout read from the spool

The decollation mission finishes NOTOK.

**Corrective Action:** Try to correct the sysout. If it is not possible to correct the sysout, and you want Control-D to process such corrupted sysouts, temporarily specify APPLY=Y for the optional wish WD3597. If the problem persists, keep all sysouts of this execution of the Control-D monitor, and contact BMC Customer Support.

**Note:**

BMC recommends not to specify APPLY=Y for the optional wish WD3597 as a permanent setting.

### REP27EW jobId,jobName,ddName FROM numRead LINES READ FROM SPOOL, numLines LINES IN numPages PAGES PASSED TO CDAM

**Explanation:** The number of lines of sysout read from the spool is not the same as the number of lines of sysout written to CDAM.

The variables in this message are:
The Control-D monitor terminates with the user code U027.

**Corrective Action:** If there is an urgent reason to temporarily bypass the U027 abend, specify APPLY=Y for the optional wish WD3597. (Note that some lines from the spool might be lost.) Keep all sysouts of this execution of the Control-D monitor, and contact BMC Customer Support.

**Note:**
BMC recommends *not* to specify APPLY=Y for the optional wish WD3597 as a permanent setting.

**REP27FI** `jobId,jobName,ddName SYSOUT IS HELD IN GENERIC CLASS clss`

**Explanation:** The sysout of the identified job cannot be decollated by a generic decollation mission. The reason is an error identified in a previous message.

The variables in this message are:

- `jobName` - the name of the job with the problematic sysout
- `jobId` - the job ID of the job with the problematic sysout
- `ddName` - the name of the DD statement with the problematic sysout
- `clss` - the spool class of the sysout

Processing continues, but the status of the sysout is set to HELD.

**Corrective Action:** Examine the log for the previous message that identifies the error, and proceed according to the User Response for that message.

**REP27GE** `jobId,jobName,ddName JES I/O ERROR RSN rsn FOR SYSOUT CLASS clss`

**Explanation:** A JES I/O error occurred during the reading of sysout from the spool.

The variables in this message are:
jobName - the name of the job with the sysout that was being read when the mismatch occurred
jobId - the job ID of the job with the sysout that was being read when the mismatch occurred
ddName - the name of the DD statement with the sysout that was being read when the mismatch occurred
rsn - the reason code from the FDBK field of JES
class - the spool class of the sysout

The decollation mission finishes NOTOK.

**Corrective Action:** Try to correct the sysout. If the problem persists, keep all sysouts of this execution of the Control-D monitor, and contact BMC Software Customer Support.

**Messages REP300 through REP3xx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

REP304E xxxxxxx NOT OK WITH cc Y REASON CODE zzzz MQ NAME uuuuuuuu

**Explanation:** An error was detected during interface with IBM WebSphere MQ Series.

The variables in this message are:

- xxxxxxxx - which can be one of the following interface functions:
  - MQCONN
  - MQDISC
  - MQOPEN
  - MQGET
  - MQPUT
  - MQCLOS
  - MQCOMMT
- cc - the completion code, which can be
  - 0
  - 1,
  - 2
- zzzz - the reason code, which can have many different values. More detailed information about reason codes is included in the IBM WebSphere MQ Series documentation set.

System action is determined by the completion code and reason code combination. More detailed information about these codes is included in the IBM WebSphere MQ Series documentation set.
**Corrective Action:** User response to a particular completion and reason code combination is determined by that combination. More detailed information about these codes is included in the IBM WebSphere MQ Series documentation set.

**REP305E INSUFFICIENT MEMORY TO DECOLLATE MESSAGE FROM MQ**

**Explanation:** Insufficient memory to decollate the message from the IBM WebSphere MQ queue.

**Corrective Action:** Increase the Control-D monitor REGION size.

**REP306E IOAUCODE INITIALIZATION FAILED RC rc REASON rsn**

**Explanation:** An error was detected during initialization of the table used in the translation of an XML report or in the checking of XPath values of the mission definition. The message can be issued from

- the R screen
- the A.Z screen
- the Control-D monitor

Possible causes of this error are:

- the ENCODTBL member was not found in the IOA IOAENV library
- the ENCODTBL member contains more than 100 entries
- some other internal error

The following system actions occur:

- The translation of the XML report does not proceed. Control-D continues processing.

**Corrective Action:** No action is required.

1. Check the ENCODTBL member in the IOA IOAENV library, make any necessary corrections, reactivate the IOA Online facility, and continue the mission definition edition.
2. Check the ENCODTBL member in the IOA IOAENV library, make any necessary corrections, reactivate Control-D, and run this mission again.

If the problem persists contact BMC Software Customer Support.

**REP307E UNICODE TRANSLATION FAILED RC rc REASON rsn**

**Explanation:** An error was detected during translation of an XML report to EBCDIC or during the checking of XPath-values of the mission definition for XML reports. The message can be issued from

- the R screen
- the A.Z screen
- the Control-D monitor

The variables in this message are:

- **rc** - the return code

Valid values are:

- 4 - incomplete translation, due to separator (FF)
INCONTROL for z/OS Messages Manual

- 8 - the encoding pair that was specified in ENCODTBL is not supported
- 12 - the input data in the XML report was incorrect
- 16 - internal error: incorrect parameters
- 20 - one of the members that was specified in ENCODTBL was not found in the IOA IOAENV library

- rsn - the code that disclosed the detailed reason for the internal error

The following system actions occur:

- The translation of the XML report does not proceed. Control-D continues processing.

Corrective Action: No action is required.

1. Check the ENCODTBL member in the IOA IOAENV library, make any necessary corrections, reactivate the IOA Online facility, and continue the mission definition edition.
2. Check the ENCODTBL member in the IOA IOAENV library, make any necessary corrections, reactivate Control-D and run this mission again.

If the problem persists contact BMC Software Customer Support.

REP308I SYNCHRONIZATION WITH BACKUP/CTDDELRP ENDED

Explanation: This information message indicates that the synchronization process has finished.

Control-D received notification from the CTDDELRP utility or from the Backup Mission that the synchronization ended; therefore the decollating task on the monitor may resume. See message MONA59I for an explanation of the synchronization process.

Control-D continues the previously interrupted decollating tasks.

Corrective Action: No action is required.

REP309I SHUT DOWN UPON REQUEST OF MAIN TASK

Explanation: This information message indicates that Control-D monitor has been shut down.

Shut down of Control-D internal decollating task by request of the Control-D main task.

The Control-D monitor will shut down.

Corrective Action: No action is required.

REP30AI MQ DECOLLATION IS STOPPED

Explanation: The MQ interface process has stopped.

This message can appear for two reasons:
- The STOPMQ modify command was issued
- Errors occurred during MQ interface

Corrective Action: If errors occurred during MQ interface, review the LOG to determine the cause, make appropriate corrections, and issue the STARTMQ modify command.
REP30BE LOADING OF MODULE OF MQ STUB IS FAILED, THE NAME IS

**Explanation:** The prefix.prefixLOAD library is not installed or the IBM WebSphere MQ Series is not installed for the user, but an MQ decollation mission was defined.

The CTD30AI message will be issued and IBM WebSphere MQ decollation will be stopped.

**Corrective Action:** If the IBM WebSphere MQ Series is not installed, delete the MQ mission. Otherwise correct your installation configuration and then issue the STARTMQ modify command.

REP30CE ANY OF MQ QUEUES CAN NOT BE OPENED

**Explanation:** Control-D tried to retrieve a message from every IBM WebSphere MQ queue, but all attempts failed.

The CTD30AI message will be issued and IBM WebSphere MQ decollation will be stopped.

Review previous messages and issue appropriate responses. After you perform the necessary corrections, issue the STARTMQ modify command.

**Corrective Action:** No action is required.

REP30DI MQ QUEUE IS BEING CLOSED BECAUSE PUT/GET IS FAILED, QUEUE NAME `queueName`

**Explanation:** The access to the IBM WebSphere MQ Series queue `queueName` is being closed because of failure of MQPUT for the ESCAPE MQ queue, or failure of MQGET for the MQ queue.

Control-D continues processing MQ decollations until this message is issued for all MQ queues.

**Corrective Action:** For additional information see the IBM WebSphere MQ Series documentation set.

REP30EE MEMBER CTDMQPRM IS NOT FOUND IN CTD PARM OR VALUE OF MQNOTFIND PARAMETER IS NOT DEFINED

**Explanation:** The CTDMQPRM member was not found in CTD PARM, or the value of the MQNOTFIND parameter has not been defined.

The CTD30AI message will be issued and IBM WebSphere MQ decollation will be stopped.

**Corrective Action:** Define the CTDMQPRM member or add the name of the MQNOTFIND parameter; then issue the STARTMQ modify command.

**Messages REPB00 through REPBxx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

REPBI0E "FE" PRINT SUPPORT ERROR. RETURN CODE `rc`

**Explanation:** An executing Decollation Mission failed to create or update a Printing Mission record in the Active User Report file.
When the DO PRINT parameter is specified in a decollating mission Definition, the Control-D Decollation monitor writes an internal Printing Mission record to indicate that reports specified in the DO PRINT parameter are waiting to be printed by the Printing Mission. These records have the following key:

\[ X'FE', C'PRINTMS', \text{Printing\_Mission\_Name} \]

In this message, \( rc \) is the return code from routine CTDXRP.

The decollating mission completes decollating the reports but terminates with status NOT-OK. Reports created by this decollating mission cannot be selected by any Printing Mission specified in the DO PRINT parameter of this decollating mission.

**Corrective Action:** The reports can be manually scheduled for Deferred Printing by using option (line command) P to display the Print Window in the Active User Reports List and then specifying the Printing Mission name. If the problem persists, record the return code and contact BMC Software Customer Support.

**REPB11W DEFAULT PRINT MISSION IS NOT DEFINED FOR SUBSCRIBED REPORT**

**jobName / username / reportName**

**Explanation:** The default PRINT mission was not defined when the report was set for subscription. Subscription will not be performed.

**Corrective Action:** Do one of the following:

- Define parameter PRINT-NOTIFY=default_PRINT_mission in the CTDSPARM member in the in CTD PARM library.
- Change the decollation mission definition by adding a DO PRINT statement with MUST=S (for full subscribed reports) and/or define a PRINT mission with TYPE=S (for subscribed reports by index).

**Messages REPG00 through REPGxx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**REPG01E INDEX CREATION ERROR. RC = rc, INTERNAL RC = int_rc, REASON = rsn**

**Explanation:** Control-V was unable to create an index file.

Even though the index file is not created, the decollated report is produced.

Possible causes are:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>16</td>
<td>Insufficient memory.</td>
</tr>
<tr>
<td>20</td>
<td>Insufficient space on the volumes to create the index file.</td>
</tr>
<tr>
<td>Return Code</td>
<td>Explanation</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>28</td>
<td>Size of the index file calculated internally is not big enough for all entries.</td>
</tr>
<tr>
<td>40</td>
<td>Dynamic allocation error.</td>
</tr>
<tr>
<td>44</td>
<td>Dynamic deallocation error.</td>
</tr>
<tr>
<td>48</td>
<td>Sort error.</td>
</tr>
<tr>
<td>Other</td>
<td>Internal error.</td>
</tr>
</tbody>
</table>

This message is followed by message REPG06E.

The index is not created.

**Corrective Action:** Take appropriate actions to correct the problem associated with the specified return code:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>16</td>
<td>Increase the REGION size of the Control-D or Control-V Decollation monitor.</td>
</tr>
<tr>
<td>20</td>
<td>Clear space on the volumes defined for index files in Control-V Installation Parameters or add another volume to the Control-V Installation Parameters.</td>
</tr>
<tr>
<td>28</td>
<td>First check that definition of every subindex is correctly defined in the decollation mission. If this is not the source of the problem, turn to BMC Software Customer Support, supplying the decollation mission definition and sample pages of the report.</td>
</tr>
<tr>
<td>40</td>
<td>For a description of the return code received, see the IBM manual <em>MVS Programming: Authorized Assembler Services Guide</em>. If you cannot resolve the problem, record the return code, internal return code and reason code. Contact BMC Software Customer Support.</td>
</tr>
<tr>
<td>44</td>
<td>Take the same action outlined for return code 40 above.</td>
</tr>
<tr>
<td>48</td>
<td>Check the sort messages in the Control-D or Control-V Decollation monitor sysout. If you cannot resolve the problem, record the sort messages and contact BMC Software Customer Support.</td>
</tr>
</tbody>
</table>
Return Code | Explanation
-------------|--------------
other | Record the return code, internal return code and reason code and contact BMC Software Customer Support.

REPG02E INDEX CREATION ERROR - INDEX SPANS OVER MORE THAN ONE CDAM DATASET

**Explanation:** A Report Decollation Mission attempted to index a report which spanned more than one Compressed Dataset Access Method (CDAM) data set.

Different CDAM data sets are created for each sysout of a report. An index file cannot index more than one CDAM data set. Use separate indexes, meaning, indexes with different names, to index different CDAM data sets.

The index is not created.

**Corrective Action:** Determine how many sysouts the job has and create an index for each, or alternately modify the decollation mission so that it creates indexes with different names for each CDAM data set by using the DCAM expression ALLOCOTOPT=ONEDSN. See the Control-D and Control-V User Guide.

REPG03E INDEX CREATION ERROR - NO INDEXES CREATED

**Explanation:** The creation of the index file was not successful.

The index is not created. The status of the decollating mission is set to ENDED NOTOK.

**Corrective Action:** Check the IOA Log file and the Control-D or Control-V monitor job log for additional messages relating to this decollating mission.

REPG04W TOO MANY RESIDENT INDEXES FOR REPORT report - MAXIMUM 3

**Explanation:** An attempt was made to create more than three DASD-resident indexes for a single report. The maximum number of resident indexes for one report is three.

The index is created but is not designated DASD-resident. It will be deleted from DASD when the corresponding report is deleted and will be available on migrated media, if the report is migrated.

**Corrective Action:** Redefine the Report decollating mission to specify not more than three indexes that will remain DASD-resident.

REPG05E TOO MANY INDEXES FOR REPORT report - ONLY 9 CREATED

**Explanation:** An attempt was made to create more than nine indexes for a single report.

A maximum of nine indexes can be defined for one report.

Only the first nine indexes are created.

**Corrective Action:** Redefine the Report decollating mission to specify a maximum of nine indexes for this report.
REPG06E INDEX DSNAME=dsn BLOCKS=blk

Explanation: An error occurred during the creation of the dsn index file containing blk blocks. This message is preceded by message REPG01E. See message REPG01E for more information.

Corrective Action: No action is required.

REPG07E "DDNAMES" INDEX NOT CREATED - ALLOCOPT "ONEDSN" OR "JOBSDSN1" REQUIRED

Explanation: The user attempted to create a DDNAMES index for a report created by a decollating mission whose ON CLASS statement does not contain ALLOCOPT=ONEDSN or JOBSDSN1 in the PRINT/CDAM PARMS field.

The index is not created.

Corrective Action: Add the expression ALLOCOPT=ONEDSN or ALLOCOPT=JOBSDSN1 to the decollation mission definition. For more information on the ALLOCOPT parameter, see the CDAM chapter in the Control-D and Control-V User Guide or the Control-D and Control-V User Guide.

REPG08W MORE THAN ONE SUBINDEX WITH THE SAME NAME. ONLY THE FIRST ONE IS DEFINED

Explanation: The user attempted to specify the same name for more than one subindex of a main index.

All subindexes of a main index must have unique names. It is recommended that all indexes specified for a report have unique names.

When a subindex is encountered whose name was specified for a previously specified subindex, that subindex and all the indexes under it (if any) are not created.

Corrective Action: Change the subindex's name.

REPG09W INCONSISTENT INDEX TREE STRUCTURE. SOME INDEXES/VALUES ARE NOT CREATED.

Explanation: The index tree defined for the report in the decollation mission is not consistent in structure.

During a run of a decollation mission, a main index was encountered that does not have the same subindexes defined throughout the mission definition. The topology of the index tree must be consistent.

Some of the subindexes are not created because of this inconsistency. Other subindexes may have incorrect values.

Corrective Action: Correct the index definition in the decollation mission and rerun the mission.

REPG0EE GLOBAL INDEX CREATION ERROR - NO GLOBAL INDEXES CREATED.

Explanation: This message is issued when loading the Global Index database immediately during the decollation mission run, if the database is not loaded successfully. This message is preceded by CTD and GIX messages explaining the cause of the problem.
Control-D decollates the reports without loading the index values into the Global Index database.

**Corrective Action:** Perform the following:

- Examine the preceding messages to find out reason for the problem, and fix the problem.
- Use the CTDGBILD job to load index values from reports decollated by this mission to the Global Index database.

**REPG0GW UNSUPPORTED MULTI-VALUE INDEX STRUCTURE. SOME VALUES ARE NOT CREATED.**

**Explanation:** The indexing report has the value structure of a multi-value index that is not supported by the current implementation of Control-V.

**Corrective Action:** Contact your INCONTROL administrator.

**REPG0HE SYSTEM VARIABLE %%%var ISN'T SUITABLE FOR CURRENT ENVIRONMENT.**

**Explanation:** This message is issued when the current environment does not provide the ability to use the %%%var system variable in SET/DO SET statements in decollation missions. The reason for the problem is due to the value of %%%var.

<table>
<thead>
<tr>
<th>Variable and value</th>
<th>Possible reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>$MEMORY=ABOVEBAR</td>
<td>The environment does not support 64-bit addressing mode</td>
</tr>
</tbody>
</table>

The Control-D monitor terminates the mission with the status of NOTOK.

**Corrective Action:** Start the CONTROL-D monitor in another environment, or remove the SET/DO SET statement for the %%%var system variable from the decollation mission definition.

**RFR messages**

This group includes messages for the Control-O product.

**Messages RFR800 through RFR8xx**

This group includes messages for the Control-O product.

**RFR8E9I {CONTROL-O|CTMCMEM} LOADER TASK STARTED**

**Explanation:** In Control-O, this information message indicates that the task responsible for loading rules and Global variables has begun.

In Control-M, this information message indicates that the task responsible for loading CMEM rules has begun.

**Corrective Action:** No action is required.
INCONTROL for z/OS Messages Manual

RFR8EAE CTORFR DETECTED AN INVALID CHAIN STRUCTURE

Explanation: Control-O detected invalid structure for internal control blocks.
This message indicates an internal error.
The Control-O monitor terminates.
Corrective Action: Contact BMC Software Customer Support.

RFR8EBI {CONTROL-O | CTMCMEM} LOADER TASK ENDED

Explanation: In Control-O, this information message indicates that the task responsible for loading rules and Global variables has terminated successfully.
In Control-M, this information message indicates that the task responsible for loading CMEM rules has terminated successfully.
Corrective Action: No action is required.

RFR8ECS ERROR ATTACHING CTOCPS - GLOBAL VARIABLES COMPRESSION FEATURE INACTIVE

Explanation: The CTOCPS program, which is responsible for automatic compression of the Global AutoEdit library, could not be loaded.
The Automatic Compression Facility is not activated.
Corrective Action: Check associated MVS messages for the reason and for possible corrective actions, for example, wrong load library concatenation, or region too small.

RFR8EDS ERROR VERIFYING GLOBAL VARIABLES LIBRARY - GLOBAL COMPRESSION FEATURE INACTIVE

Explanation: The CTOCPS program detected an error while verifying that the previous LOADGLOBAL/WRITEGLOBAL action ended successfully.
When automatic compression is activated, the $$COMPST member in the Global AutoEdit library is checked to see if the previous compress ended successfully. An error was detected by the program that performs the check on the $$COMPST member. This message is preceded by messages that describe the cause of the error.
The LOADGLOBAL/WRITEGLOBAL operation that prompted the verification process is terminated.
Corrective Action: Check preceding messages for the cause of the error and possible corrective actions.

RFR8EES ERROR COMpressing GLOBAL VARIABLES LIBRARY

Explanation: Compression of the Global AutoEdit library failed.
This message is preceded by messages describing the cause of the error.
The compression process is terminated.
Corrective Action: Check preceding messages for the cause of the error and possible corrective actions.
INCONTROL for z/OS Messages Manual

RFR8EFS cmd COMMAND FAILED

Explanation: The CTORFR program detected an error while executing the cmd command. This message can result from problems while loading variables or tables, or (in Control-O) while writing variables to the Global AutoEdit library. This message is preceded by messages describing the cause of the error.

The command specified in this message is terminated.

Corrective Action: Check the preceding messages for the cause of the error and possible corrective actions.

RLR messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages RLR600 through RLR6xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

RLR621E THE UTILITY CTMRELRS MAY BE ACTIVATED ONLY FROM BATCH JOBS

Explanation: The CTMRELRS utility (the CTMRLR program) has been activated from a started task or from a TSO session. The CTMRELRS utility may be activated only from batch jobs which are submitted by the Control-M monitor.

The CTMRELRS utility stops executing with a condition code of 04. The resource is not released.

Corrective Action: See the INCONTROL for z/OS Utilities Guide for usage restriction of the utility.

RLR622E THIS JOB WAS NOT SUBMITTED FROM CONTROL-M. THE RESOURCE IS NOT RELEASED

Explanation: The CTMRELRS utility (the CTMRLR program) was activated from a job that was not submitted by the Control-M monitor. Only a job that is submitted by the Control-M monitor can release its own quantitative resources.

The CTMRELRS utility stops executing with a condition code of 04. The resource is not released.

Corrective Action: For more information on usage restriction of the utility, see the INCONTROL for z/OS Utilities Guide.

RLR623I QUANTITATIVE RESOURCE res - quantity action

Explanation: This information message indicates that the quantity of the specified quantitative resource has been released for general use or changed by the CTMRLRES utility.

The specified action is either RELEASED or CHANGED.
**Corrective Action:** No action is required.

**RLR625S** INVALID FUNCTION. USE "RELEASE" OR "CHANGE"

**Explanation:** Invalid function supplied as a parameter to the CTMRELRS utility. The CTMRELRS utility stops executing with a condition code of 04. The resource is not released or changed.

**Corrective Action:** Specify either function RELEASE or CHANGE for the utility.

**RLR627E** YOU CANNOT RELEASE MORE res THAN THOSE ALLOCATED TO THIS JOB

**Explanation:** The quantity of the res resource requested to be released by the job using the CTMRELRS utility is greater than the quantity of the resource currently allocated to the job. The utility stops executing with a condition code of 04. The resource is not released.

**Corrective Action:** Correct the parameters of the utility.

**RLR628E** RESOURCE res IS NOT ALLOCATED TO THIS JOB

**Explanation:** The res quantitative resource to be released by the CTMRELRS utility is not allocated at all to the job that activates the utility. A job can only release resources which are allocated to it. The utility stops executing with a condition code of 04. The resource is not released.

**Corrective Action:** For more information on usage restriction of the utility, see the INCONTROL for z/OS Utilities Guide.

**RLR629S** OPEN OF PARAMETER LIST FAILED. DDNAME "DARELIN"

**Explanation:** Open of the control statements file failed (the DARELIN DD statement in the CTMRELRS utility).

Possible causes are:

- The DARELIN DD statement is missing.
- The data set described by the DARELIN DD statement does not exist, or cannot be opened for sequential read, or the record length is not 80.

Program execution stops with a condition code of 08.

**Corrective Action:** Correct the JCL for the job and run it again.

**RLR630E** YOU CANNOT INCREASE THE NUMBER OF quantResourceName ALLOCATED TO THIS JOB

**Explanation:** The quantity requested to be changed using the CTMRELRS utility is greater than the quantity of the resource currently allocated to the job. The CTMRELRS utility can only be used to decrease the quantity of the resource allocated to a job.
The utility stops executing with a condition code of 4. The resource amount allocated to the job is not changed.

**Corrective Action:** Correct the parameters of the job.

**RLR631E** RESOURCE *quantResource* WAS NOT FOUND IN THE RESOURCE FILE

**Explanation:** The *quantResource* Quantitative resource does not exist. The missing resource was named as input to the CTMRLR program.

**Corrective Action:** Ensure that the name of the resource specified as input to the program matches the resource name in the job scheduling definition.

**RLR632I** JOB RELEASED *num* UNITS OF RESOURCE *quantResource*

**Explanation:** This information message indicates that the CTMRLR program released the specified quantity (*num*) of *quantResource* Quantitative resources while a job was still in progress.

Usually, resources are released only when a job is finished.

**Corrective Action:** No action is required.

**RSC messages**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**Messages RSC600 through RSC6xx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**RSC690I** CHECKING RESULTS OF MISSION *misName* ODATE=modate TIMESTAMP=misTime

**Explanation:** This information message indicates that the restore job that executes the pointed out mission started to check the result of the restore utility.

The variables in this message are:

- *misName* - the name of the restore mission
- *modate* - the original scheduling date of the restore mission
- *misTime* - the time stamp of the restore mission

**Corrective Action:** No action is required.
RSC691E INVALID PARAMETERS FOR RESTORE ANALYZE PROGRAM

Explanation: An invalid parameter was passed to the restore job. This message is produced by the last step of the restore job, which executes the CTDRSC program. CTDRSC analyzes the output of the restore process. The parameters passed to this program are wrong. For further details please refer to the INCONTROL for z/OS Administrator Guide.

The restore of the requested data sets will not be performed. The status of the Restore Mission will remain RESTORE IN PROCESS.

Corrective Action: No action is required.

1. Check the last step of the restore job which can be found on the library allocated to the DADJOB DD statement. This step executes the CTDRSC program, and has two parameters; timestamp and mission name. Refer to the sample skeleton job RSTDFDSS on the Control-D SKL library for the correct format of these two parameters, modify the JCL, and rerun the job. The status of the Restore Mission will then change to ENDED OK.

2. In order to prevent this problem from occurring again, modify the last step of the restore job which can be found on the library allocated to the DADSKL DD statement.

RSC692E DATASET: dsn NOT FOUND AFTER RESTORE. RC FROM LOCATE IS rc

Explanation: One or more CDAM extents were not found during the ANALYZE step of the RESTORE procedure.

Contact your local INCONTROL administrator.

Corrective Action: No action is required.

RSC693E DATASET WAS NOT RESTORED: dsn

Explanation: A CDAM data set that should have been restored by the restore job was not restored.

A CDAM data set that should have been restored by a certain Restore Mission, was not restored when the restore job finished. The restore failure might have been caused by security problems, insufficient space in disk, and so on.

An error message is issued, and the Restore Mission ends NOTOK.

Corrective Action: Check the sysout of the restore job, locate the appropriate DF/DSS or FDR error messages, and solve the problem. After the problem has been solved, rerun the Restore Mission.

RSC694E MISSION misName TIMESTAMP=misTime FAILED TO OPEN RESTORE UTILITY MESSAGES FILE

Explanation: The restore job executing the specified restore mission was unable to open the messages file of the invoked restore utility.

The variables in this message are:

- misName - the name of the restore mission
- misTime - the time stamp of the restore mission

The restore mission ends NOTOK.
Corrective Action: Check the additional messages issued from the restore job.

RSC695E NO PENDING RESTORE MISSION *misName* TIMESTAMP=*misTime* FOUND IN ACTIVE MISSION FILE

Explanation: The restore job intended for execution of the specified restore mission did not find that mission in the Active Mission file.

The variables in this message are:
- *misName* - the name of the restore mission
- *misTime* - the time stamp of the restore mission

This may occur because the restore mission was removed from the Active Mission file or was reset by the CTDRESET utility before the job finished.

The restore job only prints the restore utility log.

Corrective Action: Check the IOALOG.

RSC696E MISSION *misName* TIMESTAMP=*misTime* FAILED TO OPEN ACTIVE MISSION FILE

Explanation: The restore job executing the specified restore mission was unable to open the Active Mission file.

The variables in this message are:
- *misName* - the name of the restore mission
- *misTime* - the time stamp of the restore mission

The restore job only prints the restore utility log.

Corrective Action: Call your INCONTROL Administrator.

RSC698I RESULT OF MISSION *misName* ODATE=*modate* TIMESTAMP=*misTime* IS OK

Explanation: This information message indicates that the restore mission finished successfully.

The variables in this message are:
- *misName* - the name of the restore mission
- *modate* - the original scheduling date of the restore mission
- *misTime* - the time stamp of the restore mission

Corrective Action: No action is required.

RSC699E RESULT OF MISSION *misName* ODATE=*modate* TIMESTAMP=*misTime* IS NOT OK

Explanation: An error was encountered in the restore mission execution. The detailed description of the error is given in the previous displayed messages.
The variables in this message are:

- **misName** - the name of the restore mission
- **modate** - the original scheduling date of the restore mission
- **misTime** - the time stamp of the restore mission

The restore mission ends NOTOK.

**Corrective Action:** Check the report of mission execution in the IOALOG and in the output of the restore job.

**RSC69DI RESTORED REPORT: ID=recordId jobname/recipient/report**

**Explanation:** This information message indicates that backed up (migrated) report is successfully restored in the Active User Reports file.

The variables in this message are:

- **recordId** - the internal database identifier of the report
- **jobname** - the name of the job that created the report
- **recipient** - the user for whom the report was created
- **report** - the name of the report

**Corrective Action:** No action is required.

**RSC69EE FAILED TO RESTORE REPORT: ID=recordId jobname/recipient/report**

**Explanation:** The restore job was unable to restore the backed up (migrated) report in the Active User Reports file due to an error in the restore job execution.

The variables in this message are:

- **recordId** - the internal database identifier of the report
- **jobname** - the name of the job that created the report
- **recipient** - the user for whom the report was created
- **report** - the name of the report

The restore mission ends NOTOK.

**Corrective Action:** Check the output of the restore job.

**RSC69FW FAILED TO RESTORE NOTE OF REPORT: ID=recordId jobname/recipient/report**

**Explanation:** The restore job successfully restored the backed up (migrated) report in the Active User Reports file, but was unable to restore the notes of the report due to an error occurred in the restore job execution.

The variables in this message are:
Messages RSCA00 through RSCAxx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

RSCA50I MISSION misName ODATE=modate TIMESTAMP=misTime WAIT FOR ANOTHER RESTORE/CTDDELRP TO TERMINATE

Explanation: This information message indicates that the restore job executing the misName mission has been suspended until the CTDDELRP utility or another restore job being executed finishes.

The variables in this message are:

- misName - the name of the restore mission
- modate - the original scheduling date of the restore mission
- misTime - the time stamp of the restore mission

Corrective Action: No action is required.

RSCA51W MISSION misName ODATE=modate TIMESTAMP=misTime NO APPROPRIATE RESTORE REQUEST FOUND ON HIS/MIG FILE

Explanation: The restore job did not find any restore request assigned to the mission being executed.

The variables in this message are:

- misName - the name of the restore mission
- modate - the original scheduling date of the restore mission
- misTime - the time stamp of the restore mission

The restore mission ends NOTOK.

Corrective Action: No action is required.

RSCA52E MISSION misName ODATE=modate TIMESTAMP=misTime FAILED TO UPDATE THE MISSION STATUS. RC=rc

Explanation: The restore job failed to update status of the restore mission that it executed.

The variables in this message are:
The restore mission remains in RESTORE IN PROCESS status.

Corrective Action: Call your INCONTROL Administrator.

RSCA53E "FE" PRINT SUPPORT ERROR. RETURN CODE rc

When a record with status WAITING FOR PRINT is restored, the Control-D Decollation monitor writes an internal Printing Mission record to indicate that there are reports waiting to be printed by the Printing Mission specified in the DO PRINT parameter. These records are produced with the following key: X'FE','PRINTMS',Printing-Mission-Name. rc is the return code from routine CTDXRP.

The Restore Mission restores the reports but terminates with NOTOK status. The restored reports will not be selected by any Printing Mission whose name is specified in Decollation Mission parameter DO PRINT.

Corrective Action: These reports can be manually scheduled for Deferred Printing by using line command P to display the Print Window under option U and then specifying the Printing Mission name. If the problem persists, report the return code to BMC Software Customer Support.

RSCA53W MISSION misName ODATE=modate TIMESTAMP=misTime FAILED IN PRINTING MANAGEMENT. RC=rc

Explanation: The restore job successfully restored reports assigned to the executed mission, but failed to assign those of them which have not yet been printed to the corresponding print missions.

The variables in this message are:

- misName - the name of the restore mission
- modate - the original scheduling date of the restore mission
- misTime - the time stamp of the restore mission
- rc - the return code passed back from the program that manages the print requests.

Corrective Action: Use the CTDBLXRP utility to reset the print requests management.

RSCA54I RSTRESET PROCESSING STARTED

Explanation: This information message denotes the normal start of the RSTRESET Control-D utility.

The RSTRESET utility changes the status of all active restore missions to ENDED NOT OK, and changes the status of all reports selected for restoring to BACKED UP.

Corrective Action: No action is required.
RSCA55I RSTRESET PROCESSING ENDED

Explanation: This information message indicates that the RSTRESET Control-D utility ended normally.
Corrective Action: No action is required.

RSCA56E MISSION misName ODATE=modate TIMESTAMP=misTime CANNOT CONTINUE WORKING

Explanation: This message indicates that due to an error that occurred when processing the User Reports file, the restore job cannot continue. The detailed description of the error is given in the previous displayed message CTD908S.

The variables in this message are:
- misName - the name of the restore mission
- modate - the original scheduling date of the restore mission
- misTime - the time stamp of the restore mission

The restore mission ends NOTOK.
Corrective Action: Call your INCONTROL Administrator.

RSCA57W FAILED TO ASSIGN REPORT FOR PRINTING: ID=recordId/jobname/recipient/report

Explanation: The restore job successfully restored the specified report, but failed to assign it to a print mission.

The variables in this message are:
- recordId - the internal database identifier of the report
- jobname - the name of the job that created the report
- recipient - the user for whom the report was created
- report - the name of the report

Corrective Action: Use the CTDBLXRP utility to reset the print requests management.

RSCA58S OPEN OF ACTIVE MISSIONS FILE FAILED.

Explanation: The CTDRESET utility has failed to open the Active Mission file.
The utility does not reset reports restore processing.
Corrective Action: Call your INCONTROL Administrator.

RSCA59I RESTORE MISSION misName ODATE=modate TIMESTAMP=misTime IS RESET

Explanation: This information message indicates that the CTDRESET utility successfully reset the pending restore mission.
The variables in this message are:

- **misName** - the name of the restore mission
- **modate** - the original scheduling date of the restore mission
- **misTime** - the time stamp of the restore mission

**Corrective Action:** No action is required.

RSCA5AI REPORT: ID=recordId/jobname/recipient/report IS RESET TO STATUS 'WAIT RESTORE / BACKED UP'

**Explanation:** This information message indicates that the CTDRESET utility reset the status of the report to WAIT RESTORE or to BACKED UP in correspondence with parameter specified in the utility call.

The variables in this message are:

- **recordId** - the internal database identifier of the report
- **jobname** - the name of the job that created the report
- **recipient** - the user for whom the report was created
- **report** - the name of the report

**Corrective Action:** No action is required.

RSCA5BI RESTORE RESET PROCESSING TERMINATED

**Explanation:** Due to a severe error during the execution of the CTDRESET utility, its execution has terminated. The detailed description of the error is given in the previous displayed messages.

The utility did not reset reports restore processing.

**Corrective Action:** Call your INCONTROL Administrator.

RSCA5CE MISSION misName ODATE=misoDate TIMESTAMP=misTime FAILED TO UPDATE ITS STATUS (SECURITY VIOLATION)

**Explanation:** The restore mission indicated in the message cannot update its status in the Active Mission file because of a security violation.

The mission remains in status IN PROCESS.

**Corrective Action:** Perform the following actions:
1. Run the CTDRESET utility to reset the mission status.
2. Correct the security rules related to the restore mission job.
3. Rerun the mission.

RSCA5DE MISSION misName ODATE=misoDate TIMESTAMP=misTime FAILED TO UPDATE ITS STATUS (UPDATE QUEUE OVERFLOW)

**Explanation:** The restore mission indicated in the message cannot update its status in the Active Mission file because of update queue overflow in the Active Mission file service.
The mission remains in status IN PROCESS.

**Corrective Action:** Perform the following actions:

1. Run the CTDRESET utility to reset the mission status.
2. If the mission ended NOTOK, rerun the mission.

**RSCA5EE** STATUS OF MISSION *misName* ODATE=*misoDate* TIMESTAMP=*misTime* CANNOT BE RESET (RC=rc)

**Explanation:** Where rc is the return code of the Active Mission file service.

Utility CTDRESET cannot reset, in the Active Mission file, the status of the mission indicated in the message.

The mission remains in status IN PROCESS.

**Corrective Action:** Prepare the IOA LOG and contact BMC Customer Support.

**RSCA5FE** STATUS OF MISSION *misName* ODATE=*misoDate* TIMESTAMP=*misTime* CANNOT BE RESET (SECURITY VIOLATION)

**Explanation:** Utility CTDRESET cannot reset the status of the mission indicated in the message because of a security violation.

The mission remains in status IN PROCESS.

**Corrective Action:** Perform the following actions:

1. Correct the security rules related to the utility job.
2. Rerun the utility.

**RSCA5QE** STATUS OF MISSION *misName* ODATE=*misoDate* TIMESTAMP=*misTime* CANNOT BE RESET (UPDATE QUEUE OVERFLOW)

**Explanation:** Utility CTDRESET cannot reset the status of the mission indicated in the message overflow because of the update queue in the Active Mission file service.

The mission remains in status IN PROCESS.

**Corrective Action:** Perform the following actions:

1. Rerun the utility.
2. If the problem recurs, prepare the IOA LOG and contact BMC Customer Support.

**RST messages**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.
Messages RST400 through RST4xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

RST499I SHUT DOWN UPON REQUEST OF MAIN TASK

**Explanation:** This information message indicates that shutdown of the Control-D monitor has been requested.

Shutdown of Control-D internal restore task by request of Control-D main task.

The Control-D monitor shuts down.

**Corrective Action:** No action is required.

RST49AE CONTROL-D JOB LIBRARY FULL. COMPRESS THE JOB LIBRARY AND RERUN THE MISSION

**Explanation:** This information message indicates that a restore mission failed to update a job member in the JOB library of Control-D because the library was full.

The restore mission ends with status NOTOK.

**Corrective Action:** Compress the Control-D JOB library, and rerun the restore mission.

Messages RST600 through RST6xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

RST676I RESTORE MISSION {STARTED | RESTARTED} WITH TIMESTAMP=misTime

**Explanation:** This information message indicates which restore mission is starting (re-starting), and its time stamp.

In this message, misTime is the identity of the restore mission that is starting (restarting).

**Corrective Action:** No action is required.

RST678I RESTORE MISSION misName TIMESTAMP=misTime ENDED OK

**Explanation:** This information message indicates that the restore mission finished OK.

The variables in this message are:

- misName - the name of the restore mission
- misTime - the time stamp of the restore mission

**Corrective Action:** No action is required.
RST679E RESTORE MISSION *misName* TIMESTAMP=*misTime* ENDED NOT OK

**Explanation:** The restore mission finished NOTOK.

The variables in this message are:
- *misName* - the name of the restore mission
- *misTime* - the time stamp of the restore mission

**Corrective Action:** No action is required.

RST67BI RESTORE *jobId* SUBMITTED WITH TIMESTAMP=*misTime*

**Explanation:** This information message indicates that the restore job generated by the restore mission was submitted for execution.

In this message:
- *jobId* - the system identifier of the submitted job.
- *misTime* - the identity of the restore mission. It is copied to the generated job.

**Corrective Action:** No action is required.

RST67CI RESTORE JOB PLACED IN CONTROL-D JOB LIBRARY WITH TIMESTAMP=*misTime*

**Explanation:** This information message indicates that the restore job generated by the restore mission was placed to the Control-D JOB library.

In this message, *misTime* is the identity of the restore mission. It is copied to the generated job.

**Corrective Action:** No action is required.

RST67DI *misName*jobname/recipient REPORT ID=recordId PICKED UP FOR RESTORE. TIMESTAMP=*misTime* NAME=report

**Explanation:** This information message indicates that report requested to be restored is picked up by the *misName* restore mission.

The variables in this message are:
- *misName* - the name of the mission
- *jobname* - the name of the job that created the report
- *recipient* - the user for whom the report was created
- *recordId* - the internal database identifier of the report
- *misTime* - the time stamp of the mission
- *report* - the name of the report

**Corrective Action:** No action is required.
RST680E THERE ARE NO RESTORE REQUESTS FOR MISSION misName (TIMESTAMP=misTime)

**Explanation:** The started restore mission did not find any report assigned to it.

The variables in this message are:

- **misName** - the name of the restore mission
- **misTime** - the time stamp of the restore mission

The restore mission ends NOTOK.

**Corrective Action:** No action is required.

RST681E RC=rc FROM CTDX011.MISSION misName TIMESTAMP=misTime TERMINATED

**Explanation:** This error message indicates that user’s Exit program CTDX011 passed back the rc return code to Control-D, which prevents the restore mission from continuing execution.

The variables in this message are:

- **misName** - the name of the restore mission
- **misTime** - the time stamp of the restore mission

The restore mission ends NOTOK.

**Corrective Action:** Call your INCONTROL Administrator.

RST682E RC=rc FROM CTMMEM. MISSION misName TIMESTAMP=misTime TERMINATED

**Explanation:** An error preventing a restore mission from continuing execution occurred during the process of Control-D SKL or JOB library.

In this message:

- **rc** - the return code passed back from the program that was processing the library
- **misName** - the name of the restore mission
- **misTime** - the time stamp of the restore mission

The restore mission ends NOTOK.

**Corrective Action:** Call your INCONTROL Administrator.

RST683E RC=rc FROM CTMCND. MISSION misName TIMESTAMP=misTime TERMINATED

**Explanation:** An error preventing a restore mission from continuing execution occurred during the process of the condition coded in the restore job skeleton.

In this message:
- rc - the return code passed back from the program that was processing the condition
- misName - the name of the restore mission
- misTime - the time stamp of the restore mission

The restore mission ends NOTOK.

**Corrective Action:** Call your INCONTROL Administrator.

RST684E SKELETON sklName NOT FOUND. MISSION misName TIMESTAMP=misTime STOPPED

**Explanation:** The sklName restore job skeleton required by the executing restore mission was not found in the Control-D SKL library.

In this message:
- sklName - the name of the restore job skeleton
- misName - the name of the restore mission
- misTime - the time stamp of the restore mission

The restore mission ends NOTOK.

**Corrective Action:** Call your INCONTROL Administrator.

RST688I RESTORE TASK STARTED.

**Explanation:** This information message indicates that Control-D internal restore task has started.

Normal message when a restore task is started.

**Corrective Action:** No action is required.

Messages RSTI00 through RSTIxx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

RSTI01S pgm UNABLE TO OPEN FILE ddName

**Explanation:** The pgm program is unable to open the file referenced by the specified DD name.

The ddName file may be missing. This message is accompanied by a system message explaining the cause of the problem.

The program terminates.

**Corrective Action:** Supply the required DD name if it is missing. Otherwise, see the accompanying system message and take appropriate action.

RSTI02S pgm UNABLE TO LOAD modName

**Explanation:** The specified program is unable to load the modName module.
The `modName` module is probably missing from the IOA Load library. The program is terminated.

**Corrective Action:** Prepare the Control-M monitor full output and contact BMC Customer Support.

**RSTI03I** AJF/CONDITIONS JOURNAL INITIALIZED: BLOCKSIZE `num`

**Explanation:** This information message indicates that the Control-M Journal file was successfully initialized during New Day processing.

The first record of the Journal file contains information relevant to the Control-M current working day.

In this message, `num` is the blocksize of the Journal file.

**Corrective Action:** No action is required.

**Messages RSTM00 through RSTMxx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**RSTM01W** AJF/CONDITIONS JOURNALING TERMINATED - RESTORATION BEYOND THIS TIME NOT POSSIBLE

**Explanation:** Logging to the journal file was terminated due to a detected error.

This message is preceded by a message indicating the cause of the error.

The Control-M monitor terminates the Journal facility and displays WTOR message CTML12W, which asks the operator how the monitor should proceed.

**Corrective Action:** Respond to message CTML12W.

**RSTM02I** AJF/CONDITIONS JOURNALING STARTED

**Explanation:** This information message indicates that Control-M started logging updates to the Journal file.

Changes made to the Active Jobs file and to prerequisite conditions in the IOA Conditions file are recorded in the Journal file.

**Corrective Action:** No action is required.

**RSTM03E** `text`

**Explanation:** This message is produced if an abend occurs while Control-M is writing to the Journal file. The Control-M monitor displays data about the abend, meaning the text in this message.

The Control-M monitor terminates the Journaling facility and displays WTOR message CTML12W.

**Corrective Action:** Respond to message CTML12W.

**RSTM04I** AJF/CONDITIONS JOURNALING CLOSED NORMALLY

**Explanation:** This information message indicates that Control-M Journaling ended normally.
The journaling facility was terminated in response to an operator command, or as part of Control-M shutdown.

**Corrective Action:** No action is required.

**RSTM05S** AJF/CONDITIONS JOURNALING INITIALIZATION FAILURE

**Explanation:** The Control-M journaling facility could not be started because the journal file or another file required for journaling could not be opened.

The above message describes the reason for the problem.

The Control-M monitor terminates the journaling facility and displays WTOR message CTML12W, which asks the operator whether to continue without journaling or shut down the Control-M monitor.

**Corrective Action:** Respond to message CTML12W.

**RSTM06S** JOURNAL FILE RECORD 0 FORMAT ERROR

**Explanation:** The record length of the Control-M journal file was incorrect.

This message is preceded by a message describing the specific cause of the problem.

The Control-M monitor terminates the journaling facility and displays WTOR message CTML12W, which asks the operator whether to continue without journaling or to shut down the Control-M monitor.

**Corrective Action:** Respond to message CTML12W.

**RSTM07S** JOURNAL/AJF MISMATCH: FIELD=fieldname

**Explanation:** The Control-M journaling facility could not be started because the specified journal file does not match the Active Jobs file used by the Control-M monitor.

In this message, fieldname is the name of the field in the Active Jobs file which does not match the corresponding field in the journal file.

The Control-M monitor terminates the journaling facility and displays WTOR message CTML12W.

**Corrective Action:** Respond to message CTML12W.

**RSTM08S** GETMAIN FAILURE IN PROGRAM CTRRMSTM

**Explanation:** Sufficient storage could not be obtained for journal file processing.

The Control-M monitor terminates the journaling facility and displays WTOR message CTML12W. CTML12W asks the operator to either continue without journaling or shut down the Control-M monitor.

**Corrective Action:** Respond to message CTML12W.

**RSTM09S** BUFFER OVERFLOW ERROR

**Explanation:** An internal error was detected during journal file processing.

The Control-M monitor terminates the journaling facility and displays WTOR message CTML12W.

**Corrective Action:** Respond to message CTML12W. Prepare the Control-M monitor full output and contact BMC Customer Support.
INCONTROL for z/OS Messages Manual

**RSTM10S LUW RECORD GENERATION ERROR**

**Explanation:** A error occurred while writing the LUW syncpoint record to the Journal file.

The LUW syncpoint record is the last synchronization point in the Journal file and verifies the completion of all records previously recorded in the Journal file. Without the LUW syncpoint record, records in the Journal file cannot be verified as complete.

The Control-M monitor terminates the Journal facility and displays WTOR message CTML12W.

**Corrective Action:** Respond to message CTML12W.

**RSTM12E JOURNAL FILE DCB ABEND EXIT INVOKED: SYSTEM CC=SYS', RC=rc**

**Explanation:** An abend occurred while writing to the Journal file.

sys and rc are the system codes and return codes which describe the abend.

The Control-M monitor terminates the Journal facility and displays WTOR message CTML12W.

**Corrective Action:** Respond to message CTML12W.

**RSTM15I AJF/CONDITIONS JOURNALING ACTIVITY SUSPENDED**

**Explanation:** This information message indicates that journaling has been suspended due to New Day processing.

During New Day processing, Control-M always suspends writing to the Journal file.

Journaling is automatically resumed after completion of New Day processing.

**Corrective Action:** No action is required.

**RSTM16I AJF/CONDITIONS JOURNALING ACTIVITY RESTORED**

**Explanation:** This information message indicates that Control-M resumed writing to the Journal file after completing New Day processing.

**Corrective Action:** No action is required.

**RSTM17S AJF/CONDITIONS JOURNAL SEARCH FAILURE**

**Explanation:** An error was encountered during a search of the Control-M Journal file.

During Control-M monitor startup, the journal file is searched for data that may have been added to the Active Jobs File while the Control-M monitor was down.

The Control-M monitor stops journaling and displays WTOR message CTML12W.

**Corrective Action:** Reply to message CTML12W, which follows.

**Messages RSTU00 through RSTUxx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.
RSTU01I AJF/CONDITIONS RESTORATION STARTED

**Explanation:** This information message indicates that the CTMRSTR restoration utility has begun processing.

**Corrective Action:** No action is required.

RSTU02I AJF/CONDITIONS RESTORATION ENDED

**Explanation:** This information message indicates that the CTMRSTR restoration utility has completed processing.

**Corrective Action:** No action is required.

RSTU03S AJF/CONDITIONS RESTORATION NOT ENABLED

**Explanation:** Journaling was not activated because JRNL is set to N in the CTMPARM member in the IOA PARM library. In such a case, the Control-M monitor does not record events in the journal file. Consequently, restoration of the Active Jobs File from the journal file is not possible.

The restoration utility terminates processing.

**Corrective Action:** To use the restoration utility, the Control-M monitor must be run with the JRNL parameter set to Y in CTMPARM.

RSTU05E INVALID RESTORATION PARAMETER - *parm*

**Explanation:** An unrecognized parameter was specified for the CTMRSTR utility.

The CTMRSTR utility terminates.

**Corrective Action:** Correct the specified parameter and rerun the CTMRSTR utility.

RSTU06E INVALID FORMAT OF ENDTIME PARAMETER. "YYYYMMDDHHMMSSSTH" EXPECTED

**Explanation:** An invalid format was used for the value specified for the ENDTIME parameter in the CTMRSTR utility.

The ENDTIME parameter indicates when to restore the Control-M Active Jobs file and/or the IOA Conditions file.

The CTMRSTR utility terminates.

**Corrective Action:** Correct the value for the ENDTIME parameter and rerun the CTMRSTR utility.

RSTU07S MULTIPLE SPECIFICATION OF INPUT PARAMETER NOT ALLOWED

**Explanation:** A parameter was specified more than once for a run of the CTMRSTR utility. Each parameter for this utility can be specified only once for each run of the utility.

The CTMRSTR utility terminates.

**Corrective Action:** Correct the parameters for the CTMRSTR utility and rerun the utility.
RSTU08S NO PARAMETER INPUT DATA FOUND

**Explanation:** No input parameters were specified for the CTMRSTR utility. The CTMRSTR utility terminates.

**Corrective Action:** Specify the necessary parameters following the SYSIN DD statement and rerun the utility.

RSTU09S REQUIRED STORAGE NOT AVAILABLE

**Explanation:** Insufficient storage is available for the CTMRSTR utility. The CTMRSTR utility terminates.

**Corrective Action:** Increase the region size and rerun the utility.

RSTU10W END OF FILE REACHED PRIOR TO SYNCPOINT - LAST ENTRIES IGNORED

**Explanation:** The last record in the Journal file was not a syncpoint record.

Syncpoint records are used to verify all records added to the Journal file. Only data records written to the Journal file prior to a syncpoint record are considered valid for restoration. The last syncpoint record is missing (due to an MVS system crash, cancellation of the Control-M monitor, or the like). Records written after the last syncpoint record are not restored.

**Corrective Action:** No action is required.

RSTU11I RESTORATION PROCESSING TERMINATED

**Explanation:** This information message indicates that the CTMRSTR utility ended due to an error. This message follows error messages that describe the error that caused the utility to terminate.

**Corrective Action:** Consult previous error messages, correct the error if possible, and rerun the restoration job. If CTMRSTR terminated due to a severe error (as indicated by message RSTU12E above), contact BMC Software Customer Support.

RSTU12E SEVERE PROCESSING ERROR - REASON rsn

**Explanation:** The CTMRSTR utility terminated due to an internal error. In this message, rsn is the code that indicates the reason for the error.

**Corrective Action:** Rerun the CTMRSTR utility with DEBUG set to (73:74) as specified in the restoration procedure. Contact BMC Software Customer Support. Provide the IOA representative with the message, the reason code, and any data produced by the rerun procedure.

RSTU13I RESTORATION PROCESSING COMPLETED SUCCESSFULLY

**Explanation:** This information message indicates that the CTMRSTR utility completed the restoration successfully. Restoration of the Active Jobs file and/or the IOA Conditions file was successful.

**Corrective Action:** No action is required.
RSTU14W END OF JOURNAL FILE REACHED BEFORE SPECIFIED TIME LIMIT

Explanation: The ENDTIME parameter for the CTMRSTR utility specified a value that was older than the last value found in the journal file.

The CTMRSTR utility processes all records in the journal file and execution proceeds normally.

Corrective Action: No action is required.

RSTU15E JOURNAL FILE - AJF MISMATCH: fldname

Explanation: The journal used by the CTMRSTR restoration procedure does not match the Active Jobs file used by the Control-M monitor to produce journal records.

In this message, fldname is the field name in the Active Jobs file that did not match the corresponding field in the journal file.

The CTMRSTR utility terminates.

Corrective Action: Specify the correct Active Jobs file procedure for the CTMRSTR utility and rerun the utility.

RSTU16E JOURNAL FILE - CTMPARM MISMATCH: fldname

Explanation: The journal file used by the CTMRSTR restoration utility is not compatible with one of the following parameters specified in the CTMPARM member in the IOA PARM library:

- QNAME
- the IOA version
- the Active Jobs file (AJF) size

In this message, fldname identifies the problematic parameter.

The CTMRSTR utility terminates.

Corrective Action: Specify the correct CTMPARM parameters for the CTMRSTR utility and rerun the utility.

RSTU17E ENDTIME PARAMETER VALUE INCONSISTENT WITH RESTORATION FILE TIMESTAMP

Explanation: The ENDTIME parameter specified a value earlier than the earliest timestamp in the journal file.

The CTMRSTR utility terminates.

Corrective Action: Specify a value for the ENDTIME parameter which is consistent with the data in the journal file. This value must be later than the most recent New Day processing.

RSTU18I JOURNAL FILE VERIFICATION COMPLETE

Explanation: This information message indicates that the specified journal file corresponds to the Active Jobs file defined in the CTMRSTR restoration procedure.

The restoration process begins.
Corrective Action: No action is required.

RSTU20E CONDITION RESTORATION ERROR: RC=rc REASON=rsn
Explanation: The CTMRSTR restoration utility encountered an error while attempting to restore a prerequisite condition.
The error is described in the sysout referenced by the DAPRINT DD statement.
The CTMRSTR utility terminates.
Corrective Action: The message in file DAPRINT describes the cause of the error. If the problem cannot be fixed, notify BMC Software Customer Support.

RSTU21E CONTROL-M MONITOR IS ACTIVE
Explanation: The CTMRSTR utility could not run because the Control-M monitor was active.
The CTMRSTR restoration utility terminates.
Corrective Action: Shut down the Control-M monitor and rerun the restoration utility.

RSTU22W AJF/CONDITIONS RESTORATION UTILITY WAITING FOR ACTIVE JOBS FILE
Explanation: The restore utility could not access the Active Jobs File because it was being used by another job.
The restoration utility waits until the file is accessible.
Corrective Action: No action is required.

RSTU23E CONTROL-M APPLICATION SERVER GATEWAY IS ACTIVE
Explanation: The restoration utility terminated processing because Control-M Application Server Gateway is active.
Corrective Action: Shut down the Control-M Application Server Gateway and rerun the restoration utility.

RUN messages
This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Rerat products.

Messages RUN100 through RUN1xx
This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Rerat products.
RUN1001 CONTROL-M MONITOR monName STARTED

**Explanation:** This information message is a general message issued when the identified Control-M monitor (monName) is started.

**Corrective Action:** No action is required.

RUN1011 NEWCONLIST COMMAND ACCEPTED. SUB SYSTEM(S) WILL BE NOTIFIED

**Explanation:** This information message appears after the operator issued a NEWCONLIST modify command to Control-M.

The Control-M monitor will notify all the console subsystems on all the computers of the required change.

**Corrective Action:** No action is required.

RUN102E CONTROL-M MONITOR NOT APF-AUTHORIZED

**Explanation:** The Control-M monitor is not APF-authorized. The CTMRUN module is not in an APF-authorized library, or not with attribute AC set to 1.

The Control-M monitor terminates with a return code of 8.

**Corrective Action:** Add the library name in which CTMRUN resides to the IEAAPF00 member in SYS1.PARMLIB.

RUN103E INVALID MODIFY PARAMETER. VALID PARAMETERS ARE:

**Explanation:** An erroneous parameter was passed to Control-M monitor by an operator modify command (F). A list of valid modify parameters is displayed on the console after this message.

The modify command is rejected.

**Corrective Action:** Enter a correct modify parameter.

RUN104S BLDL/ATTACH CTMMRUN FAILED FOR TASK taskName

**Explanation:** Initialization of the identified Control-M monitor internal task (taskName) failed.

Possible causes are:

- The taskName task is not found in the IOA Load library.
- There is insufficient memory for the Control-M monitor.

The exact reason (system code) can be found on the computer log.

Control-M monitor shuts down.

**Corrective Action:** Call your system programmer for assistance. If necessary, increase the Control-M monitor REGION size.

RUN105S UNRECOVERABLE ERROR ENCOUNTERED

**Explanation:** Unrecoverable error in the operation of the Control-M monitor.

The IOA Log should contain a previous message concerning the error.
The Control-M monitor will shut down with user abend 0006 or end with a return code of 8.

**Corrective Action:** Call your system programmer for assistance. If the problem is not resolved, contact BMC Software Customer Support.

**RUN106S SUBTASK subtaskName HAS ABENDED**

**Explanation:** The Control-M monitor internal subtask `subtaskName` has abended.

Control-M monitor will shut down with user abend 0006. A dump of the abending task will be included in the output.

This message may be followed by the RUN114E message, which provides more information on the cause of the error.

**Corrective Action:** Call your system programmer for assistance. If the problem is not resolved, prepare the Control-M monitor full output and contact BMC Customer Support.

**RUN107I SHUT DOWN UPON REQUEST FROM OPERATOR**

**Explanation:** This information message is the Control-M monitor shut down message upon request from the operator.

Control-M monitor shuts down.

**Corrective Action:** No action is required.

**RUN108S INITIALIZATION ROUTINE FAILED. RC= rc**

**Explanation:** Highlighted, unrollable message.

Error encountered when initializing the Control-M monitor.

The exact cause of the error is indicated by the return code (`rc`).

The Control-M monitor shuts down.

**Corrective Action:** If the return code (rc) is 4, verify that the JES subsystem name as defined in IEFSSNxx is either JES2 or JES3, and that the JESTYPS parameter in the IOAPARM member is either JES2 or JES3.

If the return code is 8, certain load modules are missing from the IOA LOAD library. Restore the original LOAD library.

If the return code is 24, the IOAEST table (the dynamic destination table for group Shout messages) is missing from the IOA PARM library.

**RUN109I THE NUMBER OF INTERVALS TO WAIT FOR THE CONTROL-M DAILY IS SET TO numberIntervals**

**Explanation:** This information message indicates that after a Control-M monitor issues message CTM113I, it is waiting for the displayed number of Control-M sleeping intervals for the New Day procedure to start executing. If the New Day procedure does not start executing, message CTML03W is issued, followed by message CTML06W.

**Corrective Action:** No action is required.
RUN111I JOURNAL COMMAND ACCEPTED: cmd

**Explanation:** This information message indicates that a JOURNAL=ENABLE or JOURNAL=DISABLE modify command was accepted. The command is echoed in the message as `cmd`.

**Corrective Action:** No action is required.

RUN112I fileName SUPPORT NOT ACTIVATED

**Explanation:** This information message indicates that History/Journal support is not set to Y in the CTMPARM member.

This message is generated in response to a HISTALOC/JOURNAL=ENABLE or HISTALOC/JOURNAL=DISABLE modify command. This command could not be processed because History/Journaling is not enabled.

**Corrective Action:** Set HIST/JRNL to Y in the CTMPARM member.

RUN113I CONTROL-M MONITOR monName NEW DAY PROCEDURE STARTED

**Explanation:** Highlighted, unrollable message.

This information message indicates that the Control-M monitor has begun performing a number of housekeeping tasks prior to submitting the New Day procedure.

Control-M suspends processing at the time specified in CTMPARM to allow the New Day procedure to run. The Control-M monitor remains suspended until the New Day procedure is successfully completed. At the successful completion of the New Day procedure, the monitor resumes normal execution.

**Corrective Action:** No action is required.

RUN114E JOB HANDLED AT TIME OF ABEND: ID=id MEMBER=memName USER-ID=userId

**Explanation:** A subtask abended.

As a result of the subtask abend, message RUN106S is issued. This message follows RUN106S with additional information. The ID, member name and user ID displayed in the message are from the Master Index file (MIT) that was handled by the subtask when it abended.

This message may be followed by the RUN123E message.

**Corrective Action:** No action is required.

RUN116S OPEN OF ACTIVE JOBS FILE FAILED - DDNAME "DACKPT"

**Explanation:** Highlighted, unrollable message.

Open of Control-M Active Jobs file failed (the DACKPT DD statement).

Possible causes are:
The DACKPT DD statement is missing.

The data set described by the DACKPT DD statement is not the Control-M Active Jobs file.

The data set described by the DACKPT DD statement is the Control-M Active Jobs file, but of another Control-M monitor, or of a different version of Control-M.

The Control-M monitor will shut down.

Corrective Action: Correct the JCL for the Control-M monitor.

RUN117S ACTIVE JOBS FILE IS BEING FORMATTED NOW

Explanation: Highlighted, unrollable message.

The Control-M monitor was started while the Active Jobs file was being formatted.

The Control-M New Day procedure did not finish formatting the file, either because it (the New Day procedure) is still working, or because it abended. The Control-M monitor cannot be started until the New Day procedure finishes executing successfully.

The Control-M monitor shuts down.

Corrective Action: Check how the New Day procedure finished executing. All the problems of the New Day procedure must be corrected before restarting the Control-M monitor.

However, if an IPL occurred during the previous run of the New Day procedure, it will correct itself when restarted. Therefore, it can be restarted without correction.

If the Control-M New Day procedure is abended, it may be necessary to set all dates in the date control record (the DATREC member in the CTM PARM library) to one day prior to the current day and rerun the New Day procedure. If the procedure ends successfully, you will be able to restart the Control-M monitor.

RUN118S FILE ALLOCATED TO DDNAME "DACKPT" IS NOT THE EXPECTED ACTIVE JOBS FILE

Explanation: Highlighted, unrollable message.

The data set described by the DACKPT DD statement is not the expected Control-M Active Jobs file.

This could be due to one of the following:

- The file allocated to the DACKPT DD statement is not the Control-M Active Jobs file.
- The file allocated to the DACKPT DD statement is the Control-M Active Jobs file, but it is of a different version, or of a different Control-M monitor.

The Control-M monitor will shut down.

Corrective Action: Correct the JCL for the Control-M monitor.

RUN119S ACTIVE JOBS FILE IS DAMAGED - NOTIFY THE IOA ADMINISTRATOR

Explanation: Highlighted, unrollable message.

The contents of the Active Jobs file have been corrupted.
The Active Jobs file is marked as FORMAT during New Day processing, and marked as FREE at successful completion. Currently, the file is not marked as FORMAT, nor as FREE.

The Control-M monitor will shut down.

**Corrective Action:** Call your system programmer for assistance. If the problem is not resolved, call your INCONTROL Administrator.

**RUN120I** CONTROL-M MONITOR xxxxxxxx SHUTTING DOWN

**Explanation:** Highlighted, unrollable message.

This information message is a Control-M/D message issued when shutting down the Control-M monitor by a P command, or on certain internal Control-M events.

The IOA Log should contain additional messages concerning the reason for shutting down.

The Control-M monitor shuts down.

**Corrective Action:** No action is required.

**RUN121S** CONTROL-M MONITOR ENDED WITH ERROR

**Explanation:** Highlighted, unrollable message.

The Control-M monitor ended with an error.

The IOA Log should contain additional messages concerning the specific error.

The Control-M monitor will shut down.

**Corrective Action:** Check the IOA Log (or the computer log) for the reason. Call the system programmer for assistance if needed. Try to start the Control-M monitor again as soon as possible.

**RUN122W** YOUR CONTROL-M IS ALREADY ACTIVE. QNAME "qName"

**Explanation:** Highlighted, unrollable message.

Someone has attempted to start a Control-M monitor which is already active. Two Control-M monitors with the same QNAME cannot run at the same time.

The newly-started Control-M monitor will shut down.

**Corrective Action:** No action is required.

**RUN123I** CONTROL-M INTERVAL IS SET TO nn.nn SECONDS

**Explanation:** This information message is a result of setting a Control-M sleeping interval by an operator command. For more details please refer to the INCONTROL for z/OS Administrator Guide.

Control-M monitor wakes up every nn.nn seconds, and checks what to do.

**Corrective Action:** No action is required.

**RUN124E** VALID PARAMETERS FOR KEYWORD keyword ARE: parms

**Explanation:** A MODIFY command containing invalid syntax was entered for the Control-M monitor. The message displays the valid parameters.

**Corrective Action:** Enter one of the parameters displayed in the message.
RUN125I valid_operator_command

**Explanation:** This information message indicates a valid operator command. It is part of the Control-M response to an invalid operator command issued to Control-M.

In response to an invalid command, Control-M issues the RUN103E message, which identifies the error, and a series of RUN125I messages, each containing a valid operator command.

The invalid operator command is ignored.

**Corrective Action:** Issue a valid operator command.

RUN126I NEW EXIT CTMX004 LOADED

**Explanation:** This information message indicates successful execution of the CTMX004 operator modify command.

A new Control-M resource acquisition user exit was loaded.

**Corrective Action:** No action is required.

RUN127I NEWDEST COMMAND ACCEPTED: NEWDEST=tableName

**Explanation:** This information message indicates that a NEWDEST operator command has successfully been passed to the Control-M monitor.

The Control-M monitor replaces the current destination table with the destination table identified in the message (tableName).

**Corrective Action:** No action is required.

RUN128S OPEN OF DUAL ACTIVE JOBS FILE FAILED-DDNAME "DAALTCKP"

**Explanation:** Highlighted, unrollable message.

Open of the Control-M Alternate (dual) Active Jobs file failed (the DAALTCKP DD statement).

Possible causes are:

- The DAALTCKP DD statement is missing.
- The data set described by the DAALTCKP DD statement is not a Control-M Active Jobs file.

This message will be produced only if Control-M is working in dual file mode (selected by setting the DUALDB parameter in the IOAPARM member in the IOA PARM library to Y).

The Control-M monitor shuts down with an error message.

**Corrective Action:** Correct the JCL for the Control-M procedure, and start it again. If you do not wish to run in dual file mode, correct the Control-M Installation Parameters (IOAPARM).

RUN12AE CONTROL-M EXTENDED MCS INITIALIZATION FAILED. RC=rc, MCSOPER RC=mcs_rc REASON=rsn

**Explanation:** Initialization of the extended MCS console component of Control-M failed.

Valid values for the first return code in the message are:
<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>Authorization failed</td>
</tr>
<tr>
<td>12</td>
<td>Version of operating system not supported</td>
</tr>
<tr>
<td>16</td>
<td>The second return code (mcs_rc) and the reason code (rsn) from the MCSOPER facility are displayed.</td>
</tr>
<tr>
<td>20</td>
<td>The second return code (mcs_rc) and the reason code (rsn) from the MCSOPER facility are displayed.</td>
</tr>
<tr>
<td>24</td>
<td>Insufficient memory</td>
</tr>
<tr>
<td>32</td>
<td>ENQ for the console already held.</td>
</tr>
</tbody>
</table>

All services relying on an extended MCS console function are inoperable.

**Corrective Action:** Correct the problem according to the return code displayed in the message.

For the meanings of the MCSOPER return and reason codes that are displayed if the first return code is 16 or 20, refer to the MCSOPER macro description in the IBM manual *Application Development Reference - Services for Authorized Assembler Language Programs*.

Once the cause of the problem has been corrected, bring the Control-M monitor down and up again.

**RUN130E SYNTAX ERROR. "QUIESQRES" COMMAND IGNORED**

**Explanation:** The Control-M monitor attempted to evaluate the QUIESQRES command identified in the preceding CTML18I message, but found invalid command syntax.

For a detailed description of the command syntax, see the section on activating and deactivating quiesced quantitative resources in the Control-M chapter of the *INCONTROL for z/OS Administrator Guide*.

The Control-M monitor ignores the command.

**Corrective Action:** Enter another QUIESQRES command using valid syntax.

**RUN131I NO QUIESCE TIME ASSIGNED TO RESOURCE resourceName**

**Explanation:** The following command was given:

```
F CONTROLM,QUIESQRES=resourceName,DISPLAY|NOW|OFF|hhmm
```

with the parameter DISPLAY or OFF. However, no QUIESCE time was assigned to the resourceName resource.

**Corrective Action:** No action is required.

**RUN132I NO QUIESCE TIME ASSIGNED TO ANY RESOURCE**

**Explanation:** The following command was given:

```
F CONTROLM,QUIESQRES=resourceName,DISPLAY|NOW|OFF|hhmm
```
with the parameter DISPLAY or OFF. However, no resource had a QUIESCE time assigned.

**Corrective Action:** No action is required.

RUN133I yyyy-mm-dd hh:mm QUIESCE TIME ASSIGNED TO RESOURCE resourceName

**Explanation:** This information message displays the action of the Control-M monitor in response to the following command:

F CONTROLM,QUIESQRES=resourceName,DISPLAY|NOW|OFF|hh:mm

The date and time assigned in response to this command depend on the setting of the DISPLAY | NOW | OFF parameter, as follows:

- **DISPLAY** - the time that is currently assigned
- **NOW** - the time assigned is the time current at the time the command is processed
- **hh:mm** - the time assigned is the time specified in the command

**Corrective Action:** No action is required.

RUN183E JOB WAS PUT ON HOLD BY THE AUTOMATIC RECOVERY FEATURE

**Explanation:** Highlighted, unrollable message.

A job was put into Held status after a subtask abended.

As a result of the abending of the subtask, the RUN114E message is issued. If the MAXJ BHLD parameter in the CTMPARM member is set to a value greater than zero, this message is issued following the RUN114E message.

The MAXJ BHLD parameter sets the maximum number of jobs that can be put into Held status.

**Corrective Action:** No action is required.

RUN184E MAXIMUM NUMBER REACHED FOR AUTOMATIC RECOVERY FEATURE - DISABLED

**Explanation:** A job was previously put into Held status after a subtask abended. As a result of the abending of the subtask, the RUN114E and RUN183E messages are issued.

This message is issued following the RUN183E message if both the following conditions are satisfied:

- the MAXJ BHLD parameter in the CTMPARM member is set to a value greater than zero
- the number of jobs already put into Held status is equal to the value set in the MAXJ BHLD parameter

The MAXJ BHLD parameter sets the maximum number of jobs that can be put into Held status.

**Corrective Action:** No action is required.
RUN188W \textit{subtaskName} IS PROCESSING JOB \textit{jobName} ORDI D \textit{orderID} FOR MORE THAN \textit{number} MINUTES

**Explanation:** The \textit{subtaskName} subtask has been processing the job for an unreasonable amount of time. The task is most likely hung or in a loop.

Possible causes are:

- If CPU utilization by the Control-M monitor is not unusually high, most probably the subtask is waiting for completion of a system action (for example, recall of migrated data set), or it may point to a problem in \textit{MVS or JES}.
- If CPU utilization by the Control-M monitor is unusually high, it may indicate a loop (in the base code or in a user exit).

The Control-M monitor continues processing as usual. The subtask continues processing of the indicated job.

**Corrective Action:** Review the system log for additional messages related to the problem.

If the reason for the problem is unclear, take the system (SVC) dump of the Control-M monitor's address space using the DUMP console command. Specify parameter SDATA=(CSA,GRSQ,SUM,RGN,TRT).

If the problem is outside Control-M, holding the job being processed and restarting the Control-M monitor may have only temporary effect.

**Messages RUN200 through RUN2xx**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**RUN284I** DEST TABLE LOAD SUCCESSFUL: NEWDEST=\textit{tableName}

**Explanation:** This information message indicates that as a result of an operator NEWDEST command, the Control-M monitor successfully loaded the destination table identified in the message.

**Corrective Action:** No action is required.

**RUN285E** NEWDEST PARAMETER MISSING OR INVALID

**Explanation:** The destination table passed to the Control-M monitor by means of an operator NEWDEST command is invalid or missing.

The specified destination table is not loaded.

**Corrective Action:** Enter the NEWDEST command specifying a destination table which has been previously defined in a library concatenated to the STEPLIB DD statement of the Control-M procedure.

**Messages RUNL00 through RUNLxx**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.
RUNL00I CONTROL-M MONITOR monName PROCESSING SUSPENDED

**Explanation:** This information message indicates that the Control-M monitor has stopped processing jobs temporarily to allow the New Day procedure to begin execution.

Control-M suspends processing at the time specified in CTMPARM to allow the New Day procedure to run. The Control-M monitor remains suspended until the New Day procedure ends. At the successful completion of the New Day procedure, the monitor resumes normal execution.

**Corrective Action:** No action is required.

RUNL01I CONTROL-M MONITOR monName PROCESSING RESUMED

**Explanation:** In general, this message indicates that the Control-M monitor resumed processing jobs after the New Day procedure completed successfully. However, under the Control-M monitor operator command `F CTMTROLM,NEWDAY=NOW,ORDERONLY`, this message can appear before the Newday procedure ends.

**Corrective Action:** No action is required.

RUNL02I CONTROL-M MONITOR monName NEW DAY PROCESSING COMPLETE

**Explanation:** This message indicates that all phases of New Day Processing for the specified monitor ended successfully. However, under the Control-M monitor operator command `F CTMTROLM,NEWDAY=NOW,ORDERONLY`, this message can appear before the Newday procedure ends.

The Control-M monitor resumes execution.

**Corrective Action:** No action is required.

RUNL03W NEW DAY PROCEDURE NOT DETECTED

**Explanation:** Highlighted, unrollable message.

The Control-M monitor received no indication that the New Day procedure began processing. The Control-M monitor requests the start of the New Day procedure, and periodically checks the progress of the procedure. This message is issued when the monitor does not receive any indication that the New Day procedure started executing.

The Control-M monitor issues message CTML06W or RUNL06W to ask the operator how to proceed.

**Corrective Action:** No action is required.

RUNL04W NEW DAY END OF AJF FORMATTING NOT DETECTED

**Explanation:** Highlighted, unrollable message.

The Control-M monitor detected that the formatting of the Active Jobs file (AJF) did not complete successfully within a specified time interval.

The Control-M monitor issues message CTML06W or RUNL06W to ask the operator how to proceed.

**Corrective Action:** No action is required.
RUNL05W NEW DAY PROCEDURE ERROR - PHASE phase number

**Explanation:** *Highlighted, unrollable message.*

During follow-up of the New Day procedure, the Control-M monitor detected an abnormal condition. The Control-M monitor issues message CTML06W or RUNL06W to ask the operator how to proceed.

**Corrective Action:** Reply R for retry. If the message is reissued, note the phase number and reply E to terminate the monitor. To reactivate the monitor, run the Control-M New Day procedure, and when it completes successfully, restart the monitor. Give BMC Customer Support the phase number specified in this message and the Control-M monitor full output.

RUNL06W REPLY "R" FOR RETRY OR "E" FOR END

**Explanation:** *Highlighted, unrollable message.*

While checking the progress of the New Day procedure execution, the Control-M monitor detected an error.

This message is accompanied by a message explaining the cause of the problem.

The Control-M monitor waits for a reply to this message.

**Corrective Action:** Type R or E and press **Enter**, with the following results:
- R - the Control-M monitor waits an additional interval. Issue this reply after all problems with the New Day procedure are resolved so that the monitor will resume normal execution.
- E - the Control-M monitor stops execution

RUNL07W CONTROL-M MONITOR monName WAITING FOR NEW DAY PROCEDURE

**Explanation:** Normal message of Control-M monitor when it stops processing jobs temporarily to allow the New Day procedure to begin execution.

Control-M suspends processing at the time specified in CTMPARM to allow the New Day procedure to run. The Control-M monitor remains suspended until the New Day procedure is successfully completed. Upon successful completion of the New Day procedure, the monitor resumes normal execution.

**Corrective Action:** No action is required.

RUNL08W END OF NEW DAY PROCEDURE NOT DETECTED

**Explanation:** *Highlighted, unrollable message.*

Control-M monitor found no indication that New Day procedure completed execution. The Control-M monitor issues message CTML06W or RUNL06W to ask the operator how to proceed.

**Corrective Action:** No action is required.

RUNL09E DUAL FILES ALLOCATION ERROR. PROCESSING CONTINUES DUE TO SYSTEM PARAMETERS

**Explanation:** *Highlighted, unrollable message.*
Allocation of the dual IOA Conditions file or the dual Active Jobs file (AJF) failed, but processing continues because system parameters have indicated that this condition should be ignored.

Wish WM1944 in the IOADFLTS member of the DOC library was activated to allow an allocation error for dual files to be ignored. (If the wish has not been applied when an allocation error occurs, Control-M terminates execution.)

The Control-M monitor continues normal execution.

**Corrective Action:** If you require dual file processing, do the following:

1. Bring down the Control-M monitor.
2. Determine the cause of the allocation error and correct it.
3. Bring up and reactivate the Control-M monitor.

**RUNL0AI**

**NEWDAY PARAMETERS SET:** `expression`

**Explanation:** This message is issued in response to the following operator command:

`F CONTROLM,NEWDAY=expression`

Special NEWDAY processing is performed as specified in `expression`. For more information, see the *INCONTROL for z/OS Administrator Guide*, “CTM,” “Special Newday Parameters.”

**Corrective Action:** No response required.

**RUNL0BI**

**NEWDAY PROCESS SCHEDULED FOR hh:mm WILL BE BYPASSED**

**Explanation:** In response to the `F CONTROLM,NEWDAY=SKIP` operator command, Newday processing is skipped.

NEWDAY processing normally scheduled to begin at `hh:mm` is bypassed due to the special NEWDAY command. For more information regarding the special NEWDAY commands, see the *INCONTROL for z/OS Administrator Guide*, “CTM,” “Special Newday Parameters.”

**Corrective Action:** No response required.

**RUNL0CI**

**NEWDAY PROCESS HAS BEEN BYPASSED**

**Explanation:** This informational message is issued at the time scheduled for Newday processing (according to the DAYTIME parameter in CTMPARM). Newday processing is skipped as a result of one of the following commands:

- `F CONTROLM,NEWDAY=SKIP`
- `S CONTROLM,NEWDAY=SKIP`

Newday processing is skipped. For more information regarding the special NEWDAY commands, see the *INCONTROL for z/OS Administrator Guide*, “CTM,” “Special Newday Parameters.”

**Corrective Action:** No response required.
RUNL0DE NEWDAY COMMAND NOT 'SKIP' - IGNORED

**Explanation:** The `S CONTROLM,NEWDAY= expression` command was entered with an invalid value of `expression`. In this command, the only valid value for `expression` is `SKIP`. For more information, see the *INCONTROL for z/OS Administrator Guide*, “CTM,” “Special Newday Parameters.”

The command is ignored.

**Corrective Action:** Correct and re-enter the NEWDAY command.

RUNL10I RESUME REQUEST ACCEPTED

**Explanation:** This information message indicates that the RESUME request submitted by the user has been accepted.

**Corrective Action:** No action is required.

RUNL11W AJF/CONDITION JOURNALING DISABLED

**Explanation:** The Control-M monitor stopped journaling updates to the Active Jobs file due to a detected error.

The error which caused journaling to be terminated is described in earlier messages.

WTOR message RUNL12W is displayed, enabling the user to continue without the Journal facility or to shut down the Control-M monitor.

**Corrective Action:** Respond to message CTML12W.

RUNL12W REPLY ‘C’ CONTINUE WITHOUT JOURNALING, ‘I’ INITIALIZE, OR ‘E’ END

**Explanation:** This WTOR message is displayed when the Control-M Journaling facility is shut down.

This message may be preceded by messages explaining the reason for Journaling facility shutdown. This message also appears after running the restoration utility successfully to provide an opportunity to reset the journal file. The user can run the restoration utility repeatedly (perhaps to different end times) before initializing the journal file.

Responses to this WTOR message allow the user to continue Control-M without journaling, or to shut down Control-M so that a problem can be fixed.

The Control-M monitor waits for a reply to this message.

**Corrective Action:** See preceding messages for information describing why journaling was stopped.

Specify one of the following values as a response to this message:
C - Continue normal execution without updating the Journal file. Restoration of the Active Jobs file will not include updates made after Journaling was stopped.

I - Re-initialize the journal file. The Control-M monitor continues normal processing, including journaling.

E - Stop execution of the Control-M monitor.

**RUNL13I** CONTROL-M MONITOR CONTINUING WITHOUT JOURNALING

**Explanation:** This information message is issued when the user specified C in response to WTOR message CTML12W.

The Control-M monitor continues normal execution. The Journal file is no longer updated.

**Corrective Action:** No action is required.

**RUNL16E** COMMAND IGNORED - CURRENT fileName STATUS: fileStatus

**Explanation:** The user attempted to enable/disable the Control-M Journal or History allocation for space reuse functions. However, the current fileStatus status of this facility already complies with the user request.

The command is ignored.

**Corrective Action:** No action is required.

**RUNL17I** CURRENT ACTIVE JOBS FILE UTILIZATION: nn%

**Explanation:** This information message is issued in conjunction with message CTM863W, which indicates that the Active Jobs file (AJF) is nearly full. Both messages are issued when the threshold value specified by the AJFTHRSH CTMPARM parameter is reached.

**Corrective Action:** Increase the size of the AJF using the CTMCJF utility.

**RUNL18I** COMMAND RECEIVED: cmd RUNL18I

**Explanation:** This information message displays the MODIFY command (cmd) entered for the Control-M monitor.

**Corrective Action:** No action is required

**RUNL19I** QUIESTIME IS SET: yyyy

**Explanation:** This information message displays the current value of QUIESTIME (the Control-M monitor planned shutdown time), where yyyy is one of the following values:

- hhmm - the planned shutdown time set by the QUIESTIME command
- NOW - the submission of any job has been stopped
- OFF - all QUIESTIME requests have been cancelled

This message is added to the System Log.

**Corrective Action:** No action is required.
SAR (CA-View) messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages SARM00 through SARMxx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**SARM40E {CA-View | CA-DISPATCH} CONVERSION - TAPE I/O ERROR text**
(78 chars max)

**Explanation:** An I/O error occurred while the report was being read from the archive tape.

Creation of the CDAM report file is halted.

**Corrective Action:** Analyze the message to determine the reasons for the I/O error. If possible, use external means for recovery. If recovery is completed successfully, run the restore job again.

**SARM41E {CA-View | CA-DISPATCH} CONVERSION - REPORT NOT FOUND reportName, JOB: jobName (job_num), DATE: date, TIME: time**

**Explanation:** The requested report could not be located in the tape.

The CA-VIEW (SAR) archive directory indicates that the report resides on a specific tape, but the report could not be located on that tape.

The request for the report is denied.

**Corrective Action:** Investigate the CA-VIEW (SAR) archive for potential corruption, or locate the report on other tapes.

**SARM42E {CA-View | CA-DISPATCH} CONVERSION - COULD NOT OPEN TAPE WITH FILE dsn**

**Explanation:** The report restore program could not open the tape that hold the archive reports.

The CA-VIEW (SAR) archive directory indicates that the report resides on a specific tape, but the report could not be located on that tape.

The request to restore the report is denied.

**Corrective Action:** Investigate the CA-VIEW (SAR) archive for potential corruption, verify that the tape is not damaged, or locate the report on other tapes.

**SARM43E {CA-View | CA-DISPATCH} CONVERSION - COULD NOT CREATE CDAM DATASET**

**Explanation:** The restore report could not be written to the CDAM subsystem.

An error occurred while the report was being restored to a CDAM file.
The request to restore the report is terminated.

**Corrective Action:** Check the CDAM subsystem and its allocation parameters to ensure that the CDAM subsystem can accept new files.

**SARM44E \{CA-View | CA-DISPATCH\} CONVERSION - CDAM FILE \textit{dsn} CREATED**

**Explanation:** This information message indicates that a CDAM file was successfully created to satisfy the restore request.

The restored report is ready for insertion in the Active User Reports file.

**Note:** Although the message code ends with E, this message does not indicate that an error occurred.

**Corrective Action:** No action is required.

**SARM45E INFOPAC CONVERSION - REPORT NOT FOUND \textit{reportName}, FILE: \textit{dsn}**

**Explanation:** The report that was requested cannot be located on the tape.

The RESTORE request for the report is rejected.

**Corrective Action:** Do the following:
1. Check if the correct INFOPAC archive volume was mounted.
2. If the correct tape was mounted, examine the tape for possible corruption.

**SCD messages**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**Messages SCD200 through SCD2xx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**SCD201I CONTROL-D SCHEDULER STARTED**

**Explanation:** This information message indicates that the Control-D monitor internal scheduler task started.

Normal message when Control-D monitor is started.

**Corrective Action:** No action is required.

**SCD202S INSUFFICIENT MEMORY FOR CONTROL-D MONITOR**

**Explanation:** Insufficient memory for the initiation of Control-D monitor.
Control-D monitor will shut down.

**Corrective Action:** Increase the Control-D monitor region size.

**SCD203I** ELIGIBLE FOR PROCESSING

**Explanation:** This information message indicates that the mission has been given permission to run.

All the runtime conditions for mission execution have been met, and all the resources have been acquired for the mission. The mission will soon be executed by Control-D.

**Corrective Action:** No action is required.

**SCD204E** OUTPUT CONDITION condname_date NOT ADDED/DELETED - SECURITY VIOLATION

**Explanation:** User is not authorized to add or delete the condition condname_date to or from the conditions file. The date is in mddd format.

The mission definition contains an OUT statement or a DO COND statement (or both) for the referenced condition. The condition was not added or deleted because the user ID of the mission is not authorized to add or delete the condition.

Output condition is not added or deleted, but processing continues.

**Corrective Action:** Consult your INCONTROL administrator.

**SCD208I** PROCESSING ENDED "OK"

**Explanation:** This information message indicates that the mission finished executing OK.

Control-D determined that the mission ended OK because other events were marked OK in the mission’s parameters, and no other event was either unexplained or marked NOTOK.

**Corrective Action:** No action is required.

**SCD218I** RECYCLED FOR POSSIBLE REPROCESSING

**Explanation:** This information message indicates that the cyclic task was recycled for possible execution.

If all runtime conditions are met, the mission will be immediately eligible.

**Corrective Action:** No action is required.

**SCD219I** PROCESSING ENDED "NOT OK"

**Explanation:** This information message indicates that the Control-D monitor determined that the mission ended NOTOK.

The general Control-D message when a mission finishes executing NOTOK. The IOA Log should contain prior messages detailing the reasons.

**Corrective Action:** No action is required.
SCD220I  missionType missionName WILL BE REPROCESSED

Explanation: This information message is issued because a manual request to rerun a mission was accepted.

The mission will be placed in WAIT SCHEDULE state again. If all runtime conditions are met, the mission will be started immediately.

Corrective Action: No action is required.

SCD229S OPEN FAILED FOR DDNAME "DARES"

Explanation: Open of a debugging output file failed (the DARES DD statement).

This is probably because the DARES DD statement is missing in the Control-D procedure.

The Control-D monitor will shut down with error message.

Corrective Action: Correct the JCL for the Control-D monitor procedure and start it again.

SCD230S OPEN FAILED FOR DDNAME "DARESC" OR "DASINC"

Explanation: Open of IOA Conditions file failed (the DARESC or DASINC DD statement).

Possible causes are:

- The DARESC DD statement is missing.
- The DASINC DD statement is missing.
- The data set described by the DARESC DD statement is not the IOA Conditions file.
- The data set described by the DASINC DD statement is not the IOA Conditions synchronization file.
- The data set described by the DARESC DD statement is the IOA Conditions file, but it is of a different version or of a different Control-D monitor.

Control-D monitor shuts down with error message.

Corrective Action: Correct the JCL for the Control-D procedure, and start the procedure again.

SCD231E REP Q23AREP1 MISSION IS NOT PROCESSED BECAUSE OF CONDITION ERROR

Explanation: The mission was not processed because an error which was detected for an IN condition. See the corresponding error message in Screen 5. The status of this condition is unknown and this mission is not processed, but processing continues.

Corrective Action: Consult your INCONTROL administrator.

SCD241W OUTPUT CONDITION cond_date NOT UPDATED - NO MORE SPACE. NOTIFY THE IOA ADMINISTRATOR

Explanation: Highlighted, unrollable message.

No more space to add output conditions to the conditions file. The date is in mmdd format.
The record for that specific day of the month is full. For example, if a condition with date reference of January 3rd cannot be added, an entry in the Conditions file that contains conditions for January 3rd, February 3rd, March 3rd, and so on, is full.

The condition is not added, and a highlighted message is displayed on the operator console. Control-D continues to function, but missions that depend on the condition are not submitted.

**Corrective Action:** Immediate action:

- Enter Control-D Online Facility Resource Map (screen 4). By changing the date range limit, look for conditions with the same day (but of a different month) as the condition that could not be added, and delete them manually - providing that they are not needed.
- Add the failing condition manually in order to maintain production flow.
- Report the event to your system programmer.

Long term action:

1. You should run the IOACLCOND Control-M utility more often.
2. You may want to increase the record length of the IOA Conditions file. For more information on how to do this, see the section on expanding IOA files in the INCONTROL for z/OS Administrator Guide.

**SCD249I SHUT DOWN UPON REQUEST OF MAIN TASK**

**Explanation:** This information message announces the shutdown of the Control-D monitor.

Shutdown of Control-D internal selector task by request of Control-D main task.

The Control-D monitor will shut down.

**Corrective Action:** No action is required.

**Messages SCDA00 through SCDAxx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**SCDA95E VALUE OF CNDREC# PARAMETER IN IOAPARM IS NOT EQUAL TO ACTUAL FILE SIZE**

**Explanation:** The CNDREC# parameter in IOAPARM has been changed but the IOA Conditions file has not been rebuilt.

A difference was detected between the length of the IOA Conditions file and the length specified in the IOAPARM member of the PARM library.

This is usually due to using the IOAPARM member (read from the IOA Load library) for the wrong monitor.

The monitor shuts down.

**Corrective Action:** To correct this situation, do one of the following:
Rebuild the IOA Conditions file, so that its length is as specified in IOAPARM.

Modify the CNDREC# parameter in IOAPARM so that its length is the length of the existing IOA Conditions file.

After correcting the problem, restart the monitor.

SEL messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages SEL100 through SEL1xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

SEL15CI memName... THE MEMBER HAS BEEN COPIED INTO OVERLIB lib

Explanation: The memName member has been copied from the MEMLIB library into the OVERLIB library, because the COPMEM20 installation parameter was set to Y.

Corrective Action: No action is required.

SEL15CW memName... THE MEMBER HAS NOT BEEN COPIED INTO OVERLIB. REASON: rc-rsn. LIBRARY: lib

Explanation: Although the COPMEM20 Control-M installation parameter was set to Y, Control-M failed to copy the memName member into the OVERLIB library.

The variables in this message are:

- memName - the name of the member that was not copied
- rc - the return code from the IOAMEM program
- rsn - the reason code from the IOAMEM program
- lib - the name of the OVERLIB library

For explanation of the values of rc and rsn, see the description of the IOAMEM Assembler Macro in the INCONTROL for z/OS Administrator Guide.

Corrective Action: Take corrective action on the basis of the values of rc and rsn.

SEL15DI memName... THE MEMBER HAS BEEN DELETED FROM OVERLIB lib

Explanation: The memName member has been deleted from the lib OVERLIB library, because either the DELOVER or the DELOVRUN Control-M installation parameter was set to Y.

Corrective Action: No action is required.
SEL15DW  *memName*... THE MEMBER HAS NOT BEEN DELETED FROM OVERLIB. REASON: *rc-rsn.* LIBRARY: *lib*

**Explanation:** Although either the DELOVRER or the DELOVRUN Control-M installation parameter was set to Y, Control-M failed to delete the *memName* member from the OVERLIB library.

The variables in this message are:

- *memName* - the name of the member that was not deleted
- *rc* - the return code from the IOAMEM program
- *rsn* - the reason code from the IOAMEM program
- *lib* - the name of the OVERLIB library

For explanation of the values of rc and rsn, see the description of the IOAMEM Assembler Macro in the *INCONTROL for z/OS Administrator Guide*.

**Corrective Action:** Take corrective action on the basis of the values of rc and rsn.

Messages SEL200 through SEL2xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**SEL201I** SELECTOR STARTED

**Explanation:** This information message is issued when Control-M is started and indicates that the Control-M monitor internal selector task has started.

**Corrective Action:** No action is required.

**SEL202S** INSUFFICIENT MEMORY FOR CONTROL-M MONITOR

**Explanation:** Highlighted, unrollable message.

Insufficient memory for the initiation of Control-M monitor.

Control-M monitor will shut down.

**Corrective Action:** Increase the Control-M monitor region size.

**SEL203I** *taskType memName jobName/jobId OID=orderId* ELIGIBLE FOR RUN

**Explanation:** This information message indicates that the job/started task has been given permission to run.

All the runtime conditions for job submission have been met, and all the resources have been acquired for the job. The job will soon be submitted by Control-M.

**Corrective Action:** No action is required.
SEL204E taskType memName jobName /jobId OID=orderId OUTPUT CONDITION condNameDate NOT ADDED/DELETED - SECURITY VIOLATION

Explanation: User is not authorized to add/delete the condition condNameDate to/from the conditions file. The date is in mmdd format.

The job definition contains OUT statements or ON STEP/DO COND statements (or both) for the referenced condition. The condition was not added/deleted because the user ID of the job order is not authorized to add or delete the condition.

Output condition is not added/deleted, but processing continues.

Corrective Action: Consult your INCONTROL administrator.

SEL205I OID=orderId RERUN IN PROCESS USING MEMBER memName

Explanation: This information message indicates that a DO RERUN instruction has been activated.

An event which requires a rerun has been triggered. Control-M will place the job again in wait schedule state. If all the runtime conditions are met the job will be submitted immediately.

Corrective Action: No action is required.

SEL206W taskType memName jobName /jobId OID=orderId ABENDED CC abCode STEP pgmStep /procStep

Explanation: The job abended with abend code abCode in step pgmStep/procStep.

Corrective Action: No action is required.

SEL207E taskType memName jobName /jobId OID=orderId NOT SUBMITTED. REASON rsn

Explanation: Submission of job failed for the reason identified in the message.

Valid values for rsn are:

<table>
<thead>
<tr>
<th>rsn</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>CANCL</td>
<td>Submission cancelled by user exit or by the AutoEdit Facility.</td>
</tr>
<tr>
<td>ERAJF</td>
<td>Error while reading the jobs dsn list from the AJF.</td>
</tr>
<tr>
<td>GETER</td>
<td>Error while reading the job from the JCL library.</td>
</tr>
<tr>
<td>INUSE</td>
<td>The JCL library is allocated exclusively to another task (DISP=OLD). The Control-M monitor tries to repeat the processing according to the INUSE#WI and INUSE#RT parameters. For information about these parameters, see the INCONTROL for z/OS Installation Guide.</td>
</tr>
<tr>
<td>rsn</td>
<td>Explanation</td>
</tr>
<tr>
<td>-------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td>NOARC</td>
<td>Restart was requested, but the archived sysout of the job could not be accessed.</td>
</tr>
<tr>
<td>NOJOB</td>
<td>A job statement was not found in the member.</td>
</tr>
<tr>
<td>NLIB</td>
<td>Problem with access to the JCL library.</td>
</tr>
<tr>
<td>NOMEM</td>
<td>Member not found in the library.</td>
</tr>
<tr>
<td>WRITE</td>
<td>Write error while writing a line to the JES internal reader.</td>
</tr>
</tbody>
</table>

Look for more details in the previous log messages of this job.

**Corrective Action:** No action is required.

SEL208I  taskType memName jobName/jobId OID=orderId ENDED "OK"
RUN-NO=<run number>

**Explanation:** This information message indicates that a job finished executing OK. The Control-M run number is incremented each time a cyclic task is executed or a job is rerun.

The job ended successfully in one of the following ways:

- The job ended with a condition code from 00 through 04, which is the Control-M default for ended OK.
- Other events were marked OK in the production parameters and no event was unexplained or marked NOTOK.
- If `text` is FORCED OK, the job was terminated upon request and therefore marked as ended OK.
- If `text` is CLEANUP, the run was a Control-M/Restart Cleanup run.
- If `text` is (DUMMY JOB), the job that was run was a Control-M dummy job.

For more information, see the Control-M for z/OS User Guide.

**Corrective Action:** No action is required.

SEL209E  taskType memName jobName/jobId OID=orderId SYSOUT DI SAPPEARED

**Explanation:** The job sysout disappeared. The Control-M monitor could not check the sysout to analyze job execution results.

Possible causes are:
Someone purged the output of the job before the Control-M monitor was able to read it.

Someone released the job from Held status and the job was printed before the Control-M monitor was able to read it.

In the case of a started task, if the JES parameters signify that the STCMCLAS is not to be printed, then sysouts of STCs will always disappear.

The job finishes executing NOTOK, and the code JLOST is used to describe the event.

**Corrective Action:** Check the exact reason for the disappearance of the job and try to prevent it from happening again. See a description of sending a job to a held output class in the *INCONTROL for z/OS Installation Guide*, and sending a job SYSDATA to a held output class in the *INCONTROL for z/OS Administrator Guide* for additional considerations regarding the Control-M held class.

**SEL20AE** ERROR IN CTMPPE RC=rc, INFORM YOUR IOA ADMINISTRATOR

**Explanation:** An internal error was detected in MAINVIEW Batch Optimizer (MVBO) support.

Control-M ends with an error and shuts down.

**Corrective Action:** Perform the following steps:

1. Activate debug level 75.
2. Restart the Control-M monitor.
3. Recreate the error.
4. Send full output of the Control-M monitor to your INCONTROL Administrator.

**SEL20BE** OID=orderId, MAXIMUM PIPES IN COLLECTION EXCEEDED (255), PIPES IGNORED

**Explanation:** Too many pipes were specified for the collection or the job added too many pipe definitions to the collection.

This message is issued by Control-M. This message may occur if:

- The job definition includes more than 255 pipe definitions.
- The collection contains the maximum number of pipes and the job tries to add additional pipe definitions.

The pipe definitions in the job (and in other jobs belonging to the same collection) will be ignored.

**Corrective Action:** Ensure that no more than 255 pipes are defined in the collection.

**SEL20CI** taskType memName jobName/ jobId OID= orderId FOLLOWING IGNORED DUE TO BYPASS REQUEST: list-of-definitions-that-will-be-ignored

**Explanation:** This information message indicates that the Control-M monitor has accepted a request to bypass some selection criteria and/or post-processing actions.

**Corrective Action:** No action is required.
**SEL210E**  
*taskType memName jobName/jobId OID=orderId NOT RUN- J CL ERROR*  

**Explanation:** Job not run because of a JCL error.  
The job failed on JCL before execution.  
The code JNRUN is used to describe the event.  
**Corrective Action:** Correct the JCL for the job and rerun it.

**SEL211W**  
*taskType memName jobName/jobId OID=orderId FAILED- J CL ERROR IN STEP pgmStep/procStep*  

**Explanation:** Job failed on JCL error during execution in step pgmStep/procStep.  
The code JFAIL is used to describe the event.  
**Corrective Action:** Correct the reason for the failure and rerun the job if necessary.

**SEL212W**  
*taskType memName jobName/jobId OID=orderId UNEXPLAINED COND CODE: code*  

**Explanation:** Job failed because of unexplained condition code in one of the job's steps.  
Job ended with a condition code of code greater than 04 which is not referred to in the CODES parameter as OK.  
**Corrective Action:** No action is required.

**SEL213W**  
*taskType memName jobName/jobId OID=orderId FAILED REASON UNKNOWN. CC problem_code STEP pgmStep/procStep*  

**Explanation:** Job failed with problem code problem_code in step pgmStep/procStep for an unknown reason.  
The code *UKNW is used to describe this event.  
**Corrective Action:** If this message is issued for all jobs, ensure that the OUT180 DD statement is still in the Control-M monitor procedure.

**SEL214I**  
*OID=orderId RERUN NEEDED*  

**Explanation:** This information message indicates that a DO RERUN instruction has been activated.  
Control-M detected an event which requires a rerun. The rerun attempt will be performed according to Control-M production parameters: RERUNMEM, MAXRERUN and INTERVAL.  
**Corrective Action:** No action is required.

**SEL215W**  
*OID=orderId NO (MORE) RERUNS*  

**Explanation:** The number of reruns specified in the MAXRERUN parameter has been exhausted.  
An automatic rerun will not be performed. You can still rerun the job manually.
Corrective Action: No action is required.

SEL216W taskType memName jobName/jobId OID=orderId UNEXPLAINED COND CODE condCode STEP pgmStep/procStep

Explanation: An unexplained condition code (condCode) has been returned in relation to the pgmStep/procStep step.

The job ended with a condition code (condCode) that was greater than 04, and the condition code and pgmStep/procStep are not referred to in the CODES parameters of the job production data as OK.

Corrective Action: No action is required.

SEL217W taskType memName jobName/jobId OID=orderId FAILED- JCL ERROR (AFTER UNEXPECTED COND CODE: code)

Explanation: Job failed on JCL error during execution, while a previous step ended with a “bad” condition code.

This usually represents a situation where a file which should have been created in the previous step is not found (meaning that a JCL error has occurred), because the previous step failed (bad cc).

The code JFAIL is used to describe the event.

Corrective Action: No action is required.

SEL218I taskType memName jobName/jobId OID=orderId RECYCLED FOR POSSIBLE EXECUTION text

Explanation: This information message indicates that the cyclic task was recycled for possible execution. If all runtime conditions are met, the job/STC will be submitted/starred immediately.

This is the general Control-M message when a cyclic task is recycled for possible execution.

If text is AFTER CLEANUP, the run was a Control-M/Restart Cleanup run.

Corrective Action: No action is required.

SEL219I taskType memName jobName/jobId OID=orderId ENDED "NOT OK" RUN-NO=<run number>

Explanation: This information message indicates that the Control-M monitor determined that the job ended NOTOK.

This is the general Control-M message when a job finishes executing NOTOK. The IOA Log file should contain prior messages detailing the reasons. The Control-M run number is incremented each time a cyclic task is executed or a job is rerun.

The job ended unsuccessfully in one of the following ways:
The job ended with a condition code greater than 04 which is the Control-M default for ended NOTOK.

Other events were marked NOTOK in the production parameters or some event was unexplained and marked NOTOK.

If `text` is FORCED OK, the job was terminated upon request and therefore marked as ended OK.

If `text` is CLEANUP, the run was a Control-M/Restart Cleanup run.

See the Control-M for z/OS User Guide for more information.

**Corrective Action:** No action is required.

SEL220I taskType memName jobName/jobId OID=orderId WILL BE RERUN

**Explanation:** This information message is issued because a manual request to rerun a job/STC was accepted.

The job/STC will be placed in WAIT SCHEDULE state again. If all runtime conditions are met, the job/STC will be submitted/started immediately.

**Corrective Action:** No action is required.

SEL221I OUTPUT CONDITION cond WAS func BY THE ON CONTROL-M CMEM FACILITY

**Explanation:** This information message indicates that the Control-M On Spool Jobs Facility added or deleted a prerequisite condition.

**Corrective Action:** No action is required.

SEL223I OID=orderId JOB jobName MAXRERUN LIMIT REACHED

**Explanation:** This information message indicates that the last run of a cyclic job ended. Control-M resubmits each cyclic job for execution until it has run the number of times defined by MAXRERUN in the job definition.

**Corrective Action:** No action is required.

SEL224I CYCLING STOPPED BY "DO STOPCYCL" STATEMENT

**Explanation:** This information message indicates that a cycling of a cyclic task, cyclic job, or cyclic Started task, stopped as a result of the execution of a DO STOPCYCL statement.

**Corrective Action:** To reactivate the cycling, rerun or restarting the cyclic task.

SEL225I taskType memName jobName/jobId OID=orderId DO FORCEJOB table/job ALREADY PERFORMED

**Explanation:** This information message indicates that Control-M did not execute the DO FORCEJOB request even though the corresponding ON PGMST condition was satisfied. This happens when a job is RESTARTed, the corresponding DO FORCEJOB was already performed during original job run (or one of following RESTARTs) and the Control-M/Restart installation parameter FORCONCE is specified as Y (Yes).
Corrective Action: No action is required.

SEL229S OPEN FAILED FOR DDNAME "DARES"

Explanation: Open of a debugging output file failed (the DARES DD statement).
This is probably because the DARES DD statement is missing in the Control-M procedure.
Control-M monitor will shut down with error message.
Corrective Action: Correct the JCL for the Control-M monitor procedure and start it again.

SEL230S OPEN FAILED FOR DDNAME "DARESF"

Explanation: Open of Control-M Resources file failed (the DARESF DD statement).
Possible causes are:
- The DARESF DD statement is missing.
- The data set described by the DARESF DD statement is not the Control-M Resources file.
- The data set described by the DARESF DD statement is the Control-M Resources file of a different version or a different Control-M monitor.
Control-M monitor shuts down.
Corrective Action: Correct the JCL for the Control-M procedure, and start it again.

SEL241W taskType memName jobName /jobId OID=orderId OUTPUT CONDITION condNameDate NOT UPDATED - NO MORE SPACE. NOTIFY THE IOA ADMINISTRATOR

Explanation: Highlighted, unrollable message.

No more space to add output conditions to the conditions file. The date is in mmdd format.
The record for the specified day of the month is full. For example, if a condition with date reference of January 3 cannot be added, then an entry in the conditions file that contains conditions for the third day of every month is full.
The condition is not added, and a highlighted message is displayed on the operator console. Control-M continues to function, but the jobs that depend on the condition are not submitted.
Corrective Action: Immediate actions:
1. Enter the Control-M Online Facility Resource Map (screen 4). By changing the date range limit, find conditions with the same day (but a different month) as the condition that could not be added, and manually delete those that are not needed.
2. Add the failing condition manually, to maintain production flow.
3. Report the event to your system programmer.

Long term actions:
4. Run the IOALCND Control-M utility more often.
5. Increase the record length of the IOA Conditions file. For more information on how to do this, see the description of expanding IOA files in the INCONTROL for z/OS Administrator Guide.
SEL244S OPEN OF DD NAME "DAALTRES" AND/OR "DAALTSNC" FAILED. DUAL RESOURCE FILE IS NOT AVAILABLE.

Explanation: Open of IOA alternate (dual) Conditions file (the DAALTCND DD statement) failed.
Possible causes are:
- The DAALTCND DD statement is missing.
- The DAALTSNC DD statement is missing.
- The data set described by the DAALTCND DD statement is not an IOA Conditions file.
This message will be produced only if Control-M is working in dual file mode (indicated in IOAPARM).
The Control-M monitor will shut down with an error message.
Corrective Action: Correct the JCL for the Control-M procedure, and start it again. If you do not wish to run in dual file mode, correct the Control-M Installation Parameters (IOAPARM).

SEL249I SHUT DOWN UPON REQUEST OF MAIN TASK

Explanation: This information message announces the shut down of the Control-M monitor.
Shut down of Control-M internal selector task by request of Control-M main task.
The Control-M monitor will shut down.
Corrective Action: No action is required.

SEL250I CONDITION cond {DELETED | ADDED}: RUNNUMBER=num

Explanation: This information message indicates that a condition has been added or deleted by Control-M as the result of job processing options.
This message is issued at sites where the MSEL250I parameter is set to Y. For more information, see the section on customizing Control-M in the INCONTROL for z/OS Installation Guide.
The variables in this message are:
- cond - the condition that was added or deleted
- num - the run number
The program adds or deletes the cond condition.
Corrective Action: No action is required.

SEL251S ENQ FAILED FOR FILE DARESF

Explanation: ENQ of the Control-M Resources file failed. The file is probably enqueued by another process that is not releasing it.
The Control-M monitor does not start or stop running.
Corrective Action: Cancel the address space of the process that is not releasing the Control-M Resources file. Control-M must access this file.
INCONTROL for z/OS Messages Manual

SEL252S INIT FAILED FOR FILE DARESF

Explanation: The Control-M monitor failed to initialize the Control-M Resources file. The reason appears in the accompanying message.

The Control-M monitor does not start.

Corrective Action: Use the information in the accompanying message to correct the cause of the failure.

SEL253I OID=orderId JOB IS HOLDING num UNITS OF RESOURCE quantResource

Explanation: This information message indicates that a job got control of the specified number (num) of quantResource Quantitative resources.

When a job is ready to run, the system gives it the resources it requested.

The variables in this message are:
- orderId - the order ID of the job
- num - the specified number of units
- quantResource - the name of the Quantitative resource

The system reduces the number of available units of this resource until the job finishes and the resources become available again.

Corrective Action: No action is required.

SEL254I OID=orderId JOB RELEASED num UNITS OF quantResource

Explanation: This information message indicates that a job released the specified quantity (num) of quantResource Quantitative resources.

When a job finishes, it releases the resources it used.

The variables in this message are:
- orderId - the order ID of the job
- num - the specified number of units
- quantResource - the name of the Quantitative resource

The system returns the resources the job used to the list of available resources.

Corrective Action: No action is required.

SEL255I OID=orderId JOB ACQUIRED CONTROL contResource MODE {E | S}

Explanation: This information message indicates that a job got control of the contResource Control resource in the specified mode (Exclusive or Shared).

The variables in this message are:
SEL256I OID=orderId JOB RELEASED CONTROL contResource MODE {E | S}

Explanation: This information message indicates that a job released the contResource Control resource that was held in the specified mode (Exclusive or Shared).

When a job finishes, it releases the resources it used.

The variables in this message are:
- orderId - the order ID of the job
- contResource - the name of the Control resource

Corrective Action: No action is required.

SEL259I JOB DECREASED num UNITS FROM RESOURCE resourceName DEFINITION

Explanation: This information message indicates that the job ENDED OK, and according to its definition, Control-M decreased the value of the resourceName quantitative resource by num units.

Corrective Action: No action is required.

SEL286I OID=orderId WAITING FOR CONFIRMATION

Explanation: This information message indicates the job is eligible to be run by Control-M, but the job is waiting for manual restart decision confirmation.

The job has a status of WAIT CONFIRMATION. For the job to run, the user must confirm that this job can be restarted. For information about the CONFIRM command, see the Control-M for z/OS User Guide.

Corrective Action: No action is required.

SEL28TE CNDJNL FILE SIZE DOES NOT MATCH CND FILE SIZE -- JOURNALING DISABLED

Explanation: The size of the IOA Conditions base image file differs from the size of the production Conditions file.

The IOA Conditions base image file CNDJNL is created after New Day processing and is used by the CTMRSTR restore utility. The size of this file must be identical to that of the production Conditions file.

The Control-M monitor deallocates the file and waits for instructions as described in message CTML12W.

Corrective Action: Reply C, I, or E to message CTML12W.
SEL28UE RESJ NL FILE SIZE DOES NOT MATCH RES FILE SIZE -- JOURNALING DISABLED

**Explanation:** The size of the Control-M Resource file base image file differs from the size of the production Resource file.

The Control-M Resource file RESJ NL is created after New Day processing and is used by the CTMRSTR restore utility. The size of this file must be identical to that of the production Resource file.

The Control-M monitor deallocates the file and waits for instructions as described in message CTML12W.

**Corrective Action:** Reply C, I, or E to message CTML12W.

SEL28VE FILE `fileName` DEALLOCATED. RESIZE FILE AND USE JOURNAL=ENABLE COMMAND TO REALLOCATE

**Explanation:** This message accompanies message CTM921E, CTM287E, or CTM288E and indicates that the problematic base image file has been deallocated.

**Corrective Action:** Define a file of correct size matching the corresponding production file and use the ENABLE command to allocate the new file to the Control-M monitor.

Messages SELC00 through SELCxx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

SELC60I QUANTITATIVE RESOURCE `resourceName` action

**Explanation:** This information message displays the results of a DO RESOURCE action in a Control-O rule. The quantitative resource has been added, deleted, or changed in the Control-M Resources file.

**Corrective Action:** No action is required.

SELC61I QUANTITY OF RESOURCE `resourceName` CHANGED `old_qty` ==> `{+ | -} delta_qty`

**Explanation:** This information message displays the results of a Control-O DO RESOURCE request. The quantity of resource is increased (+) or decreased (-) from `old_qty` by the amount in `delta_qty`. If no sign is indicated, the quantity has been set to the amount specified in `delta_qty`.

The variables in this message are:
- `resourceName` - the name of the resource
- `old_qty` - the original quantity
- `delta_qty` - the amount increased or decreased

**Corrective Action:** No action is required.
SELC62E QUANTITATIVE RESOURCE resourceName TO BE CHANGED DOESN'T EXIST

Explanation: The quantitative resource resourceName which was specified in a Control-O DO RESOURCE action does not exist in the Control-M Resources file.

Someone may have deleted the quantitative resource from the Control-M Resources file or it may never have been added.

Corrective Action: Scan the IOA Log to see why the resource may have been deleted. Check that the syntax of the resource in the Control-O DO RESOURCE action is correct.

SELC63E CANNOT ADD QUANTITATIVE RESOURCE resourceName. FILE IS FULL

Explanation: The quantitative resource resourceName specified in a Control-O DO RESOURCE action, cannot be added to the Control-M Resources file because the file is full.

The quantitative resource is not added to the file.

Corrective Action: Contact your systems programmer about the possibility of increasing the capacity of the Control-M Resources file.

SELC64E QUANTITATIVE RESOURCE res NOT action - SECURITY VIOLATION

Explanation: The Control-O resource action that was requested (add/change) was not performed due to security restrictions at the site.

The resource action is not performed.

Corrective Action: If you think the user that owns the rule should be authorized to issue resource requests, please contact your INCONTROL administrator. You may need to adapt your Control-M security criteria.

SELC65I OUTPUT CONDITION cond WAS action BY CONTROL-O

Explanation: The information message displays the results of a Control-O DO COND action.

The Control-M monitor adds/deletes the prerequisite condition.

Corrective Action: No action is required.

SELC66E OUTPUT CONDITION condition/date NOT action - SECURITY VIOLATION

Explanation: Control-O issued a DO COND request, but the Prerequisite Condition was not added/deleted.

User is not authorized to add/delete this condition from the IOA Conditions file.

Corrective Action: If you think the user that owns the rule should have the authority to perform DO COND actions, contact your INCONTROL administrator. You may need to adapt your Control-M security criteria.
INCONTROL for z/OS Messages Manual

SELC68E VALUE OF CNDREC# PARAMETER IN IOAPARM IS NOT EQUAL TO ACTUAL FILE SIZE

**Explanation:** The CNDREC# parameter in the IOAPARM member has been changed, but the IOA Conditions file has not been rebuilt.

A difference between the length of the IOA Conditions file and the CNDREC# value specified in the IOAPARM member of the PARM library was detected.

This is usually caused by using the IOAPARM member (read from the IOA Load library) for the wrong monitor.

The Control-M monitor shuts down.

**Corrective Action:** Correct the problem and restart the monitor.

SELC69E UPDATE OF QUANTITATIVE RESOURCE resourceName FAILED

**Explanation:** The action specified in a CONTRO-O DO RESOURCE statement failed, because it would have produced an illegal quantity.

Updating the resource would have produced either a negative quantity or a quantity greater than the maximum of 9999. Therefore it was rejected.

The system ignores the illegal statement and continues processing.

**Corrective Action:** Check and correct, if necessary, the definition of the quantitative resource to be updated and/or the rule defining how to update it.

SELC6AW QUANTITATIVE RESOURCE resourceName NOT CHANGED BECAUSE IT'S ALREADY HANDLED BY CONTROL-M

**Explanation:** DO RESOURCE statement in Control-M/Operator Rule was ignored by Control-M Monitor because the corresponding Rule was triggered by the message issued from a job submitted by Control-M and the Quantitative Resource (whose name specified in DO RESOURCE) is already allocated to the job by Control-M.

**Corrective Action:** No action is required.

SELC95I taskType memName jobName/jobId OID=orderId WILL BE REACTIVATED

**Explanation:** This information message indicates that as a result of a user request, the job or STC is reactivated, and the Control-M monitor searches again for the sysout of the job or STC.

When option A (Reactivate) is specified for a job or STC in the Active Environment screen, the status of that job or STC changes from DISAPPEARED to SUBMITTED, and the Control-M monitor searches again for the sysout of the job to analyze job execution results.

**Corrective Action:** No action is required.

SELC96I OID=orderId WILL RETRY SUBMIT LATER

**Explanation:** This information message indicates that submission of the job could not be completed because of a temporary problem (for example, data set in use).
This information message accompanies other messages which identify the reason for the submission failure.

Control-M will retry submission later, for a maximum of three attempts. After three attempts to submit the job, the submission is cancelled.

Corrective Action: Check previous error messages. Correct the error and rerun the job.

Messages SELL00 through SELLxx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

SELL31E NO SPACE FOR QUANTITATIVE RESOURCE resourceName.
NOTIFY YOUR IOA ADMINISTRATOR

Explanation: A resource (resourceName) could not be acquired because the Quantitative Resource List is full.

Resource acquisition is delayed until enough space is regained in the Quantitative Resource List in the Control-M Resources file. This message is not issued more often than once a minute.

Corrective Action: Ask your INCONTROL administrator to increase the logical record length of the Control-M Resources file. If the logical record length is already set to the maximum length allowed, wait until previously acquired quantitative resource entries are freed when jobs end. A third alternative is to have the INCONTROL administrator make more room available by deleting unused quantitative resource definitions.

SHB messages

This group includes messages for the IOA (infrastructure) product.

Messages SHB200 through SHB2xx

This group includes messages for the IOA (infrastructure) product.

SHB282I text (userId)

Explanation: Highlighted, unrollable message.

This information message is activated by the SHOUT facility.

In this message, userId is the user ID of the job order requesting the SHOUT.

Corrective Action: No action is required.

SHB284I NEW DYNAMIC DESTINATION TABLE LOADED

Explanation: This information message indicates that a new Dynamic Destination Table has been loaded by the IOA Runtime environment. This message is also generated when the SHOUT Facility is initialized under the IOA Runtime environment.
Corrective Action: No action is required.

**SHB285W DYNAMIC DESTINATION TABLE NOT LOADED**

**Explanation:** Loading of the Dynamic Destination Table by the IOA Runtime Environment failed. This could be due to one of the following causes:

- There is insufficient memory for loading the table.
- The IOADEST table does not exist in the IOA PARM library.

If the failure occurs during the initialization of the IOA Runtime Environment, SHOUT notifications will not be controlled by the Dynamic Destination Table.

**Corrective Action:** Check the MVS Log for the reason for the failure (probably a system abend code). Correct the problem and then run the job again.

**SHD messages**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**Messages SHD200 through SHD2xx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**SHD282I text (usr).**

**Explanation:** Highlighted, unrollable message.

This information message is activated by the SHOUT Facility.

In this message, usr is the user ID of the job order requesting the SHOUT.

**Corrective Action:** No action is required.

**SHD284I NEW DYNAMIC DESTINATION TABLE LOADED**

**Explanation:** This information message indicates that a new Dynamic Destination Table has been loaded by the Control-D monitor. The message also appears on initialization of the SHOUT Facility under the Control-D monitor.

**Corrective Action:** No action is required.

**SHD285W DYNAMIC DESTINATION TABLE NOT LOADED**

**Explanation:** Loading of the Dynamic Destination Table by the Control-D monitor failed. It could be due to one of the following:
Insufficient memory for loading the table.

The Ioadest table does not exist in the IOA PARM library.

If the failure happens during the initialization of the Control-D monitor, then SHOUT notifications will not be controlled by the Dynamic Destination Table. If this happens as a result of an F CONTROLD,NEWDEST command (operator command instructing the Control-D monitor to load a new Destination Table), the old destination table will remain in effect.

**Corrective Action:** Check the MVS Log for the reason for the failure (probably a system abend code). Correct the problem and then, in order to load the table, issue the operator command F CONTROLD,NEWDEST.

### SHT messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

#### Messages SHT200 through SHT2xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**SHT280I MAILDEST TABLE WAS {LOADED | RELOADED}**

**Explanation:** This information message indicates that the MAILDEST table was LOADED during Control-M initialization, or was RELOADED as a result of a NEWMAILDEST command.

The MAILDEST table must be loaded before shout messages can be sent to their specified addresses.

If there are jobs in the Active Jobs File (AJF) when a NEWMAILDEST command is issued, the MAILDEST table is reloaded, this message is issued and shout messages are sent.

If the AJF is empty, when a NEWMAILDEST command is issued, the MAILDEST table is not reloaded. As soon as a job is put into the AJF, MAILDEST is reloaded, this message is issued and shout messages are sent.

**Corrective Action:** No action is required.

**SHT281W MAILDEST TABLE WAS NOT FOUND IN ANY LIBRARY REFERENCED BY DD STATEMENT DAPARM. UNABLE TO SEND SHOUT**

**Explanation:** The MAILDEST member is not in the IOA PARM library.

The IOAMAIL module reads the MAILDEST member to prepare a full address for each name on the mail list.

This message is produced when a job scheduling definition or rule issues a SHOUT or DO MAIL action to a destination specifying an e-mail address that cannot be resolved due to the absence of a MAILDEST member in the IOA PARM library.

The MAILDEST member is not loaded and shout messages are not sent.

**Corrective Action:** Build a new MAILDEST member in the IOA PARM library and try again.
**SHT282I text (userId)**

**Explanation:** Highlighted, unrollable message.

This information message is activated by the SHOUT facility. The userId is for the job order requesting the SHOUT.

**Corrective Action:** No action is required.

---

**SHT284I NEW DYNAMIC DESTINATION TABLE LOADED**

**Explanation:** This information message indicates that a new Dynamic Destination Table has been loaded by the Control-M monitor. This message is also generated when the SHOUT Facility is initialized under the Control-M monitor.

**Corrective Action:** No action is required.

---

**SHT285W DYNAMIC DESTINATION TABLE NOT LOADED**

**Explanation:** Loading of the Dynamic Destination Table by the Control-M monitor failed.

It could be due to one of the following:

- Insufficient memory for loading the table.
- The IOADEST table does not exist in the IOA PARM library.

If the failure happens during the initialization of the Control-M monitor, then SHOUT notifications will not be controlled by the Dynamic Destination Table. If this happens as a result of an F CONTROLM,NEWDEST command (operator command instructing the Control-M monitor to load a new Destination Table), the old destination table will remain in effect.

**Corrective Action:** Check the MVS Log for the reason for the failure (probably a system abend code). Correct the problem and then, in order to load the table, issue the operator command F CONTROLM,NEWDEST.

---

**SHT286E OPEN DAM2G FILE BY CTWWMG FAILED**

**Explanation:** The CTWWMG program is unable to open the DAM2G communication file.

To send Shout messages to an Enterprise Controlstation, Control-M uses the CTWWMG program to first write those messages and their records to DAM2G.

**Corrective Action:** Ask your INCONTROL administrator to correct the problem.

---

**SHT287E INVALID OPERATION CODE FROM CTWWMG**

**Explanation:** The CTWWMG program cannot write Shout message records to the DAM2G communication file because an invalid operation code was used to write the record.

To send Shout messages to an Enterprise Controlstation, Control-M uses the CTWWMG program to first write those messages and their records to DAM2G.

**Corrective Action:** Ask your INCONTROL administrator to correct the problem.
**SHT288E ERROR IN PREPARING SHOUT TO MAIL, RC = rc**

**Explanation:** The rc error occurred during preparation to send Shout messages.

Valid values for rc are:

<table>
<thead>
<tr>
<th>rc</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>GETMAIN failure in IOAMAIL.</td>
</tr>
<tr>
<td>02</td>
<td>Error occurred while loading modules in IOAMAIL.</td>
</tr>
<tr>
<td>03</td>
<td>Error occurred in the PRPGRP routine during preparation of group addresses.</td>
</tr>
<tr>
<td>04</td>
<td>Error occurred while reading or writing to the buffers.</td>
</tr>
<tr>
<td>05</td>
<td>Error in DOMAIL routine.</td>
</tr>
<tr>
<td>06</td>
<td>Error in MAILDEST structure.</td>
</tr>
<tr>
<td>07</td>
<td>Error in FREEMAIN.</td>
</tr>
<tr>
<td>08</td>
<td>Error in input parms.</td>
</tr>
<tr>
<td>11</td>
<td>GETMAIN failure in CTMMAL.</td>
</tr>
<tr>
<td>12</td>
<td>Error occurred while loading modules in CTMMAL.</td>
</tr>
<tr>
<td>13</td>
<td>FREEMAIN error in CTMMAL.</td>
</tr>
</tbody>
</table>

**Corrective Action:** Do one of the following:

- If rc is 03, 04 or 05, correct errors in the MAILDEST table.
- For all other rc values, contact your INCONTROL administrator or system programmer for help.

**SIM messages**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**Messages SIM0 through SIM0xx**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.
SIM075S OPEN OF DDNAME "DASIMOUT" FAILED. SIMULATION STOPPED

Explanation: Open of simulation printout file failed (the DASIMOUT DD statement - the CTMSIM utility).
This is due to one of the following:

- The DASIMOUT DD statement is missing.
- The data set described by the DASIMOUT DD statement cannot be opened for sequential write.

The simulation stops executing with a condition code of 08.

Corrective Action: Correct the JCL for the job.

SIM076I SIMULATION STARTED

Explanation: This information message indicates that simulation started (the CTMSIM Control-M utility).
This message is issued by the CTMSIM Control-M utility, which activates the Simulation and Forecasting Facility.

Corrective Action: No action is required.

SIM077S OPEN OF DDNAME "DASIMPRM" FAILED. SIMULATION STOPPED

Explanation: Open of simulation parameters file failed (the DASIMPRM DD statement - the CTMSIM utility)
This could be due to one of the following:

- The DASIMPRM DD statement is missing.
- The data set described by the DASIMPRM DD statement cannot be opened for sequential read.

The simulation stops executing with a condition code of 08.

Corrective Action: Correct the JCL for the job.

SIM078I SIMULATION ENDED

Explanation: This information message indicates that simulation ended (the CTMSIM Control-M utility).

Corrective Action: No action is required.

SIM079S INVALID SIMULATION PARAMETER: - parm

Explanation: Invalid simulation parameter (the CTMSIM Control-M utility). For details, refer to the section on the Simulation and Forecasting facility in the Control-M for z/OS User Guide.

The simulation stops executing with a condition code of 08.

Corrective Action: Correct the simulation parameters (the DASIMPRM DD statement).

SIM080S SIMULATION INTERVAL MUST BE FROM 3 TO 99 SECONDS

Explanation: Invalid interval parameter for Control-M simulation facility. Simulation interval must be from 3 to 99 seconds, inclusive. For details, refer to the section on the Simulation and Forecasting facility in the Control-M for z/OS User Guide.
The simulation stops executing with a condition code of 08.

**Corrective Action:** Correct the simulation interval (the DASIMPRM DD statement).

**SIM081S INVALID DAYTIME FORMAT. "yyymmddhhmm" EXPECTED**

**Explanation:** Invalid format of SIMSTART SIMEND, ADD, DELETE or CHANGE simulation parameters. The SIMSTART and SIMEND simulation parameters or the ONDAYTIME subparameter (of the ADD, DELETE and CHANGE command) should be in day-time format yymmddhhmm. For more information, see the section on the Simulation and Forecasting facility in the *Control-M for z/OS User Guide*.

The simulation stops executing with a condition code of 08.

**Corrective Action:** Correct SIMSTART or SIMEND or ONDAYTIME simulation parameter (the DASIMPRM DD statement).

**SIM082S MULTIPLE USE OF PARAMETER. ONLY ONE OCCURRENCE IS ALLOWED**

**Explanation:** Result of multiple use of INTERVAL, SIMSTART or SIMEND simulation parameters (the CTMSIM Control-M utility).

Only one occurrence of INTERVAL, SIMSTART or SIMEND simulation parameters is allowed. For details, refer to the section on the Simulation and Forecasting facility in the *Control-M for z/OS User Guide*.

The simulation stops executing with a condition code of 08.

**Corrective Action:** Please omit one of the multiple occurrences of the relevant simulation parameter (the DASIMPRM DD statement).

**SIM083S SIMULATION START TIME IS GREATER THAN SIMULATION END TIME**

**Explanation:** The daytime specified in the SIMEND simulation parameter is prior to the daytime specified in the SIMSTART parameter (the CTMSIM Control-M utility).

For details, refer to the section on the Simulation and Forecasting facility in the *Control-M for z/OS User Guide*.

The simulation stops executing with a condition code of 08.

**Corrective Action:** Correct the SIMSTART or SIMEND simulation parameter (the DASIMPRM DD statement).

**SIM084S MISSING OBLIGATORY SIMULATION PARAMETERS**

**Explanation:** Missing obligatory simulation parameters: INTERVAL, SIMSTART or SIMEND. For details, refer to the section on the Simulation and Forecasting facility in the *Control-M for z/OS User Guide*.

The simulation stops executing with a condition code of 08.

**Corrective Action:** Correct the simulation parameters (the DASIMPRM DD statement).
SIM085S LOADING OF SIMULATION CONTROL TABLE FAILED. SIMULATION STOPPED

Explanation: Loading of simulation control table failed. The CTMSMT module is not in the IOA SIML library, or there is insufficient memory.

Corrective Action: Check the IOA SIML library or increase region size.

Simulation stops.

SIM086W MEMBER memName LIBRARY lib WILL NOT TAKE PART IN THE SIMULATION

Explanation: The status of the job on the simulation input Active Jobs file (AJF) is not WAIT SCHEDULE. The Control-M simulation facility processes only jobs which have a WAIT SCHEDULE status on the simulation input Active Jobs file. Jobs with other status's are ignored.

Control-M simulation continues processing.

Corrective Action: No action is required.

SIM087W MEMBER memName LIBRARY lib - DEFAULT ELAPSED TIME USED

Explanation: Result of request for execution of simulation for a Quick Submit job on which Control-M does not have statistical information in the Job Execution Statistics file (the DASTAT DD statement).

The default elapsed time of 3 minutes was used for a Quick Submit job. The job execution statistical data must be periodically accumulated from the Log file by the CTMJSA utility. You can specify expected execution time of a new job with the NEWJOB statement. For details, refer to the Control-M for z/OS User Guide.

Corrective Action: No action is required.

SIM088S INVALID RC WHILE READING JOBS EXECUTION STATISTICS FILE. RC=rc ERROR=err

Explanation: Invalid return code rc while reading the job execution statistics file.

The job execution statistics file is a VSAM file. The return code (rc) is the general VSAM return code, and the error (err) is the VSAM FDBK area.

The simulation stops executing with a condition code of 08.

Corrective Action: Check the relevant IBM literature for the meaning of the return code and FDBK area.

SIM089S INSUFFICIENT MEMORY TO PERFORM SIMULATION

Explanation: Insufficient memory to perform simulation.

The CTMSIM utility that activates the simulation may use a large amount of CPU and memory. For details, refer to the section on the Simulation and Forecasting facility in the Control-M for z/OS User Guide.

The simulation stops executing with a condition code of 08.
Corrective Action: Increase the job region size (of the CTMSIM utility).

SIM090S VALID MEMBER NAME EXPECTED AFTER "NEWJOB"/"OLDJOB" STATEMENT

Explanation: Invalid missing member name after NEWJOB (or OLDJOB) statement (the DASIMPRM DD statement).

The NEWJOB statement is used to specify the expected execution time of the new job. The OLDJOB statement is used to specify the execution time of a job when it is different from the average. The member is the basis for identifying the job order in the Active Jobs file.

The simulation stops executing with a condition code of 08.

Corrective Action: Correct the member parameter in the NEWJOB (or OLDJOB) statement (the CTMSIM utility).

SIM091S VALID GROUP NAME OF 1-20 CHARACTERS IS EXPECTED AFTER "GROUP" SUB-COMMAND

Explanation: Invalid or missing GROUPNAME parameter in sub-command GROUP of the NEWJOB statement (the DASIMPRM DD statement).

The GROUPNAME should be from 1 through 20 characters. The NEWJOB parameters member and group name are the basis for identifying the job order in the Active Jobs file. For details, refer to the section on the Simulation and Forecasting facility in the Control-M for z/OS User Guide.

The simulation stops executing with a condition code of 08.

Corrective Action: Correct the GROUP sub-command in the NEWJOB statement (the CTMSIM utility).

SIM092S CPU ID OF ONE CHARACTER IS EXPECTED AFTER "CPUID" SUB-COMMAND

Explanation: The CPUID parameter in CPUID sub-command of NEWJOB statement (the DASIMPRM DD statement) is invalid or missing.

In a multiple CPU environment, the job can have different execution times on different CPUs. Therefore it is necessary to specify the expected elapsed time for each CPU the job may run on. The CPUID parameter should be of one character - identical to the CPUID used by JES for this CPU. For details, refer to the simulation parameters in the Control-M for z/OS User Guide.

The simulation stops executing with a condition code of 08.

Corrective Action: Correct the CPUID parameter in the CPUID sub-command of NEWJOB statement (the CTMSIM utility).

SIM093S INVALID EXECTIME FORMAT. "nnmm.xx" EXPECTED

Explanation: Invalid or missing EXECTIME parameter in NEWJOB statement (the DASIMPRM DD statement).

The EXECTIME is given in minutes (mmmm) and hundredths of a minute (xx). For more information, see the NEWJOB statement in the Control-M for z/OS User Guide.

The simulation stops executing with a condition code of 08.
Corrective Action: Correct the EXECTIME parameter in the NEWJOB statement (the CTMSIM utility).

SIM094S MISSING "EXECTIME" SUB-COMMAND AFTER "NEWJOB"/
"OLDJOB" COMMAND

Explanation: Missing EXECTIME sub-command after NEWJOB (or OLDJOB) command (the DASIMPRM DD statement).

EXECTIME sub-command is obligatory in NEWJOB (or OLDJOB) statement. For details, refer to the NEWJOB or OLDJOB statement in the Control-M for z/OS User Guide.

Corrective Action: Add the EXECTIME sub-command or omit the NEWJOB (or OLDJOB) statement (the CTMSIM utility).

SIM095S MISSING EITHER "CONDITION" OR "RESOURCE" IN COMMAND

Explanation: Missing either CONDITION or RESOURCE in simulation command (the DASIMPRM DD statement).

ADD, DELETE or CHANGE commands can be used either with CONDITIONS or with RESOURCES. For details, refer to the simulation parameters in the Control-M for z/OS User Guide.

The simulation stops executing with a condition code of 08.

Corrective Action: Correct the ADD, DELETE, or CHANGE simulation command.

SIM096S CONDITION/RESOURCE NAME MUST BE 1-20 CHARACTERS

Explanation: Invalid/missing CONDITION or RESOURCE name in simulation parameters (the DASIMPRM DD statement).

CONDITION or RESOURCE name must be 1-20 characters. For details, refer to the simulation parameters the Control-M for z/OS User Guide.

The simulation stops executing with a condition code of 08.

Corrective Action: Please correct the CONDITION or RESOURCE name in the simulation parameters (the CTMSIM utility).

SIM097S MISSING "ONDAYTIME" SUB-COMMAND

Explanation: Missing ONDAYTIME sub-command in the simulation parameters (the DASIMPRM DD statement).

ONDAYTIME sub-command is obligatory in ADD, DELETE or CHANGE commands of the simulation parameters. For details, refer to the simulation parameters in the Control-M for z/OS User Guide.

The simulation stops executing with a condition code of 08.

Corrective Action: Please add an ONDAYTIME sub-command to the ADD, DELETE or CHANGE command of the simulation parameters.

SIM098I TASK taskName DID NOT FINISH EXECUTING

Explanation: This information message indicates that taskName task (job/started task) did not finish executing within simulation time limits (SIMEND).
The task started executing and was still executing at the end of the simulation.

**Corrective Action:** No action is required.

**SIM099I TASK taskName STILL WAITS SCHEDULE**

**Explanation:** This information message indicates that `taskName` task is still waiting to be scheduled after the simulation end time specified in the SIMIEND ONDAYTIME.

The job/started task was in wait schedule state at simulation end time. It probably did not execute.

**Corrective Action:** No action is required.

**Messages SIM100 through SIM1xx**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**SIM100W JOB jobName IS A QUICK-SUBMIT JOB - DEFAULT ELAPSED TIME USED**

**Explanation:** The Control-M Simulation Facility encountered a Quick Submit job in the input for the simulation process.

The Quick Submit job is handled as a standard job. Default execution time is assumed for the job.

**Corrective Action:** No action is required.

**SIM101S INVALID CHANGE REQUEST**

**Explanation:** The number of elements in a quantitative resource could not be changed, because the resource is not defined in the Control-M Resources file.

The CHANGE RESOURCE command is ignored.

**Corrective Action:** Make sure a resource is defined in the Control-M Resources file before using the CHANGE RESOURCE command of the simulation utility to change it.

**Messages SIM500 through SIM5xx**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**SIM500I INPUT LEN=len REC=inputRecordMsg**

**Explanation:** This information message is generated when the CTOTEST Control-O utility is invoked.

**Corrective Action:** This message is sent to CTOTEST. It echoes the input record.

**SIM501S OPEN FAILED FOR DDNAME CMDMSGFL**

**Explanation:** The attempt to open input file CMDMSGFL failed.

Possible causes are:
The CMDMSGFL DD statement is misspelled.
The data set (member) referenced by the CMDMSGFL DD statement does not exist.
CTOTEST execution terminates.

**Corrective Action:** Check if the CMDMSGFL DD statement is present in the JCL.

**SIM502S INPUT PARAMETER ERROR**

**Explanation:** The subsystem name input parameter is invalid or missing.
CTOTEST execution terminates.

**Corrective Action:** Check if PARM=subsystemName is present in the parameter string.

**SIM503I RC rc LEN=len REC=msgText**

**Explanation:** This information message is generated when the CTOTEST Control-O utility is invoked.
The variables in this message are:
- **rc** - return code
- **len** - new message length
- **msgText** - new message text

**Corrective Action:** No action is required.

**SLC messages**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**Messages SLC0 through SLC0xx**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**SLC001I CTMSLC STARTED**

**Explanation:** This information message indicates that the CTMSLC utility, which enables you to remove old job scheduling definitions from the schedule library, has started.

**Corrective Action:** No action is required.

**SLC00AI NO JOBS WERE DELETED BY LIBRARY CLEANUP PROCESS**

**Explanation:** The CTMSLC utility completed successfully without deleting any job scheduling definitions from the scheduling library.
The utility terminates with a return code of 4.

**Corrective Action:** No action is necessary.
SLC025I  CTMSLC ENDED

**Explanation:** This information message indicates that the CTMSLC utility ended normally. The CTMSLC utility enables you to remove old job scheduling definitions from the schedule library.

**Corrective Action:** No action is required.

### SLG messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

#### Messages SLG900 through SLG9xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**SLG9B1E** SYSTEM LOGGER CONNECT REJECTED, DASD-ONLY LOG STREAM IS ALREADY CONNECTED TO BY ANOTHER LOG STREAM IN THE SYSPLEX

**Explanation:** The System Logger rejected an attempt to connect to a DASD-only log stream because another log stream in the Sysplex is already connected. Only applications from the same system (LPAR) can connect simultaneously to the DASD-only log streams. If you are using DASD-only log streams, then Control-M, CMEM or Control-O, and IADDC (the CONNECT DIRECT interface) must all be running in the same LPAR.

The attempt to connect is rejected.

**Corrective Action:** Determine which system you want to connect to the log stream, and rerun the component that failed in the correct system.

If you want all members in a Sysplex to have access to the log stream, use coupling facility log streams rather than DASD-only log streams. For more information, see the description of sysplex configuration parameters in the INCONTROL for z/OS Installation Guide.

### SLO messages

This group includes messages for the Control-O product.

#### Messages SLO100 through SLO1xx

This group includes messages for the Control-O product.

**SLO160I** {CONTROL-O | CTMCQMEM} SELECTOR STARTED

**Explanation:** This information message indicates the start of the Control-O Selector task, which controls the runtime selection criteria for rules.
Corrective Action: No action is required.

SLO161I {CONTROL-O | CTMCMEM} SELECTOR ENDED

Explanation: This information message indicates normal termination of the Control-O Selector task that controls the runtime selection criteria for rules.

Corrective Action: No action is required.

SLO163S OPEN FAILED FOR DDNAME "DARESF" OR "DASINC"

Explanation: Open of IOA Conditions or Resources file failed (the DARESF or the DASINC DD statement).

Possible causes are:
- The DARESF DD statement is missing.
- The DASINC DD statement is missing.
- The data set described by the DARESF DD statement is not the IOA Conditions or Resources file.
- The data set described by the DASINC DD statement is not the Control-O Conditions or Resources Synchronization file.
- The data set described by the DARESF DD statement is the Control-O Conditions or Resources file, but it is of a different version or of a different Control-O monitor.
- The volume of this data set cannot be accessed by the Control-O monitor.
- The data set is not on the volume specified in the Control-O procedure.

Control-O monitor shuts down with error message.

Corrective Action: Correct the JCL for the Control-O procedure, and restart the monitor.

SLO164S INTERNAL ERROR PROCESSING RESOURCE FILE FOR CONDITION cond

Explanation: An internal error occurred while the cond condition was being processed. The Control-O monitor is terminated.

Corrective Action: Contact BMC Software Customer Support.

SLO165E COND name date NOT action BY CONTROL-O - SECURITY VIOLATION

Explanation: Control-O issued a DO COND request, but the user is not authorized by the security exit to add or delete this condition in the IOA Conditions file.

The prerequisite condition is not added or deleted.

Corrective Action: Contact your INCONTROL administrator.
SLO166W COND name date NOT UPDATED BY CONTROL-O - NO MORE SPACE. NOTIFY THE IOA ADMINISTRATOR

Explanation: Highlighted, unrollable message.

There is no more space for adding output conditions to the IOA Conditions file. The record for the specified day of the month is full. For example, if a condition with date reference of January 3rd cannot be added, an entry in the conditions file which contains conditions for January 3rd, February 3rd, March 3rd, and so on, is full.

The format for the date specified in this message is mmdd.

The condition is not added. A highlighted message is displayed on the operator console. Control-O or CMEM continues to function, but the rules that depend on the condition may not be triggered.

Corrective Action: Perform the following immediate actions and then perform the long term actions described below.

Immediate actions:
1. Enter the IOA Conditions list (Screen 4).
2. Look for conditions with the same day (but with a different month) as the condition that could not be added. Delete them manually if they are not needed.
3. Add the failing condition manually in order to maintain production flow.
4. Report the event to your System Programmer.

Long term actions:
- Run the IOACLCOND utility more often.
- Increase the record length of the IOA Conditions file. For more information on how to do this, see the description of expanding IOA files in the INCONTROL for z/OS Administrator Guide.

SLO167I COND name date WAS action BY {CONTROL-O | CTMCMEM}

Explanation: This information message displays the results of a Control-O or CMEM DO COND request. The Control-O or CMEM monitor adds/deletes the prerequisite condition.

Corrective Action: No action is required.

SLO168I COND name date ALREADY action

Explanation: This information message indicates that the user requested an action that has already been performed.

The user either tried to add a condition that already exists or tried to delete a condition that had already been deleted.

Corrective Action: No action is required.
SLO169W COND name date NOT ADDED BY {CONTROL-O | CTMCMEM}
GLOBAL DATE ADDITION IS NOT SUPPORTED

**Explanation:** A DO COND statement in a rule requested the addition of the specified condition with date **** or $$$$$. This date specification is valid only when conditions are being deleted.

The DO COND request is not performed.

**Corrective Action:** Correct the DO COND statement.

---

**SMF messages**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**Messages SMF0 through SMF0xx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**SMF041S SMFWTM RETURNED RC= 4 - SMF RECORD TOO LONG**

**Explanation:** *Highlighted, unrollable message.*

Control-D attempted to write an SMF record which could not fit completely in an SMF data set.

The user modified Control-D Exit CTDX006, but moved an incorrect value to the SMFLEN field (DSECT CTDUSMF). This field contains the length of the SMF record.

The SMF record is not written, but Control-D continues processing. Control-D sets an internal indication that a permanent error is present on SMF recording, and will not continue to attempt SMF recording. From this point on, instead of writing to SMF, message SMF049I is written to the IOA Log. This log message is a replacement for SMF recording, and can be entered into SMF after the problem is fixed.

**Corrective Action:** Correct the problem in CTDX006, assemble and link-edit this exit, and bring down Control-D. When Control-D is brought up again, SMF recording will resume.

**SMF042S SMFWTM RETURNED RC= 8 - SMF RECORD TOO SHORT**

**Explanation:** *Highlighted, unrollable message.*

Control-D attempted to write an SMF record which is smaller than 18 characters long.

The user modified the Control-D Exit CTDX006, but moved an incorrect value to the SMFLEN field (DSECT CTDUSMF). This field contains the length of the SMF record.

The SMF record is not written, but Control-D continues processing. Control-D sets an internal indication that a permanent error is present on SMF recording, and will not continue to attempt SMF recording. From this point on, instead of writing to SMF, message SMF049I is written to the Control-D log. This log message is a replacement for SMF recording, and can be entered into SMF after the problem is fixed.

**Corrective Action:** Correct the problem in CTDX006, assemble and link-edit this exit, and bring down Control-D. When Control-D is brought up again, SMF recording will resume.
SMF043S SMFWTM RETURNED RC= 16 - SMF IS NOT ACTIVE

**Explanation:** *Highlighted, unrollable message.*

Control-D attempted to write an SMF record, but SMF is not active.

The SMF record is not written, but Control-D continues processing. Control-D sets an internal indication that a permanent error is present on SMF recording, and will not continue to attempt SMF recording. From this point on, instead of writing to SMF, the message SMF049I is written to the IOA Log. This log message is a replacement for SMF recording, and can be entered into SMF after the problem is fixed.

**Corrective Action:** Initiate SMF recording, then bring down Control-D. When Control-D is brought up again, SMF recording will resume.

SMF044S SMFWTM RETURNED RC= 20 - SMF EXIT IEFU83 SUPPRESSED THE RECORD

**Explanation:** *Highlighted, unrollable message.*

Control-D attempted to write an SMF record, but SMF exit IEFU83 suppressed the record.

The SMF record is not written, but Control-D continues processing. Control-D sets an internal indication that a permanent error is present on SMF recording, and will not continue to attempt SMF recording. From this point on, instead of writing to SMF, message SMF049I is written to the IOA Log. This log message is a replacement for SMF recording, and can be entered into SMF after the problem is fixed.

**Corrective Action:** Correct SMF exit IEFU83 to allow Control-D to write SMF records. When Control-D is brought up again, SMF records will resume.

SMF045S SMFWTM RETURNED RC= 24 - THE SMF FILES ARE FULL

**Explanation:** *Highlighted, unrollable message.*

Control-D attempted to write an SMF record, but the SMF files are full.

The SMF record is not written, but Control-D continues processing. Control-D will write message SMF049I to the IOA Log file. This log message is a replacement for SMF recording, and can be entered into SMF later.

Control-D will keep attempting to write to the SMF file. If the SMF file is still full, message SMF049I will be written to the log.

Please note that Control-D does not have to be taken down. As soon as room is found on an SMF file, SMF recording will take place automatically.

**Corrective Action:** The operator should clear SMF files according to the conventions of the site. As soon as this is done, Control-D will automatically continue with SMF recording.

SMF046S INTERNAL PROBLEM IN MVS. SMF RECORD NOT WRITTEN

**Explanation:** *Highlighted, unrollable message.*

Control-D attempted to write an SMF record, but there is an internal problem in MVS.
This is due to one of the following return codes from MVS:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>26</td>
<td>Record is not currently being recorded.</td>
</tr>
<tr>
<td>40</td>
<td>Buffer storage caused data to be lost.</td>
</tr>
<tr>
<td>44</td>
<td>SVC 83 unable to establish recovery.</td>
</tr>
</tbody>
</table>

Refer to message SMF047S for the return code.

The SMF record is not written, but Control-D continues processing. Control-D sets an internal indication that a permanent error is present on SMF recording, and will not continue to attempt SMF recording. From this point on, instead of writing to SMF, message SMF049I is written to the IOA Log. This log message is a replacement for SMF recording, and can be entered into SMF after the problem is fixed.

**Corrective Action:** Call the system programmer. After the problem is fixed by the system programmer, bring down Control-D. When Control-D is brought up again, SMF recording will resume.

**SMF047S RC=rc RECEIVED FROM MACRO SMFWTM**

**Explanation:** Highlighted, unrollable message.

Control-D is unable to write SMF records. Possible causes are:

- Message SMF046S was issued. This message specifies the RC returned by SMF.
- An unknown return code was issued by SMF. This message specifies the RC returned by SMF.

The SMF record is not written, but Control-D continues processing. Control-D sets an internal indication that a permanent error is present on SMF recording, and will not continue to attempt SMF recording. From this point on, instead of writing to SMF, message SMF049I is written to the Control-D log. This log message is a replacement for SMF recording, and can be entered into SMF after the problem is fixed.

**Corrective Action:** Call the INCONTROL administrator.

**SMF048S CONTROL-D SMF RECORDING IS TERMINATED - PLEASE TAKE CORRECTIVE ACTION**

**Explanation:** Highlighted, unrollable message.

Control-D is unable to write SMF records.

This message is issued whenever a permanent error is present on SMF recording. This message is issued for messages SMF041S through SMF050S.

The SMF record is not written, but Control-D continues processing.

**Corrective Action:** Refer to messages SMF041S through SMF050S.

**SMF049I USER=user ODATE=date COP=#copies P=#pages L=#lines**

**Explanation:** If STAT is set to Y in CTDPARM, this information message is issued when a Printing Mission prints a report.
date is in either mmdd or ddmm format, depending on the site standard.

- # copies - the number of copies to produce for this report.
- # pages - the number of pages in this report.
- # lines - the number of lines in this report.

**Corrective Action:** No action is required.

**SMF050S INVALID VALUE value IN THE INSTALLATION PARAMETER "SMF"**

**Explanation:** Highlighted, unrollable message.

Control-D attempted to write an SMF record, but an invalid value is present on the SMF field in CTDPARM. The SMF field in CTDPARM can contain the following values:

- Character string, length of three, value NO.
- A 3-digit number, value 128 through 255.

The SMF record is not written, but Control-D continues processing. Control-D sets an internal indication that a permanent error is present on SMF recording, and will not continue to attempt SMF recording. From this point on, instead of writing to SMF, message SMF049I is written to the IOA Log. This log message is a replacement for SMF recording, and can be entered into SMF after the problem is fixed.

**Corrective Action:** Call your INCONTROL administrator.

**SNM messages**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**Messages SNMA00 through SNMAxx**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**SNMA01W LENGTH OF SNMP MESSAGE EXCEEDED ALLOWED MAXIMUM(70), MESSAGE TRUNCATED**

**Explanation:** An attempt was made to send an SNMP message the length of which exceeded the permitted maximum.

The length of an SNMP message must not exceed 70 characters.

The problematic SNMP message is truncated. Processing continues.

**Corrective Action:** Correct the rule that created the problematic message.

**SNMA02E INVALID IP ADDRESS SPECIFIED IN HOST PARAMETER: ipAdd.**

**Explanation:** The SNMP interface encountered a syntax error in the IP address specified in the HOST parameter.
In this message, _ipAdd_ is the identity of the problematic IP address.

The entry in the SNMP Destination table that contains the invalid IP address is disabled. Processing continues.

**Corrective Action:** Correct the problematic IP address in the SNMP Destination table and issue a NEWSNMPDST modify command.

**SNMA03S FAILURE TO READ SNMP DESTINATION TABLE, RC( _rc_ ) REASON( _rsn_ )**

**Explanation:** A severe error occurred when the SNMP interface was trying to read the SNMP Destination table from the IOA PARM library.

The variables in this message are:

- _rc_ - the return code that indicates the nature of the failure
- _rsn_ - a reason code that provides more information about the failure

SNMP interface processing is discontinued.

**Corrective Action:** Contact BMC Software Customer Support.

**SNMA04S INSUFFICIENT MEMORY TO READ SNMP DESTINATION TABLE**

**Explanation:** A severe error occurred when the SNMP interface was trying to read the SNMP Destination table from the IOA PARM library.

SNMP interface processing is discontinued.

**Corrective Action:** Contact BMC Software Customer Support.

**SNMA06E FAILURE TO RECOGNIZE THE LINE**

**Explanation:** The SNMP interface failed to recognize a line in the SNMP Destination table. The sequential number of the problematic line is identified in the SNMA0NI message that precedes this SNMA06E message.

The problematic line in the SNMP Destination table is ignored. Processing continues.

**Corrective Action:** Correct the problematic line in the SNMP Destination table and issue a NEWSNMPDST modify command.

**SNMA07S SNMP DESTINATION TABLE IS EMPTY**

**Explanation:** The SNMP interface discovered that the SNMP Destination table does not contain any lines.

SNMP interface processing is discontinued.

**Corrective Action:** Fill the SNMP Destination table by adding lines and issue a NEWSNMPDST modify command.

**SNMA09I SNMP DESTINATION TABLE processed result**

**Explanation:** The SNMP interface successfully read and processed the SNMP Destination table.

The variables in this message are:
processed - the type of action Valid values are:
- PROCESSED - The SNMP Destination table was read and processed when the SNMP interface was called for the first time.
- REFRESHED - The SNMP Destination table was successfully refreshed in memory when the NEWSNMPDST Modify command was issued.

result - the result of the processing Valid values are:
- SUCCESSFULLY - The SNMP Destination table was read and processed successfully.
- WITH ERRORS - Errors were encountered during the reading or processing of the SNMP Destination table.

Corrective Action: No action is required.

SNMA0AE FAILURE TO PROCESS SNMP DESTINATION TABLE, RC(rc) REASON(rsn)

Explanation: The SNMP interface failed to process the SNMP Destination table.
The variables in this message are:
- rc - the return code that indicates the nature of the failure
- rsn - a reason code that provides more information about the failure

SNMP interface processing is discontinued.
Corrective Action: Correct the SNMP Destination table and issue a NEWSNMPDST modify command.

SNMA0BE COMMA SHOULD NOT PRECEDE STATEMENT(HOST) IN A GROUP

Explanation: The SNMP interface encountered a syntax error while processing the SNMP Destination table. The sequential number of the problematic line is identified in the SNMA0NI message that precedes this SNMA0BE message.
The entry in the SNMP Destination table identified in the SNMA0NI message is ignored. Processing continues.
Corrective Action: Correct the identified entry in the SNMP Destination table, and issue a NEWSNMPDST modify command.

SNMA0CE COMMA MUST PRECEDE DEFINITION(PORT)

Explanation: The SNMP interface encountered a syntax error while processing the SNMP Destination table. The sequential number of the problematic line is identified in the SNMA0NI message that precedes this SNMA0BE message.
The PORT definition can only be used together with the HOST definition.
The entry in the SNMP Destination table identified in the SNMA0NI message is ignored. Processing continues.
Corrective Action: Correct the SNMP Destination table entry identified in the SNMA0NI message, and issue a NEWSNMPDST modify command.
SNMA0DE PARAMETER(\textit{parm}) IS INVALID, ENTRY DISABLED

\textbf{Explanation:} An error was found in the \textit{parm} parameter of the SNMP Destination table. The sequential number of the problematic line is identified in the SNMA0NI message that precedes this SNMA0DE message.

In this message, valid values for \textit{parm} are:

- \texttt{PORT}
- \texttt{HOST}

The entry in the SNMP Destination table identified in the SNMA0NI message is ignored. Processing continues.

\textbf{Corrective Action:} Correct the identified entry in the SNMP Destination table, and issue a NEWSNMPDST modify command.

SNMA0EE UNDEFINED NICK=\textit{nick} SPECIFIED IN GROUP=\textit{grp}, ENTRY DISABLED

\textbf{Explanation:} A group of recipients in the SNMP Destination table refers to a nickname statement that is not defined in the nicknames section of the Destination Table.

The variables in this message are:

- \texttt{nick} - the undefined nickname
- \texttt{grp} - the name of the group that contains \texttt{nick}

The entry in the SNMP Destination table that contains \texttt{grp} is ignored. Processing continues.

\textbf{Corrective Action:} Correct the problematic entry in the SNMP Destination table, and issue a NEWSNMPDST modify command.

SNMA0FE INVALID HOST VALUE SPECIFIED IN \textit{defn}=\textit{host_val}, ENTRY DISABLED

\textbf{Explanation:} An invalid HOST value was discovered in the definition identified in the message.

The variables in this message are:

- \texttt{defn} - the identity of the definition that contains the invalid HOST value
  - \texttt{NICK}
  - \texttt{GROUP}
- \texttt{host_val} - the invalid HOST value

The entry in the SNMP Destination table that contains the invalid HOST value is ignored. Processing continues.

\textbf{Corrective Action:} Correct the problematic HOST value and issue a NEWSNMPDST modify command.

SNMA0GE \textit{stmt} STATEMENT BELONGS TO NEITHER NICK NOR GROUP

\textbf{Explanation:} The identified statement in the SNMP Destination table is not a NICK statement, nor does it belong to any group.
In this message, stmt is the problematic statement. Valid values are:

- HOST
- PORT

The identified entry in the SNMP Destination table is disabled. Processing continues.

**Corrective Action:** Correct the identified entry in the SNMP Destination table and issue a NEWSNMPDST modify command.

**SNMA0HE NICK STATEMENT MUST CONTAIN HOST DEFINITION, ENTRY DISABLED**

**Explanation:** The identified NICK statement in the SNMP Destination table does not contain a HOST definition.

A NICK statement in a SNMP Destination table must contain a HOST definition.

The identified entry in the SNMP Destination table is disabled. Processing continues.

**Corrective Action:** Correct the identified entry in the SNMP Destination table and issue a NEWSNMPDST modify command.

**SNMA0LS MODE=mode CALL CAN BE ISSUED AFTER MODE=INIT ONLY**

**Explanation:** The SNMP interface encountered a severe internal error.

In this message, mode is the mode of the invalid call that was found. Valid values are:

- SEND
- LOAD
- CLOSE

SNMP interface processing is discontinued.

**Corrective Action:** Note the value of mode and contact BMC Software Customer Support.

**SNMA0MS INSUFFICIENT MEMORY(mem_size), FAILURE TO GETMAIN area**

**Explanation:** The SNMP interface failed to acquire the storage necessary to create an area in memory of the size requested.

The variables in this message are:

- `mem_size` - the requested size of area
- `area` - the name of the requested area in memory

SNMP interface processing is discontinued.

**Corrective Action:** Contact BMC Software Customer Support.
SNMA0NI ERROR DETECTED IN SNMP DESTINATION TABLE, LINE=lineNum

**Explanation:** This message precedes other messages, and identifies by number the line in which an error was detected.

In this message, lineNum is the number of the problematic line.

**Corrective Action:** Correct the problematic line in the SNMP Destination table, and issue a NEWSNMPDST modify command.

SNMA000S FAILURE TO LOAD MODULE(modName)

**Explanation:** The SNMP interface encountered a severe error. The specified load module was not found in the IOA LOAD library.

In this message, modName is the name of the load module that could not be loaded.

SNMP interface processing is discontinued.

**Corrective Action:** Contact BMC Software Customer Support.

SNMA0PS INTERNAL ERROR, INVALID OR MISSING MCT ADDRESS

**Explanation:** The SNMP interface encountered a severe internal error.

SNMP interface processing is discontinued.

**Corrective Action:** Contact BMC Software Customer Support.

SNMA0QS INTERNAL ERROR, INVALID OR MISSING SNMV ADDRESS

**Explanation:** The SNMP interface encountered a severe internal error.

SNMP interface processing is discontinued.

**Corrective Action:** Contact BMC Software Customer Support.

SNMA0RS FAILURE TO REFRESH SNMP DESTINATION TABLE

**Explanation:** The SNMP interface encountered a severe internal error.

SNMP interface processing is discontinued.

**Corrective Action:** Contact BMC Software Customer Support.

SNMA0SS SNMP DESTINATION TABLE IS UNAVAILABLE

**Explanation:** The SNMP interface encountered a severe internal error.

SNMP interface processing is discontinued.

**Corrective Action:** Contact BMC Software Customer Support.

SNMA0TS IOASNMC failed, SNMV vector is not initialized

**Explanation:** The SNMP interface encountered a severe internal error.
INCONTROL for z/OS Messages Manual

SNMP interface processing is discontinued.

**Corrective Action:** Contact BMC Software Customer Support.

**SNMA0UW INVALID PORT VALUE SPECIFIED, DEFAULT 162 IS USED**

**Explanation:** An invalid port number was specified in the SNMP Destination table. The default SNMP trap port number, 162, is assigned instead of the invalid port number.

**Corrective Action:** Correct the line in the SNMP Destination table that contains the problematic port number, and issue a NEWSNMPDST modify command.

**SNMA0WS MISSING SNMP MESSAGE LENGTH**

**Explanation:** The SNMP interface encountered a severe internal error. SNMP interface processing is discontinued.

**Corrective Action:** Contact BMC Software Customer Support.

**SNMA0XS SNMP MESSAGE WAS NOT SPECIFIED**

**Explanation:** The SNMP interface encountered a severe internal error. SNMP interface processing is discontinued.

**Corrective Action:** Contact BMC Software Customer Support.

**SNMA0YS INTERNAL ERROR, INVALID OR MISSING MCT ADDRESS**

**Explanation:** The SNMP interface encountered a severe internal error. SNMP interface processing is discontinued.

**Corrective Action:** Contact BMC Software Customer Support.

**SNMA0ZS INTERNAL ERROR, INVALID OR MISSING SNMV ADDRESS**

**Explanation:** The SNMP interface encountered a severe internal error. SNMP interface processing is discontinued.

**Corrective Action:** Contact BMC Software Customer Support.

Messages SNMT00 through SNMTxx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**SNMT01S FAILURE TO SEND SNMP TRAP, TCP/IP STACK stack UNAVAILABLE**

**Explanation:** ISTACK parameter was specified in the IOAPARM member and the system has TCP/IP dual stack mode, but the specified stack is not running.

The message reappears every time Control-O or Control-M attempt to send an SNMP message.
Corrective Action: Either bring up the started task named 'stack', or remove the ISTACK parameter from IOAPARM and recycle Control-M, or start a new Control-O monitor.

SNMT02S INTERNAL ERROR: FAILURE TO BUILD SNMP TRAP, DESTINATION(dest)
Explanation: The SNMP interface encountered a severe internal error.
In this message, dest is the identity of the SNMP listener to which the SNMP interface was to send the SNMP message that failed when being built.
SNMP interface processing is discontinued.
Corrective Action: Contact BMC Software Customer Support.

SNMT03S FAILURE TO ALLOCATE STORAGE FOR SNMP TRAP, DESTINATION(dest)
Explanation: The SNMP interface encountered a severe internal error.
In this message, dest is the identity of the SNMP destination to which the SNMP interface was to send the SNMP message that failed when being built.
SNMP interface processing is discontinued.
Corrective Action: Contact BMC Software Customer Support.

SNMT06E FAILURE TO OBTAIN LOCAL IP ADDRESS, ERRNO(errno.errno_id)
Explanation: The SNMP interface failed to determine the IP address of the sending machine.
The variables in this message are:
- errno - the name of the internal TCP/IP event. For a description of possible values of errno, refer to the appropriate TCP/IP vendor documentation.
- errno_id - the numeric identity of the internal TCP/IP event. For a description of possible values of errno_id, refer to the appropriate TCP/IP vendor documentation.
SNMP interface processing is discontinued.
Corrective Action: Note the value of errno and errno_id, and contact BMC Software Customer Support.

SNMT07S SOCKET() CALL FAILED, DESTINATION(dest) ERRNO(errno.errno_id)
Explanation: The SNMP interface encountered a severe internal error.
The variables in this message are:
**SNMT08E**: FAILURE TO SEND SNMP TRAP TO DESTINATION(*dest*), ERRNO(*errno.errno_id*)

**Explanation**: The SNMP interface failed to send an SNMP message. The variables in this message are:

- *dest* - the identity of the SNMP destination to which the SNMP interface failed to send the message.
- *errno* - the name of the internal TCP/IP event. For a description of possible values of *errno*, refer to the appropriate TCP/IP vendor documentation.
- *errno_id* - the numeric identity of the internal TCP/IP event. For a description of possible values of *errno_id*, refer to the appropriate TCP/IP vendor documentation.

SNMP interface processing is discontinued.

**Corrective Action**: Note the value of *dest*, *errno*, and *errno_id*, and contact BMC Software Customer Support.

**SNMT09E**: FAILURE TO RESOLVE HOSTNAME(*hostname*)

**Explanation**: The SNMP interface failed to resolve the host name *hostname*. *hostname* is the identity of the SNMP destination.

SNMP interface processing is discontinued.

**Corrective Action**: Contact BMC Software Customer Support.

**SNMT0AE**: INVALID IPV6 SNMP DESTINATION ADDRESS *address*

**Explanation**: The destination address of a DO SHOUT SNMP or DO SNMP contains the colon (:) character, but the address is not a syntactically valid IPv6 address.

**Corrective Action**: Correct the address. If you specified an IPv4-mapped IPv6 address, change it to an IPv4 address. See message ECAP9UE for more examples.

**SNMT0BE**: IPV6 NOT ACTIVE ON SYSTEM

**Explanation**: The destination address of a DO SHOUT SNMP or DO SNMP contains the colon (:) character, but TCP/IP IPv6 support is not active on the z/OS system.

**Corrective Action**: If IPv6 is not active, then specify only IPv4 addresses.
SNMT10S BIND() CALL FAILED, SNMP-MASTER-AGENT( hostname) ERRNO( errno.errno_id)

Explanation: The SNMP interface failed in the BIND() call.

- **errno** - the name of the internal TCP/IP event. For a description of possible values of **errno**, refer to the appropriate TCP/IP vendor documentation.
- **errno_id** - the numeric identity of the internal TCP/IP event. For a description of possible values of **errno_id**, refer to the appropriate TCP/IP vendor documentation.
- **hostname** - the hostname of the SNMP Master Agent

SNMP interface processing is discontinued.

Corrective Action: Note the value of **hostname**, **errno**, and **errno_id**, and contact BMC Software Customer Support.

SNMT11S SNMP-DPI PORT-QUERY SEND FAILED TO SNMP-MASTER-AGENT( hostname) ERRNO( errno.errno_id)

Explanation: The SNMP interface failed in the SENDTO() call to the SNMP Master Agent. This call includes the QUERY_DPI_PORT request, which gives in the reply the port on which the Master SNMP Agent listens for connections.

- **errno** - the name of the internal TCP/IP event. For a description of possible values of **errno**, refer to the appropriate TCP/IP vendor documentation.
- **errno_id** - the numeric identity of the internal TCP/IP event. For a description of possible values of **errno_id**, refer to the appropriate TCP/IP vendor documentation.
- **hostname** - the hostname of the SNMP Master Agent

SNMP interface processing is discontinued.

Corrective Action: Note the value of **hostname**, **errno**, and **errno_id**, and contact BMC Software Customer Support.

SNMT12S RECVFROM() CALL FAILED, SNMP-MASTER-AGENT( hostname) ERRNO( errno.errno_id)

Explanation: The SNMP interface failed in the RECVFROM() call to the SNMP Master Agent. This call receives the reply to the QUERY_DPI_PORT request, which gives in the reply, the port on which the Master SNMP Agent listens for connections.

- **errno** - the name of the internal TCP/IP event. For a description of possible values of **errno**, refer to the appropriate TCP/IP vendor documentation.
- **errno_id** - the numeric identity of the internal TCP/IP event. For a description of possible values of **errno_id**, refer to the appropriate TCP/IP vendor documentation.
- **hostname** - the hostname of the SNMP Master Agent

SNMP interface processing is discontinued.
Corrective Action: Note the value of hostname, errno, and errno_id, and contact BMC Software Customer Support.

SNMT13S NO REPLY TO SNMP-DPI PORT-QUERY FROM SNMP-MASTER-AGENT(hostname), PORT(udp-port)

Explanation: The SNMP interface did not receive, within 3 seconds, a reply to the QUERY_DPI_PORT request, which gives the port on which the Master SNMP Agent listens for TCP/IP connections.

- udp-port - the UDP port on which the SNMP Master Agent receives PORT-QUERY requests, which gives the port on which the Master SNMP Agent listens for TCP/IP connections.
- hostname - the hostname of the SNMP Master Agent

SNMP interface processing is discontinued.

Corrective Action: Note the value of hostname and udp-port, and contact BMC Software Customer Support.

SNMT14S COULD NOT RESOLVE SNMP-MASTER-AGENT(hostname)

Explanation: The SNMP interface failed to resolve the hostname hostname. In this message, hostname is the identity of the SNMP Master Agent host.

SNMP interface processing is discontinued.

Corrective Action: Contact BMC Software Customer Support.

SNMT15S INVALID SNMP-MASTER-AGENT IP ADDRESS(ip_address)

Explanation: The SNMP interface could not use the configured IP address of the SNMP Master Agent because it is an invalid IP address.

- ip_address - the IP address of the SNMP Master Agent.

SNMP interface processing is discontinued.

Corrective Action: Configure a valid IP address.

SNMT16S SOCKET(SOCK_STREAM) FAILED, ERRNO(errno.errno_id)

Explanation: The SNMP interface failed in the SOCKET() call.

- errno - the name of the internal TCP/IP event. For a description of possible values of errno, refer to the appropriate TCP/IP vendor documentation.
- errno_id - the numeric identity of the internal TCP/IP event. For a description of possible values of errno_id, refer to the appropriate TCP/IP vendor documentation.

SNMP interface processing is discontinued.

Corrective Action: Note the value of errno and errno_id, and contact BMC Software Customer Support.
INCONTROL for z/OS Messages Manual

SNMT17S IOCTL(FIONBIO) FAILED, ERRNO(errno.errno_id)

Explanation: The SNMP interface failed in the IOCTL() call, which attempted to set the socket to non-blocking.

- **errno** - the name of the internal TCP/IP event. For a description of possible values of `errno`, refer to the appropriate TCP/IP vendor documentation.
- **errno_id** - the numeric identity of the internal TCP/IP event. For a description of possible values of `errno_id`, refer to the appropriate TCP/IP vendor documentation.

SNMP interface processing is discontinued.

Corrective Action: Note the value of `errno` and `errno_id`, and contact BMC Software Customer Support.

SNMT18S SELECT() FAILED, ERRNO(errno.errno_id)

Explanation: The SNMP interface failed in the SELECT() call.

- **errno** - the name of the internal TCP/IP event. For a description of possible values of `errno`, refer to the appropriate TCP/IP vendor documentation.
- **errno_id** - the numeric identity of the internal TCP/IP event. For a description of possible values of `errno_id`, refer to the appropriate TCP/IP vendor documentation.

SNMP interface processing is discontinued.

Corrective Action: Note the value of `errno` and `errno_id`, and contact BMC Software Customer Support.

SNMT19S CONNECT() TO SNMP-MASTER-AGENT FAILED, ERRNO(errno.errno_id)

Explanation: The SNMP interface failed in the CONNECT() call to the SNMP Master Agent.

- **errno** - the name of the internal TCP/IP event. For a description of possible values of `errno`, refer to the appropriate TCP/IP vendor documentation.
- **errno_id** - the numeric identity of the internal TCP/IP event. For a description of possible values of `errno_id`, refer to the appropriate TCP/IP vendor documentation.

SNMP interface processing is discontinued.

Corrective Action: Note the value of `errno` and `errno_id`, and contact BMC Software Customer Support.

SNMT20S CONNECT() TO SNMP-MASTER-AGENT TIMEDOUT

Explanation: The SNMP interface CONNECT() call to the SNMP Master Agent timed out.

SNMP interface processing is discontinued.

Corrective Action: Contact BMC Software Customer Support.
SNMT21S SEND() DPI TO SNMP-MASTER-AGENT FAILED, ERRNO(errno.errno_id)

**Explanation:** The SNMP interface failed in the SEND() call to the SNMP Master Agent.

- **errno** - the name of the internal TCP/IP event. For a description of possible values of errno, refer to the appropriate TCP/IP vendor documentation.
- **errno_id** - the numeric identity of the internal TCP/IP event. For a description of possible values of errno_id, refer to the appropriate TCP/IP vendor documentation.

SNMP interface processing is discontinued.

**Corrective Action:** Note the value of errno and errno_id, and contact BMC Software Customer Support.

SNMT22S CONNECTION TO SNMP-MASTER-AGENT LOST

**Explanation:** The SNMP interface detected that the connection to the SNMP Master Agent has been lost. SNMP interface tries to re-establish connection with the SNMP Master Agent.

**Corrective Action:** No action is required.

SNMT23S UNEXPECTED RESPONSE FROM SNMP-MASTER-AGENT TO DPI PORT QUERY

**Explanation:** The SNMP interface received an un-recognized response from the SNMP Master Agent to the QUERY_DPI_PORT request.

SNMP interface processing is discontinued.

**Corrective Action:** Contact BMC Software Customer Support.

SNMT24I CONNECTION ESTABLISHED WITH SNMP-MASTER-AGENT ON HOST(hostname) PORT(port)

**Explanation:** The SNMP interface established a TCP/IP connection with the SNMP Master Agent.

- **hostname** - the hostname of the SNMP Master Agent
- **port** - the TCP/IP port of the SNMP Master Agent

**Corrective Action:** No action is required.

SPG messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.
Messages SPG0 through SPG0xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

SPG008E INTERNAL ERROR - SPGB PARAMETER ADDRESS IS ZERO

**Explanation:** While a report was being viewed online during processing of the SPAGE command, an internal error occurred. The SPGB parameter address was found to be 0.

The SPAGE command is not processed.

**Corrective Action:** Do the following:

1. Record the following information:
   - the text of this message
   - the IOA products that are installed at your site
   - all the messages in the IOA log that relate to the report that was being viewed when the error occurred
   - your actions while the report was being viewed, reconstructed as far as possible

2. Contact BMC Software Customer Support.

SPG012E UNABLE TO OBTAIN STORAGE FOR INITIAL SPAGE BLOCK

**Explanation:** An internal error occurred while a report was being viewed on line during processing of the SPAGE command. Storage could not be obtained for the initial SPAGE block.

The SPAGE command is not processed.

**Corrective Action:** Increase the region size and retry the SPAGE command.

SPG016E UNABLE TO OBTAIN PROGRAM WORK AREA STORAGE

**Explanation:** An internal error occurred while a report was being viewed on line during processing of the SPAGE command. Storage could not be obtained for the program work area.

The SPAGE command is not processed.

**Corrective Action:** Increase the region size and retry the SPAGE command.

SPG020E INTERNAL ERROR - REPORT RECORD PARAMETER ADDRESS IS ZERO

**Explanation:** An internal error occurred while a report was being viewed on line during processing of the SPAGE command. The RECORD parameter address was found to be 0.

The SPAGE command is not processed.

**Corrective Action:** Do the following:

1. Record the following information:
   - the text of this message
   - the IOA products that are installed at your site
all the messages in the IOA log that relate to the report that was being viewed when the error occurred

your actions while the report was being viewed, reconstructed as far as possible

2. Contact BMC Software Customer Support.

SPG024E SECURITY EXIT DENIED ACCESS TO THE SPAGE COMMAND

**Explanation:** You are not authorized to use the SPAGE command.

The SPAGE command is not processed.

**Corrective Action:** Notify your INCONTROL administrator.

SPG028E UNABLE TO RELEASE EXCESS STORAGE OF EXISTING SPAGE BLOCK

**Explanation:** An internal error occurred while a report was being viewed on line during processing of the SPAGE command. The excess storage of the existing space block could not be released.

The SPAGE command is not processed.

**Corrective Action:** Do the following:

1. Record the following information:
   - the text of this message
   - the IOA products that are installed at your site
   - all the messages in the IOA log that relate to the report that was being viewed when the error occurred
   - your actions while the report was being viewed, reconstructed as far as possible

2. Contact BMC Software Customer Support.

SPG032E UNABLE TO OBTAIN STORAGE FOR EXTENDED SIZE SPAGE BLOCK

**Explanation:** An internal error occurred while a report was being viewed on line during processing of the SPAGE command. The excess storage of the extended size space block could not be released.

The SPAGE command is not processed.

**Corrective Action:** Increase the region size and retry the command.

SPG036E UNABLE TO RELEASE STORAGE OF COPIED SPAGE BLOCK

**Explanation:** An internal error occurred while a report was being viewed on line during processing of the SPAGE command. The excess storage of the copied space block could not be released.

The SPAGE command is not processed.

**Corrective Action:** Do the following:

1. Record the following information:
   - the text of this message
INCONTROL for z/OS Messages Manual

- the IOA products that are installed at your site
- all the messages in the IOA log that relate to the report that was being viewed when the error occurred
- your actions while the report was being viewed, reconstructed as far as possible

2. Contact BMC Software Customer Support.

SPG040E  INTERNAL ERROR - FUNCTION ID PARAMETER ADDRESS IS ZERO

**Explanation:** An internal error occurred while a report was being viewed on line during processing of the SPAGE command. The function ID parameter address was found to be 0.

The SPAGE command is not processed.

**Corrective Action:** Do the following:

1. Record the following information:
   - the text of this message
   - the IOA products that are installed at your site
   - all the messages in the IOA log that relate to the report that was being viewed when the error occurred
   - your actions while the report was being viewed, reconstructed as far as possible

2. Contact BMC Software Customer Support.

SPG044E  INTERNAL ERROR - FUNCTION ID CODE IS INVALID

**Explanation:** An internal error occurred while a report was being viewed on line during processing of the SPAGE command. The function ID code was found to be invalid.

The SPAGE command is not processed.

**Corrective Action:** Do the following:

1. Record the following information:
   - the text of this message
   - the IOA products that are installed at your site
   - all the messages in the IOA log that relate to the report that was being viewed when the error occurred
   - your actions while the report was being viewed, reconstructed as far as possible

2. Contact BMC Software Customer Support.

SPG048E  INTERNAL ERROR - WORD COUNT PARAMETER ADDRESS IS ZERO

**Explanation:** An internal error occurred while a report was being viewed on line during processing of the SPAGE command. The WORD COUNT parameter address was found to be 0.

The SPAGE command is not processed.
Corrective Action: Do the following:

1. Record the following information:
   - the text of this message
   - the IOA products that are installed at your site
   - all the messages in the IOA log that relate to the report that was being viewed when the error occurred
   - your actions while the report was being viewed, reconstructed as far as possible
2. Contact BMC Software Customer Support.

SPG052E I NTERNAL ERROR - CURRENT PAGE PARAMETER ADDRESS IS ZERO

Explanation: An internal error occurred while a report was being viewed on line during processing of the SPAGE command. The CURRENT PAGE parameter address was found to be 0.

The SPAGE command is not processed.

Corrective Action: Do the following:

1. Record the following information:
   - the text of this message
   - the IOA products that are installed at your site
   - all the messages in the IOA log that relate to the report that was being viewed when the error occurred
   - your actions while the report was being viewed, reconstructed as far as possible
2. Contact BMC Software Customer Support.

SPG056 E PARAMETER NOT RECOGNIZED - CORRECT THE COMMAND AND TRY AGAIN

Explanation: While a report was being viewed on line during processing of the SPAGE command, a parameter was not recognized.

The SPAGE command is not processed.

Corrective Action: Correct the parameter in the command and retry the command.

SPG060 E I NTERNAL ERROR - WORD LIST PARAMETER ADDRESS IS ZERO

Explanation: An internal error occurred while a report was being viewed on line during processing of the SPAGE command. The WORD LIST parameter address was found to be 0.

The SPAGE command is not processed.

Corrective Action: Do the following:

1. Record the following information:
   - the text of this message
the IOA products that are installed at your site
all the messages in the IOA log that relate to the report that was being viewed when the error occurred
your actions while the report was being viewed, reconstructed as far as possible

2. Contact BMC Software Customer Support.

SPG064E  INVALID PARAMETER LENGTH - CORRECT THE COMMAND AND TRY AGAIN

Explanation: While a report was being viewed on line during processing of the SPAGE command, the length of a parameter was found to be invalid.
The SPAGE command is not processed.
Corrective Action: Correct the length of the problematic parameter and retry the command.

SPG068E  INVALID PAGE NUMBER - SPECIFY A NUMBER FROM 1 TO 99999999

Explanation: While a report was being viewed on line during processing of the SPAGE command, the number of a page was found to be invalid.
Page numbers in the SPAGE command must be in the range from 1 through 99999999.
The SPAGE command is not processed.
Corrective Action: Correct the problematic page number and retry the command.

SPG072E  START PAGE NUMBER MUST BE SPECIFIED BEFORE END PAGE NUMBER

Explanation: While a report was being viewed on line during processing of the SPAGE command, the number of the end page was found to have been specified before the number of the start page.
In the SPAGE command, the start page number must appear before the end page number.
The SPAGE command is not processed.
Corrective Action: Correct the problematic page number and retry the command.

SPG076E  START PAGE NUMBER MUST NOT BE GREATER THAN END PAGE NUMBER

Explanation: While a report was being viewed on line during processing of the SPAGE command, the specified start page number was found to be greater than the specified end page number.
In the SPAGE command, the start page number must be less than the end page number.
The SPAGE command is not processed.
Corrective Action: Correct the problematic page number and retry the command.
SPG080E  INTERNAL ERROR - SECURITY EXIT CALL ROUTINE ADDRESS IS ZERO

**Explanation:** An internal error occurred while a report was being viewed on line during processing of the SPAGE command. The security exit call routine address was found to be 0.

The SPAGE command is not processed.

**Corrective Action:** Do the following:

1. Record the following information:
   - the text of this message
   - the IOA products that are installed at your site
   - all the messages in the IOA log that relate to the report that was being viewed when the error occurred
   - your actions while the report was being viewed, reconstructed as far as possible

2. Contact BMC Software Customer Support.

SPG084E  INTERNAL ERROR - SECURITY EXIT FUNCTION ID ADDRESS IS ZERO

**Explanation:** An internal error occurred while a report was being viewed on line during processing of the SPAGE command. The security exit function ID address was found to be 0.

The SPAGE command is not processed.

**Corrective Action:** Do the following:

1. Record the following information:
   - the text of this message
   - the IOA products that are installed at your site
   - all the messages in the IOA log that relate to the report that was being viewed when the error occurred
   - your actions while the report was being viewed, reconstructed as far as possible

2. Contact BMC Software Customer Support.

SPG088E  START PAGE NUMBER GREATER THAN NUMBER OF PAGES IN THE REPORT

**Explanation:** An internal error occurred while a report was being viewed on line during processing of the SPAGE command. The specified start page number was found to be greater than the number of pages in the report.

The SPAGE command is not processed.

**Corrective Action:** Correct the problematic page number and retry the command.
INCONTROL for z/OS Messages Manual

SPG092E INTERNAL ERROR - SPAGE COMMAND IS NOT SUPPORTED FOR $SYSDATA RECORDS

**Explanation:** An internal error occurred while a report was being viewed on line during processing of the SPAGE command.

The SPAGE command does not support $SYSDATA records.

The SPAGE command is not processed.

**Corrective Action:** Exit from the $SYSDATA record, reenter a User record, and retry the SPAGE command.

SPY messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages SPY100 through SPY1xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

SPY1A0I JOB jobName OID=orderId JOBID CHANGED FROM jobId1 TO jobId2

**Explanation:** This information message indicates that an NJE job was given a new JES job ID.

NJE jobs are sometimes given a new JES job ID which is different than the original one, because the original job id has been taken by another job, or by a spin-off data set of the same job.

The JES job ID of the job is updated to reflect the change.

**Corrective Action:** No action is required.

Messages SPY200 through SPY2xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

SPY250I CONTROL-M IS TERMINATING. TERMINATION SHOULD BE COMPLETED IN LESS THAN TWO MINUTES

**Explanation:** Highlighted, unrollable message.

This information message indicates that the Control-M monitor is about to shut down because of an internal problem. Due to a unique situation, the termination process may take longer than usual.

Control-M monitor will shut down after approximately one minute.
Corrective Action: Do not cancel the Control-M monitor. If it does not shut down after 5 minutes, cancel it with DUMP, prepare the Control-M monitor full output, and notify BMC Customer Support. Find out why the Control-M monitor shut down and start it again as soon as possible.

SPY251I  SPY STARTED
Explanation: This information message is generated when the Control-M monitor internal SPY task is started.
Corrective Action: No action is required.

SPY252S  taskType memName jobName /jobId OID=orderId SEVERE INTERNAL ERROR
Explanation: Severe Control-M monitor internal error while processing the above mentioned job order. Control-M monitor will abend with user code 0006. The internal task CTMSPY will abend with user code 0040.
Corrective Action: Control-M Log should contain additional messages describing the type of error.

SPY253E  taskType memName jobName /jobId OID=orderId NOT FOUND IN QUEUE num TIMES
Explanation: Control-M monitor searched number times but did not find the job in the JES queue.
Possible causes are:
- Someone has purged the job (before, during or after execution).
- The user tried to activate a started task that does not exist in the Procedures library.
- The user activated a started task, but the JES parameter STCMCLAS is directed to a non-print output class. See the section on Started Tasks in the Control-M Installation Considerations section in the INCONTROL for z/OS Installation Guide.
- The job/STC has been sent to another NJE node while the Control-M NJE option has not been installed.
- The jobs output has been read by an external writer before the Control-M monitor has managed to read it. See the section on the Control-M Operational Parameter - HLDCLAS, in the INCONTROL for z/OS Installation Guide.

The job will finish with status Disappeared. The event code is JLOST.
Corrective Action: Check the reason for the disappearance of the job/STC and correct it. Make sure that no-one purges the output of Control-M jobs. (Only cancel commands should be allowed.)

SPY254I  taskType memName jobName /jobId OID=orderId SEVERE SCANNED
Explanation: This information message is generated when the Control-M monitor finishes processing the job’s output.
Corrective Action: No action is required.
SPY255S taskType memName jobName /jobId OID=orderId CONTROL-M SHUTTING DOWN - SEVERE ERROR WHILE PROCESSING JOB SYSOUT

**Explanation:** Highlighted, unrollable message.

Control-M monitor had a severe error while reading the output of the job and is shutting down.
Control-M monitor will shut down.

**Corrective Action:** Check the contents of the IOA Log for prior messages that will clarify the picture. If you cannot correct the reason, and whenever you start the Control-M monitor, the monitor shuts down again for the same reason, then enter screen 3 of the Online Facility and hold the job order. Prepare the Control-M monitor full output and contact BMC Customer Support.

SPY256S taskType memName jobName /jobId OID=orderId CONTROL-M SHUTTING DOWN - COMMUNICATION TO "JES" NOT AVAILABLE

**Explanation:** Highlighted, unrollable message.

The Control-M monitor detected some problem in communication to JES, and shuts down as a precaution. The Control-M monitor is usually one of the first components of the computer environment to detect problems in JES operation. Usually this is because JES was brought down, or is about to get stuck because of an internal JES problem.
The Control-M monitor will shut down.

**Corrective Action:** Correct the JES problem and restart the Control-M monitor.

SPY257E taskType memName jobName /jobId OID=orderId DISAPPEARED BECAUSE OF CONTROL-M SHUT DOWN

**Explanation:** A started task had been started by the Control-M monitor, but had not yet been assigned a job number by the JES, when the Control-M monitor was forced to shut down. When the Control-M monitor was brought up, it considered the output as lost.
The status of the started task will be Disappeared.

**Corrective Action:** Check very carefully. Maybe the started task did run while the Control-M monitor was down. If so, you have to notify Control-M manually of the results.

SPY258S taskType memName jobName/blank OID=orderId INSUFFICIENT MEMORY FOR CONTROL-M MONITOR

**Explanation:** Highlighted, unrollable message.

Insufficient memory for Control-M monitor to trace a started task.
The started task has just been initiated by the Control-M monitor, and the Control-M monitor requires a small work area in order to try to locate the job ID assigned by JES to the started task. Unfortunately, there is insufficient memory for the required work area.
The Control-M monitor will try again after a few seconds (it is possible that memory will be released by other components of the Control-M monitor). Meanwhile, the started task will remain with a STARTED status and the job ID is “blank.” Under severe circumstances of this event, the Control-M monitor may shut down.
Corrective Action: Increase the Control-M monitor region size and start it again. You are working on the limits.

SPY259I SHUT DOWN UPON REQUEST OF MAIN TASK

Explanation: This information message announces the shut down of the Control-M monitor.
Shut down of Control-M internal spy task by a request of Control-M main task.
Control-M monitor will shut down.

Corrective Action: No action is required.

SPY270E taskType memName jobName/jobId OID=orderId SYSOUT action FAILED [FROM=class][DSN=dsn] [SECURITY VIOLATION]

Explanation: A sysout operation on the job’s output has failed. SECURITY VIOLATION is displayed if, during an ARCHIVE attempt, the IOASE32 security module does not allow the allocation of the archive data set specified by DSN=dsn.

The failing action can be:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RELEASE</td>
<td>Release the sysout.</td>
</tr>
<tr>
<td>DELETE</td>
<td>Delete (purge) the sysout.</td>
</tr>
<tr>
<td>NEWCLASS==&gt;class</td>
<td>Change sysout class (to the specified class).</td>
</tr>
<tr>
<td>NEWDEST==&gt;destination</td>
<td>Change sysout destination to the specified destination.</td>
</tr>
<tr>
<td>ARCHIV</td>
<td>Copy the sysout to a data set.</td>
</tr>
</tbody>
</table>

- The FROM= class appears when the sysout operation will be limited to a specified class (not on all the held sysouts).
- The DSN= dsn designates the data set name used for the archiving action.

The sysout operation will not be executed, but it will not affect the finishing status of the job (OK or NOTOK).

Corrective Action: Look for a previous message that will clarify the reason for the failure. You will have to execute the sysout operation manually (until next time).

SPY271E taskType memName jobName/jobId OID=orderId SYSOUT DDNAME "OUT180" OPEN OF DDNAME "OUT180" FAILED

Explanation: Highlighted, unrollable message.
Open of Control-M work data set described by the OUT180 DD statement failed.
This may be due to the following:
The OUT180 DD statement is missing.
The OUT180 DD statement cannot be opened for sequential processing.
The Control-M monitor will shut down with an error message.

**Corrective Action:** Correct the JCL for the Control-M monitor and start it again.

**SPY272E** taskType memName jobName/jobId d OID=orderId INTERNAL STACK CAPACITY OVERFLOW. SEE MESSAGES AND CODES FOR REQUIRED ACTION

**Explanation:** Control-M monitor internal job events stack capacity exceeded.

When Control-M monitor analyzes the job's output, all the execution events such as condition codes, abend codes, user defined codes, and so on, are accumulated in a stack (in memory). For some reason the stack became full, and Control-M monitor cannot finish analyzing the job's results. This can happen because of:

- A loop in user exit CTMX003 (which is capable of adding events to the stack).
- An internal error in the Control-M monitor.

Message SPY278E will be issued. The job will finish with ENDED NOT OK - REASON UNKNOWN status.

**Corrective Action:** Ask your system programmer to check Control-M exit CTMX003. If this does not solve the problem, call BMC Software Customer Support. Keep the sysout of the job causing the problem in hold status so further testing can be carried out.

**SPY273E** taskType memName jobName/jobId d INTERNAL ERROR. RBA=rba INVALID "CODES"- SEE MESSAGES AND CODES FOR REQUIRED ACTION

**Explanation:** Internal error in the operation of Control-M monitor.

Invalid data discovered in the job order which resides in the rba in the Active Jobs file. It can be due to the following:

- A Control-M user exit incorrectly modified the job order.
- Someone incorrectly modified the Active Jobs file.
- A chain of unexpected processing errors occurred prior to this event.
- Internal Control-M monitor error.

SPY278E message will follow, and the job will finish with ENDED NOT OK - REASON UNKNOWN status.

**Corrective Action:** Check the IOA Log. If there are previous severe errors regarding this job, they are probably the cause of the problem. Correct them and the problem should be resolved. Otherwise, have your system programmer call BMC Software Customer Support for assistance. The IOA representative will need a copy of the Active Jobs file.

**SPY275E** OID=orderId NOT CATLGD x ON DSNAME dsn

**Explanation:** A NOT CATLGD 2 (or NOT RECTLGD 2) event has occurred during job execution on data set dsn.
The default of this event is NOTOK for the entire job. The user may specify an ON STEP ANYSTEP CODES *NCT2 DO OK to signify that the event NCT2 (NOT CATLGD 2) is considered OK for this job.

The status of the job will be according to user definition.

**Corrective Action:** No action is required.

**SPY276E** taskType memName jobName/jobId d OID=orderId READING SYSOUT FAILED

**Explanation:** Reading of job’s sysout failed.

Control-M failed to read the job’s output.

The job will finish with status FAILED - REASON UNKNOWN (the event *UKNW).

**Corrective Action:** Check the IOA Log for additional messages which will clarify the reason for the problem.

**SPY277E** taskType memName jobName/jobId d OID=orderId INTERNAL ERROR INVALID SYSOUT OPTION_opt. SEE MESSAGES AND CODES FOR REQUIRED ACTION

**Explanation:** Internal error in the operation of Control-M monitor.

Invalid data discovered in the job order. It can be due to the following:

- Control-M user exit incorrectly modified the job order.
- Someone incorrectly modified the Active Jobs file.
- A chain of unexpected processing errors occurred prior to this event.
- Internal Control-M monitor error.

**Corrective Action:** Check the IOA Log. If there are previous severe errors regarding this job, they are probably the cause of the problem. Correct them and the problem should be resolved. Otherwise, have your system programmer call BMC Software Customer Support for assistance. The IOA representative will need a copy of the Active Jobs file.

**SPY278E** taskType memName jobName/jobId d OID=orderId OUTPUT PROCESSING FAILED

**Explanation:** General message when the processing of the output of the job fails.

The Control-M should contain additional messages concerning the reasons.

Determined by the problem which has caused the failure.

**Corrective Action:** Check the IOA Log for additional messages.

**SPY279I** taskType memName jobName/jobId d OID=orderId SYSOUT action [FROM=class] [DSN=dsn]

**Explanation:** This information message is the result of a successful sysout operation on the job’s sysout.
The sysout operation can be:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RELEASED</td>
<td>Release the sysout.</td>
</tr>
<tr>
<td>DELETED</td>
<td>Delete (purge) the sysout.</td>
</tr>
<tr>
<td>NEWCLASS==&gt;class</td>
<td>Change sysout class (to the specified class).</td>
</tr>
<tr>
<td>NEWDEST==&gt;destination</td>
<td>Change sysout destination (to the specified destination).</td>
</tr>
<tr>
<td>ARCHIVED</td>
<td>Copy the sysout to a data set</td>
</tr>
</tbody>
</table>

- The FROM=class will appear when the sysout operation will be limited to a specified class (not on all the held sysouts).
- The DSN=dsn will designate the data set name used for the archiving action.

Corrective Action: No action is required.

**SPY27AI**  
OID=orderId  
CYCLING STOPPED BY "DO STOPCYCL" STATEMENT

Explanation: A DO STOPCYCL statement in a job scheduling definition caused Control-M to stop cycling a job.

Control-M stops initiating the job at regular intervals when it encounters a DO STOPCYCL statement.  
Control-M stops cycling the job and reports the status of the job as OK or NOTOK, depending on the last run of the job.

Corrective Action: To resume cycling of the job, issue a RERUN or RESTART statement for the job from the Active Environment screen.

**SPY27CW**  
step/range stepName.procstepName / stepsRangeNname  
REFERENCED BY "ON PGMST" DOESN'T MATCH ANY STEP IN J CL OF JOB

Explanation: The installation parameter DEFSTEP=Y is specified in the CTMPARM member and the step/range referenced by the ON PGMST statement in the job definition does not match any step in the job's JCL.

The 'Post-Processing Failed' characteristic is added to the job's status in Control-M.

Corrective Action: Check the JCL of job and its corresponding job definition. If one of them was changed, the other one should be corrected accordingly.

**SPY280W**  
taskType memName jobName/jobId OID=orderId  
duser message

Explanation: A user message to the Control-M Log.

The message is created by user exit CTMX003.

The exit is activated during the Control-M sysout scan. If you do not understand the meaning of the message, consult your INCONTROL administrator.
Corrective Action: No action is required.

SPY281I taskType memName jobName/jobId OID=orderId START start_daytime STOP end_daytime CPU nnnn MIN ss SEC SRB nnnn MIN ss SEC elapsed_time initiator_num class systemId user_data

Explanation: This information message displays a statistical record containing job and group execution statistics.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_daytime</td>
<td>Start time of the job as Julian date + hour + minutes.</td>
</tr>
<tr>
<td>end_daytime</td>
<td>Termination time of the job as Julian date + hour + minutes.</td>
</tr>
<tr>
<td>CPU</td>
<td>CPU time in minutes and seconds.</td>
</tr>
<tr>
<td>SRB</td>
<td>SRB time in minutes and seconds.</td>
</tr>
</tbody>
</table>

The information described above is taken from the job’s output statistical messages (IEF375I, IEF376I).

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elapsed-time</td>
<td>Elapsed time in minutes and hundredths of a minute.</td>
</tr>
<tr>
<td>initiator-num</td>
<td>Initiator number</td>
</tr>
<tr>
<td>class</td>
<td>Class in which the job executed.</td>
</tr>
<tr>
<td>systemId</td>
<td>4-character system identifier (where the job executed).</td>
</tr>
<tr>
<td>userData</td>
<td>Statistical information optionally added by user exit CTMX003.</td>
</tr>
</tbody>
</table>

If taskType is GRP, this message represents group execution statistics. However:

- the CPU and SRB times will be zero,
- the elapsed time is the time between the start of the first job in the group entity until the end of the last job in the group entity, and
- the class, initiator_num, systemId and user-data fields will be blank.

Corrective Action: No action is required.

SPY283I taskType memName jobName/jobId OID=orderId RE-QUEUED FOR EXECUTION ON STEP step ($EJ COMMAND)

Explanation: This information message indicates that the job has been requeued for execution by operator command $EJ (JES2) or has been restarted (JES3 message IAT2006).
This message is recorded for each “requeue” (restart) event during the lifetime of the job. It is an informative message.

**Corrective Action:** No action is required.

**SPY287I OID=orderId JOB SYSOUT WAS PURGED SUCCESSFULLY**

**Explanation:** This information message indicates that Control-M cancelled a job submission and purged the job sysout.

During AutoEdit resolution an in-use data set was encountered, such as a `%%INCLUDE` statement specified for a data set that is in use. Control-M purged the job sysout because an attempt will be made to resubmit the job.

Control-M will attempt to resubmit the job.

**Corrective Action:** No action is required.

**SPY288W OID=orderId SUBSYSTEM REQUEST TO PURGE JOB SYSOUT FAILED**

**Explanation:** Control-M cancelled a job submission, but did not manage to purge the job sysout.

During AutoEdit resolution an in-use data set was encountered, such as a `%%INCLUDE` statement specified for a data set that is in use. Control-M tried to purge the job sysout because an attempt will be made to resubmit the job.

Control-M will attempt to resubmit the job.

**Corrective Action:** Manually purge the job sysout for the failed job.

**SPY289E CONTROL-M EXTENDED MCS TRACKING STOPPED. RC=rc**

**Explanation:** Highlighted, unrollable message.

A system error occurred when Control-M monitor attempted an extended MCS console operation. Control-M stops using the extended MCS console.

**Corrective Action:** Check for a preceding system or IOA message related to this message, and proceed accordingly.

**SPY28AE OID=orderId CTMCJ I INTERNAL ERROR. RC=rc, REASON=rsn, JOBID=jobId**

**Explanation:** An internal error occurred when an NJE job with a changed job ID was being processed. The process of the job is aborted.

**Corrective Action:** Call BMC Software Customer Support with the following data: Job SYSDATA files (the first 3 files of the job created by the system), the IOA Log file for that job, and the message text showing the exact RC, REASON and JOBID.
SPY28GI OID=orderid TAPE DRIVE UNITS USED=nn nn nn nn nn nn nn nn
Explanation: This information message provides statistical information on the tape drive usage of a job. At the end of each job execution, the job log is checked to evaluate tape drive usage. The UNITDEF member of the Control-M PARM library is used to associate logical names to physical resources (meaning tape drive units). UNITDEF sorts tape drive unit addresses into twelve groups or less.

The variables in this message are:

- **orderId** - the order ID of the job
- **nn** - The number of tape drives in each group used by the tape drive. In the message, each tape drive group is identified by its order after USED (for example, the first group corresponds to the first nn).

Corrective Action: No action is required.

SPY28HW OID=orderid AUTO TAPE DRIVE RESOURCE ADJUSTMENT IS BYPASSED DUE TO PREVIOUS MESSAGE
Explanation: Resource adjustment for the Automatic Tape Adjustment facility was bypassed for current job end processing.

An error occurred during resource adjustment for the Automatic Tape Adjustment facility. The reason is described in the preceding message.

Job end processing continues without tape drive adjustment.

Corrective Action: Check the reason described in the preceding message.

SPY28JE OID=orderid ERROR ANALYZING PARM MEMBER "UNITDEF" AT LINE lineNum
Explanation: An error was detected in the specified line of UNITDEF. There is probably a syntax error.

The Automatic Tape Adjustment facility is turned OFF for the job, and processing continues.

Corrective Action: To implement automatic tape adjustment, correct the error in the specified line and restart Control-M.

SPY28KW OID=orderid DAUNITDF DD CARD MISSING
Explanation: There is no valid DD statement that points to UNITDEF.

Either the statement is missing or it contains a syntax error.

The Automatic Tape Adjustment facility is turned OFF for the current job, and processing continues.

Corrective Action: To implement automatic tape adjustment, correct the DD statement that points to UNITDEF and restart Control-M.
SPY28LS OID=orderId GETMAIN FAILED IN CTMATD AUTO TAPE PROCESSING

**Explanation:** There is not enough memory to perform Automatic Tape adjustment.
The region may be too small.
The Automatic Tape Adjustment facility is turned OFF for the current job, and processing continues.

**Corrective Action:** To implement automatic tape adjustment, increase the size of the region and restart Control-M. If there still is not enough memory, contact your local systems analyst.

SPY28ME OID=orderId TAPE UNIT unitId IS NOT DEFINED IN "UNITDEF" MEMBER

**Explanation:** During Automatic Tape Adjustment facility processing, a Tape Unit address was specified in the job log. However, this unit address was not defined in the UNITDEF member.
Resource adjustment for the Automatic Tape Adjustment facility of Control-M was unable to assign Tape Unit address unitId to a defined tape drive type.
The unknown tape drive is ignored for the job and processing continues.

**Corrective Action:** Check the UNITDEF member of the Control-M PARM library. Verify that the unit address is properly defined.

SPY28NI NEW TAPE DRIVE DEFINITION IS LOADED PER OPERATOR REQUEST

**Explanation:** This information message indicates that a fresh copy of the UNITDEF member is now in use.
A new copy of the UNITDEF member was loaded in response to modify command F.

**Corrective Action:** No action is required.

Messages SPYD00 through SPYDxx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

SPYD55S OID=orderId SYSOUT ARCHIVING FAILED

**Explanation:** Highlighted, unrollable message.
The Control-M monitor failed to archive SYSDATA for the job. This message is preceded by other messages detailing the nature of the error.
Control-M terminates processing.

**Corrective Action:** Do the following:
1. Please refer to the preceding messages and follow the steps recommended in the description of those messages.
2. Start the Control-M monitor again. If the problem persists, report it to your INCONTROL administrator, who should prepare the Control-M monitor full output and contact BMC Customer Support.

SRV messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages SRV100 through SRV1xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

SRV100I srvr - IOA ARCHIVE SERVER INITIALIZATION STARTED

Explanation: This information message indicates that the IOA Archive Server has started and is currently building the required internal environment.

Corrective Action: No action is required.

SRV101E srvr - IOA ARCHIVE SERVER INITIALIZATION FAILED RC rc IN STEP step

Explanation: The IOA Archive Server encountered an internal error. The cross-memory environment could not be established.

The IOA Archive Server shuts down.

Corrective Action: Activate the Control-D subsystem. If it is already active, deactivate then reactivate it. Try to reactivate the IOA Archive server. If this does not help, check for other system messages that might clarify the cause of the problem and precede accordingly. If these measures are of no avail, record the return code, step name and all other related messages and contact BMC Software Customer Support.

SRV102E srvr - IOA ARCHIVE SERVER NOT APF-AUTHORIZED

Explanation: The IOA Archive Server is not APF (Authorized Programming Facility) authorized. The IOASSRV module is not in an APF authorized library or does not have attribute AC=1.

The IOA Archive Server terminates with a return code of 8.

Corrective Action: Add the name of the library in which the IOASSRV module resides to the IEAAPF00 member in the SYS1.PARMLIB library.

SRV103E srvr - COMMAND FAILED - cmdText

Explanation: An invalid command or parameter was passed to the IOA Archive Server by an operator MODIFY command. This message is accompanied by another message that indicates why the command failed.

The MODIFY command is not executed.

Corrective Action: See the accompanying message, which indicates why the command failed.
SRV104S srvr BDL/LD FAILED FOR THE MODULE modName

Explanation: Loading of the modName module failed. Possible causes are:

- There is insufficient memory.
- Another system-oriented cause may be found in the system log.

The IOA Archive Server terminates with a return code of 8.

Corrective Action: Check the system job log for more information. If the problem persists, contact BMC Software Customer Support.

SRV105S srvr - UNRECOVERABLE ERROR ENCOUNTERED

Explanation: An unrecoverable error occurred in the operation of the IOA Archive Server.

The IOA Log file should contain a previous message about the error.

The IOA Archive Server shuts down.

Corrective Action: Check the accompanying message in the IOA Log file. Contact your system programmer for assistance. If the problem is not resolved, contact BMC Software Customer Support.

SRV106S srvr - MEDIA mediaName HAS ABENDED

Explanation: An IOA Archive Server internal subtask abended.

The IOA Log file and system log should contain previous messages about this error.

The IOA Archive Server issues an implicit START command for this media. Attempts are made to initialize media mediaName and continue normal processing. If these attempts fail, the IOA Archive Server sets the status of the abended media to never active and this media becomes unavailable for use by the IOA Archive Server.

Corrective Action: Check the IOA Log file and system log for additional messages which may indicate why media mediaName abended. If the problem is not resolved, contact BMC Software Customer Support.

SRV107I srvr - SHUT DOWN UPON REQUEST FROM OPERATOR

Explanation: This information message indicates that the IOA Archive Server is shutting down upon operator's request.

Corrective Action: No action is required.

SRV108E srvr - REASON: COMMAND IS INVALID

Explanation: An invalid command was passed to the IOA Archive Server. This message follows message IOA103E or SRV103E, which contains the text of the failed command.

The MODIFY command is not executed.

Corrective Action: For more information, refer to the section that describes the IOA Archive Server in the Control-D and Control-V User Guide. Enter a valid MODIFY command.
INCONTROL for z/OS Messages Manual

SRV109S srvr - MEDIA TYPE media_type IS INVALID OR NOT SUPPORTED

Explanation: The IOA Archive Server encountered an invalid or unsupported media type specified in the IOASPRM member (IOA Archive Server Installation Parameters).

The media type specified in the IOASPRM member should match one of the supported media types specified in the IOA Archive Server Program List (the IOASPROG member).

The IOA Archive Server terminates with a return code of 8.

Corrective Action: For more information about currently supported media types, refer to the section on how to set IOA Archive Server Installation Parameters in the INCONTROL for z/OS Installation Guide. Correct the media type in the IOASPRM member (IOA Archive Server Installation Parameters). Start the IOA Archive Server again. If the problem is not resolved, contact BMC Software Customer Support.

SRV10AS srvr - SERVER NAME IS NOT EQUAL TO THE PROCNAME SPECIFIED IN IOASPRM

Explanation: Highlighted, unrollable message.

The name of IOA Archive Server does not match the value of the PROCNAME parameter in the IOASPRM member. The name of the IOA Archive Server must be the same as the value of the PROCNAME IOA Archive Server Installation Parameter in the IOASPRM member.

The IOA Archive Server terminates with a return code of 8.

Corrective Action: Use the correct IOA Archive Server name or correct the value of the PROCNAME parameter. Restart the IOA Archive Server.

SRV10BI srvr - IOA ARCHIVE SERVER SHUTTING DOWN

Explanation: Highlighted, unrollable message.

This information message indicates that the IOA Archive Server is shutting down due to operator command or due to internal events.

The IOA Log file should contain additional messages about the reason for shutting down the IOA Archive Server.

The IOA Archive Server shuts down.

Corrective Action: No action is required.

SRV10CS srvr - IOA ARCHIVE SERVER ENDED WITH ERROR

Explanation: An error caused the IOA Archive Server to terminate. The IOA Log file and system log file should contain additional messages identifying the specific error.

The IOA Archive Server shuts down.

Corrective Action: Check the IOA Log file and the system log for the reason. Contact your system programmer for assistance if needed.

SRV10DW srvr - YOUR IOA ARCHIVE SERVER IS ALREADY ACTIVE. QNAME qName

Explanation: Highlighted, unrollable message.
An attempt was made to start an IOA Archive Server which is already active. It is impossible to run two IOA Archive Servers with the same qName at the same time.

The newly-started IOA Archive Server with the same qName shuts down.

**Corrective Action:** No action is required.

**SRV10EE srvr - REASON: PARAMETER IS INVALID**

**Explanation:** An invalid parameter was passed to the IOA Archive Server by operator command MODIFY. This message follows the IOA103E or SRV103E message, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

**Corrective Action:** For more details, refer to the section that describes the IOA Archive Server in the Control-D and Control-V User Guide. Reissue the MODIFY command with valid parameters.

**SRV110E srvr - INSUFFICIENT STORAGE FOR INITIALIZATION RC=rc**

**Explanation:** There is insufficient memory to initiate or operate the IOA Archive Server.

The IOA Archive Server shuts down.

**Corrective Action:** Increase the IOA Archive Server REGION size. If the problem persists, record the return code and contact BMC Software Customer Support.

**SRV114S srvr - BLDL/ATTACH FAILED FOR MODULE modName**

**Explanation:** Initialization of an IOA Archive Server internal task failed.

Possible causes are:

- Insufficient memory to attach the task.
- The modName module does not exist in the LOAD library.

The IOA Archive Server terminates.

**Corrective Action:** Check the system log for additional messages which clarify the situation. Try one of the following:

- If the attach failed because of lack of memory, increase the REGION size in the IOA Archive Server procedure.
- If the IOA LOAD library does not contain the modName module, contact BMC Software Customer Support.

**SRV115E srvr - OPEN OF DDNAME ddName FAILED**

**Explanation:** Open of the ddName DD statement failed.

Possible causes are:

- The ddName DD statement is missing.
- The data set referenced by the ddName DD statement does not exist.

The IOA Archive Server terminates with a return code of 8.
Corrective Action: Correct the JCL and rerun the job.

SRV116W srvr - ALL MEDIA ARE INACTIVE
Explanation: Highlighted, unrollable message.
The IOA Archive Server issues this message when it determines that no active media are allocated to it.
Every media was terminated due to operator request or internal error. This message disappears when a START command is issued for any media.
The IOA Archive Server continues processing.
Corrective Action: If information about the status of a media is needed, issue a DISPLAY command.

SRV117I srvr - IOA ARCHIVE SERVER INITIALIZATION COMPLETE
Explanation: This information message indicates that the IOA Archive Server was successfully initialized.
Corrective Action: No action is required.

SRV118E srvr - REASON: MEDIA mediaName IS INCORRECT
Explanation: The media was specified in a MODIFY operator command, but was not defined in the IOASPRM member, which defines the IOA Archive Server Installation Parameters. This message follows message IOA103E or SRV103E, which indicates that operator command MODIFY failed and contains the text of the failed command.
The MODIFY command is not executed.
Corrective Action: For more details, refer to the section that describes the IOA Archive Server in the Control-D and Control-V User Guide. Reissue the MODIFY command with the correct media name.

SRV11AE srvr - REASON: MEDIA mediaName ALREADY INACTIVE
Explanation: An attempt was made to stop media mediaName which was already inactive. This message follows message IOA103E or SRV103E, which indicates that operator command MODIFY failed and contains the text of the failed command.
The MODIFY command is not executed.
Corrective Action: No action is required.

SRV11BE srvr - REASON: MEDIA mediaName ALREADY ACTIVE
Explanation: An attempt was made to start media mediaName which was already active. This message follows message IOA103E or SRV103E, which indicates that operator command MODIFY failed and contains the text of the failed command.
The MODIFY command is not executed.
Corrective Action: No action is required.

SRV11CE srvr - INITIALIZATION OF ALL MEDIA FAILED
Explanation: During initialization, the IOA Archive Server determined that initialization failed for all media specified in the IOASPRM member (IOA Archive Server Installation Parameters).
Every media was terminated due to an unrecoverable error. The IOA Log file should contain additional messages concerning specific errors.

The IOA Archive Server terminates with a return code of 8.

**Corrective Action:** Check the IOA Log file and the system log for messages describing the error. Contact the system programmer for assistance if needed. Start the IOA Archive Server again. If the problem is not resolved, contact BMC Software Customer Support.

**SRV11DW srvr - nn CYCLES PERFORMED WHILE WAITING FOR MEDIA INITIALIZATION TO BE COMPLETED**

**Explanation:** Highlighted, unrollable message.

The IOA Archive Server cannot complete the initialization phase. During IOA Archive Server initialization, a period of time equal to nn cycles elapsed before any media specified for use by the IOA Archive Server completed the initialization process. Each cycle is one IOA Archive Server sleeping interval, whose value in hundredths of a second is defined in the INTERVAL parameter in the IOASPRM member in the IOA Archive Server Installation Parameters.

The initialization of the IOA Archive Server is not completed.

**Corrective Action:** Check the IOA Log file and the system log for the cause of the problem. If the IOA Archive Server waits a long time for media to complete initialization, and the reason for the delay cannot be determined, issue the CANCEL command to stop the IOA Archive Server. Restart the IOA Archive Server. If the problem is not resolved, contact BMC Software Customer Support.

**SRV11EW srvr - nn CYCLES PERFORMED WHILE WAITING FOR MEDIA TO TERMINATE**

**Explanation:** The IOA Archive Server cannot complete the termination phase. During IOA Archive Server termination, a period of time equal to nn cycles elapsed before the media specified for use by the IOA Archive Server completed the termination process. Each cycle is one IOA Archive Server sleeping interval, whose value in hundredths of a second is defined in the INTERVAL parameter in the IOASPRM member in the IOA Archive Server Installation Parameters.

The termination of the IOA Archive Server is not completed.

**Corrective Action:** Check the IOA Log file and the system log for the cause of the problem. If the IOA Archive Server waits a long time for media to complete termination, and the reason for the delay cannot be determined, issue operator command CANCEL to stop the IOA Archive Server. If the problem is not resolved, contact BMC Software Customer Support.

**SRV11FW srvr - REASON: MEDIA mediaName IS BUSY**

**Explanation:** A command cannot be passed to media mediaName for execution because the media has not finished executing a previous command. This message follows message IOA103E or SRV103E, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

**Corrective Action:** Reissue the MODIFY command later.
SRV120S srvr - INTERNAL ERROR RC=rc

Explanation: The IOA Archive Server encountered an internal error. The IOA Archive Server terminates with abend code 0006. The output includes a dump of the abend.

Corrective Action: Report the message ID and return code to BMC Software Customer Support.

SRV121E srvr - REASON: MEDIA mediaName INACTIVE

Explanation: An attempt was made to start a device assigned to media mediaName while that media was inactive. Media mediaName must be started before issuing a START command for a device assigned to it. This message follows message IOA103E or SRV103E, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

Corrective Action: Issue the following operator command to start media mediaName: F IOASMON,START MEDIA=media-name

After media mediaName is initialized successfully, issue the MODIFY command to start a device. For more details, refer to the section that describes the IOA Archive Server in the Control-D and Control-V User Guide.

SRV122W srvr IOA ARCHIVE SERVER PARAMETERS CONTAIN NO MEDIA OR ONLY MEDIA TYPE DASD

Explanation: During the initialization phase, the IOA Archive Server determined that the IOASPRM member does not include a definition for any media or only includes definitions for media of the DASD type. Possible causes are:

- The IOASPRM member in the IOA PARM library does not define any media.
- The IOASPRM member in the IOA PARM library has definitions for only DASD media.

Do not activate the IOA Archive Server unless a media type other than DASD is defined in the IOASPRM member.

The IOA Archive Server shuts down.

Corrective Action: If the services of the IOA Archive Server are required, add appropriate media to the IOASPRM member in the IOA Archive Server Installation Parameters, and restart the IOA Archive Server.

SRV123W cdam_srvr_name - GETMAIN FAILED DURING SESSION OPENING OF USER userId

Explanation: An attempt to access a migrated index failed because there is insufficient memory in the IOA Archive server to open a session. A session is opened in the IOA Archive server when accessing a migrated index. This error occurs when there is not enough memory in the IOA Archive server to hold the RBA range table of the user, and the index record for that index.

The session is not opened and the migrated index cannot be viewed.

Corrective Action: Increase the region of the IOA Archive server.
SRV124W cdam_srvr_name - OSE TYPE PASSED TO SERVER BY USERID userId IS INVALID

Explanation: An internal error occurred when accessing a migrated index. A session is opened in the IOA Archive Server when accessing a migrated index.

The session is not opened and the migrated index cannot be viewed.

Corrective Action: Print the user record and index records of the report. Record the last actions of the user before the error occurred. Supply this information to BMC Software Customer Support.

SRV127E srvr - DEBUG LEVEL MUST BE A NUMBER BETWEEN 0-255

Explanation: The MODIFY operator command to activate the IOA Archive Server debug facility contains an invalid DEBUG level. Valid DEBUG levels are between 0 and 255. Zero specifies no debugging.

The MODIFY command is not executed. The DEBUG facility is not activated.

Corrective Action: Reissue the operator command with the correct debug level. The required debugging level should be supplied by BMC Software Customer Support.

SRV128I srvr - DEBUG LEVEL IS SET TO num

Explanation: This information message indicates that the IOA Archive Server debug level has been set to num by a MODIFY operator command.

Each debug level activates the trace option on different components of the IOA Archive Server.

The DEBUG level is set to level num.

Corrective Action: No action is required.

Messages SRV500 through SRV5xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

SRV5A0E SERVER serverId, SECURITY ENVIRONMENT CREATION FAILED RC=rc REASON=rsn

Explanation: The IOASECUR security handling module failed to establish the security environment.

In rules in which value OWNER or TRIGGER has been specified for the RUNTSEC parameter, the IOASECUR module runs a security check on every DO KSL/TSO request included in the rule.

This message is often accompanied by message SRV5A1I/CTO281I which contains the error message returned by the locally active security product.

The KSL/TSO request is not performed.

Corrective Action: See the DOCSECUR member in the IOA DOC library for a description of rc and rsn.

Correct the security definitions, and verify changes made to the IOASECUR security module. For more information, see the SRV5A1I/CTO281I message (if issued).
SRV5A1I ERROR MESSAGE = text

Explanation: This information message indicates that the IOASECUR security module failed to establish the security environment.

In rules in which value OWNER or TRIGGER has been specified for the RUNTSEC parameter, the IOASECUR module runs a security check on every DO KSL/TSO request included in the rule.

In this message, text is the error message returned by the security product active at the site.

The KSL/TSO request is not performed.

Corrective Action: Depending on the message text, correct the security definitions and/or verify changes made to the IOASECUR security module.

SRV5A2W SERVER serverId, SECURITY ENVIRONMENT CLEANUP FAILED
RC=rc REASON=rsn

Explanation: The IOASECUR security handling module failed to reset the security environment.

In rules in which value OWNER or TRIGGER has been specified for the RUNTSEC parameter, the IOASECUR module runs a security check on every DO KSL/TSO request included in the rule.

This message is often accompanied by message SRV5A1I which contains the error message text returned by the locally active security product.

Depending on the values of rc and rsn, the DO KSL/TSO request may or may not be performed.

Corrective Action: See the DOCSECUR member in the IOA DOC library for a description of rc and rsn.

Correct the security definitions, and/or verify changes made to the IOASECUR security module. For more information, see the SRV5A1I or CTO281I message (if issued).

SRV5A3I CONTROL-O SERVER serverId STARTED

Explanation: This information message indicates that the serverId Control-O server has been successfully started.

Corrective Action: No action is required.

SRV5A4I CONTROL-O SERVER serverId ENDED

Explanation: This information message indicates that the serverId Control-O server has been successfully terminated.

Corrective Action: No action is required.

SRV5A5E SERVER serverId SEVERE ERROR - details

Explanation: The specified server detected an internal error.

The server is terminated.

Corrective Action: Contact BMC Software Customer Support.
SRV5A6I SERVER serverId, request = requestParms

Explanation: This information message indicates that the specified server has begun executing the specified request.

Corrective Action: No action is required.

SRV5A7I SERVER serverId, request COMPLETION CODE = rc ELAPSED elapsed CPU cpu SRB srb

Explanation: This information message indicates that server serverId completed the specified request.

The variables in this message are:
- serverId - the identity of the server that completed the request
- request - the identity of the TSO request or KOA script that was completed
- rc - the completion code of request
- elapsed - the time that elapsed during execution of request
- cpu - the CPU time
- srb - the number of SRB units

elapsed and cpu are expressed in the format mmm.ss.hh, where
- mmm is the number of minutes
- ss is the number of seconds
- hh is the hundredths of seconds

Corrective Action: No action is required.

SRV5A8W SERVER serverId, TIMEOUT OCCURRED. REQUEST request

Explanation: The request performed by the server ran for an interval longer than the number of seconds specified in the TIMEOUT subparameter.

System action depends on the following:
- If the rule issued the request and the WAITMODE subparameter is set to Y, the rule resumes with a %%TSORC or %%KSLRC of 522.
- If the STOP subparameter was set to Y, the request is canceled.
- Otherwise, the server continues performing the request.

Corrective Action: No action is required.

SRV5A9S CONTROL-O SERVER serverId HAS ABENDED. ABEND CODE = abCode

Explanation: The server detected an internal abend.

This message indicates an internal error.
The serverId server is terminated.

**Corrective Action:** Contact BMC Software Customer Support.

**Messages SRVH00 through SRVHxx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**SRVH00I DOWNLOAD OF ACTIVE DATABASE STARTED**

**Explanation:** Information message issued by the Control-M Application Server indicating that the download of the IOA and Control-M database is currently in progress.

**Corrective Action:** No action is required.

**SRVH01I DOWNLOAD OF ACTIVE DATABASE ENDED SUCCESSFULLY**

**Explanation:** Information message issued by the Control-M Application Server indicating that the download of the IOA and Control-M database has ended successfully.

**Corrective Action:** No action is required.

**SRVH02I SERVER IS READY TO RECEIVE REQUESTS**

**Explanation:** This information message indicates that the Enterprise Controlstation Workstation Gateway server has finished its initialization. The server is now ready to receive requests issued by the Enterprise Controlstation Workstation Gateway.

**Corrective Action:** No action is required.

**SRVH03E DOWNLOAD OF ACTIVE DATABASE FAILED**

**Explanation:** Download of the IOA and Control-M database failed.

The download of the IOA and Control-M database, performed by the Control-M Application Server, has ended with an error.

The Control-M Application Server shuts down.

**Corrective Action:** Look in the job log, SYSPRINT and IOA Log for messages containing the reason for the failure. After the problem has been resolved, restart the Control-M Application Server.

**SRVH04E MODULE modName SHOULD BE REUSABLE**

**Explanation:** This message indicates that an IOA module that should have been reusable, is not.

The modName module is supplied with the IOA installation tape with the reusable attribute bit on. However, the reusable attribute has become corrupted.

The program stops executing.

**Corrective Action:** Copy the modName module from the IOA installation tape to the IOA load library, refresh LLA, and rerun the program.
SRVH05E ERROR DETECTED BY WORKSTATION GATEWAY DURING DOWNLOAD

**Explanation:** Download of the Active Jobs file failed due to an error encountered by the Workstation Gateway.

Download of the Active Jobs file was initiated, but the Workstation Gateway indicated that an error was encountered on the workstation side.

Download of the Active Jobs file fails.

**Corrective Action:** Look for error messages issued by the workstation and correct the problem accordingly.

SRVH06I WORKSTATION DATABASE IS SYNCHRONIZED WITH THE MAINFRAME DATABASE

**Explanation:** This information message is issued after establishment of communication, and indicates either that download of the Active Jobs file has ended successfully, or that it is not required.

**Corrective Action:** No action is required.

SRVH07E KSL INTERNAL ERROR TYPE *err_type*, RC = *rc*

**Explanation:** The Control-M Application Server encountered problems interfacing with the KSL subtask. In this message, *err_type* is one of the following:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0001TYPE</td>
<td>Attempt to initialize KSL subtask.</td>
</tr>
<tr>
<td>TYPE 0002</td>
<td>Waiting for KSL subtask to perform a request.</td>
</tr>
<tr>
<td>TYPE 0003</td>
<td>KSL subtask ended abnormally.</td>
</tr>
</tbody>
</table>

The return code contains the system abend code.

The Control-M Application Server shuts down.

**Corrective Action:** Check the messages in the job log and the output in file DAKSLOUT. If message CTM555S appears, increase the REGION size. If no relevant messages appear, contact BMC Software Customer Support.

SRVH08I DOWNLOAD OF {CONTROL-M ACTIVE JOBS FILE | RES. FILE AND IOA COND. FILE} {STARTED | ENDED}

**Explanation:** This information message indicates that downloading of the specified file started or ended.

The specified file is being downloaded from Control-M on the mainframe to an Enterprise Controlstation. This message indicates which phase of the download process was reached.

**Corrective Action:** No action is required.
SRVH09E OPEN OF KSL COMMUNICATION FILE FAILED. DDNAME "KSLCOMM"

**Explanation:** Open of the KSL Communication file failed (the KSLCOMM DD statement). This error message is issued by the Control-M Application Server and may be due to one of the following:

- The KSLCOMM DD statement is missing.
- The Control-M Application Server JCL procedure has been modified.

The Control-M Application Server shuts down.

**Corrective Action:** Correct the Control-M Application Server JCL procedure, and restart the Control-M Application Server.

SRVH10I {CTWSRVE | CTWDET} {STARTED | ENDED}

**Explanation:** This information message indicates that the Control-M Application Server initiated or shut down subtasks.

**Corrective Action:** No action is required.

SRVH12E SERVER INTERNAL ERROR TYPE type

**Explanation:** The server program detected an internal error.

This error message is issued by the CTWSRVR program, which is activated as part of the Control-M Application Server, and is due to reasons beyond the user's control.

The Control-M Application Server shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

SRVH14E ABEND sysAbend-userAbend DURING DOWNLOAD - MEMBER: memName ORDERID: orderId

**Explanation:** A system or user abend occurred while downloading a member.

The variables in this message are:

- **sysAbend** - the number of the system abend
- **userAbend** - the number of the user abend
- **memName** - the member's name
- **orderId** - the member's order ID

The Control-M Application Server terminates processing.

If DWNLDERR=LOG is specified in the CTMPARM member, this message is written to the IOA log file and no further action is taken. If DWNLDERR=EMX is specified in the CTMPARM member, the **memName** member is excluded from the download process when the Control-M Application Server is restarted.

**Corrective Action:** Contact BMC Software Customer Support and provide the error information.
SRVH15W POSSIBLE LOOP DURING DOWNLOAD - MEMBER: memName ORDERID: orderId numSeconds

Explanation: The Control-M Application Server detected a possible loop during download in the processing of the memName member.

The variables in this message are:
- memName - the member’s name
- orderId - the member’s order ID
- numSeconds - the number of seconds that have passed since the loop possibility was first detected

Corrective Action: Determine whether the problem is transient or whether it is necessary to shut down the Control-M Application Server and possibly exclude the memName member from the download process when the Control-M Application Server is restarted.

SRVH16I MEMBER: memName ORDERID: orderId EXCLUDED FROM DOWNLOAD

Explanation: This information message indicates that the memName member was not downloaded during the current downloading of jobs from the AJF to Control-M/EM because it was previously excluded from this process.

The member may have been automatically excluded because it caused an abend during a prior download and DWNLDERR=EMX is specified in the CTMPARM member, or because it was intentionally excluded using the CTMAPI command EMDOWNLD EXCLUDE MEMBER= memName.

The variables in this message are:
- memName - the member’s name
- orderId - the member’s order ID

Corrective Action: No action is required.

SRVH17I MEMBER: memName ORDERID: orderId WILL BE EXCLUDED FROM NEXT DOWNLOAD

Explanation: This information message indicates that the memName member will not be downloaded during the next downloading of jobs from the AJF to Control-M/EM.

This action is taken because the exclude action is indicated in the CTMPARM member by the parameter DWNLDERR=EMX.

Corrective Action: No action is required.

SSO messages

This group includes messages for the Control-O product.
Messages SSO200 through SSO2xx
This group includes messages for the Control-O product.

SSO230E SUBSYSTEM cto_subsys_name INITIALIZATION FAILED - JES COMMAND SUPPRESSION NOT ACTIVATED

Explanation: During Control-O initialization, Control-O failed to activate the Control-O subsystem (cto_subsys_name) that is used to suppress JES2 commands.

To suppress JES2 commands, Control-O uses the subsystem identified in the JCMDSSN parameter in the CTOPARM member in the IOA PARM library. That subsystem must be defined in SYS1.PARMLIB(IEFSSN xx), and must be activated in the last IPL before Control-O is started.

Control-O initialization continues, but the JES2 command suppression function is disabled.

Corrective Action: Notify the INCONTROL administrator.

SSO231E SUBSYSTEM cto_subsys_name WAS NOT PRE-DEFINED - JES COMMAND SUPPRESSION NOT ACTIVATED

Explanation: During Control-O initialization, Control-O failed to activate the Control-O subsystem (cto_subsys_name) that is used to suppress JES2 commands, because the subsystem was not properly predefined.

To suppress JES2 commands, Control-O uses the subsystem identified in the JCMDSSN parameter in the CTOPARM member in the IOA PARM library. That subsystem must be defined in SYS1.PARMLIB(IEFSSN xx), and must be activated in the last IPL before Control-O is started.

Control-O initialization continues, but the JES2 command suppression function is disabled.

Corrective Action: Notify the INCONTROL administrator.

SSO234W SUBSYSTEM subsys ALREADY INACTIVE

Explanation: During Control-O termination, Control-O deactivates the IOA subsystem and the Control-O subsystem currently in use. On this occasion, the subsystem identified in the message was already inactive.

Control-O termination continues.

Corrective Action: Notify the INCONTROL administrator.

SSO235W subsys ALREADY ACTIVE

Explanation: During Control-O initialization, Control-O tried to activate the IOA subsystem and the Control-O subsystem, but detected that the subsys subsystem was already active.

Control-O initialization continues.

Corrective Action: Notify the INCONTROL administrator.

SSO236E ERROR WHILE ATTEMPTING TO OPEN THE STEPLIB DATASET

Explanation: Control-O could not open file STEPLIB.
Control-O encountered an error opening the STEPLIB file while attempting to activate the alternate subsystem.

Control-O continues without activating the alternate subsystem.

**Corrective Action:** Verify that a STEPLIB library or concatenation of libraries exists. Reactivate Control-O.

**SSO237E** ERROR WHILE ATTEMPTING TO LOCATE (BLDL) ONE OF THE SUBSYSTEM FUNCTION ROUTINES

**Explanation:** Control-O could not find at least one of the alternate subsystem function routines. While attempting to activate the alternate subsystem, Control-O could not find at least one of the alternate subsystem function routines in the STEPLIB library or concatenation of libraries. Control-O continues without activating the alternate subsystem.

**Corrective Action:** Verify that these modules exist in the STEPLIB library or concatenation of libraries and reactivate Control-O.

**SSO238E** ERROR WHILE ATTEMPTING TO LOAD ONE OF THE SUBSYSTEM FUNCTION ROUTINES

**Explanation:** Control-O could not load at least one of the alternate subsystem function routines. While attempting to activate the alternate subsystem, Control-O could not find at least one of the alternate subsystem function routines in the STEPLIB library or concatenation of libraries. Control-O continues without activating the alternate subsystem.

**Corrective Action:** Verify that these modules exist in the STEPLIB library or concatenation of libraries and reactivate Control-O.

**SSO239E** ERROR WHILE ATTEMPTING TO ACQUIRE STORAGE FOR SUBSYSTEM FUNCTION ROUTINES OR THE SSVT

**Explanation:** Control-O could not acquire enough CSA (Common Service Area) storage to load alternate subsystem function routines or to build the SSVT for the alternate subsystem. Control-O continues without activating the alternate subsystem.

**Corrective Action:** If storage defined for CSA is not large enough, increase the CSA size and perform an IPL.

**SSO23AI** ALTERNATE SUBSYSTEM *subsys* SUCCESSFULLY INITIALIZED

**Explanation:** This information message indicates that the CTOSSO module successfully activated the alternate subsystem.

**Corrective Action:** No action is required.
STM messages

This group includes messages for the Control-O product.

Messages STM700 through STM7xx

This group includes messages for the Control-O product.

STM741S ERROR IN CONTROL STATEMENT - err

Explanation: An invalid control statement was encountered. The CTORSTM statistics reports utility encountered one of the following errors:

- INVALID SORTBY STATEMENT A SORTBY statement contains an invalid sort key.
- NO PARAMETER SPECIFIED No operand was specified in the control statement.
- INVALID STATEMENT An unrecognized control statement was encountered.
- MASK TOO LONG An INCLUDE/EXCLUDE statement contains a mask which is longer than 12 characters.

The CTORSTM utility terminates with a return code of 08.

Corrective Action: Correct the invalid statement and rerun the job.

STM742S ERROR IN OPEN OF INPUT FILE

Explanation: The CTORSTM statistics report utility could not open the input file specified in the DAREPIN DD statement.

An OPEN request was issued to the input file, but was unsuccessful. A possible cause of the problem is that the DAREPIN DD statement may not have been specified in the job stream.

The utility terminates with a return code of 08.

Corrective Action: Look for previous MVS error messages regarding the opening of the input file. Correct the error and rerun the job.

STM743S INTERNAL ERROR - errorText

Explanation: The CTORSTM statistics report utility encountered the errorText internal error.

The utility terminates with return code of 08.

Corrective Action: Contact BMC Software Customer Support.

STM744S ERROR IN OPEN OF REPORT FILE

Explanation: The CTORSTM statistics report utility could not open the report file specified in the SYSPRINT DD statement.

An OPEN request was issued to the REPORT file, but was unsuccessful. A possible cause of the problem is that the SYSPRINT DD statement may not have been specified in the job stream.

The utility terminates with a return code of 08.
Corrective Action: Look for previous MVS error messages regarding the opening of the report file. Correct the error and rerun the job.

STM745S ERROR IN OPEN OF STATISTICS FILE

Explanation: The CTORSTM statistics report utility could not open the Statistics file. Failure to open the Statistics file may have been caused by one of the following:

 The data set allocated to the DASTF DD statement was not formatted as a Control-O Statistics file.
 The data set allocated to the DASTF DD statement was formatted as a Control-O Statistics file by a different version of Control-O.
 The data set allocated to the DASTF DD statement belongs to a different installation of Control-O.

The utility terminates with a return code of 08.

Corrective Action: Look for previous MVS error messages regarding the opening of the Statistics file. Correct the error and rerun the job.

STM746S STATISTICS FILE DYNAMIC ALLOCATION ERROR rc/rsn/dsn

Explanation: Dynamic allocation of the dsn Statistics file failed with a return code of \textit{rc} and a reason code of \textit{rsn}.

The CTORSTM statistics report utility terminates with a return code of 08.

Corrective Action: See the IBM manual \textit{MVS Programming: Authorized Assembler Services Guide} to determine the cause of the error and correct the error accordingly. If not successful, contact BMC Software Customer Support.

STM747W ERROR IN CLOSE OF STATISTICS FILE

Explanation: The CTORSTM statistics report utility could not successfully close the Statistics file. The utility terminates with a return code of 08.

Corrective Action: If no MVS error messages clarifying the error were issued, this is probably an internal error. In this case, please report it to BMC Software Customer Support.

STM748I NO INPUT CONTROL STATEMENTS WERE SPECIFIED. DEFAULT REPORT WILL BE PRODUCED

Explanation: This information message indicates that no report control statements were specified in the input data set.

The input data set is empty. The report is produced using the following default control statements:

\texttt{SORTBY COUNTINCLUDE *}

The default report is produced.

Corrective Action: No action is required.
STO messages

This group includes messages for the Control-O product.

Messages STO100 through STO1xx

This group includes messages for the Control-O product.

STO171S STATISTICS FILE OVERFLOW

**Explanation:** All Statistics file index entries are in use. No new statistics can be accumulated.

The Statistics Facility could not accumulate statistics because the number of message IDs exceeds the maximum number of allowable entries in the Statistics file.

Statistics accumulation stops.

**Corrective Action:** Please review the following recommendations; then format the Statistics file and restart the Statistics Facility:

1. Enlarge the Statistics file by using the following procedure: a. Increase the value of the STREC# parameter in CTOPARM.b. Delete or rename the old Statistics file to allow a new Statistics file allocation.c. Allocate and format a new Statistics file.
2. Use AutoEdit option %%$STATID to customize message ID determination. This option can be used to decrease the number of message IDs that are generated. See the *INCONTROL for z/OS Administrator Guide* for more information.

STO172S STATISTICS FILE IS NOT FREE

**Explanation:** The Statistics file is locked.

Either the Statistics file is in use by another Control-O monitor or utility, or Control-O abended previously while updating the Statistics file.

Statistics accumulation is not performed.

**Corrective Action:** Check if another Control-O monitor or utility uses this Statistics file. If this is not the case, then reformat the Statistics file and restart the Statistics Facility.

STO173S OPEN OF STATISTICS FILE FAILED

**Explanation:** The Control-O Statistics facility attempted to open the Statistics file but did not succeed.

Failure to open the Statistics file may be due to the following:

- The data set allocated to the DASTF DD statement was not formatted as a Control-O Statistics file.
- The data set allocated to the DASTF DD statement was formatted as a Control-O Statistics file by a different version of Control-O.
- The data set allocated to the DASTF DD statement belongs to a different installation of Control-O.

Statistics accumulation is not performed.

**Corrective Action:** Look for previous MVS error messages regarding the opening of the Statistics file. Correct the error and rerun the job.
STO174S FILE ALLOCATED TO DDNAME "DASTF" IS NOT A CONTROL-O STATISTICS FILE

Explanation: The Control-O Statistics Facility attempted to read the file allocated to DD name DASTF, but it is not a formatted Statistics file.
Statistics accumulation is not performed.
Corrective Action: Format the Statistics file and restart the Statistics Facility.

STO175E RELEASE OF THE STATISTICS FILE IS NOT SUPPORTED BY THIS RELEASE

Explanation: The format of the Statistics file is not supported by the current release of Control-O. The Statistics file could not be read by the Control-O Statistics Facility.
The Statistics file was formatted by an earlier release of Control-O.
Statistics accumulation is not performed.
Corrective Action: Format the Statistics file in the currently supported format, and restart the Statistics Facility.

STO176E THE STATISTICS FILE BELONGS TO A DIFFERENT CONTROL-O MONITOR

Explanation: The assigned ID of the Statistics file does not match the ID of the Control-O monitor.
When a Statistics file is formatted, it is associated with a particular Control-O monitor. The CTOMFST Statistics Formatting utility takes the ID of the Control-O monitor from the QNAME parameter in CTOPARM, and assigns it to the Statistics file.
The ID of the active Control-O monitor does not match the assigned ID of the Statistics file. The probable cause of the error is that the value of QNAME was changed without reformattting the Statistics file.
Statistics accumulation is not performed.
Corrective Action: Format the Statistics file with the correct Control-O ID and restart the Statistics Facility.

STO177S CONTROL-O STATISTICS SEVERE INTERNAL ERROR, ID=code

Explanation: The Control-O Statistics Facility encountered an internal error.
In this message, code is the internal error code.
Statistics accumulation stops.
Corrective Action: Look for previous messages to identify the cause of the problem and contact BMC Software Customer Support.

STO178S STORAGE ALLOCATION FOR STATISTICS FAILED

Explanation: Storage allocation for the Control-O Statistics Facility failed because the Statistics Facility could not obtain enough working storage for processing.
Statistics accumulation is not performed.
**Corrective Action:** Increase the Control-O region size and restart a new Control-O monitor.

STO179S I/O ERROR ACCESSING THE STATISTICS FILE

**Explanation:** A READ/WRITE error occurred when accessing the Statistics file.
Statistics accumulation stops.

**Corrective Action:** Look for previous MVS error messages regarding Statistics file I/O errors, and correct accordingly. If MVS messages do not clarify the error, please contact BMC Software Customer Support.

STO180S CONTROL-O STATISTICS FILE INTERNAL ERROR. RECORD TYPE MISMATCH

**Explanation:** The Statistics Facility has encountered a corruption in the Statistics file. The Statistics file cannot be processed.
Statistics accumulation stops.

**Corrective Action:** Contact BMC Software Customer Support.

STO181S CONTROL-O STATISTICS INTERNAL ERROR. WRITE FAILED FOR SECTION section

**Explanation:** Due to an internal error, update of the Statistics file failed while writing a section of the Statistics file.
Statistics accumulation stops.

**Corrective Action:** Contact BMC Software Customer Support.

STO182S CLOSE OF CONTROL-O STATISTICS FILE FAILED

**Explanation:** During termination, the Control-O Statistics Facility failed to close the Statistics file.
The Statistics Facility continues terminating without closing the Statistics file.

**Corrective Action:** Check the system log for previous error messages. If none are found, please contact BMC Software Customer Support.

STO184I CONTROL-O STATISTICS ACCUMULATION STARTED

**Explanation:** This informative message indicates that the Control-O Statistics Facility initialization completed successfully and that Control-O statistics are being accumulated.

**Corrective Action:** No action is required.

STO185S CONTROL-O STATISTICS INITIALIZATION ERROR

**Explanation:** Control-O Statistics Facility did not initialize successfully.
Statistics accumulation is not performed.

**Corrective Action:** Look for previous error messages in the IOA Log to determine the cause of the error, and then correct accordingly.
STO186E STATISTICS ACCUMULATION ERROR WHILE PROCESSING SUBSYSTEM REQUESTS

Explanation: The Statistics Facility detected an error while processing requests from the Control-O subsystem.

Statistics accumulation stops.

Corrective Action: Look for previous error messages in the IOA Log to determine the cause of the error, and then correct accordingly.

STO187E STATISTICS ACCUMULATION ERROR DURING FILE UPDATE

Explanation: The Statistics Facility detected an error while updating the Statistics file.

Statistics accumulation stops.

Corrective Action: Look for previous error messages in the IOA Log to determine the cause of the error, and then correct accordingly.

STO189I CONTROL-O STATISTICS ACCUMULATION ENDED

Explanation: This informative message is issued after normal termination of the Statistics Facility.

Statistics accumulation is discontinued.

Corrective Action: No action is required.

STO190S CONTROL-O STATISTICS TERMINATION ERROR

Explanation: Control-O Statistics Facility did not terminate successfully.

The Statistics Facility continues the termination process.

Corrective Action: Look for previous error messages in the IOA Log to determine the cause of the error, and then correct accordingly.

STO191S STATISTICS ACCUMULATION ERROR WHILE PROCESSING USER REQUESTS

Explanation: The Statistics Facility detected an error while processing a SHOW, EXCLUDE or RESET online user request.

Statistics accumulation stops.

Corrective Action: Look for previous error messages in the IOA Log to determine the cause of the error, and correct accordingly.

STO192E STATISTICS REQUEST FOR MESSAGE ID msgId FAILED - MESSAGE ID NOT FOUND

Explanation: A SHOW, EXCLUDE or RESET request for message ID msgId failed.

An online user requested a SHOW/EXCLUDE/RESET for message ID msgId. This message ID was not found in the Statistics file.

The online request is not performed. The Statistics Facility continues processing.
**Corrective Action:** Notify BMC Software Customer Support of the problem.

STO193E STATISTICS REQUEST FOR MESSAGE ID msgId FAILED - INVALID REQUEST

**Explanation:** Due to an internal error, the user’s online request regarding message ID msgId was not recognized.

The request is not performed. The Statistics Facility continues processing.

**Corrective Action:** Notify BMC Software Customer Support.

STO194W WAITING FOR THE STATISTICS FILE - FILE IN USE

**Explanation:** Control-O is attempting to access the Statistics file, but it is in use by another Control-O monitor or Control-O utility.

Control-O waits and attempts to access the Statistics file again.

**Corrective Action:** This message is not necessarily the result of an error. It may be issued while generating a statistics report or when the Online Facility attempts to access the Statistics file. If the Statistics file is not freed in a reasonable period of time, check what job is using it and free it.

STO195E RESET OF STATISTICS FOR MESSAGE ID msgId FAILED

**Explanation:** An online user requested a RESET of the statistics for message ID msgId, but due to internal error, the request could not be performed by Control-O.

The RESET request is not performed. The Statistics Facility continues processing.

**Corrective Action:** Notify BMC Software Customer Support.

STO196S STATISTICS FILE DYNAMIC ALLOCATION ERROR rc/rsn/dsn

**Explanation:** Dynamic allocation of Statistics file dsn failed with return code rc and reason code rsn.

Statistics accumulation is not performed.

**Corrective Action:** See the IBM manual *MVS Programming: Authorized Assembler Services Guide* to determine this cause of the error, and correct the error accordingly. If not successful, contact BMC Software Customer Support.

STO197I CONTROL-O STATISTICS GLOBAL RESET COMPLETE

**Explanation:** This information message indicates that a global statistics reset was completed successfully.

Global statistics reset command F CONTROLO, RESETSTAT was issued and performed successfully.

**Corrective Action:** No action is required.

STO198E RESET OF DATE FOR MESSAGE ID msgId FAILED

**Explanation:** Statistics for message ID msgId were reset as requested, but due to an internal error, update of the last reset date was not successful.
Statistics are reset. The Statistics Facility continues processing, but the indicated last reset date is incorrect.

**Corrective Action:** Notify BMC Software Customer Support.

**STO199I STATISTICS OF MESSAGE ID msgId RESET**

**Explanation:** This informative message indicates that the requested statistics reset for message ID msgId was successfully performed.

**Corrective Action:** No action is required.

**Messages STO200 through STO2xx**

This group includes messages for the Control-O product.

**STO240W STATISTICS FILE NEARLY FULL - percentage USED**

**Explanation:** Highlighted, unrollable message.

The Statistics file is approaching its maximum capacity.

The Statistics file continues accumulating statistics until it becomes full.

**Corrective Action:** The user can take one of three actions:

- Reformatted the Statistics file using installation job DEFSTAT. This deletes all saved statistics and restarts the tracking process.
- Enlarge the Statistics file using the CTOCSF utility. This retains the existing statistics and increases the space available for the tracking of new message IDs.
- Do nothing. If the Statistics file becomes full, statistics of message IDs which exist in the file will continue to be tracked, but new message IDs will not be added to the file.

**STO241E STATISTICS FILE IS FULL. NEW MESSAGE IDS WILL BE LOST**

**Explanation:** Highlighted, unrollable message.

The Statistics file is full.

All statistics records according to the number (STREC#) set in the CTOPARM parameter file have been utilized.

Control-O continues to collect statistics for existing messages, but the statistics for new message IDs are not saved.

**Corrective Action:** The user can take one of three actions:

- Reformatted the Statistics file using installation job DEFSTAT. This deletes all saved statistics and restarts the tracking process.
- Enlarge the Statistics file using the CTOCSF utility. This retains the existing statistics and enables new message IDs to be tracked.
- Do nothing. Statistics of message IDs which exist in the file will continue to be tracked. Statistics of new message IDs will not be tracked.
SUB messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages SUB100 through SUB1xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**SUB130I jobName/jobId OID=orderId RELEASED**

**Explanation:** This information message indicates that the Control-M monitor released a job for execution.

Jobs ordered by the On Spool Facility are not submitted by Control-M. They are released for execution by Control-M using an operator command.

**Corrective Action:** No action is required.

**SUB131I SUBMITTER STARTED**

**Explanation:** This information message is generated when the Control-M monitor internal submitter task starts.

**Corrective Action:** No action is required.

**SUB132I taskType memName stcname OID=orderId/STARTED**

**Explanation:** This information message indicates that the started task specified in the member parameter started.

Normal message when starting a started task.

**Corrective Action:** No action is required.

**SUB133I taskType memName jobName/jobId OID=orderId SUBMITTED FROM LIBRARY lib**

**Explanation:** This information message indicates that a job has been submitted.

**Corrective Action:** No action is required.

**SUB134E taskType memName jobName/jobId OID=orderId OPEN OF MEMBER FAILED**

**Explanation:** Open of the memName member for submission failed.

This could be due to one of the following:
The member does not exist in the specified library.

Insufficient memory to open the memName member.

The job will not be submitted and the job will finish with NOT SUBMITTED status for reason NOMEM.

Corrective Action: No action is required.

1. Check for the existence of the member in the library.
2. Increase the Control-M monitor REGION size.

SUB135E taskType memName jobName/jobId OID=orderId SUBMIT FAILED

Explanation: Submission of job failed.

Control-M Log should contain a prior message concerning the reason for failure.

Corrective Action: Check the Control-M Log for the failure reason.

SUB136E taskType memName jobName/jobId OID=orderId NO JOB CARD

Explanation: A job statement is missing in the member.

The member specified in the member parameter does not contain a job statement.

Corrective Action: No action is required.

- Check the contents of the memName member. If necessary, correct and rerun.
- Check if the JCL member is in ISPF format. Control-M does not support this format.

SUB137W taskType memName jobName/jobId OID=orderId MORE THAN ONE JOB CARD

Explanation: The memName member contains more than one job statement.

Control-M submits all the jobs in the member but controls the first one only.

Corrective Action: It is highly recommended to put only one job statement (one job) in a member.

SUB138E OID=orderId READING OF THE SYSOUT OF PREVIOUS RUN(S) OF ORDERID orderId FAILED

Explanation: Control-M was unable to read the archived sysout of previous runs of the job.

For restarted jobs only, Control-M/Restart retrieves all the required information from the sysout of the job. For restarted NJE jobs, the Control-M monitor must read the sysout since it may not be available on the remote processor. The likely reason that the sysout was not found is that it was manually deleted.

The job will not be submitted (and therefore not restarted) by Control-M.

Corrective Action: Check why the archived sysout was not available for reading. If the CDAM files were manually deleted, the restart cannot be run. If the sysout still exists, contact your INCONTROL administrator.
SUB139S INITIALIZATION OF SUBMITTER FAILED

Explanation: Initialization of Control-M monitor internal submitter task failed. Control-M monitor shuts down.

Corrective Action: Check the IOA Log and the computer log for the reason of failure.

SUB13AI task-type task-name OID=order-id SUBMITTER STARTED

Explanation: This information message indicates that Control-M has begun the submission process for the indicated task. Message SUB133I will follow and indicates the task was submitted.

Corrective Action: No action is required.

SUB140S INSUFFICIENT MEMORY FOR CONTROL-M MONITOR

Explanation: Insufficient memory for Control-M monitor (during the submission process). Control-M monitor will shut down.

Corrective Action: Try to increase the REGION of the Control-M monitor.

SUB141E taskType memName jobName/jobId DSN memLib NOT FOUND

Explanation: The data set described by the memLib parameter is not on the disk. The job will not be submitted, and the job will finish with NOT SUBMITTED status for reason NOLIB.

Corrective Action: Check the validity of the memLib parameter.

SUB142E taskType memName jobName/jobId DSN memLib - DYNAMIC ALLOCATION FAILED

Explanation: Dynamic allocation for the data set specified in the memLib parameter failed. Probable causes are:

- Insufficient memory for Control-M monitor.
- The DALIB1 DD statement is allocated to the Control-M monitor procedure (it should be reserved for Control-M use).
- Other system-related reason.

The job will not be submitted and the job will finish in NOT SUBMITTED status.

Corrective Action: Do one of the following:

- Increase Control-M monitor REGION size.
- Omit the DALIB1 DD statement from the Control-M monitor procedure.
- See the IOA Log, the computer log, and the Control-M monitor sysout for additional messages that will clarify the reason.

If all the above steps fail, call BMC Software Customer Support for assistance.
SUB143E  taskType memName jobName/jobId orderId INTERNAL ERROR ON routineName MISSING PARAMETER. NOTIFY THE IOA ADMINISTRATOR

Explanation: Internal error in the Control-M monitor.
Depending on the severity of the problem, the Control-M monitor will shut down, or at least the job submission will be stopped.

Corrective Action: Have your system programmer call your IOA administrator for assistance. If the Control-M monitor keeps shutting down, hold the problematic job order in the Control-M Active Environment screen (3).

SUB144E  taskType memName jobName/jobId OID=orderId INTERNAL ERROR ON routineName ACT BEFORE INIT. INFORM IOA ADMINISTRATOR

Explanation: Internal error in Control-M monitor.
 Depending on the severity of the problem, the Control-M monitor will shut down, or at least the job submission will be stopped.

Corrective Action: Have your system programmer call your IOA Administrator for assistance. If the Control-M monitor keeps shutting down, hold the problematic job order in the Control-M Active Environment screen (3).

SUB145E  taskType memName jobName/jobId OID=orderId ERROR IN IOAMEM FUNCTION func: RETURN CODE rc

Explanation: Internal error in Control-M monitor.
The eight digits that rc represents include a 4-digit reason code and a 4-digit return code. For more information on these codes, see the description of IOAMEM in the INCONTROL for z/OS Administrator Guide.
Job submission stops. In some cases, the Control-M monitor will shut down.

Corrective Action: Ask your INCONTROL administrator for assistance. If the Control-M monitor shuts down repeatedly, use the H option of the Control-M Active Environment screen (3) to hold the order that is causing the problem.
If the return code indicates that an abend has occurred, check the Control-M system log for system messages associated with the abend.

SUB146W  taskType memName jobName/jobId OID=orderId TOO MANY DSNAMES FOR CTMLIB

Explanation: Internal Table Overflow in AutoEdit processing.
There is a limit to the number of libraries which may be open simultaneously in the process of submission of a single job. In the processing of AutoEdit variables each time a library is named in a %INCLIB statement which is not the last statement of the current %INCMEM, an entry is made in an internal table. This table’s capacity has been exceeded.
The Control-M monitor shuts down with error.
Corrective Action: While the Control-M monitor is shut down, hold the job order causing the problem. Delete it after the Control-M monitor is restarted. The job must be simplified before it can be successfully processed by Control-M.

SUB147S INITIALIZATION OF MAIN LIB FAILED. DDNAME ddName

Explanation: The Control-M JCL library initialization failed (the DALIB DD statement).
This message is issued for one of the following reasons:
- The Control-M monitor could not be initialized.
- The user attempted to order or force a job which cannot be found.
- The problem can be due to one of the following:
  - The DALIB DD statement is missing from the Control-M monitor procedure.
  - The data set referenced by the DALIB DD statement is not a partitioned data set with record length 80.
  - Other reasons described in the System log.

System action depends on the following:
- If the Control-M monitor indicates a problem with the [main library], the monitor will shut down.
- If the message indicates that a job could not be found, the order/force request is ignored.
Corrective Action: Check the computer log and/or the IOA Log file for messages which describe the problem. Correct the problem. If necessary, restart the Control-M monitor.

SUB148E taskType memName jobName/jobId OID=orderId DSN NOT CATALOGED

Explanation: Data set described by the MEMLIB or OVERLIB parameter is not cataloged.
The job will not be submitted, and it will finish with NOT SUBMITTED status for reason NOLIB.
Corrective Action: Check the validity of the MEMLIB or OVERLIB parameter.

SUB149W taskType memName jobName/jobId OID=orderId DSN memLib IN USE (DISP=OLD)

Explanation: The data set described by the memLib parameter is in use.
Another user is holding the library using the statement DISP=OLD.
Submission of this member will be tried again after a few seconds.
Corrective Action: See if the user who is holding the library can free it.

SUB14AE JOB memName OID=orderId NOT SUBMITTED, MIGRATED DSN lib

Explanation: Highlighted, unrollable message.
The job was not submitted because the library that contains its member migrated.
The job is not submitted and is assigned a NOTOK status for reason NOLIB.

**Corrective Action:** Restore the library to disk and submit the job again.

```plaintext
SUB150E  taskType memName jobName/jobId OID=orderId UNEXPECTED ERROR ON CTMLIB FUNCTION func. NOTIFY THE IOA ADMINISTRATOR
```

**Explanation:** Internal error in the Control-M monitor.

Depending on the severity of the problem, the Control-M monitor will shut down, or at least the job submission will be stopped.

**Corrective Action:** Have your system programmer call your IOA administrator for assistance. If the Control-M monitor keeps shutting down, hold the problematic job order in the Control-M Active Environment screen (3).

```plaintext
SUB151E  taskType memName jobName/jobId DSN memLib - NOT A LIBRARY
```

**Explanation:** The data set described by the `memLib` parameter is not a library supported by Control-M. The job will not be submitted and it will finish with NOT SUBMITTED status for reason NOLIB.

**Corrective Action:** Check the validity of the `memLib` parameter.

```plaintext
SUB152E  taskType memName jobName/jobId DSN memLib - RECFM NOT FIXED
```

**Explanation:** Record format of the data set described by the `memLib` parameter is not fixed. The job will not be submitted and it will finish with NOT SUBMITTED status for reason NOLIB.

**Corrective Action:** Check the validity of the `memLib` parameter.

```plaintext
SUB153E  taskType memName jobName/jobId DSN dsn - LRECL GREATER THAN 255
```

**Explanation:** Record length of the data set described by the `memLib` parameter is greater than 255. The job will not be submitted and it will finish with NO MEMBER status for reason NOMEM.

**Corrective Action:** Use library with data set record length less than 256, as described by the `memLib` parameter.

```plaintext
SUB158S SHUT DOWN: INTERNAL ERROR
```

**Explanation:** Internal error in Control-M monitor submitter.

Control-M monitor is shut down.

**Corrective Action:** Look in the Control-M Log (open the SHOW window and specify Y in all message types). If this message is preceded by one of the following messages: SUB153E, SUB152E, SUB151E, then it means that the data set allocated to the DALIB DD statement of the Control-M monitor is not a PDS JCL library. Correct the procedure.
Otherwise, have your system programmer call BMC Software Customer Support for assistance.

**SUB159I SHUT DOWN UPON REQUEST OF MAIN TASK**

**Explanation:** This information message indicates that the Control-M monitor shut down upon request of the main task.

The Control-M monitor shuts down.

**Corrective Action:** No action is required.

**SUB160I USER EXIT CTMX002 IS NOT ACTIVE**

**Explanation:** This information message indicates that User Exit CTMX002 is not active.

Exit CTMX002 checks each line of the submitted job. However, this exit, which is supplied by Control-M, was not found - which means that the module was probably deleted.

Processing proceeds without checking each line of the submitted job.

**Corrective Action:** Check whether or not Exit CTMX002 was erroneously deleted from the IOA Load library. Notify your INCONTROL administrator.

**SUB161E taskType memName jobName/jobId OID=orderId SEVERE INTERNAL ERROR WHILE PROCESSING AUTOEDIT INSTRUCTIONS, RC=rc. SUBMISSION CANCELLED**

**Explanation:** Severe Control-M internal error during submission of member.

The error occurred in the AutoEdit language interpreter.

Depending on the severity of the error, Control-M monitor will shut down, or at least job submission will be cancelled.

**Corrective Action:** Have your system programmer prepare the Control-M monitor full output and contact BMC Customer Support. You will probably be able to submit the member if you change (or omit) your AutoEdit control statements in the member, but please keep a copy of the original member for problem resolution. If you hold the job order, Control-M monitor will not shut down.

**SUB162E taskType memName jobName/jobId OID=orderId INVALID RETURN CODE FROM EXIT exitName - rc PROCESSING CONTINUES**

**Explanation:** Invalid return code from the `exitName` user exit.

Submission of the member continues.

**Corrective Action:** Have your system programmer correct the user exit. Check the submitted job very carefully for possible errors.

**SUB163E taskType memName jobName/jobId OID=orderId SUBMISSION CANCELLED DUE TO REQUEST FROM EXIT exitName**

**Explanation:** Submission cancelled due to a request from the `exitName` user exit.
Job submission is terminated by a deliberate JCL error in the JCL stream. The job status will be not submitted reason CANCEL.

**Corrective Action:** Look for additional messages in the IOA Log. If you do not understand the reason for the cancellation of submission, ask your system programmer.

**SUB164I taskType memName jobName/jobId OID=orderId msg**

**Explanation:** This information message is generated by Control-M submission exit CTMX002. The message usually explains the reason for cancelling the submission of the job, but it may be only an informational message.

**Corrective Action:** No action is required.

**SUB165E taskType memName jobName/jobId OID=orderId SUBMISSION CANCELLED - JOB CARD CANNOT BE RESOLVED BY CONTROL-M**

**Explanation:** Invalid format of job statement in member.

Job submission is terminated. The job status will be NOT SUBMITTED reason NOJOB.

**Corrective Action:** Correct the JCL in the `memName` member and rerun the job.

**SUB166E SUBMITTER FAILURE. CTMLIB ABENDED abCode ON FUNCTION func OID=orderId**

**Explanation:** Highlighted, unrollable message.

An abend has occurred while trying to read a member. The abend code and function can suggest the cause of the problem.

Control-M monitor does not abend. Processing of other jobs continues, but the job submission is terminated.

**Corrective Action:** Resolve the problem according to the abend code and rerun the job.

**SUB167E taskType memName jobName/jobId OID=orderId SUBMISSION CANCELLED DUE TO REQUEST FROM AUTOEDIT FACILITY**

**Explanation:** Submission cancelled due to a request from Control-M AutoEdit facility due to severe AutoEdit syntax error.

Control-M Log should contain prior messages concerning the type of AutoEdit error.

Job submission is terminated by a deliberate JCL error in the JCL stream. The job status will be NOT SUBMITTED reason CANCEL.

**Corrective Action:** Correct the AutoEdit statements causing the problem and rerun the job.

**SUB168S taskType memName jobName/jobId OID=orderId CONTROL-M SHUTTING DOWN - COMMUNICATION TO "JES" NOT AVAILABLE**

**Explanation:** Highlighted, unrollable message.

The Control-M monitor cannot communicate with JES, and therefore shuts down.
This can be due to the following:

- JES is not working or is in the process of shutting down.
- A subsystem of JES stopped working. JES will probably shut down soon with error, or may get stuck.
- Some problem with JES operation.
- Error in Control-M interface to JES.

The Control-M monitor shuts down as a precaution. If something is wrong with JES, then the results of job submission or initiating of a started task may be unpredictable.

Corrective Action: If the problem is JES-related, after the JES problem is solved, start the Control-M monitor again.

If you cannot find the cause of the problem, have your system programmer prepare the Control-M monitor full output and contact BMC Customer Support. The sysout of the DADUMP2 DD statement of the Control-M monitor procedure should contain a dump of problem related areas which can help the Control-M support team.

In any case, try to start Control-M monitor again. Production must continue.

SUB169E taskType memName jobName/jobId OID=orderId SEVERE INTERNAL ERROR WHILE STARTING A STARTED TASK RC=rc. TASK WAS NOT STARTED

Explanation: Severe Control-M monitor error while starting a started task.

The problem is probably in the Control-M monitor communication with JES. The rc can be interpreted by the Control-M support team.

Control-M monitor submission task will abend with U0042.

The Control-M monitor will abend on U0006.

Corrective Action: Start the Control-M monitor again. If the problem repeats, hold the started task which causes the problem (it will be in WAIT START state on the Active Environment screen). If the problem continues to appear for every started task, hold all the started tasks that should be started by Control-M. This will allow the jobs to run while someone tries to resolve the problem. Keep the dumps and contact your IOA representative.

SUB170E SEVERE INTERNAL ERROR WHILE RELEASING AN ON SPOOL JOB RC=rc OID=orderId. JOB NOT RELEASED

Explanation: When the On Spool Facility tried to get the status of the job before releasing it, it received an unknown return code from the subsystem request.

The job is not released.

Corrective Action: Have your INCONTROL administrator prepare the Control-M monitor full output and contact BMC Customer Support.
SUB191E taskType memName jobName/jobId OID=orderId SYMBOL NOT RESOLVED - symbol

Explanation: AutoEdit symbol not resolved.

This error message is issued by the CTMJSP program which is used to analyze AutoEdit statements. The symbol could not be found in the symbols environment. For details, see the Control-M for z/OS User Guide.

The variable jobName/jobId does not appear in the message when the error occurs before the job statement is processed.

Job submission is terminated with a reason code of CANCL.

Corrective Action: Correct the AutoEdit syntax in the JCL for the job and rerun it.

SUB192E taskType memName jobName/jobId OID=orderId SYNTAX ERROR. ORIGINAL LINE - lineText

Explanation: Job submission is terminated with a reason code of CANCL. This message is generally issued in one of the following cases:

- An AutoEdit syntax error was detected on original line lineText during analysis and substitution of an AutoEdit statement.
- A reserved Control-M system AutoEdit variable was used invalidly (for example, as the target of an AutoEdit statement or function).

Original line lineText is the original AutoEdit statement before any substitution has taken place.

The variable jobName/jobId does not appear in the message when the error occurs before the job statement is processed.

This message may follow message SUB191E, which describes the error. This message may be followed by message SUB197I, which gives information about the location of the error.

For more information, see the Control-M for z/OS User Guide.

Corrective Action: Correct the AutoEdit syntax in the JCL for the job and rerun it.

If the original line is “SETOLOC%% VARIABLE = val”, insert the line “RESOLVENO” in the original AutoEdit statement above this line.

SUB193E taskType memName jobName/jobId OID=orderId INTERNAL ERROR. LINE - line

Explanation: Internal error while processing AutoEdit statements in the line identified in the message.

This error message is issued by the CTMJSP program which is used to analyze AutoEdit statements.

Job submission is terminated with a reason code of CANCL.

Corrective Action: Have your system programmer call BMC Software Customer Support for assistance.
SUB194E taskType memName jobName/jobId OID=orderId INSUFFICIENT STORAGE TO PROCESS AUTOEDIT STATEMENTS. SUBMISSION CANCELLED

Explanation: Insufficient memory to process AutoEdit statements during job submission.
This error message is issued by the CTMJSP program which is used to analyze AutoEdit statements. Job submission is terminated with a reason code of CANCL.
Corrective Action: Increase the REGION size of the Control-M monitor and rerun the job.

SUB195S BLDL/LOAD OF "CTMMEM" FAILED

Explanation: The CTMMEM module cannot be loaded.
This error message is issued by the CTMJ SP program which is used to analyze AutoEdit statements. This could be due to one of the following:
- The module does not appear in the load module search list.
- There is insufficient memory to load the program.
The Control-M monitor will shut down with an error message.
Corrective Action: Check whether the module is in the IOA Load library. Increase the Control-M monitor REGION size if needed.

SUB196E taskType memName jobName/jobId OID=orderId ERROR IN MEMBER memName LINE lineNum

Explanation: Error in AutoEdit symbols the memName member in the lineNum line.
This error message is issued by the CTMJ SP program which is used to analyze AutoEdit statements. A member loaded by a %%LIBSYM (or %%GLOBAL) command contains data in invalid format. For details, see the Control-M for z/OS User Guide.
The variable jobName/jobId does not appear in the message when the error occurs before the job statement is processed.
Job submission is terminated with a reason code of CANCL.
Corrective Action: Correct the contents of the member.

SUB197I taskType memName jobName/jobId OID=orderId OFFSET offset IN SUBSTITUTED LINE - text

Explanation: This information message follows message SUB192E or SUB198W, which gives the original text of a line at which an AutoEdit problem was encountered.
The variable jobName/jobId does not appear in the message when the error occurs before the job statement is processed. This message indicates that the problem occurred at the specified offset in the partially or fully substituted line.
Corrective Action: No action is required.
**SUB198W** taskType memName jobName/jobId OID=orderId REDUNDANT DATA ON LINE - lineNum

**Explanation:** Redundant text was detected in the original line, during analysis and substitution of an AutoEdit statement.

The line identified in the message is the original AutoEdit statement before any substitution has taken place. This message may be followed by SUB197I, which gives more details about the redundant text.

The redundant text is ignored and AutoEdit processing continues.

**Corrective Action:** No action is required.

**SUB199W** OID=orderId SUBMISSION TERMINATED FOR NON FIRST JOB STREAM IN THE JCL MEMBER memName LIBRARY lib

**Explanation:** The `memName` JCL member contains two or more jobs, but the installation set Control-M default specifies that only the first job in a job member is submitted.

Control-M can control only one job for each member. When more than one job resides in a member, Control-M controls only the first job. The default at your installation specifies that submission of all other jobs be cancelled.

An alternative installation default allows for submission of multiple jobs, with only the first job controlled by Control-M.

Only the first job in the member is submitted.

**Corrective Action:** Separate the member into several members with one job in each member, or contact your INCONTROL administrator to change the installation default to enable submission of multiple jobs in a single member.

**SUB19AW** UNCLOSED %%IF statement

**Explanation:** The submitted job contained a %%IF auto-edit statement that was not closed with a %%ENDIF auto-edit statement. A %%ENDIF auto-edit statement was automatically added to the end of the member to close the statement.

**Corrective Action:** Verify that the %%IF auto-edit statement is complete.

**SUB19BW** MISSING LABEL REFERENCED BY ACTIVE %%GOTO STATEMENT: <label>

**Explanation:** The "%%GOTO labelx" auto-edit statement is active, but the "%%LABEL labelx" auto-edit statement is not found in the JCL member.

Control-M processes the job as if the "%%LABEL labelx" auto-edit statement is at the end of the JCL member.

**Corrective Action:** Add the "%%LABEL labelx" auto-edit statement to its correct position in the JCL member.
SUB1A1W OID=orderId JOB CARD TOO LONG. CONTROL-M WILL NOT ADD MSGCLASS/MSGLEVEL/RESTART PARAMETERS

Explanation: The last line of the JOB statement was too long (past column 70), so that Control-M was unable to add more lines to the JOB statement.

Control-M requires correct MSGCLASS and MSGLEVEL parameters in order to analyze the result of the job's run. If these parameters are invalid or missing, Control-M tries to add default values for them to the JOB statement. Furthermore, Control-M may add a RESTART parameter to the job if needed.

Addition of any of these parameters may require the adding of another JCL line, which in turn requires the adding of a comma (,) to the last existing line. If there is no room at the end of the last existing line to add the comma, the additional line (and therefore, the additional parameters) cannot be added.

Control-M will submit the job as is, without changing any of the mentioned parameters.

Corrective Action: Split the last line of the JOB statement into two lines.

SUB1A2E OID=orderId INSUFFICIENT MEMORY TO READ ARCHIVED SYSOUTS

Explanation: The CTMARC internal module failed to read Archived Sysout Data Sets.

The Control-M monitor has attempted to perform a RESTART for an NJE job. As part of this attempt, all archived SYSDATA must be read from the Archived Sysout Data sets and passed as data to the CONTROLR step executed at the remote site. The attempt to read archived SYSDATA has failed due to lack of virtual storage available to the Control-M monitor.

The job submission is cancelled by the Control-M monitor.

Corrective Action: Retry the restart manually. If the problem persists, please report it to your INCONTROL administrator.

SUB1A4E OID=orderId SEVERE INTERNAL ERROR WHILE READING ARCHIVED SYSOUTS. LAST RC=rc. SUBMISSION CANCELLED

Explanation: Error occurred in the CTMARC internal module CTMARC.

When the Control-M monitor attempts to perform a job restart, it calls the CTMARC internal module to obtain information about the location of the archived SYSDATA for that job. That information must be passed to the CONTROLR step as data during job submission. The error rc indicates the nature of the problem. Possible errors which might occur in the module are:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
<td>The name of Archived Sysout Data Set does not follow the Control-M/Restart naming convention for this type of data set.</td>
</tr>
<tr>
<td>16</td>
<td>Archived sysout data sets (which are accessed to retrieve archived SYSDATA) belong to another job.</td>
</tr>
</tbody>
</table>

The job submission is cancelled by the Control-M monitor.
Corrective Action: Please contact BMC Software Customer Support for assistance.

SUB1A5E OID=orderId NO RECORDS ABOUT JOB’S PREVIOUS RUN(S). RESTART IMPOSSIBLE

Explanation: An internal error occurred in Control-M.
A job has been rescheduled for restart but the result of the original run of the job is not available. Job restart cannot be performed before the original run has finished execution.
The job submission is cancelled by the Control-M monitor.

Corrective Action: Please contact BMC Software Customer Support for assistance.

SUB1A6W OID=orderId OPEN OF STATISTICS FILE FAILED. RC=rc ERROR=err

Explanation: This information message is generated if an attempt to open the Control-M Job Statistics file fails.
Possible causes are:
- The DASTAT DD statement is missing.
- A VSAM open error occurred.

Corrective Action: Look for VSAM messages or other system messages, and correct the JCL for the Control-M monitor procedure.

SUB1A7W OID=orderId MISSING JOB STATISTICS. SHOUT WHEN EXECTIME PARAMETER IGNORED

Explanation: This information message is generated if job statistics data is missing from the Job Statistics file.
Possible causes are:
- The DASTAT DD statement is missing or there was a VSAM open error (if this message was preceded by the SUB1A6I message).
- The Job Statistics file contains no information about the previous executions of the job.

Corrective Action: Use the CTMJ SA utility to accumulate statistics data from the IOA Log in order to have most updated Job Statistics file. All the relative SHOUT WHEN EXECTIME messages, which rely on the statistic average exectime will be ignored.

SUB1A8E ACCESS DENIED TO JCL LIBRARY lib

Explanation: The user (specified in the USER field of the Job Scheduling Definition) is not authorized to access the JCL library specified in the Job Scheduling Definition.
The job is not submitted.

Corrective Action: Correct the LIBRARY field in the Job Scheduling Definition, and reorder the job.
SUB1A9E OID=orderId SYSOUT OF THE JOB'S PREVIOUS RUN WAS LOST. JOB IS NON RESTARTABLE

Explanation: Internal error in Control-M.
A job has been rescheduled for restart but all Archived Sysout Data Sets were deleted prior to submission of the restarted job.
The job submission is cancelled by the Control-M monitor.

Corrective Action: Try to determine why the Archived Sysout Data Sets were deleted before the job entry was deleted from the Control-M Active Jobs file.
Please refrain from manual deletion of these files.
If the files were not deleted manually, but were deleted by Control-M processing, please notify BMC Software Customer Support for assistance.

TIM messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages TIM300 through TIM3xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

TIM300I CONTROL-M TIMER STARTED

Explanation: This information message indicates that the Control-M monitor internal timer task started. It is routinely issued when the Control-M monitor is started.
Corrective Action: No action is required.

TIM301I SHUT DOWN UPON REQUEST FROM MAIN TASK

Explanation: This information message announces the shutdown of the Control-M monitor.
Shutdown of Control-M timer task upon request from Control-M main task.
Control-M monitor shuts down.
Corrective Action: No action is required.

TIM302I INTERVAL CHANGED FROM num1 TO num2 SECONDS

Explanation: This information message is generated by a change to the Control-M monitor “sleeping” interval by an F CONTROLM, INTERVAL= xx command.
The variables in this message are:
INCONTROL for z/OS Messages Manual

- **num1** - the old "sleeping" interval value
- **num2** - the new "sleeping" interval value

**Corrective Action:** No action is required.

**TMD messages**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**Messages TMD300 through TMD3xx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**TMD300I CONTROL-D TIMER STARTED**

**Explanation:** This information message indicates that the Control-D monitor internal timer task started. It is routinely issued when the Control-D monitor is started.

**Corrective Action:** No action is required.

**TMD301I SHUT DOWN UPON REQUEST FROM MAIN TASK**

**Explanation:** This information message announces the shutdown of the Control-D monitor. Shutdown of Control-D timer task upon request from Control-D main task.

**Corrective Action:** No action is required.

**TMD302I INTERVAL CHANGED FROM nn TO nn SECONDS**

**Explanation:** This information message is generated when the Control-D monitor “sleeping” interval is changed by an F CONTROLD,INTERVAL= xx command.

The variables in this message are:
- **num1** - the old "sleeping" interval value
- **num2** - the new "sleeping" interval value

**Corrective Action:** No action is required.

**TMO messages**

This group includes messages for the Control-O CMEM product.
Messages TMO0 through TMO0xx

This group includes messages for the Control-O CMEM product.

TMO001I {CONTROL-O | CTMCMEM} monitor TIMER SUBTASK STARTED.

LEVEL sting

Explanation: This information message indicates the start of the Control-O TIMER task, which controls the product timer and cleanup processing.

Corrective Action: No action is required.

TMO002I {CONTROL-O | CTMCMEM} TIMER SUBTASK ENDED.

Explanation: This information message indicates the normal termination of the Control-O TIMER task which controls the product timer and cleanup processing.

Corrective Action: No action is required.

TMO004I SVCDUMP WAS CAPTURED SUCCESSFULLY.

Explanation: The Control-O or CMEM monitor successfully captured an SVC dump as a result of an internal process request.

The monitor continues to operate normally.

Corrective Action: Verify that the dump has been successfully written to the system dump files.

TMO005E SVCDUMP WAS FAILED. A PARTIAL DUMP WAS TAKEN BECAUSE THE DUMP DATA SET DID NOT HAVE SUFFICIENT SPACE.

Explanation: The Control-O or CMEM monitor tried to dump the monitor and ECSA. The dump request failed because the dump dataset is too small to contain all the areas that are dumped.

The monitor continues to operate normally.

Corrective Action: Increase the dump files, since they are too small for Control-O or CMEM requirements. Take into account that the ECSA is also dumped by the request.

TMO006E SVCDUMP CAPTURED FAILED RC 8 REASON=reason (HEX).

Explanation: The Control-O or CMEM monitor tried to dump the monitor and ECSA storage areas. The dump request failed. The SDUMPX system service returns a return code of 8.

The monitor continues to operate normally.

Corrective Action: Refer to SDUMPX Reason Codes for Return Code 08 in IBM's MVS Programming Authorized Assembler Services Reference.

TMO007W RELEASING DEAD WSC AT address JOBNAME=jobName ASID=number

Explanation: The Control-O or CMEM monitor found that the WSC block is marked as in use, but it is not in use.
The monitor continues to operate normally. It may issue an SVCDUMP request.

Corrective Action: If a SVCDUMP is taken, save it. If the message is issued often, send the following information to BMC Software Customer Support:
- The SVCDUMP file
- The monitor’s SYSOUTs

BMC Software Customer Support will analyze the dump to find why the WSC was not released.

TMO008W  RELEASING WSC AT  address  JOBNAME=jobName  ASID=number

Explanation: The Control-O or CMEM monitor found that the WSC block has been marked as being in use for a very long time. Normally, the Control-O or CMEM process should hold the WSC block only for a very short time.

The monitor continues to operate normally. It may issue an SVCDUMP request.

Corrective Action: If a SVCDUMP is taken, save it. If the message is issued often, send the following information to BMC Software Customer Support:
- The SVCDUMP file
- The monitor’s SYSOUTs

BMC Software Customer Support will analyze the dump to find why the WSC was not released.

TMO009I  TIMEOUT WSC AT  address  JOBNAME=jobName  ASID=number

Explanation: The Control-O or CMEM monitor found that the WSC block has been marked as being in use for a very long time. Normally, the Control-O or CMEM process should hold the WSC block only for a very short time.

The monitor continues to operate normally. The monitor will check the WSC again in subsequent cycles and then decide what action to take.

Corrective Action: If a SVCDUMP is taken, save it. If the message is issued often, send the following information to BMC Software Customer Support:
- The SVCDUMP file
- The monitor’s SYSOUTs

BMC Software Customer Support will analyze the dump to find why the WSC was not released.

TPM messages

This group includes messages for the IOA (infrastructure) product.

Messages TPM100 through TPM1xx

This group includes messages for the IOA (infrastructure) product.
TPM160E mediaName - INTERNAL ERROR IN VOLSER LIST FOR DSN dsn

Explanation: Media mediaName encountered an internal error while trying to access an extent of data set dsn.

The user request is not executed. Depending on internal error severity, one of the following actions occurs:

- Media mediaName terminates. The IOA Archive Server continues processing.
- Media mediaName abends with User Abend 0007. The IOA Archive Server terminates with User Abend 0006. The output includes a dump of the abend.

Corrective Action: Check the IOA Log file and system log for messages describing the error. Contact the system programmer for assistance, if needed. If the problem is not resolved, record the return code and contact BMC Software Customer Support.

TPM161S mediaName - INTERNAL ERROR ENCOUNTERED - RC=rc

Explanation: Media mediaName encountered an internal error.

The user request is not executed. Depending on internal error severity, one of the following actions occurs:

- Media mediaName terminates. The IOA Archive Server continues processing.
- Media mediaName abends with User Abend 0007. The IOA Archive Server terminates with User Abend 0006. The output includes a dump of the abend.

Corrective Action: Check the IOA Log file and system log for messages describing the error. Contact the system programmer for assistance, if needed. If the problem is not resolved, record the return code and contact BMC Software Customer Support.

TPM162E mediaName - DSN dsn IS CATALOGED ON MORE THAN 5 VOLUMES

Explanation: An attempt was made to access an extent of the dsn data set which spans more than five volumes.

The viewing of reports from a data set which migrated on more than five volumes is not supported.

The user request is not executed.

Corrective Action: No action is required.

TPM163E mediaName - DSN "dsnt" IS SECOND FILE ON MULTI-VOLUME SET

Explanation: IOASMON detected a file that was created as a second file on the second volume of a multi-volume set.

An error during the migration process caused a file to be written as the second file on the second volume of a multi-volume set. This might cause a dead-lock while servicing the retrieval request. To avoid the possibility of a deadlock, the retrieval request is rejected.

The retrieval request is rejected.
Corrective Action: Unmigrate the report, re-decollate and migrate the report again.

TRE messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages TRE100 through TRE1xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

TRE150I LOADING OF RECIPIENT TREE STARTED

**Explanation:** This information message indicates that the loading of the Control-D Recipient Tree started. It is routinely issued when the Recipient Tree is being loaded.

**Corrective Action:** No action is required.

TRE151S OPEN OF RECIPIENT TREE MEMBER FAILED - DDNAME "DATREE"

**Explanation:** An attempt to open the Recipient Tree definition member failed.

Possible causes are:
- The DATREE DD statement is missing.
- The file allocated to the DATREE DD statement is not the Control-D Recipient Tree.
- The attempt to open the tree member referenced by the DATREE DD statement failed.

This message can be produced in the following situations:
- during initialization of the Control-D monitor or Printers Control monitor
- when security checking in the Online User Report List screen
- when using KeyStroke Language (KSL) scripts
- when issuing Control-D operator command LOADTREE to a Control-D component

**Corrective Action:** The System Action and User Response are shown in the following table:

<table>
<thead>
<tr>
<th>When Message Issued</th>
<th>System Action</th>
<th>User Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>During initialization of the Control-D monitor or Printers Control monitor</td>
<td>The Control-D monitor shuts down.</td>
<td>Modify the JCL procedure (CONTROLD/CTDPRINT) DATREE DD statement to point to the correct library and member, and bring up Control-D.</td>
</tr>
<tr>
<td>When Message Issued</td>
<td>System Action</td>
<td>User Response</td>
</tr>
<tr>
<td>-----------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>When security checking in the Online User Report List screen</td>
<td>The user will not be able to enter the User Report List screen.</td>
<td>Modify the CLIST (CTDISPF, CTMISPFD, DMAN, ROSDMAN, ROSTMAND, TMAND) DATREE DD statement to point to the correct library and member, exit from the Control-D Online Facility, and reenter the Online Facility.</td>
</tr>
<tr>
<td>When using KeyStroke Language (KSL) scripts</td>
<td>The job will end with errors. KSL reports will not be produced.</td>
<td>Modify the JCL procedure (CTDRKSL/CTMRKSLD) to point to the correct library and member name, and rerun the job.</td>
</tr>
<tr>
<td>When issuing Control-D operator command LOADTREE to a Control-D component</td>
<td>The new Recipient Tree will not be loaded. Control-D (or another component) will continue using the “old” Recipient Tree.</td>
<td>Modify the Recipient Tree using the Online Recipient Tree Definition screen, and reenter the LOADTREE operator command.</td>
</tr>
</tbody>
</table>

TRE152E PARENT `parent OF RECIPIENT `recipient` IS NOT IN THE TREE OR PARENT LEVEL IS INCORRECT - RECIPIENT IGNORED

**Explanation:** The recipient entry with the name and level specified in the parent name and parent level fields is not found in the Recipient tree.

This message can be produced in the following situations:

- during the initialization of the Control-D monitor and Printers Control monitor
- when entering the Online User Report List screen
- the KeyStroke Language
- the Control-D operator command LOADTREE was issued
- the IOAOMON1 operator command LOADTREE was issued
- when IOAOMON1 is initialized
- when saving an edited tree
- when executing the CHECK command to verify the tree

The loading of the Recipient Tree will continue. However, this particular recipient will not become part of the Recipient Tree.
Corrective Action: Correct the parent name in the Recipient Tree using the Online Recipient Tree Definition screen. Depending on the situation, do as shown in the following table:

<table>
<thead>
<tr>
<th>When Message Issued</th>
<th>User Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>During initialization of the Control-D monitor and Printers Control monitor</td>
<td>Issue a LOADTREE operator command to load in the new Recipient Tree.</td>
</tr>
<tr>
<td>When entering the Online User Report List screen</td>
<td>Exit from the Control-D Online Facility, and reenter the Online Facility.</td>

TRE153E INVALID LEVEL /lvl OF RECIPIENT recip - RECIPIENT IGNORED

Explanation: An invalid Recipient Tree level has been entered.

The Recipient Tree levels are installation defined (the CTDPARM member). The valid levels are displayed at the top of the Control-D Recipient Tree screen. This message can be produced under in one of the following situations:
The loading of the Recipient Tree will continue. However, this particular recipient will not become part of the Recipient Tree.

**Corrective Action:** Enter a valid Recipient Tree level in the Recipient Tree using the Online Recipient Tree Definition screen. Depending on the situation, do as shown in the following table:

<table>
<thead>
<tr>
<th>When Message Issued</th>
<th>User Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>During initialization of the Control-D monitor and Printers Control monitor</td>
<td>Issue a LOADTREE operator command to load in the new Recipient Tree.</td>
</tr>
<tr>
<td>When entering the Online User Report List screen</td>
<td>Exit from the Control-D Online Facility, and reenter the Online Facility.</td>
</tr>
<tr>
<td>The KeyStroke Language</td>
<td>Rerun the job.</td>
</tr>
<tr>
<td>When the Control-D operator command LOADTREE was issued</td>
<td>Reenter the LOADTREE operator command.</td>
</tr>
<tr>
<td>When the IOAOMON1 operator command LOADTREE was issued</td>
<td>Reenter the LOADTREE operator command.</td>
</tr>
<tr>
<td>When IOAOMON1 is initialized</td>
<td>Issue a LOADTREE operator command for IOAOMON1.</td>
</tr>
<tr>
<td>When saving an edited tree</td>
<td>Correct the tree and resave.</td>
</tr>
<tr>
<td>When executing a CHECK command to verify the tree</td>
<td>Correct the tree and reissue the command.</td>
</tr>
</tbody>
</table>

**TRE154S INSUFFICIENT MEMORY TO LOAD THE RECIPIENT TREE - LOADING ABORTED**

**Explanation:** Insufficient memory to load the Recipient Tree.

The loading of the Recipient Tree is aborted. This message can be produced in the following situations:
During the initialization of the Control-D monitor and Printers Control monitor.

When security checking in the Online User Report List screen.

The KeyStroke Language.

When the Control-D operator command LOADTREE was issued.

**Corrective Action:** The System Action and User Response are shown in the following table:

<table>
<thead>
<tr>
<th>When Message Issued</th>
<th>System Action</th>
<th>User Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>During initialization of the Control-D monitor and Printers Control monitor</td>
<td>The Control-D monitor will shut down.</td>
<td>Increase the REGION parameter of the Control-D monitor and Printers Control monitor - JCL procedures CONTROLD and CTDPRINT.</td>
</tr>
<tr>
<td>While security checking in the Online User Report List screen</td>
<td>The user cannot enter the Online Recipient Tree Definition screen.</td>
<td>Log on again using a larger SIZE parameter.</td>
</tr>
<tr>
<td>The KeyStroke Language</td>
<td>The job ends with errors. KSL reports are not produced.</td>
<td>Increase the REGION parameter of the job, and rerun.</td>
</tr>
<tr>
<td>When the Control-D operator command LOADTREE was issued</td>
<td>The new Recipient Tree is not loaded. Control-D continues using the “old” Recipient Tree.</td>
<td>Increase the REGION parameter of the Control-D monitor and Printers Control monitor - JCL procedures CONTROLD and CTDPRINT. Bring down Control-D, and then up again.</td>
</tr>
</tbody>
</table>

TRE155S THE RECIPIENT TREE IS EMPTY. LOADING ABORTED

**Explanation:** The Recipient Tree is empty. Loading is aborted.

The Recipient Tree must be defined using the Installation Parameters. This message can be produced in the following situations:

- During the initialization of the Control-D monitor and Printers Control monitor.
- When security checking in the Online User Report List screen.
- The KeyStroke Language.
- The Control-D operator command LOADTREE was issued.

The following system actions can occur, depending on the situation:
During initialization of the Control-D monitor and Printers Control monitor: The Control-D monitor shuts down.

When security checking in the Online User Report List screen: The user cannot enter the Online Recipient Tree Definition screen.

The KeyStroke Language: The job ends with errors. KSL reports are not produced.

The Control-D operator command LOADTREE was issued: The new Recipient Tree is not loaded. Control-D continues using the “old” Recipient Tree.

**Corrective Action:** Delete this Recipient Tree member from the library, then generate a new Recipient Tree using the Online Recipient Tree Definition screen. Depending on the situation, do as shown in the following table:

<table>
<thead>
<tr>
<th>When Message Issued</th>
<th>User Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>During initialization of the Control-D monitor and Printers Control monitor</td>
<td>Bring up the Control-D monitor.</td>
</tr>
<tr>
<td>When security checking in the Online User Report List screen</td>
<td>Exit from the Control-D Online Facility, and reenter the Online Facility.</td>
</tr>
<tr>
<td>The KeyStroke Language</td>
<td>Rerun the job.</td>
</tr>
<tr>
<td>When the Control-D operator command LOADTREE was issued</td>
<td>Reenter the LOADTREE operator command.</td>
</tr>
</tbody>
</table>

**TRE157E INVALID LEVEL \l/vl OF PARENT parent IN RECIPIENT recip**

**Explanation:** The Recipient Tree level entered for the parent of this recipient is invalid.

The valid levels are displayed at the top of the Recipient Tree screen. This message can be produced in the following situations:

- during the initialization of the Control-D monitor and Printers Control monitor
- when entering the Online User Report List screen
- the KeyStroke Language
- the Control-D operator command LOADTREE was issued
- the IOAOMON1 operator command LOADTREE was issued
- when IOAOMON1 is initialized
- when saving an edited tree
- when executing the CHECK command to verify the tree

The loading of the Recipient Tree will continue. However, this particular recipient will not become part of the Recipient Tree.
**Corrective Action:** Correct the level for the parent using the Online Recipient Tree Definition screen. Depending on the situation, do as shown in the following table:

<table>
<thead>
<tr>
<th>When Message Issued</th>
<th>User Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>During initialization of the Control-D monitor and Printers Control monitor</td>
<td>Issue a LOADTREE operator command to load in the new Recipient Tree.</td>
</tr>
<tr>
<td>When entering the Online User Report List screen</td>
<td>Exit from the Control-D Online Facility, and reenter the Online Facility.</td>
</tr>
<tr>
<td>The KeyStroke Language</td>
<td>Rerun the job.</td>
</tr>
<tr>
<td>When the Control-D operator command LOADTREE was issued</td>
<td>Reenter the LOADTREE operator command.</td>
</tr>
<tr>
<td>When the IOAOMON1 operator command LOADTREE was issued</td>
<td>Reenter the LOADTREE operator command.</td>
</tr>
<tr>
<td>When IOAOMON1 is initialized</td>
<td>Issue a LOADTREE operator command for IOAOMON1.</td>
</tr>
<tr>
<td>When saving an edited tree</td>
<td>Correct the tree and resave.</td>
</tr>
<tr>
<td>When executing a CHECK command to verify the tree</td>
<td>Correct the tree and reissue the command.</td>
</tr>
</tbody>
</table>

**TRE158E LEVEL lvl OF THE PARENT parent IS LOWER THAN THE LEVEL OF RECIPIENT recip**

**Explanation:** The level of the parent of the recipient is lower than the level of the recipient being defined.

The level of the parent must be higher than the level of the “child.” (Note that the order can be seen in the Recipient Tree Entry screen).

**Corrective Action:** Enter a parent name with a different level or give the recipient a lower level.

**TRE159E ERROR IN FREEMAIN OF PREVIOUS TREE, LOADING OF NEW TREE CONTINUED**

**Explanation:** The freeing of the memory for the previous Recipient Tree failed.

The Control-D operator command LOADTREE was issued in order to load in a new Recipient Tree. After loading memory for the “new” Recipient Tree, Control-D attempts to free the memory assigned to the “old” Recipient Tree.
The loading of the “new” Recipient Tree will be accepted. However, the memory allocated to the “old” tree will not be freed until Control-D is shut down.

**Corrective Action:** No action is required.

**TRE160I** CONTROL-D RECIPIENT TREE LOADED - *num* RECIPIENTS

**Explanation:** This information message indicates that the Recipient Tree was successfully loaded.

**Corrective Action:** No action is required.

**TRE161E** RECIPIENT *recip* ALREADY IN TREE - CURRENT RECIPIENT ENTRY IGNORED

**Explanation:** The recipient entered (*recip*) is already in the Recipient Tree. The current recipient entry is ignored.

A recipient name (not synonym) can only appear once in the Recipient Tree. This message can be produced in the following situations:

- When entering the Online User Report List screen.
- The KeyStroke Language.
- The Control-D operator command LOADTREE was issued.
- The IOAOMON1 operator command LOADTREE was issued.
- When IOAOMON1 is initialized.
- When saving an edited tree.
- When executing the CHECK command to verify the tree.
- During the initialization of the Control-D monitor and Printers Control monitor.

The loading of the Recipient Tree will continue. However, this particular recipient will not become part of the Recipient Tree (the first one will).

**Corrective Action:** Delete the duplicate recipient using the Online Recipient Tree Definition screen. Depending on the situation, do as shown in the following table:

<table>
<thead>
<tr>
<th>When Message Issued</th>
<th>User Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>During initialization of the Control-D monitor and Printers Control monitor</td>
<td>Issue a LOADTREE operator command to load in the new Recipient Tree.</td>
</tr>
<tr>
<td>When entering the Online User Report List screen</td>
<td>Exit from the Control-D Online Facility, and reenter the Online Facility.</td>
</tr>
<tr>
<td>The KeyStroke Language</td>
<td>Rerun the job.</td>
</tr>
<tr>
<td>When the Control-D operator command LOADTREE was issued</td>
<td>Reenter the LOADTREE operator command.</td>
</tr>
</tbody>
</table>
When Message Issued | User Response
---|---
When the IOAOMON1 operator command LOADTREE was issued | Reenter the LOADTREE operator command.
When IOAOMON1 is initialized | Issue a LOADTREE operator command for IOAOMON1.
When saving an edited tree | Correct the tree and resave.
When executing a CHECK command to verify the tree | Correct the tree and reissue the command.

TRE162E USER ENTRY *entry* NOT REBUILT AFTER AN INTERNAL SORT ERROR

**Explanation:** The internal sort of the tree elements failed for the user entry identified in the message. The user entry is disregarded, and processing of the tree is continued.

**Corrective Action:** Contact BMC Software Customer Support.

TRE163E MAXIMUM NUMBER OF PC USERS IS EXCEEDED. PC INFO FOR USER *usr* IS IGNORED

**Explanation:** The number of users authorized for PC file transfer exceeds the maximum number of PC users defined in the PASDPC member in the IOA PARM library.

Maximum number of PC users in PARM library is defined at the time the license is received to use Control-D/WebAccess Server.

All users over maximum will not be able to use file transfer option.

**Corrective Action:** Set AUTHORIZED TO USE PC to N for some users in screen T, or obtain a new license with a greater number of PC users.

TRE165I TREE CHECK ENDED SUCCESSFULLY. *n* RECIPIENTS

**Explanation:** This information message request is generated by the CHKTREE command. The recipient tree was checked and no errors were found. The number of recipients in the tree is displayed.

**Corrective Action:** No action is required.

TRE170I LOADING OF APPROVAL TREE STARTED

**Explanation:** This information message indicates that the loading of the Control-D Approval Tree started. It is routinely issued when the Approval Tree is being loaded.

**Corrective Action:** No action is required.
TRE171S OPEN OF APPROVAL TREE MEMBER FAILED - DDNAME "DAAPPR"

**Explanation:** An attempt to open the Approval Tree definition member failed.

Possible causes are:
- The DAAPPR DD statement is missing.
- The file allocated to the DAAPPR DD statement is not the Control-D Approval Tree.
- The attempt to open the tree member referenced by the DAAPPR DD statement failed.

This message can be produced in the following situations:
- during initialization of the Control-D monitor or Printers Control monitor
- when issuing Control-D operator command LOADTREE to a Control-D component

**Corrective Action:** The System Action and User Response are shown in the following table:

<table>
<thead>
<tr>
<th>When Message Issued</th>
<th>System Action</th>
<th>User Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>During initialization of the Control-D monitor or Printers Control monitor</td>
<td>The Control-D monitor shuts down.</td>
<td>Modify the JCL procedure (CONTROLD/CTDPRINT) DAAPPR DD statement to point to the correct library and member, and bring up Control-D.</td>
</tr>
<tr>
<td>When issuing Control-D operator command LOADTREE to a Control-D component</td>
<td>The new Approval Tree will not be loaded. Control-D (or another component) will continue using the “old” Approval Tree.</td>
<td>Modify the Approval Tree using the Online Approval Tree Definition screen, and reenter the LOADTREE operator command.</td>
</tr>
</tbody>
</table>

TRE172E PARENT parent OF APPROVAL approval IS NOT IN THE TREE OR PARENT LEVEL IS INCORRECT - APPROVAL IGNORED

**Explanation:** The approval entry with the name and level specified in the parent name and parent level fields is not found in the Approval tree.

This message can be produced in the following situations:
during the initialization of the Control-D monitor and Printers Control monitor
when entering the Online User Report List screen
the KeyStroke Language
the Control-D operator command LOADTREE was issued
the IOAOMON1 operator command LOADTREE was issued
when IOAOMON1 is initialized
when saving an edited tree
when executing the CHECK command to verify the tree

The loading of the Approval tree will continue. However, this particular Approval name will not become part of the Approval Tree.

**Corrective Action:** Correct the parent name in the Approval Tree using the Online Approval Tree Definition screen. Depending on the situation, do as shown in the following table:

<table>
<thead>
<tr>
<th>When Message Issued</th>
<th>User Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>During initialization of the Control-D monitor and Printers Control monitor</td>
<td>Issue a LOADTREE operator command to load in the new Approval Tree.</td>
</tr>
<tr>
<td>When entering the Online User Report List screen</td>
<td>Exit from the Control-D Online Facility, and reenter the Online Facility.</td>
</tr>
<tr>
<td>The KeyStroke Language</td>
<td>Rerun the job.</td>
</tr>
<tr>
<td>When the Control-D operator command LOADTREE was issued</td>
<td>Reenter the LOADTREE operator command.</td>
</tr>
<tr>
<td>When the IOAOMON1 operator command LOADTREE was issued</td>
<td>Reenter the LOADTREE operator command.</td>
</tr>
<tr>
<td>When IOAOMON1 is initialized</td>
<td>Issue a LOADTREE operator command for IOAOMON1.</td>
</tr>
<tr>
<td>When saving an edited tree</td>
<td>Correct the tree and resave.</td>
</tr>
<tr>
<td>When executing the CHECK command to verify the tree</td>
<td>Correct the tree and reissue the command.</td>
</tr>
</tbody>
</table>

**TRE173E INVALID LEVEL */v/* OF Approval - APPROVAL IGNORED**

**Explanation:** An invalid Approval Tree level has been entered.
The Approval Tree levels are installation defined (the CTD Parm member). The valid levels are displayed at the top of the Control-D Approval Tree screen. This message can be produced under in one of the following situations:

- during initialization of the Control-D monitor and Printers Control monitor
- when entering the Online User Report List screen
- the KeyStroke Language
- when the Control-D operator command LOADTREE was issued
- when the IOAOMON1 operator command LOADTREE was issued
- when IOAOMON1 is initialized
- when saving an edited tree
- when executing the CHECK command to verify the tree

The loading of the Approval Tree will continue. However, this particular Approval name will not become part of the Approval Tree.

**Corrective Action:** Enter a valid Approval Tree level in the Approval Tree using the Online Approval Tree Definition screen. Depending on the situation, do as shown in the following table:

<table>
<thead>
<tr>
<th>When Message Issued</th>
<th>User Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>During initialization of the Control-D monitor and Printers Control monitor</td>
<td>Issue a LOADTREE operator command to load in the new Approval Tree.</td>
</tr>
<tr>
<td>When entering the Online User Report List screen</td>
<td>Exit from the Control-D Online Facility, and reenter the Online Facility.</td>
</tr>
<tr>
<td>The KeyStroke Language</td>
<td>Rerun the job.</td>
</tr>
<tr>
<td>When the Control-D operator command LOADTREE was issued</td>
<td>Reenter the LOADTREE operator command.</td>
</tr>
<tr>
<td>When the IOAOMON1 operator command LOADTREE was issued</td>
<td>Reenter the LOADTREE operator command.</td>
</tr>
<tr>
<td>When IOAOMON1 is initialized</td>
<td>Issue a LOADTREE operator command for IOAOMON1.</td>
</tr>
<tr>
<td>When saving an edited tree</td>
<td>Correct the tree and resave.</td>
</tr>
<tr>
<td>When executing a CHECK command to verify the tree</td>
<td>Correct the tree and reissue the command.</td>
</tr>
</tbody>
</table>
TRE174S INSUFFICIENT MEMORY TO LOAD THE APPROVAL TREE - LOADING ABORTED

**Explanation:** Insufficient memory to load the Approval Tree.

The loading of the Approval Tree is aborted. This message can be produced in the following situations:

- During the initialization of the Control-D monitor and Printers Control monitor.
- When security checking in the Online User Report List screen.
- The KeyStroke Language.
- When the Control-D operator command LOADTREE was issued.

**Corrective Action:** The System Action and User Response are shown in the following table:

<table>
<thead>
<tr>
<th>When Message Issued</th>
<th>System Action</th>
<th>User Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>During initialization of the Control-D monitor and Printers Control monitor</td>
<td>The Control-D monitor will shut down.</td>
<td>Increase the REGION parameter of the Control-D monitor and Printers Control monitor - JCL procedures CONTROLD and CTDPRINT.</td>
</tr>
<tr>
<td>While security checking in the Online User Report List screen</td>
<td>The user cannot enter the Online Approval Tree Definition screen.</td>
<td>Log on again using a larger SIZE parameter.</td>
</tr>
<tr>
<td>The KeyStroke Language</td>
<td>The job ends with errors. KSL reports are not produced.</td>
<td>Increase the REGION parameter of the job, and rerun.</td>
</tr>
<tr>
<td>When the Control-D operator command LOADTREE was issued</td>
<td>The new Approval Tree is not loaded. Control-D continues using the “old” Approval Tree.</td>
<td>Increase the REGION parameter of the Control-D monitor and Printers Control monitor - JCL procedures CONTROLD and CTDPRINT. Bring down Control-D, and then up again.</td>
</tr>
</tbody>
</table>

TRE175S THE APPROVAL TREE IS EMPTY. LOADING ABORTED

**Explanation:** The Approval Tree is empty. Loading is aborted.

The Approval Tree must be defined using the Installation Parameters. This message can be produced in the following situations:

- During the initialization of the Control-D monitor and Printers Control monitor.
- When security checking in the Online User Report List screen.
- The KeyStroke Language.
- The Control-D operator command LOADTREE was issued.

The following system actions can occur, depending on the situation:
During initialization of the Control-D monitor and Printers Control monitor: The Control-D monitor shuts down.

When security checking in the Online User Report List screen: The user cannot enter the Online Approval Tree Definition screen.

The KeyStroke Language: The job ends with errors. KSL reports are not produced.

The Control-D operator command LOADTREE was issued: The new Approval Tree is not loaded. Control-D continues using the “old” Approval Tree.

**Corrective Action:** Delete this Approval Tree member from the library, then generate a new Approval Tree using the Online Approval Tree Definition screen. Depending on the situation, do as shown in the following table:

<table>
<thead>
<tr>
<th>When Message Issued</th>
<th>User Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>During initialization of the Control-D monitor and Printers Control monitor</td>
<td>Bring up the Control-D monitor.</td>
</tr>
<tr>
<td>When security checking in the Online User Report List screen</td>
<td>Exit from the Control-D Online Facility, and reenter the Online Facility.</td>
</tr>
<tr>
<td>The KeyStroke Language</td>
<td>Rerun the job.</td>
</tr>
<tr>
<td>When the Control-D operator command LOADTREE was issued</td>
<td>Reenter the LOADTREE operator command.</td>
</tr>
</tbody>
</table>

**TRE177E INVALID LEVEL /lv/ OF PARENT /parent/ IN APPROVAL /approval/**

**Explanation:** The Approval Tree level entered for the parent of this Approval name is invalid. The valid levels are displayed at the top of the Approval Tree screen. This message can be produced in the following situations:

- during the initialization of the Control-D monitor and Printers Control monitor
- when entering the Online User Report List screen
- the KeyStroke Language
- the Control-D operator command LOADTREE was issued
- the IOAOMON1 operator command LOADTREE was issued
- when IOAOMON1 is initialized
- when saving an edited tree
- when executing the CHECK command to verify the tree

The loading of the Approval Tree will continue. However, this particular Approval name will not become part of the Approval Tree.
Corrective Action: Correct the level for the parent using the Online Approval Tree Definition screen. Depending on the situation, do as shown in the following table:

<table>
<thead>
<tr>
<th>When Message Issued</th>
<th>User Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>During initialization of the Control-D monitor and Printers Control monitor</td>
<td>Issue a LOADTREE operator command to load in the new Approval Tree.</td>

<tr>
<td>When saving an edited tree</td>
<td>Correct the tree and resave.</td>
</tr>
<tr>
<td>When executing a CHECK command to verify the tree</td>
<td>Correct the tree and reissue the command.</td>
</tr>
</tbody>
</table>

TRE178E LEVEL lvl OF THE PARENT parent IS LOWER THAN THE LEVEL OF APPROVAL approval

Explanation: The level of the parent of the Approval name is lower than the level of the Approval name being defined.

The level of the parent must be higher than the level of the “child.” (Note that the order can be seen in the Approval Tree Entry screen).

Corrective Action: Enter a parent name with a different level or give the Approval name a lower level.

TRE180I CONTROL-D APPROVAL TREE LOADED - num APPROVALS

Explanation: This information message indicates that the Approval Tree was successfully loaded.

Corrective Action: No action is required.
TRE181E APPROVAL NAME approval ALREADY IN TREE - CURRENT APPROVAL NAME ENTRY IGNORED

Explanation: The Approval name entered is already in the Approval Tree. The current Approval name entry is ignored.

An Approval name can only appear once in the Approval Tree. This message can be produced in the following situations:

- When entering the Online User Report List screen.
- The KeyStroke Language.
- The Control-D operator command LOADTREE was issued.
- The IOAOMON1 operator command LOADTREE was issued.
- When IOAOMON1 is initialized.
- When saving an edited tree.
- When executing the CHECK command to verify the tree.
- During the initialization of the Control-D monitor and Printers Control monitor.

The loading of the Approval Tree will continue. However, this particular Approval name will not become part of the Approval Tree (the first one will).

Corrective Action: Delete the duplicate Approval name using the Online Approval Tree Definition screen. Depending on the situation, do as shown in the following table:

<table>
<thead>
<tr>
<th>When Message Issued</th>
<th>User Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>During initialization of the Control-D monitor and Printers Control monitor</td>
<td>Issue a LOADTREE operator command to load in the new Approval Tree.</td>
</tr>
<tr>
<td>When entering the Online User Report List screen</td>

<tr>
<td>When executing a CHECK command to verify the tree</td>
<td>Correct the tree and reissue the command.</td>
</tr>
</tbody>
</table>

TRE185I APPROVAL TREE CHECK ENDED SUCCESSFULLY. *n* APPROVALS

**Explanation:** This information message request is generated by the CHKTREE command. The Approval tree was checked and no errors were found. The number of Approval names in the tree is displayed.

**Corrective Action:** No action is required.

TST messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages TSTA00 through TSTAxx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

TSTA80E INVALID PARM LIST OR NO PARM LIST

**Explanation:** An invalid parameter was passed to the IOALOC program. The IOALOC program accepts either ALLOC or FREE as input parameters.

The IOALOC program stops executing.

**Corrective Action:** Supply the correct input parameter.

Messages TSTF00 through TSTFxx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

TSTF30E INTERNAL CONSOLE ERROR. FUNCTION *func*. RETURN CODES *rc1, rc2*. REASON CODE *rsn*. USING THE INTERNAL CONSOLE TERMINATES

**Explanation:** An error occurred when using the extended MCS console.

Control-D terminates the extended MCS console and starts using a standard method for preventing the mixing of chunks during deferred printing.

**Corrective Action:** Keep a system log of the problem, and a job log of the Control-D printer monitor. It is recommended to stop, then restart, the Control-D monitor to prevent a possible mixing chunks problem.
TSTF31I THE INTERNAL OPERATOR CONSOLE IS ACTIVATED

**Explanation:** This information message is generated when Control-D activates an extended MCS console to prevent the mixing of chunks during deferred printing.

When APPLY is set to YES for optional wish WD2624, Control-D uses an extended MCS console to prevent the mixing of chunks during deferred printing.

**Corrective Action:** No action is required.

TSTF32E NO RESPONSE OF INTERNAL CONSOLE. USING THE CONSOLE TERMINATES

**Explanation:** There is no response from the extended MCS console used by Control-D to prevent the mixing of chunks during deferred printing.

Control-D stops using the extended MCS console and starts using a standard method for preventing the mixing of chunks during deferred printing.

**Corrective Action:** Keep a system log of the problem, and a job log of the Control-D printer monitor. It is recommended to stop, then restart, Control-D monitor to prevent a possible mixing chunks problem.

TSTFB0S PARAMETER parm NOT RECOGNIZED

**Explanation:** The parameter specified for the IOATEST utility is invalid.

The IOATEST utility terminates with a condition code of 08.

**Corrective Action:** Correct the syntax of the parameters to IOATEST.

TSTFB1S PARAMETER SHOULD BE NUMERIC (parm)

**Explanation:** The value of a parameter that should be numeric is nonnumeric.

The IOATEST utility terminates with a condition code of 08.

**Corrective Action:** Make sure the value of the parameter is numeric.

TSTFB2S NUMERIC PARAMETER OUT OF RANGE (parm)

**Explanation:** Numeric parameter is not within the defined range.

The utility terminates with a condition code of 08.

**Corrective Action:** Make sure the value of the parameter is within the defined range.

TSTFB3S ONLY UP TO TEN MINOR LINES ARE ALLOWED FOR A MULTI-LINE MESSAGE

**Explanation:** More than ten minor lines were specified for a multi-line message; 10 is the maximum allowed.

The IOATEST utility terminates with a condition code of 08.

**Corrective Action:** Make sure that no more than 10 minor lines are specified.
TSTFB4W (parm) PARAMETER LONGER THAN ALLOWED. TRUNCATED TO LEFTMOST 4 CHARACTERS

Explanation: The value specified for the parm parameter exceeded 4 characters. The parameter value is truncated to the first four (leftmost) characters. Processing continues.

Corrective Action: Specify a valid value for the parm parameter.

UAT messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages UAT900 through UAT9xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

UAT9B1S RELEASE OF ATF FILE NOT SUPPORTED BY THIS RELEASE OF CONTROL-D

Explanation: The release defined in the Active Transfer file is not the same as the release defined in the Control-D Load library. Control-D checks that the release number defined in the Active Transfer file is the same release number that is defined in the Control-D Load library. An error occurs when trying to allocate an Active Transfer file that belongs to a different Control-D release, for example, a test or production release.

Requested function is not performed.

Corrective Action: Backup the Active Transfer file and reformat it. You can do this using ICE, as follows:

1. In the IOA Installation Menu, select Customization.
2. Select the environment to customize.
3. In the Customization screen, set Product ID to CTD and select Product Customization.
4. Select Major Step 6, Customize Control-D Dataset Parameters.
5. Select Minor Step 6, Format the A.T.F File.

UAT9B2S OPEN OF CONTROL-D ATF FILE FAILED

Explanation: An attempt by Control-D to open the Active Transfer file failed. The DAATF DD statement for the Active Transfer file is missing in the logon or Print monitor procedure.

Requested function is not performed.

Corrective Action: Check the DAATF DD statement in the Control-D and logon procedures.
UAT9B3S CONTROL-D ATF FILE IS FULL

**Explanation:** An overflow was detected in the Active Transfer file. The Active Transfer file is full and requires enlargement or compression.

Requested function is not performed.

**Corrective Action:** Compress or enlarge the Active Transfer file using the CTDCATF utility. For more details, see the *INCONTROL for z/OS Utilities Guide*.

UAT9B7S FILE ALLOCATED TO DDNAME "DAATF" IS NOT YOUR CONTROL-D ATF

**Explanation:** The QNAME defined in the Active Transfer file is not the same as the QNAME defined in CTDPARM. Either a file from another Control-D installation was accessed, or there was an error in the current installation.

Requested function is not performed.

**Corrective Action:** Check CTDPARM. If the QNAME was changed after installation procedures were performed, specify the original QNAME and rerun CTDPARM. If two different Control-D installations are running concurrently, then make sure that the files do not mix between the two different monitors.

UAT9B8S FILE ALLOCATED TO DDNAME "DAATF" IS NOT A CONTROL-D ATF

**Explanation:** The Active Transfer file does not have a valid identification. The Active Transfer file must contain the characters ATF in the first block (offset 18).

Requested function is not performed.

**Corrective Action:** Backup the Active Transfer file and reformat it. You can do this using ICE, as follows:

1. In the IOA Installation Menu, select Customization.
2. Select the environment to customize.
3. In the Customization screen, set Product ID to CTD and select Product Customization.
4. Select Major Step 6, Customize Control-D Dataset Parameters.
5. Select Minor Step 6, Format the A.T.F File.

UAT9B9S CONTROL-D ATF FILE IS FORMATTING/ CTDBAT PROBABLY ABENDED

**Explanation:** A compression or formatting of the Active Transfer file was started, but did not end successfully. The Active Transfer file contains an indicator that the format or compression processing was incomplete.

Requested function is not performed.

**Corrective Action:** Backup the Active Transfer file and reformat it. You can do this using ICE, as follows:

1. In the IOA Installation Menu, select Customization.
2. Select the environment to customize.
3. In the Customization screen, set Product ID to CTD and select Product Customization.
4. Select Major Step 6, Customize Control-D Dataset Parameters.
5. Select Minor Step 6, Format the A.T.F File.

**UBK messages**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**Messages UBK900 through UBK9xx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**UBK9C0I CTDUPBKP UTILITY STARTED**

**Explanation:** This information message indicates that the CTDUPBKP utility has started.

**Corrective Action:** No action is required.

**UBK9C1I CTDUPBKP UTILITY COMPLETED SUCCESSFULLY**

**Explanation:** This information message indicates that the CTDUPBKP utility has completed without errors.

**Corrective Action:** No action is required.

**UBK9C2S CTDUPBKP UTILITY ENDED WITH ERRORS**

**Explanation:** This information message indicates that the CTDUPBKP utility has ended with errors.

**Corrective Action:** Check all the messages issued by the CTDUPBKP utility and proceed accordingly.

**UBK9C3I FILE=ACT WAS SPECIFIED. ACTIVE USER FILE WILL BE PROCESSED**

**Explanation:** This information message indicates that FILE was set to ACT in the input parameters of the CTDUPBKP utility, and as a result the Active User file is processed.

**Corrective Action:** No action is required.

**UBK9C4I FILE=HST WAS SPECIFIED. HISTORY USER FILE WILL BE PROCESSED**

**Explanation:** This information message indicates that FILE was set to HST in the input parameters of the CTDUPBKP utility and, as a result, the History User file is processed.

**Corrective Action:** No action is required.
UBK9C5I FILE=MIG WAS SPECIFIED. MIGRATION USER FILE WILL BE PROCESSED

Explanation: This information message indicates that FILE was set to MIG in the input parameters of the CTDUPBKP utility and, as a result, the Migration User file is processed.

Corrective Action: No action is required.

UBK9C6E NO FILE PARAMETER WAS SPECIFIED

Explanation: The FILE parameter was not specified in the input parameters of the CTDUPBKP utility.

Corrective Action: Specify the FILE parameter and rerun the utility.

UBK9C7E NO $SYSDATA RECORDS FOUND IN THE {ACTIVE | HISTORY | MIGRATION} USER FILE

Explanation: The CTDUPBKP utility did not find any $SYSDATA records in the specified user file to update.

Corrective Action: Check the input FILE parameter of the utility for the correct user file, and rerun the utility.

UBK9C8E SELECT CARD WAS NOT SPECIFIED

Explanation: A SELECT statement was omitted from the input parameters of the CTDUPBKP utility.

Corrective Action: Add a SELECT statement to the CTDUPBKP input statements of the CTDUPBKP utility, and rerun the utility. For more information, see the INCONTROL for z/OS Utilities Guide.

UBK9C9I input_parm WAS SPECIFIED

Explanation: This information message displays the input parameter that the user specified for the CTDUPBKP utility.

Corrective Action: No action is required.

UBK9CAl NO VOLSER WAS FOUND FOR THE {ACTIVE | PERMANENT | HISTORY} USER FILE

Explanation: This information message indicates that a detailed report ordered by the user was not produced because the $SYSDATA record of the identified user file was not found.

Corrective Action: No action is required.
UBK9CBI input_control_stmt

**Explanation:** This information message displays the input control statement that the user specified for the CTDUPBKP utility.

If the input control statement is in error, this message is followed by message UBK9CCE.

**Corrective Action:** No action is required.

UBK9CCE ERROR IN CONTROL STATEMENT

**Explanation:** An error was found in the input control statement specified by the user for the CTDUPBKP utility.

The input control statement is displayed in message UBK9CBI which precedes this message.

The CTDUPBKP utility terminates.

**Corrective Action:** For a description of the input parameters, see the CTDUPBKP utility in the *INCONTROL for z/OS Utilities Guide*. Correct the input control statement accordingly and rerun the utility.

UBK9CDW THERE IS NO CONTROL RECORD FOR BKPMIS backupMissionName

**Explanation:** The CTDUPBKP utility could not find the Backup Control record for the backup mission of the current $SYSDATA record.

When FILE is set to HST in the input parameters of the CTDUPBKP utility, the utility attempts to read the backup control record for the backup mission of the current $SYSDATA record. In this case, the backup control record could not be found in the History file.

The CTDUPBKP utility continues with processes that do not require the backup control record.

**Corrective Action:** To create a backup control record, in the input parameters of the CTDUPBKP utility specify the backup mission name in the BKPMIS parameter, and the number of backup generations to retain in the GENER parameter. Rerun the CTDUPBKP utility.

For more information, see the CTDUPBKP utility in the *INCONTROL for z/OS Utilities Guide*.

UBK9CEE RETPD CANNOT BE CHANGED

**Explanation:** The RETPD parameter was specified as an input parameter for the CTDUPBKP utility but the generation number found in the Backup Control record was not 0.

When activating the CTDUPBKP utility, the user specified the RETPD parameter without setting GENER to NONE. The backup mission in question was previously run using the NUMBER OF DAYS TO KEEP method. Once a mission has been run using NUMBER OF DAYS TO KEEP method, it cannot be run using the RETPD method.

The CTDUPBKP utility continues with other processes.

**Corrective Action:** Either change the method in the parameters to NUMBER OF DAYS TO KEEP then rerun the utility, or define a new backup mission defined with the RETPD parameter.

UBK9CFE INVALID RETURN CODE FROM SORT. RC=rc

**Explanation:** The SORT utility called by the CTDUPBKP utility ended with errors.
The CTDUPBKP utility terminates.

**Corrective Action:** Refer to the section on return codes in the SORT utility documentation in the *INCONTROL for z/OS Utilities Guide*. Correct the cause accordingly and rerun the CTDUPBKP utility.

UBK9F0I CONTROL RECORD FOR BKPMIS `backupMissionName` HAS BEEN CREATED

**Explanation:** This information message indicates that a backup control record was recreated for the backup mission identified in the message.

A backup control record is recreated when the FILE parameter was set to HST for the backup mission, and when the original backup control record is missing.

**Corrective Action:** No action is required.

UBK9F1I CTDUPBKP IS RUNNING IN SIMULATE MODE:

**Explanation:** This information message indicates that the CTDUPBKP utility is running in simulation mode. The report listing the selected records and specified updates is produced, but no updates are actually performed.

**Corrective Action:** Analyze the report. If all requested updates are correct, run the utility in production mode (with parameter SIMULATE=NO).

UBK9F2I MI GMIS `missionName` PRIMARY/SECONDARY VOLSER `volser` IS CHANGED TO SCRATCH.

**Explanation:** This information message indicates that the volume serial number for the specified migration mission is cleaned by the CTDUPBKP utility. The next migration mission run will request a scratch tape volume for migration.

The variables in this message are:
- `missionName` - migration mission name for which the action is performed.
- `volser` - the old volume serial number which is changed to scratch.

**Corrective Action:** No action is required.

UBK9F3E NO MI GMIS PARAMETER WAS SPECIFIED.

**Explanation:** This error message is issued when the SCRATCHVOL or SCRATCHSECVOL parameter is specified, but no MI GMIS selection parameter was previously specified.

The CTDUPBKP utility terminates.

**Corrective Action:** Specify the MI GMIS selection parameter with the migration mission name or with the value ALL if you want to perform the action for all migration missions.

UBV messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.
Messages UBV900 through UBV9xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

UBV9C0I STARTING TRANSLATION OF BACKUP VOLSERS IN SYSDATA RECORDS

**Explanation:** This information message indicates that the CTDUBV utility has started translating volume serial numbers found in the User Report List files.

Volume serial numbers in the History User Report List file and, optionally, in the Active User Report List file, are translated.

**Corrective Action:** No action is required.

UBV9C1I TRANSLATION OF BACKUP VOLSERS IN SYSDATA RECORDS COMPLETED SUCCESSFULLY

**Explanation:** This information message indicates that the CTDUBV utility has finished translating volume serial numbers found in the User Report List files.

Volume serial numbers in the History User Report List file and, optionally, in the Active User Report List file, were translated.

The utility has finished processing the backup volume serial numbers.

**Corrective Action:** No action is required.

UBV9C2S TRANSLATION OF BACKUP VOLSERS IN SYSDATA RECORDS ENDED WITH ERRORS

**Explanation:** The CTDUBV utility ended with errors.

This message follows a message indicating the nature of the problem.

**Corrective Action:** Refer to the prior message for the reason the CTDUBV utility ended with errors.

UBV9C3I ACTUSR=NO WAS SPECIFIED, ACTUSR FILE BYPASSED

**Explanation:** This information message indicates that the ACTUSR parameter was set to NO in the CTDUBV utility.

Volume serial numbers in the History User Report List file are translated. Volume serial numbers in the Active User Report List file are be translated.

The utility begins processing backup volume serial numbers in only the History User Report List file.

**Corrective Action:** No action is required.
UBV9C4I  ACTUSR=YES WAS SPECIFIED, ACTUSR FILE WILL BE PROCESSED

**Explanation:** This information message indicates that the ACTUSR parameter was set to YES in the CTDUBV utility.

Volume serial numbers in both the History User Report List file and the Active User Report List file are translated.

The utility begins processing the backup volume serial numbers in the History User Report List file and the Active User Report List file.

**Corrective Action:** No action is required.

UBV9C5E  VOLSER TRANSLATION FILE DAUBVLST IS EMPTY

**Explanation:** No volume serial number translation data was provided by the DAUBVLST DD statement in the JCL for the CTDUBV utility.

DAUBVLST contains or refers to a file which contains a list of input volser and the output volser to which they should be translated. This file is empty.

The utility is terminated.

**Corrective Action:** Supply the missing Volume Translation Statements.

UBV9C6E  DAUBVLST DD STATEMENT MISSING

**Explanation:** The DAUBVLST DD statement was not found in the JCL for the CTDUBV utility.

DAUBVLST contains or refers to a file which contains a list of input volser and the output volser to which they should be translated.

The utility is terminated.

**Corrective Action:** Check the presence and spelling of the DAUBVLST DD statement.

UBV9C7E  MEMBER NOT FOUND - membrane

**Explanation:** The DAUBVLST DD statement points to a member that is not in the library.

The member referred to by DAUBVLST DD DSN=LIB(memName) was not found.

**Corrective Action:** Check the member name.

UBV9C8E  NO $SYSDATA RECORDS FOUND IN THE fileName FILE

**Explanation:** The Active User Report List file or the History User Report List file is empty.

The CTDUBV utility finished without performing any updates.

**Corrective Action:** Verify the references to the Active and History User Report List files in the JCL.

UBV9C9I  parm WAS SPECIFIED

**Explanation:** This information message indicates that the parm input parameter was specified in the DAUBVIN DD statement.
Corrective Action: No action is required.

UBV9CAI  NO detail/unmatch VOLUMES WERE FOUND FOR THE actusr/hstusr FILE

Explanation: This information message indicates that the Active or History User Report List file contained no volumes relevant to the DETAIL report option, or that the Volume Translation Statements referenced by the DAUBVLST DD statement contained no volumes relevant to the UNMATCH report.

One of the following occurred:

- For the DETAIL report option: The report was not produced because no volser specified by means of the Volume Translation Statements matched a volser in the indicated User Report List file.
- For the UNMATCH report option: The report was not produced because every volser specified by means of the Volume Translation Statements matched a volser in the indicated User Report List file.

The utility finishes without producing the requested report.

Corrective Action: If the DETAIL report was not produced, verify that the Volume Translation Statements were coded correctly and contain the correct volume serial numbers to be translated.

If the UNMATCH report was not produced, no action is required because all volumes specified in the Volume Translation Statements were found in the indicated User Report List file and translated.

UBV9CCE COLUMNS 7-9 AND 16 OF THE stmt_type CONTROL STATEMENTS MUST BE BLANK

Explanation: There is an error in the format of the DAUBVLST Volume Translation Statements.

Volume Translation Statements must contain the old volume name in columns 1-6, the new volume name in columns 10-15, and blanks in columns 7-9 and 16.

The CTDUBV utility is terminated.

Corrective Action: Find and correct the Volume Translation Statements which are causing the error.

UBV9CFE INVALID RETURN CODE FROM SORT, RC=rc

Explanation: The system sort routine failed.

The utility is terminated.

Corrective Action: Determine the cause of the sort error, correct it, and rerun the utility.

UDR messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages UDRA00 through UDRAxx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.
UDRA80E USERDAILY userdaily-name NOT PROCESSED -- DATABASE ACCESS ERROR error-code

Explanation: This message indicates an error occurred during execution of the CTMEMUDL procedure. Data related to userdaily-name could not be retrieved from the database. The CTMEMUDL procedure stops processing.

Corrective Action: Note the error code (error-code) and contact BMC Software Customer Support.

UDRA81E USERDAILY userdaily-name NOT PROCESSED -- CMEM/CTO ENVIRONMENT NOT FOUND

Explanation: This error message indicates the database interface program was not available during the processing of the CTMEMUDL procedure. This prevented the retrieval of data related to userdaily-name from the userdaily database. The CTMEMUDL procedure stops processing.

Corrective Action: Activate CMEM or Control-O and then rerun the CTMEMUDL procedure.

UDRA82I USERDAILY userdaily-name PROCESSED SUCCESSFULLY

Explanation: This information message indicates the CTMEMUDL procedure successfully generated ORDER statements for tables contained in userdaily-name as specified in the userdaily database.

Corrective Action: No action is required.

UDRA83E USERDAILY userdaily-name PROCESSED -- FUNCTION: functionName ERROR: error-code

Explanation: This message indicates an error (error-code) occurred while executing the functionName function during processing of the CTMEMUDL procedure.

Corrective Action: Note the function name and error code, and then contact BMC Software Customer Support.

UDRA84E INVALID EMDAILY PARAMETER ON EXEC STATEMENT

Explanation: This error message indicates that an unrecognized value was specified for the EMDAILY parameter when the CTMEMUDL procedure was invoked.

Corrective Action: Specify a valid userdaily name for the EMDAILY parameter. The maximum size of this parameter is 10 characters. For more information on managing User Daily Jobs from Control-M/Enterprise Manager, see the INCONTROL for z/OS Administrator Guide.
UDRA85E USERDAILY userdaily-name NOT FOUND IN DATABASE

Explanation: This error message indicates the userdaily name (userdaily-name) does not exist in the userdaily database. The userdaily name (userdaily-name) was specified for the EMDAILY parameter when the CTMEMUDL procedure was invoked.

The CTMEMUDL procedure stops processing.

Corrective Action: Execute the CTMEMUDL procedure with the EMDAILY parameter set to '* LIST' to obtain a list of all userdaily jobs in the userdaily database.

UDRA86I CTMUDR STARTED

Explanation: This informational message indicates that the initial program invoked by the CTMEMUDL procedure has begun processing.

Corrective Action: No action is required.

UDRA87I CTMUDR ENDED

Explanation: This information message indicates the normal termination of the initial program invoked by the CTMEMUDL procedure.

Corrective Action: No action is required.

UDRA88I INPUT REQUEST: request

Explanation: This information message shows the value (request) of the EMDAILY parameter used when invoking the CTMEMUDL procedure.

Corrective Action: No action is required.

ULD messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages ULDU00 through ULDUxx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

ULDU80I LOADING OF RECORDS INTO USER FILE STARTED

Explanation: This information message indicates that the CTDULD utility has started normally. The CTDULD utility copies records from a sequential file to the current User Report List.

Corrective Action: No action is required.

ULDU81I LOADING OF RECORDS INTO USER FILE ENDED OK

Explanation: This information message indicates that the CTDULD utility has ended.
The CTDULD utility copies records from a sequential file to the current User Report List.

**Corrective Action:** No action is required.

**ULDU82W DUPLICATE RECORD FOR userName jobName IGNORED**

**Explanation:** There is already a record identified as `userName jobName` in the current User Report List file. The current record with that identity is ignored.

**Corrective Action:** No action is required.

**ULDU83I num1 RECORDS READ FROM INPUT FILE, num2 RECORDS ADDED TO USER FILE**

**Explanation:** This information message indicates that the CTDULD utility has read `num1` records from the input file and added `num2` records to the User Report List file.

**Corrective Action:** No action is required.

**ULDU84I num DUPLICATE RECORDS REJECTED**

**Explanation:** While the CTDULD utility was copying records from a sequential file to the current User Report List file, duplicate records were found. This information message displays the total number of records rejected as duplicates.

**Corrective Action:** No action is required.

**ULDU85I num RECORDS REPLACED**

**Explanation:** While the CTDULD utility was copying records from a sequential file to the current User Report List file, records were replaced. This information message displays the total number of records replaced.

**Corrective Action:** No action is required.

**ULDU86S INCORRECT REPLACE PARAMETER, SHOULD BE "Y" OR "N"**

**Explanation:** The user tried to run the CCTDULD utility with the REPLACE parameter set to an invalid value.

Valid values for the CTDULD utility REPLACE parameter are:

- Y
- N

The CTDULD utility terminates.

**Corrective Action:** Set the REPLACE parameter to Y or N and rerun the utility.

**ULDU87E LOADING OF RECORDS INTO USER FILE ENDED WITH ERROR**

**Explanation:** The CTDULD Control-D utility ended with an error.

The utility stops executing.
Corrective Action: Examine the job sysout for other error messages, and take appropriate corrective action, then rerun the utility.

ULDU88S OPEN OF DDNAME ddName FAILED
Explanation: The ddName DD statement failed to open.
Possible causes are:
- The ddName DD statement is missing.
- The data set described by the ddName DD statement does not exist.
The CTDULD utility stops executing with a condition code of 8 or 12.
Corrective Action: Correct the JCL of the CTDULD utility and rerun the utility.

ULDU89S INCORRECT DBFILE PARAMETER, SHOULD BE ACT, PRM, HST OR MIG
Explanation: The user tried to submit the CTDULD utility with an invalid DBFILE parameter value. The available DBFILE parameter values are ACT, PRM, HST, and MIG.
The utility stops with RC=8.
Corrective Action: Correct the DBFILE parameter in the JCL and resubmit the job.

UMG messages
This group includes messages for the Control-V product.

Messages UMGM00 through UMGMxx
This group includes messages for the Control-V product.

UMGM01I CONTROL-V UNMIGRATE STARTED
Explanation: This information message indicates that the CTVUNMIG Control-V utility started.
CTVUNMIG returns migrated files to DASD.
Corrective Action: No action is required.

UMGM02I CONTROL-V UNMIGRATE ENDED O.K.
Explanation: This information message indicates that the CTVUNMIG Control-V utility ended normally.
Corrective Action: No action is required.

UMGM03S CONTROL-V UNMIGRATE ENDED WITH ERRORS
Explanation: The CTVUNMIG Control-V utility ended with errors.
CTVUNMIG terminates.
Corrective Action: Check the job log or the IOA log for the other messages generated by this error. Correct the problem, and rerun the CTVUNMIG utility.

UMGM04E LOADING OF CONTROL-{D | V} INSTALLATION PARAMETERS FAILED
Explanation: Load of the CTDPARM or CTVPARM module failed.
Loading of the Control-D or Control-V Installation Parameters failed. Possible causes are:
- The IOA Load library is not in the load modules search list.
- There is insufficient memory to load the IOA Installation Parameters.
- A specified load module does not exist in the Load library.
The CTVUNMIG utility continues without sending messages to the IOA log.
Corrective Action: To produce messages to the IOA log, try one of the following:
- If the IOA Load library is not in the search list, add a STEPLIB DD statement to the library.
- If the loading failed because of lack of memory, increase the region size.
Rerun CTVUNMIG.

UMGM05S OPEN OF IOA LOG FILE FAILED
Explanation: The IOA Log file was unable to open the DALOG. DD statement.
Possible causes are:
- The DALOG DD statement is missing.
- The file allocated to the DALOG DD statement is not the IOA Log file.
- The file allocated to the DALOG DD statement is the IOA Log file, but it is of a different version or of a different IOA installation.
The CTVUNMIG utility continues without sending messages to the IOA log.
Corrective Action: To produce messages to the Job log:
1. Check the Job log for additional messages associated with this error.
2. Correct the JCL for the job
3. Rerun CTVUNMIG.

UMGM06E INVALID PARAMETER:- parm
Explanation: The user specified an invalid parameter for the CTVUNMIG utility.
The utility stops executing with an error.
Corrective Action: Correct the parm parameter and rerun the utility.

UMGM07E MISSING PARAMETERS
Explanation: The user omitted mandatory parameters from the input to the CTVUNMIG utility.
CTVUNMIG stops executing with an error.

**Corrective Action:** Specify the required parameters and rerun the utility.

**UMGM08S UNABLE TO LOAD MODULE modName**

**Explanation:** Control-V was unable to load the modName module.

Possible causes are:
- The IOA Load library is not in the load modules search list.
- Insufficient storage was available to load the module.
- The modName module does not exist in the IOA Load library.

In this message, modName is the name of the unloadable module.

System action depends on the cause:
- If modName is the IOASPRM module, the CTVUNMIG utility continues without IOA parameters.
- If modName is the LSMCALL module, the utility stops executing with an error.

**Corrective Action:** No action is required.
- If the IOA Load library is not in the search list, add a STEPLIB DD statement to the library.
- If the loading failed due to lack of memory, increase the REGION size.
- Rerun CTVMIG.

**UMGM09S OPEN OF PARAMETERS FILE FAILED. DDNAME SYSIN**

**Explanation:** CTVMIG was unable to open the SYSIN DD statement.

This problem could be due to either of the following:
- The SYSIN DD statement is missing.
- The data set described by the SYSIN DD statement cannot be opened for sequential read.

The utility stops executing with a condition code of 08.

**Corrective Action:** Correct the CTVUNMIG JCL, and rerun the job.

**UMGM10S OPEN OF DDNAME=ddName DSNAME=dsn FAILED**

**Explanation:** The user specified a DD name that could not be opened.

The utility stops executing with a condition code of 16.

**Corrective Action:** Check the system log for messages generated in response to this failure. If you are unable to solve the problem, report the contents of the messages to BMC Software Customer Support.

**UMGM11I DDNAME=ddName DSNAME=dsn DYNAMIC ALLOCATION FAILED**

**Explanation:** This information message identifies the data set name of an unallocated DD name.

This message follows dynamic allocation error message CTD922E.
The variables in this message are:

- `ddName` - the unallocated DD name
- `dsn` - the name of the data set referenced by `ddName`

**Corrective Action:** No action is required.

**UMGM121I FILE DSNAME=dsn UNMIGRATION ENDED**

**Explanation:** This information message indicates that the specified file was successfully unmigrated. In this message, `dsn` is the last extent of a CDAM file that was unmigrated. The unmigrated file can be found on DASD.

**Corrective Action:** No action is required.

**UMGM13E MIGRATED FILE EOD REACHED**

**Explanation:** This information message indicates that the size of the migrated file did not correspond to the information in the header of that file.

The job stops executing with a condition code of 08.

**Corrective Action:** Contact BMC Software Customer Support and send the complete log of the job.

**UMGM15E INPUT CARD WITH ORIGINAL INDEX FILE NAME IS MISSING**

**Explanation:** A migrated Index file name is specified as a parameter to the CTVUMG utility but the card with the original Index file name and its parameters is missing.

If the message is issued during the restore migrated job run, it means that there are problems with the automatically created restore job. These problems are usually the result of manually editing the job. The utility stops.

**Corrective Action:** To correct this problem do one of the following actions:

- If the message is issued during the restore migrated job run, resubmit the restore migrated mission to create a new restore job.
- If the message is issued by the CTVUNMIG utility because the migrated Index file name was manually specified as input parameter, use the restore migrated mission instead of the CTVUNMIG utility to restore Index files together with CDAM files.

**UMGM1A5M MISMATCH BETWEEN DISK TYPE hdtype AND REQUESTED TYPE rtype (hrtype)**

**Explanation:** The user specified the wrong disk type in the parameter for the CTVUNMIG utility.

There was a mismatch between the disk type `hdtype` of the original CDAM file and the disk type that is associated with the `rtype` unit name.

The variables in this message are:
- **hdtype** - the disk type of the original CDAM
- **rtype** - the type of the unit requested by the user
- **hrtype** - the device type associated with rtype

CTVUNMIG stops executing with a condition code of 08.

**Corrective Action:** Specify the correct disk type in the PARM field and delete the DS name from the disk (as specified in message UNGM1BI) and rerun the job.

**UMGM1BI PLEASE DELETE ALLOCATED FILE dsn**

**Explanation:** This information message follows error message UMGM1AS and indicates the DS name to be deleted from the disk.

**Corrective Action:** Delete the specified file.

### UPD messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

### Messages UPDJ 00 through UPDJ xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**UPDJ 01E UPD INTERNAL ERROR. TYPE type**

**Explanation:** An internal error of the specified type occurred during processing of the UPD subtask.

The Control-M Application Server shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

**UPDJ 02E OVERRUN OF THE UPDATE MESSAGES QUEUE. TRANSMISSION TOO SLOW OR NOT ENOUGH MEMORY**

**Explanation:** The storage available for database update messages is full.

New database update messages have overwritten old messages that have not yet been sent. This may be due to a lack of memory or may happen when a large number (usually several thousand) of update messages have been accumulated without being sent, due to slow transmission of the messages.

Slow transmission may be due to one of the following:

- Communications bottleneck, such as inadequate communication bandwidth
- Mainframe bottleneck, such as high paging of the Control-M Application Server
- Workstation bottleneck, such as CPU overload

The Control-M Application Server shuts down.
Corrective Action: If message xxxJ07E (for example, UPDJ07E) precedes this message, implement the User Action from that message. Otherwise, determine where the bottleneck is and resolve it.

UPDJ03E ADD INTERNAL ERROR. TYPE type
Explanation: An internal error of the type type occurred during processing of the CTWADD subroutine. The Control-M Application Server shuts down.
Corrective Action: Contact BMC Software Customer Support.

UPDJ04E DEL INTERNAL ERROR. TYPE type
Explanation: An internal error of the type type occurred during processing of the CTWDEL subroutine. The Control-M Application Server shuts down.
Corrective Action: Contact BMC Software Customer Support.

UPDJ05E READ INTERNAL ERROR. TYPE type
Explanation: An internal error of the type type occurred during processing of the CTWREAD subroutine.
The Control-M Application Server shuts down.
Corrective Action: Contact BMC Software Customer Support.

UPDJ06E LOCK OF UPD CHAIN FAILED. STD=std FUNC=func
Explanation: Locking of the update messages chain has failed.
Access to the update messages chain is serialized by a locking mechanism. Subtask number std in function func attempted to lock the chain several times but was unsuccessful.
The Control-M Application Server shuts down.
Corrective Action: Contact BMC Software Customer Support.

UPDJ07E GETMAIN FOR UPD MESSAGE FAILED. OLDEST MESSAGE(S) WILL BE DELETED
Explanation: The storage available for database update messages is full.
New database update messages have overwritten old messages that have not yet been sent. This happens when a large number (usually several thousand) of update messages have been accumulated without being sent, due to slow transmission of the messages.
Slow transmission may be due to one of the following:
Communications bottleneck, such as inadequate communication bandwidth
Mainframe bottleneck, such as high paging of the Control-M Application Server
Workstation bottleneck, such as CPU overload

Storage space is made available for these messages by deleting the oldest message not yet sent. The Control-M Application Server continues processing. As long as there is a lack of storage space, old messages not yet sent will continue to be deleted to make room for new messages.

**Corrective Action:** Increase the storage space available by increasing the REGION size of the Control-M Application Server. If slow transmission is a problem, determine where the bottleneck is and resolve it.

**UPDJ 08E MAXIMUM MESSAGES IN UPD CHAIN REACHED. OLDEST MESSAGE WILL BE DELETED**

**Explanation:** The storage available for database update messages is full. New database update messages have overwritten old messages that have not yet been sent. This happens when a large number (usually several thousand) of update messages have been accumulated without being sent, due to slow transmission of the messages.

Slow transmission may be due to one of the following:

- Communications bottleneck, such as inadequate communication bandwidth
- Mainframe bottleneck, such as high paging of the Control-M Application Server
- Workstation bottleneck, such as CPU overload

Storage space is made available for these messages by deleting the oldest message not yet sent. The Control-M Application Server continues processing. As long as there is a lack of storage space, old messages not yet sent will continue to be deleted to make room for new messages.

**Corrective Action:** Determine where the bottleneck is and resolve it.

**UPDJ 50I CTWUPD STARTED**

**Explanation:** This information message indicates that the Control-M Application Server started the CTWUPD subtask.

**Corrective Action:** No action is required.

**UPDJ 51I LOGICAL CONNECTION IS SUSPENDED WHILE THE ACTIVE JOBS FILE IS BEING FORMATTED**

**Explanation:** This information message indicates that the logical connection between the Control-M Application Server and the Workstation Gateway is temporarily suspended, because the Active Jobs file is currently being formatted.

The workstation database is not up-to-date, and no requests issued by the Enterprise Controlstation Control Application will be handled, until the format of the Active Jobs file is completed.

**Corrective Action:** No action is required.
**UPDJ52I LOGICAL CONNECTION RESUMED**

**Explanation:** This information message indicates that the logical connection between the Control-M Application Server and the Workstation Gateway has been resumed.

The workstation database may now request synchronization, and other requests issued by the Enterprise Controlstation Control Application will now be handled.

**Corrective Action:** No action is required.

**UPDJ53I LOGICAL CONNECTION SUSPENDED DUE TO STOPLINK MODIFY COMMAND**

**Explanation:** This information message indicates that the Control-M Application Server received a STOPLINK modify command.

The STOPLINK modify command causes disconnection until a STARTLINK modify command is received.

The Control-M Application Server stops transferring updates and disconnects from the Enterprise gateway.

**Corrective Action:** Enter a STARTLINK modify command.

**UPDJ58E DATABASE UPDATES SENT TO THE WORKSTATION GATEWAY HAVE NOT BEEN CONFIRMED IN TIME**

**Explanation:** The Control-M Application Server sent database updates to the Enterprise Controlstation Workstation Gateway, but did not receive confirmation for them in time.

This error message is issued by the Control-M Application Server program and is due to one of the following:

- The Workstation Gateway has stopped responding, due to an error condition in the software or hardware.
- Responses are delayed because of poor performance.

**Corrective Action:** Check if the workstation is hanging and if there are any error messages at the workstation which indicate the cause of the problem. If the workstation is not hanging, there must be some performance bottleneck in the system. Try to determine whether this bottleneck is at the workstation side, in the communication media, or at the mainframe.

**UPDJ59E CONFIRMATION SEQUENCE NUMBER ERROR. EXPECTED=exp_num RECEIVED=rcv_num**

**Explanation:** The Control-M Application Server has received an out of sequence confirmation of a database update.

This error message is issued by the Control-M Application Server. The Mainframe Gateway expects to receive confirmations for database updates in increasing order, but a confirmation with a sequence number of rcv_num has been received, when a confirmation with a sequence number of at least exp_num was expected.

The Control-M Application Server continues executing.

**Corrective Action:** Contact BMC Software Customer Support.
UPDJ 60E DATA BASE UPDATE TYPE msgType HAS BEEN REJECTED BY THE WORKSTATION GATEWAY

Explanation: The Enterprise Controlstation gateway rejected a message of the msgType type from the Control-M Application Server.

This message is issued each time a database update message is rejected by the Enterprise Controlstation gateway.

Possible values for msgType are:

<table>
<thead>
<tr>
<th>msgType</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Update of full Active Jobs file record.</td>
</tr>
<tr>
<td>B</td>
<td>Short update of an Active Jobs file record.</td>
</tr>
<tr>
<td>N</td>
<td>New job that was added to the Active Jobs file.</td>
</tr>
<tr>
<td>O</td>
<td>Update of full Active Jobs file record.</td>
</tr>
<tr>
<td>X</td>
<td>Update of only the fixed part of an active jobs.</td>
</tr>
<tr>
<td>C</td>
<td>Condition update.</td>
</tr>
<tr>
<td>R</td>
<td>Control resource update.</td>
</tr>
<tr>
<td>Q</td>
<td>Quantitative resource update.</td>
</tr>
<tr>
<td>T</td>
<td>Alert (Shout message) to workstation.</td>
</tr>
</tbody>
</table>

The gateway continues processing. Rejected database updates are written to the file referenced by the DASNAP DD statement.

Corrective Action: Look for error messages on the workstation side and correct the problem accordingly. Review the rejected database updates in the file referenced by DASNAP.

UTI messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages UTI 300 through UTI 3xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.
UTI330I COMPRESSED DATASET ACCESS METHOD MAINTENANCE UTILITY STARTED

Explanation: This information message indicates the normal start of the CTDAMUTI utility.
Corrective Action: No action is required.

UTI331I COMPRESSED DATASET ACCESS METHOD MAINTENANCE UTILITY ENDED OK

Explanation: This information message indicates the normal termination of the CTDAMUTI utility.
Corrective Action: No action is required.

UTI332S COMPRESSED DATASET ACCESS METHOD MAINTENANCE UTILITY ENDED WITH ERRORS

Explanation: The CTDAMUTI Compressed Dataset Access Method utility ended with errors.
This is a general message when the CTDAMUTI utility ends with errors. The job sysout should contain prior messages detailing the reasons.
Corrective Action: No action is required.

UTI333E INVALID CDAM MAINTENANCE UTILITY FUNCTION: func

Explanation: An invalid function was given to the CTDAMUTI Control-D utility.
For more information, refer to the section on the CTDAMUTI CDAM Maintenance Utility in the Control-D and Control-V User Guide.
The CTDAMUTI utility terminates with a return code of 08.
Corrective Action: Correct the function, and rerun the CTDAMUTI utility.

UTI334W NO CDAM FILES FOUND FOR THE SPECIFIED SELECTION CRITERIA

Explanation: No CDAM data sets were found that match the data set identification parameters given to the CTDAMUTI utility.
The CTDAMUTI CDAM Maintenance Utility attempts to locate CDAM data sets based on the data set identification parameters given to it. For more information, see the Control-D and Control-V User Guide.
One of the following problems is present:
- An error was made by the user in the data set identification parameter.
- Someone deleted the required CDAM data sets.
The CTDAMUTI utility will terminate with a return code of 04.
Corrective Action: No action is required.
1. Do one of the following:
   - Correct the data set identification parameter.
• Restore the requested CDAM data sets.
2. Rerun the utility.

UTI335S OPEN OF PARAMETERS FILE FAILED. DDNAME "SYSIN"

Explanation: The open of the SYSIN DD statement failed.

For more information, see the section on the CTDAMUTI CDAM Maintenance Utility in the Control-D and Control-V User Guide.

Possible causes are:
 The SYSIN or DAMUTIN DD statement is missing.
 The data set described by the SYSIN or DAMUTIN DD statement cannot be opened for sequential read.

The CTDAMUTI utility terminates with a return code of 12.

Corrective Action: Correct the CTDAMUTI JCL and rerun the utility.

UTI336I CDAM DATASET dsn IS BEING COPIED

Explanation: This information message from the CTDAMUTI utility indicates that CDAM data set dsn was copied successfully.

The CTDAMUTI utility terminates with a return code of 0.

Corrective Action: No action is required.

UTI337I CDAM DATASET dsn DELETED

Explanation: This information message from the CTDAMUTI utility indicates that CDAM data set dsn was deleted successfully.

The CTDAMUTI utility terminates with a return code of 0.

Corrective Action: No action is required.

UTI338W CDAM DATASET dsn IS NOT A SYSOUT (CANNOT BE PRINTED)

Explanation: The dsn CDAM data set is not a sysout file, meaning, a SYSOUT parameter was not specified when this CDAM file was created.

This warning message is issued by the CTDAMUTI utility.
The sysout class is set to *, and the dsn CDAM data set is printed.

Corrective Action: No action is required.

UTI339S OPEN OF OUTPUT (SPOOL PRINT) FILE FAILED

Explanation: Internal error in the CTDAMUTI utility.
The dynamic allocation of a sysout print file by the CTDAMUTI utility failed.
The CTDAMUTI utility terminates with a return code of 12.

Corrective Action: Have your system programmer call your IOA representative for assistance.
UTI33AS NO SELECTION PARAMETERS ARE SPECIFIED

Explanation: No CDAM selection parameters were specified in the input of the CTDAMUTI utility. At least one CDAM selection parameter must be specified in the input of the CTDAMUTI utility. The CTDAMUTI utility ends with an error.
Corrective Action: Rerun the CTDAMUTI utility specifying CDAM selection parameters.

UXD messages

This group includes messages for the Control-M/Analyzer product.

Messages UXDX00 through UXDXxx

This group includes messages for the Control-M/Analyzer product.

UXDX01E CTDX005 IS CALLED FOR AN INVALID FUNCTION function REQUEST REJECTED.

Explanation: Sample Exit Program CTDX005 was called for the function unintended function. The request is ignored.
Corrective Action: Notify your INCONTROL administrator.

UXDX02E CONTROL CHARACTER TRANSLATION ERROR

Explanation: An error occurred when sample Exit Program CTDX005 attempted to transfer ASA control characters to machine control characters, or vice versa. Translation of the current record is terminated.
Corrective Action: Notify your INCONTROL administrator.

UXDX03E ABEND abCode OCCURED IN CONTROL-D EXIT 005

Explanation: Abend abCode occurred during the execution of sample Exit Program CTDX005. The current request is terminated. The Exit program returns with a return code of 12.
Corrective Action: Notify your INCONTROL administrator.

UXDX04E ABEND abCode OCCURED IN CONTROL-D EXIT 003

Explanation: Abend abCode occurred during the execution of sample Exit Program CTDX003. The current request is terminated. The Exit program returns with a return code of 12.
Corrective Action: Notify your INCONTROL administrator.
UXDX05E PRINT FILE *ddName* CANNOT BE OPENED. REPORTS WILL BE SENT TO A SPOOL.

**Explanation:** Sample Exit Program CTDX005 was unable to open the *ddName* print file. The print mission’s output is rerouted to a spool instead of a dataset.

**Corrective Action:** Notify your INCONTROL administrator.

UXDX06E FAILED TO ALLOCATE EXISTING PRINT FILE *dsName* RC=*rc* RSN=*/rsn*

**Explanation:** Sample Exit Program CTDX005 failed to use the existing *dsName* dataset for its print file. The variables in this message are:

- *dsName* - the dataset to be used for the print file
- *rc* - the return code from the failed dynamic allocation request
- *rsn* - the reason code from the failed dynamic allocation request

The Exit program tries to create a new dataset for its print file.

**Corrective Action:** Notify your INCONTROL administrator.

UXDX07E PRINT FILE ALLOCATION ERROR: DSNAME=*dsName* RC=*rc* RSN=*/rsn*

**Explanation:** Sample Exit Program CTDX005 failed to allocate the new *dsName* dataset for its print file. The variables in this message are:

- *dsName* - the dataset to be used for the print file
- *rc* - the return code from the failed dynamic allocation request
- *rsn* - the reason code from the failed dynamic allocation request

The print mission’s output is rerouted to a spool instead of a dataset, as described in message UXDX05E.

**Corrective Action:** Notify your INCONTROL administrator.

UXDX08I PRINT FILE *ddNamedsName* ASSIGNED TO MISSION *misName*

**Explanation:** This information message indicates that the *dsName* dataset was allocated for the print mission’s *misName* print file with *ddName*.

**Corrective Action:** Notify your INCONTROL administrator.

UXDX09W FAILED TO UNALLOCATE PRINT FILE *ddName* RC=*/rc* RSN=*/rsn*

**Explanation:** Sample Exit Program CTDX005 failed to unallocate the *ddName* print file. The variables in this message are:
- `ddName` - the DD name to be used for the print file
- `rc` - the return code from the failed dynamic allocation request
- `rsn` - the reason code from the failed dynamic allocation request

The program continues with a new print file.

**Corrective Action:** Notify your INCONTROL administrator.

**UXDX0AW CONTROL-D APAPARM PROCESSING WILL BE IGNORED.**

**Explanation:** The delivered sample Exit Program CTDAPA displays this message when it fails to get the directory of the APAPARM library. The detailed description of the error is presented by the preceding messages.

APAPARM processing is not carried out.

**Corrective Action:** Notify your INCONTROL administrator.

**UXDX0BE CONTROL-D APAPARM PROCESSING IS TERMINATED.**

**Explanation:** The delivered sample Exit Program CTDAPA displays this message when it fails to read the member of the APAPARM library related to the report being processed. The detailed description of the error is presented by the preceding messages.

APAPARM processing is terminated for the report.

**Corrective Action:** Notify your INCONTROL administrator.

**UXDX0CW TOO LONG AFP COMMAND command IN MEMBER memName, IT IS IGNORED**

**Explanation:** The delivered sample Exit Program CTDAPA displays this message when it encounters an AFP command that is too long in the `memName` member of the APAPARM library. The `command` in the message displays the header of the problematic AFP command in the `memName` member.

The referred AFP command is ignored during report printing.

**Corrective Action:** Notify your INCONTROL administrator.

**UXDX0DW CONTROL-D NLP PROCESSING WILL BE IGNORED.**

**Explanation:** The delivered sample Exit Program CTDNLP displays this message when it fails to get the directory of the OUTPARMS library. The detailed description of the error is presented by the preceding messages.

NLP processing is not carried out.

**Corrective Action:** Notify your INCONTROL administrator.

**UXDX0EE CONTROL-D NLP PROCESSING TERMINATED.**

**Explanation:** The delivered sample Exit Program CTDNLP displays this message when it fails to read the member of the OUTPARMS library related to the report being processed, or when that member contains invalid data. The detailed description of the error is presented by the preceding messages.
NLP processing is terminated for the report.

**Corrective Action:** Notify your INCONTROL administrator.

**UXDX0FE INVALID NLP COMMAND command ... IN MEMBER memName**

**Explanation:** The delivered sample Exit Program CTDNLP displays this message when it encounters invalid data in the `memName` member of the OUTPARMS library. The `command` in the message displays the header of the problematic data line in the `memName` member.

See message UXDX0EE.

**Corrective Action:** Notify your INCONTROL administrator.

**UXDX0GW NLP REPORT reportName SPECIFICATION NOT FOUND IN MEMBER memName**

**Explanation:** The delivered sample Exit Program CTDNLP displays this message when it does not find an NLP specification of the `reportName` report in the `memName` member of the OUTPARMS library.

NLP processing is not carried out for the report.

**Corrective Action:** Notify your INCONTROL administrator.

**UXDX0HW CONTROL-D TP1 PROCESSING WILL BE IGNORED.**

**Explanation:** The delivered sample Exit Program CTDTP1 displays this message when it fails to get the directory of the TP1PARM library. The detailed description of the error is presented by the preceding messages.

TP1 processing is not carried out for the report.

**Corrective Action:** Notify your INCONTROL administrator.

**UXDX0IW TP1 REPORT reportName SPECIFICATION NOT FOUND IN MEMBER memName**

**Explanation:** The delivered sample Exit Program CTDTP1 displays this message when it does not find a TP1 specification of the `reportName` report in the `memName` member of the TP1PARM library.

TP1 processing is not carried out for the report.

**Corrective Action:** Notify your INCONTROL administrator.

**UXDX0JE CONTROL-D TP1 PROCESSING TERMINATED.**

**Explanation:** The delivered sample Exit Program CTDTP1 displays this message when it fails to read the member of the TP1PARM library related to the report being processed. The detailed description of the error is presented by the preceding messages.

TP1 processing is terminated for the report.

**Corrective Action:** Notify your INCONTROL administrator.
UXDX0KW CONTROL-D OUTPARMS PROCESSING WILL BE IGNORED.

**Explanation:** The delivered sample Exit Program CTDOUT displays this message when it fails to get the directory of the OUTPARMS library. The detailed description of the error is presented by the preceding messages.

OUTPARMS processing is not carried out.

**Corrective Action:** Notify your INCONTROL administrator.

UXDX0LE CONTROL-D OUTPARMS PROCESSING TERMINATED.

**Explanation:** The delivered sample Exit Program CTDOUT displays this message when it fails to read the member of the OUTPARMS library related to the report being processed. The detailed description of the error is presented by the preceding messages.

OUTPARMS processing is not carried out for the report.

**Corrective Action:** Notify your INCONTROL administrator.

UXDX0ME CONTROL-D BANNERS PROCESSING TERMINATED.

**Explanation:** Either the CTDX003 or CTDX014 delivered sample Exit Programs displays this message when it fails to get the directory of the BANNERS library or when the allocated memory is not sufficient to process banners. The detailed description of the error is presented by the preceding messages.

Banners processing is not carried out.

**Corrective Action:** Notify your INCONTROL administrator.

UXDX0NE PROGRAM CTDINX FAILED ON FUNCTION *func* WITH RC=*rc*

**Explanation:** The delivered sample Exit Program CTDX003 displays this message when it fails to print the mission bundle index or the user bundle index.

The variables in this message refer to program CTDINX, which is responsible for building those indexes:

- *func* - the type of the program call
- *rc* - the return code of the program

Printing of the bundle indexes is terminated.

**Corrective Action:** Notify your INCONTROL administrator.

UXDX0PE PROGRAM CTDINX FAILED ON FUNCTION *func* RC=*rc* FDBK=*feedback*

**Explanation:** The delivered sample Exit Program CTDX003 displays this message when it fails to initiate printing of a bundle index.

The variables in this message refer to program CTDINX, which is responsible for building those indexes:
func - the type of the program call
rc - the return code of the program
feedback - the feedback code from the SYSOUT open or (un)allocation, in case of error

Printing of the bundle indexes is not carried out.
Corrective Action: Notify your INCONTROL administrator.

VPL messages

This group includes messages for the Control-O product.

Messages VPL400 through VPL4xx
This group includes messages for the Control-O product.

VPL440I READ/WRITE GLOBAL VARIABLES STARTED
Explanation: This information message indicates that the CTOVPL program, which is responsible for loading and writing global variables, has begun read/write to the Control-O global pools.
Corrective Action: No action is required.

VPL441S INVALID PARAMETERS
Explanation: The CTOVPL program received an incorrect parameter list while executing a LOADGLOBAL/WRITEGLOBAL command.
This message indicates an internal error.
Corrective Action: Contact BMC Software Customer Support.

VPL442S ERROR OPENING DAGLBLST
Explanation: The CTOVPL program was unable to open the Global Pool List during execution of a LOADGLOBAL/WRITEGLOBAL command.
The Global Pool List is defined by the DAGLBLST DD statement in the procedure of the Control-O monitor.
The LOADGLOBAL/WRITEGLOBAL command is ignored.
Corrective Action: Check and correct the DD statement and related data set specifications in the Control-O monitor procedure.

VPL443S POOL poolid - GETMAIN ERROR
Explanation: The user issued a LOADGLOBAL command with the poolid Variable Global pool. However, the variables in this pool could not be loaded.
There is insufficient storage in ECSA for loading Global variables from the specified Global variable pool.
Command LOADGLOBAL is ignored.
Corrective Action: Increase the size of ECSA storage.

VPL444S POOL poolid - ERROR LOADING GLOBAL VARIABLES
Explanation: Control-O could not load variables from the poolid Global variable pool. This message is preceded by messages describing the cause of the error. Command LOADGLOBAL is ignored.
Corrective Action: See the accompanying messages for details about the cause of the error and possible solutions.

VPL445S POOL poolid - ERROR WRITING GLOBAL VARIABLES
Explanation: Control-O could not write variables to the poolid Global pool. This message is preceded by messages describing the cause of the error. Command WRITEGLOBAL is ignored.
Corrective Action: See the accompanying messages for details about the cause of the error and possible solutions.

VPL446S POOL poolid - NOT FOUND IN MEMORY
Explanation: The user specified a LOADGLOBAL/WRITEGLOBAL command, but Control-O could not locate the specified pool.
Control-O could not locate the specified pool while executing a LOADGLOBAL/WRITEGLOBAL command and could not locate the control block for the specified pool name. This usually happens when either the specified pool name is not defined in the Global Pool List member (DAGLBLST) or the specified member was never loaded.
The LOADGLOBAL/ WRITEGLOBAL command is ignored.
Corrective Action: No action is required.
1. Define the pool in the DAGLBLST member.
2. Load the pool by means of the LOADGLOBAL command.

VPL447S FREEMAIN INTERNAL ERROR
Explanation: The CTOVPL program was unable to free internal control blocks while executing a LOADGLOBAL/WRITEGLOBAL command.
This message indicates an internal error.
Corrective Action: Contact BMC Software Customer Support.

VPL448S ERROR FREEING AUTO-EDIT INTERNAL BLOCKS
Explanation: The CTOVPL program was unable to free internal control blocks while executing a LOADGLOBAL/WRITEGLOBAL command.
This message indicates an internal error.
Corrective Action: Contact BMC Software Customer Support.
VPL449S ERROR FREEING GLOBAL POOL INTERNAL BLOCKS

**Explanation:** Control-O could not free internal control blocks of a Global variable pool.

Control-O could not free internal control blocks while executing a LOADGLOBAL/WRITEGLOBAL command. This message indicates an internal error.

**Corrective Action:** Contact BMC Software Customer Support.

VPL44AS ERROR RELEASING COUPLING FACILITY RESOURCES

**Explanation:** Old data was not successfully deleted from the Coupling facility.

When newly loaded variables became effective after a LOAGLOBAL operation for an XAE (SYSPLEX-wide AutoEdit) database, Control-O or CMEM failed to delete the old copy of the AutoEdit databases from the Coupling facility.

Old data from the Coupling facility structure is not deleted.

As a result, unnecessary data may accumulate in the space allocated for the Coupling facility structure until the space is exhausted.

**Corrective Action:** Shut down all Control-O or CMEM monitors as soon as possible and restart them, one at a time.

In addition, send the sysout files for your monitor to BMC Software Customer Support for analysis.

VPL44BE ERROR SWITCHING COUPLING FACILITY INFORMATION

**Explanation:** During an attempt to switch to the new version of XAE database variables that were being loaded, an error occurred.

XAE variables are loaded in three steps. They are loaded to ECSA, copied to the Coupling facility and then marked effective in the Coupling facility. This message indicates a failure during the third step.

During the implicit LOADGLOBAL operation at startup, Control-O initialization fails. During ongoing operations, only the LOADGLOBAL operation fails.

**Corrective Action:** Send all the Control-O sysout files and the contents of the DAGLBLST library member to BMC Software Customer Support for analysis.

VPL44CE request (X’code!’) FOR STRUCTURE structureName FAILED.

**REASON:** rsn

**Explanation:** A request to the XAE structure failed. The message details the request name and code, and the reason for the failure.

Additional information is written to DATTRACE.

**Corrective Action:** Check that all XAE structures are allocated and that Control-O or CMEM did not lose a connection to them. If a connection was lost, restart Control-O or CMEM. Otherwise, contact BMC Software Customer Support for assistance.

VPL450S POOL poolid IS NOT SPECIFIED IN DAGLBLST

**Explanation:** Control-O could not locate the poolid pool in the DAGLBLST Global Variable Pool List member.
This message is normally issued in response to a failure of a LOADGLOBAL/WR ITEGLOBAL command in the DAGLBLST Global Pool List member. The LOADGLOBAL/WR ITEGLOBAL command is ignored.

**Corrective Action:** Do the following:

1. Define the pool in the DAGLBLST Global Pool List member.
2. Load the pool by means of command LOADGLOBAL.

**VPL451S INVALID CARD IN DAGLBLST**

**Explanation:** The CTOVPL program detected an invalid statement in the Global Pool List. The Global Pool List is defined in the DAGLBLST DD statement in the Control-O monitor procedure. The LOADGLOBAL/WR ITEGLOBAL command is ignored.

**Corrective Action:** Check and correct the Global Pool List member.

**VPL452S POOL poolid IS PROTECTED. IT CANNOT BE UPDATED**

**Explanation:** Control-O cannot execute a WRITEGLOBAL command for the poolid Global Variable pool. The poolid pool name is defined in the DAGLBLST Global Variable Pool List member as protected or temporary.

**Corrective Action:** Check the definition of the pool in the DAGLBLST member and correct the definition if necessary.

**VPL453S INTERNAL ERROR HANDLING PNX BLOCKS**

**Explanation:** This message indicates an internal error.

**Corrective Action:** Contact BMC Software Customer Support.

**VPL454S POOL poolid - AUTOEDIT ERROR, RC=rc,REASON=rsn**

**Explanation:** Control-O detected an invalid AutoEdit expression in the poolid Global Variable pool at startup or while executing command LOADGLOBAL. The poolid Global variable specified in the AutoEdit expression was not loaded. The error was caused for one of the following reasons:

- A mistake was made when the POOL member was manually edited.
- There was an internal error.

Depending on poolid type, the pool is stored in one of two locations: the Global Variables Library or a Control-O AutoEdit Variable database.

**Corrective Action:** No action is required.
1. Refer to the table in the description of message WTO283E in this document for an explanation of the return code and reason code included in this message.

2. Check the source of the AutoEdit expression.

3. Correct the error and reissue command LOADGLOBAL.

4. If the problem is due to an internal error, contact BMC Software Customer Support.

VPL455I POOL poolid HAS BEEN LOADED TYPE= pool_type
ROWS=loaded_variables/ max_variables_allowed

Explanation: This information message indicates that the Global Variable pool poolid was successfully loaded. If pool_type starts with DB, S1 or S2 the numbers in ROWS= are the loaded value and the maximum variables allowed. In other cases the values will be 0.

Corrective Action: No action is required.

VPL456I POOL poolid HAS BEEN WRITTEN

Explanation: This information message indicates that the Global Variable pool poolid was successfully written.

Corrective Action: No action is required.

VPL457W DATABASE database NOT FOUND IN DATABASES FILE

Explanation: During Control-O or CMEM initialization, Control-O or CMEM failed to load the Global AutoEdit Variable database because the database does not exist in the Global AutoEdit Variable Database file.

The member pointed to by the DD name DAGLBLST contains, among other things, a list that specifies the Control-O Global AutoEdit Variable database and the IOA Global AutoEdit Variable database. The required database that appears in the list does not exist in the Global AutoEdit Variable Database file.

Control-O or CMEM initialization continues.

Corrective Action: Notify the INCONTROL administrator.

VPL458S POOL poolid - ERRORS WHILE READING POOL

Explanation: Control-O could not read the poolid Global variable pool during execution of command LOADGLOBAL.

The poolid pool is not loaded.

Corrective Action: Verify that the Global pool is in the Global AutoEdit library and that the library is not corrupted.

VPL459I READ/WRITE GLOBAL VARIABLES ENDED

Explanation: This information message indicates that the CTOVPL program successfully completed execution of command LOADGLOBAL/WRITEGLOBAL.

Corrective Action: No action is required.
VPL45AW WARNING! poolName CONVERTED FROM Stype TO Dbtype

**Explanation:** There is a conflict between inconsistent IOAPLEX and DAGLBLST settings, as follows:
- In IOAPLEX, the ENABXES parameter or ENABXAE parameter is set to N.
- In DAGLBLST, the XAE database is specified as S1 type and S2 type, where type is one of the following database types:
  - TEMP
  - PROT
  - INPUT
  - INOUT

Control-O loads the database as a standard, or non-XAE, database. Database loading continues.

**Corrective Action:** Check whether, and how, the reduced capability affects any applications that use the downgraded XAE pool.

VPL45BE --- MEMBER TYPE ERROR ---

**Explanation:** Control-O or CMEM monitor encounter an invalid POOL TYPE in control record in the DAGLOBAL list file.

**Corrective Action:** No action is required.

VPL45CE --- KEYWORD NOT RECOGNIZED ---

**Explanation:** Control-O or CMEM monitor encounter an invalid keyword in a record in the DAGLOBAL list file.

**Corrective Action:** No action is required.

VPL45DE --- ALL BLANKS - ERROR ---

**Explanation:** Control-O or CMEM monitor the control record in the DAGLOBAL list file is all blank.

**Corrective Action:** No action is required.

VPL45EE --- NO BLANKS - ERROR ---

**Explanation:** Control-O or CMEM monitor encounter an empty control record format in the DAGLOBAL list file.

**Corrective Action:** No action is required.

VPL45FE --- LESS THAN ZERO ---

**Explanation:** Control-O or CMEM monitor encounter an invalid control record value in the DAGLOBAL list file.

**Corrective Action:** No action is required.
VPL45GE --- INVALID CARD FORMAT ---

**Explanation:** Control-O or CMEM monitor encounter an invalid control record format in the DAGLOBAL list file.

**Corrective Action:** No action is required.

VPL45HE RECORD=record

**Explanation:** Control-O or CMEM monitor encounter an error in the DAGLOBAL list file the previous error messages.

The record has been rejected.

**Corrective Action:** Correct the record and LOADGLOBAL or WRITEGLOBAL as necessary.

VPL45IE MAXIMUM NUMBER OF ROWS max-num-rows EXCEEDED WHILE LOADING POOL pool-name. LOAD STOPPED.

**Explanation:** During LOADGLOBAL of AutoEdit POOL pool-name, excessive rows were encountered beyond the maximum number of defined rows max-num-rows in screen IV.

The loading stops.

**Corrective Action:** If the unloaded AutoEdit variable is required, increase the maximum number of rows for the pool using the screen IV and re-issue the LOADGLOBAL command.

VPL45JI XAE TYPE 2 POOL pool-name HAS NOT BEEN LOADED BECAUSE ANOTHER LPAR HAS ALREADY LOADED IT.

**Explanation:** During initial loading of AutoEdit POOLs, loading of the POOL pool-name, has been skipped because the POOL has already been loaded by Control-O/CMEM on another LPAR.

**Corrective Action:** No action is required.

VRF messages

This group includes messages for the IOA (infrastructure) product.

Messages VRFJ 00 through VRFJ xx

This group includes messages for the IOA (infrastructure) product.

VRFJ 00E ddName - REAL NUMBER OF BLOCKS DIFFERENT THAN DEFINED

**Explanation:** The number of blocks in the file, indicated by the ddName DD statement, does not match the CNDREC# parameter defined in the IOAPARM member. The IOACCND verification program terminates with a return code of 04.

**Corrective Action:** Correct the number of blocks specified in the CNDREC# parameter table, or increase the file size so that it contains at least as many blocks as specified in the table.
VRFJ 01E ddName - NUMBER OF BLOCKS ALLOCATED GREATER THAN DEFINED

**Explanation:** The actual size of the file pointed to by the `ddName` DD statement was greater than the size defined in the parameter table by a factor of more than one track.

The size of the file is defined in IOAPARM, CTMPARM or CTDPARM, depending on the product in which the file is used.

The verification program terminates with a return code of 04.

**Corrective Action:** Correct the number of blocks specified in the parameter table, or change the file size, so that they correspond more closely.

VRFJ 02E ddName - NOW BEING FORMATTED - TRY AGAIN LATER

**Explanation:** File utilization data cannot be obtained because the Active Jobs file pointed to by the `ddName` DD statement is currently being formatted.

Processing of the Active Jobs file terminates with a return code of 08.

**Corrective Action:** Try running the IOAVERFY utility later.

VRFJ 03E ddName - PARM QNAME qName1 DIFFERENT THAN IN FILE qName2

**Explanation:** QNAME `qName1` defined in CTMPARM differs from QNAME `qName2` specified in the file pointed to by the `ddName` DD statement.

In a correctly installed system, the qnames of the files must be identical to the QNAME specified in CTMPARM.

Processing of the current command terminates with a return code of 8.

**Corrective Action:** Reformat the file pointed to by the `ddName` DD statement using the proper installation procedures.

VRFJ 04E ddName - RECORD LENGTH FOR VERSION versn SHOULD BE len

**Explanation:** An incorrect record length was specified for the file pointed to by the `ddName` DD statement. The record length should be the length `len` specified in the message for the version of the product `versn` indicated in the message.

Processing of the current command terminates with a return code of 08.

**Corrective Action:** Delete and redefine the file with the proper record length.

VRFJ 05E ddName - INVALID VERSION - versn

**Explanation:** The IOA version found in the file pointed to by the `ddName` DD statement was not recognized.

Processing of the current command terminates with a return code of 08.

**Corrective Action:** Reformat the file and rerun the IOAVERFY utility. If the problem persists, notify BMC Software Customer Support.
VRFJ 06E ddName - DSORG org - SHOULD BE DIRECT ACCESS OR SEQUENTIAL

**Explanation:** The file pointed to by the `ddName` DD statement is defined with data set organization `org`. It should be defined as DA (Direct Access) or sequential.

Processing of the current command terminates with a return code of 08.

**Corrective Action:** Define the file according to the specifications contained in the IOA Installation Guide.

VRFJ 07E ddName - RECFM recFormat - SHOULD BE FIXED

**Explanation:** The file pointed to by the `ddName` DD statement has the record format `recFormat`. It should be defined as F (Fixed).

Processing of the current command terminates with a return code of 08.

**Corrective Action:** Define the file according to the specifications contained in the IOA Installation Guide.

VRFJ 08E ddName - DEVTYP device_type - MUST BE 3340/3350/3375/3380/3390/9345

**Explanation:** The file pointed to by the `ddName` DD statement has an invalid device type (`device_type`).

Valid device types, as indicated in the message, are 3340, 3350, 3375, 3380, 3390 and 9345.

Processing of the current command terminates with a return code of 08.

**Corrective Action:** Define a valid device type for the file.

VRFJ 12E ddName IS A MULTI VOLUME DATASET. VOL=volser

**Explanation:** The file pointed to by the `ddName` DD statement is defined on more than one volume. Volume `volser` indicates the first volume.

Processing of the current command terminates with a return code of 08.

**Corrective Action:** Make sure that the file is defined on one volume only.

VRFJ 13E ddName - volser - VOLUME NOT MOUNTED

**Explanation:** Volume `volser`, which contains the file pointed to by the `ddName` DD statement is not available.

Processing of the current command terminates with a return code of 16.

**Corrective Action:** Make sure that the volume `volser` is online, and rerun the IOAVERFY utility.

VRFJ 14E ddName - DSCB NOT FOUND ON VOLUME volser

**Explanation:** No format-1 DSCB was found on volume `volser` for the file pointed to by the `ddName` DD statement.

The file pointed to by the `ddName` DD statement is not defined on volume `volser`. 
Processing of the current command terminates with a return code of 16.

**Corrective Action:** Make sure that the correct volume is referenced in the JCL of the `ddName` DD statement, or that the file is correctly cataloged.

**VRFJ 15E ddName - I/O ERROR ON VTOC OF VOLUME volser**

**Explanation:** An error has occurred when accessing the VTOC of volume `volser`.

Processing of the current command terminates with a return code of 16.

**Corrective Action:** Contact BMC Software Customer Support.

**VRFJ 16E ddName - BLOCK SIZE IS LARGER THAN TRACK SIZE**

**Explanation:** The block size of the file pointed to by the `ddName` DD statement is larger than the size of a track on the disk on which the file resides.

Processing of the current command terminates with a return code of 08.

**Corrective Action:** Define the block size of the file to be no greater than one track.

**VRFJ 17E ddName IS AN EMPTY DATASET**

**Explanation:** The file pointed to by the `ddName` DD statement does not contain any records.

Processing of the current command terminates with a return code of 16.

**Corrective Action:** Format the file (using the appropriate formatting step in the ICE CUSTOMIZE process), and rerun the IOAVERFY utility.

**VRFJ 18E COMMAND NOT SUPPORTED IN FUJITSU (MSP) SYSTEM**

**Explanation:** The specified command cannot be used to obtain system information under Fujitsu.

Processing of the current command terminates with a return code of 08.

**Corrective Action:** No action is required.

**VRFJ 19E SUBSYSTEM subsys NOT FOUND**

**Explanation:** A LIST SUBSYSTEM command was specified for a subsystem (`subsys`) which is not defined.

The LIST SUBSYSTEM command lists the control blocks for the specified subsystem. If the subsystem name is omitted, the default is taken from IOAPARM.

Processing of the current command terminates with a return code of 08.

**Corrective Action:** Specify the LIST SUBSYSTEM command either with a correct subsystem name or without a subsystem name.

**VRFJ 20I SUBSYSTEM subsys IS NOT ACTIVE**

**Explanation:** This information message is generated when the IOAVERFY utility determines (using the LIST SUBSYSTEM command) that subsystem `subsys` is not active.

Processing of the current command terminates with a return code of 04.
Corrective Action: No action is required.

VRFJ 21I SUBSYSTEM BELONGS TO ANOTHER ENVIRONMENT
Explanation: This information message is generated if the IOA environment in the subsystem control blocks does not match the environment the IOAVERFY utility belongs to.
This message is accompanied by messages VRFJ 22I and VRFJ 23I, which provide additional information about the mismatched environments.
Blocks SSCT and SSVT are printed, and the command terminates.
Corrective Action: Provide BMC Software Customer Support with the information presented in messages VRFJ 22I and VRFJ 23I.

VRFJ 22I SUBSYSTEM subsys ENVIRONMENT: env
Explanation: This information message displays the environment (env) found in the control blocks of the subsys subsystem.
This message accompanies message VRFJ 21I, which indicates an environment mismatch between the subsystem and the IOAVERFY utility.
Corrective Action: No action is required.

VRFJ 23I VERIFICATION PROGRAM ENVIRONMENT: env
Explanation: This information message displays the environment (env) of the IOAVERFY utility.
This message accompanies message VRFJ 21I, which indicates an environment mismatch between the subsystem and the IOAVERFY utility.
Corrective Action: No action is required.

VRFJ 24E SSVT SCAN ERROR - FUNCTION TERMINATED
Explanation: The IOAVERFY utility detected an internal error while scanning the subsystem control blocks.
Processing of the current command terminates with a return code of 16.
Corrective Action: Notify BMC Software Customer Support.

VRFJ 28S NUMBER OF ALLOCATED RECORDS ON THE AJF IS NOT EQUAL TO MI0SIZE
Explanation: The value of the CKPSIZE parameter in CTMPARM is not equal to the value in the MI0SIZE field of Active Jobs File (AJF) record0 (the first record in the AJF).
DSECT CTMMI0 describes AJF record0.
The number of records in the AJF (the value in the MI0SIZE field) must equal the number specified by CKPSIZE in CTMPARM.
Processing of the current statement stops and a return code of 16 is issued.
Corrective Action: Make sure that the ALCIOVFY library member in PARM points to the correct AJF.
VRFJ 29E JOB(XXXXXX) IN TABLE(YYYYYY) DOESN'T POINT BACK TO ITS PARENT

**Explanation:** A table (identified by RBA YYYYYY) contains a job (identified by RBA Xxxxxxx), but the job does not include a reference to the table.

**Corrective Action:** Run the utility again with the CORRECT parameter.

VRFJ 2AE TABLE(YYYYYY) DOESN'T POINT TO A JOB(XXXXXX) BELONGING TO IT

**Explanation:** A job (identified by RBA Xxxxxxx) includes a reference to a table (identified by RBA YYYYYY), but the table does not contain the job.

**Corrective Action:** Run the utility again with the CORRECT parameter.

VRFJ 2BE ORPHAN JOB(XXXXXX) POINTS TO A NON-TABLE ENTITY(YYYYYY)

**Explanation:** A job (identified by RBA Xxxxxxx) includes a reference to a non-table entity (identified by RBA YYYYYY), but the job is not contained in any table.

**Corrective Action:** Run the utility again with the CORRECT parameter.

VRFJ 2CW OID IN DIAGNOSE CMD IGNORED SINCE JOB IS PART OF SMART TABLE. FULL AJF IS PROCESSED.

**Explanation:** During the execution of the IOA IOAVERFY utility in which the following request was issued:

```
DIAGNOSE AJF FORMAT OID=oid
```

the utility determined that the job associated with order-ID oid was ordered as part of (contained in) a SMART table. Since the utility supports the OID parameter for stand-alone jobs only, but not for jobs that are part of SMART tables, the DIAGNOSE FORMAT request is performed for the entire AJF. The utility continues processing the entire AJF.

**Corrective Action:** No action is required.

VRFJ 30S THE SNC RECORD SNCCND# VALUE DOESN'T MATCH IOAPARM CNDREC# PARAMETER

**Explanation:** The value of the CNDREC# parameter in IOAPARM, which specifies a number of records, does not match the number of records specified in the SNC record.

A number of records is set during installation to determine file sizes. CNDREC# specifies the number of records in the IOA Conditions file. This value must equal the number of records that SNCCND# specifies in the SNC record.

The system stops processing the current statement and issues a return code of 16.

**Corrective Action:** Make sure that the ALCIOVFY library member in IOAPARM points to the correct SNC file.
VRFJ 31E TWO CONSECUTIVE "VER" INPUT STATEMENTS ARE NOT ALLOWED

**Explanation:** Two VER statements occur in succession. One REP statement must follow each VER statement. Only the second VER statement is processed.

**Corrective Action:** Correct the VER and REP statements, and rerun the IOAVERFY utility.

VRFJ 32E A "REP" INPUT STATEMENT IS PRESENT BEFORE THE CURRENT "VER"

**Explanation:** A REP statement precedes a VER statement. Each REP statement must follow a VER statement. Only the VER statement is processed. The REP statement is ignored.

**Corrective Action:** Correct the VER and REP statements, and rerun the IOAVERFY utility.

VRFJ 33E TWO CONSECUTIVE "REP" INPUT STATEMENTS ARE NOT ALLOWED

**Explanation:** Two REP statements occur in succession. One VER statement must precede each REP statement. Only the second REP statement is processed. The first REP statement is ignored.

**Corrective Action:** Correct the VER and REP statements, and rerun the IOAVERFY utility.

VRFJ 34E A "REP" INPUT STATEMENT IS PRESENT, BUT NO PREVIOUS "VER"

**Explanation:** There is no VER statement before the current REP statement. One VER statement must precede each REP statement. The REP statement is ignored.

**Corrective Action:** Correct the VER and REP statements, and rerun the IOAVERFY utility.

VRFJ 35I THE RECORD WAS MODIFIED SUCCESSFULLY

**Explanation:** This information message indicates that the Control-M Active Jobs file, the Control-M History file, the IOA Conditions file, or the Control-M Resources file, was updated by a set of VER and REP statements.

**Corrective Action:** No action is required.
VRFJ 36S CANNOT BALANCE QUANTITATIVE RESOURCE quantResource
ADJUST IT MANUALLY

**Explanation:** The VERIFY utility found that the number of units of this resource currently in use exceeds the maximum defined for it.

**Corrective Action:** Use the ADD, CHANGE and/or DELETE options on screen 4 to manually balance the resource file.

VRFJ 37I NO ERRORS FOUND IN fileName FILE (verifyType VERIFICATION)

**Explanation:** This information message indicates that the DIAGNOSE command of the IOAVERFY utility did not find any errors in the specified file.

In this message, **verifyType** is one of the following:

- **STANDARD** - no errors were found using the standard DIAGNOSE command (without the FORMAT subparameter).
- **ENHANCED** - no errors were found using the enhanced verification method (FORMAT (and OID) subparameters).

**Corrective Action:** No action is required.

VRFJ 38E A "VER" STATEMENT MUST BE PRECEDED BY "ZAP FILE fileId"

**Explanation:** When a file is to be modified by means of the VER and REP statements using the IOAVERFY utility, the file to be modified must be identified in a ZAP statement that must precede the VER and REP statements.

The ZAP statement must be in the format

```
ZAP FILE fileId
```

where **fileId** is one of the following:

- **AJF** - the Control-M Active Jobs file
- **HST** - the Control-M History Jobs file
- **CND** - the IOA Conditions file
- **RES** - the Control-M Resources file

**Corrective Action:** No action is required.

VRFJ 40I VERIFY ENQ STARTED ON THE system-id SYSTEM FOR THE qname QNAME

**Explanation:** This informational message indicates that the IOAVERFY utility was invoked with the VERIFY ENQ parameter on the **system-id** system to verify the locking mechanism for the **qname** QNAME.

**Corrective Action:** No action is required.
VRFJ41E VERIFY ENQ FAILED. *ERROR TYPE* type *REASON CODES=* xx xx xx

**Explanation:** An error occurred when executing the IOAVERFY utility with the VERIFY ENQ parameter. The utility terminated with return code 12. The error type and reason codes displayed in the message indicate the type of error.

**Corrective Action:** Keep the IOAVERFY job log of the failed run and contact BMC Software Customer Support.

VRFJ42I VERIFY ENQ FINISHED ON THE *system-id* SYSTEM FOR THE *qname* QNAME

**Explanation:** This informational message indicates that the IOAVERFY utility, invoked with the VERIFY ENQ parameter, finished verifying the locking mechanism for the *qname* QNAME on the *system-id* system.

**Corrective Action:** Verify that the list produced by the IOAVERFY utility (beginning with the VRFJ44I title message and continuing with the VRFJ45I informational messages) includes all the systems where the instances of IOAVERFY (with the VERIFY ENQ parameter) were simultaneously invoked. Any system that is not included has a problem with the ENQ related definition. For further information about the QNAME and SHRQNAM parameters, see the chapter about IOA in the INCONTROL for z/OS Installation Guide.

VRFJ43I VERIFY ENQ: START CONTROL-M ENQ TEST? *L(IST), Q(UIT)*

**Explanation:** This informational message indicates that the IOAVERFY utility, with the VERIFY ENQ parameter, is ready to start checking the locking mechanism.

**Corrective Action:** Do one of the following:

- To start checking the locking mechanism
- Simultaneously, start instances of the IOAVERFY utility (using the same specification of the VERIFY ENQ parameter) on all the systems having access to the IOA and Control-M files.
- Enter *L*.
- To stop the checking process, terminate the utility by entering *Q*.

VRFJ44I ------- LIST OF SYSTEMS SHARING THE ENQ RESOURCES
---------------

**Explanation:** This title message precedes the VRFJ45I informational messages that display the systems that correctly share the ENQ resources.

**Corrective Action:** No action is required.

VRFJ45I *system-id*

**Explanation:** This informational message contains the name of a system (detected by the IOAVERFY utility with the VERIFY ENQ parameter) that correctly shares the ENQ resources. The list of VRFJ45I messages is preceded with the VRFJ44I title message.
Corrective Action: Verify that the list produced by the IOAVERFY utility includes all the systems where the instances of IOAVERFY (with the VERIFY ENQ parameter) were simultaneously invoked. Any system that is not included has a problem with the ENQ related definition. For further information about the QNAME and SHRQNAM parameters, see the chapter about IOA in the INCONTROL for z/OS Installation Guide.

VRFJ 46E RESOURCES WITH THE qname QNAME ARE EXCLUDED FROM GLOBAL SERIALZATION

Explanation: The IOAVERFY utility (with the VERIFY ENQ parameter) detected that ENQ requests (with the QNAME specified in the utility parameters) are excluded from cross-system serialization. If the z/OS Global Resource Serialization is being used, this occurs when RNLDEF RNL(EXCL) is defined for qname in the GRS resource name list. The utility terminates with a return code of 8.

Corrective Action: If the z/OS Global Resource Serialization is used, remove the RNLDEF RNL(EXCL) definition for qname. If another cross-system serialization facility is used, ensure that the ENQ requests for qname are correctly handled by the facility. For further information about the QNAME and SHRQNAM parameters, see the chapter about IOA in the INCONTROL for z/OS Installation Guide.

VRFJ 47E GLOBAL RESOURCE SERIALZATION NOT ACTIVE ON THE system SYSTEM

Explanation: The IOAVERFY utility (with the VERIFY ENQ parameter) detected that the global resource serialization is not active on the system where the utility ran. The utility terminates with a return code of 8.

Corrective Action: If the IOA and Control-M files are accessed from several systems (in a multi-system environment), the global resource serialization facility must be activated to provide serialized file access and update, while preventing file corruption. For further information about the QNAME and SHRQNAM parameters, see the chapter about IOA in the INCONTROL for z/OS Installation Guide.

WKJ messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages WKJ 400 through WKJ 4xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

WKJ 437E INVALID DATE date SPECIFIED FOR action

Explanation: While processing a CMEM or Control-O request for action FORCEJOB, ADDCOND, or DELCOND, the Control-M monitor encountered an invalid date.

The date was either not a valid date or was not in the format specified by the DATETYP parameter in the IOAPARM.
This message is followed by the WKJ A59E message or the WKJ C39E message which identifies the failed action.

No additional action will be taken for the failed job or table order.

**Corrective Action:** Make sure that the date format corresponds to the DATETYP parameter in IOAPARM.

**WKJ 438E** INTERNAL ERROR ON THE COMMUNICATION FILE. A SNAP IS PRODUCED

**Explanation:** Control-M has detected mismatches in the communications file while processing SHOUT to Log records from Control-O.

**Corrective Action:** There are two possible causes for this problem. The corrective action depends on the cause of the problem.

<table>
<thead>
<tr>
<th>Problem Cause</th>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>The number of subsystem-to-monitor file (S2M) records is not the same in the CTMPARM member and in the FORMSUB2 job, the file allocation and format job.</td>
<td>Compare the CTMCPU statements in CTMPARM with the FORMSUB2 job that was run for each system. If the problem persists, save the snap (dump), prepare the Control-M monitor full output, and contact BMC Customer Support.</td>
</tr>
<tr>
<td>The value of the SMODE parameter in CMMPARM or CTOPARM is not F.</td>
<td>Ensure that the SMODE parameter in CMMPARM or CTOPARM is set to F.</td>
</tr>
</tbody>
</table>

The affected records are not written to the IOA Log. A snap dump is written to the DADUMP DD statement.

**WKJ 439E** MISSING JOB jobName IN TABLE tableName IN lib

**Explanation:** The jobName job was not found in the tableName table.

A FORCEJOB request for the jobName job in the tableName table failed.

This message is followed by message WKJ A59E, which contains more details about the error.

No additional action will be taken for the failed job order.

**Corrective Action:** Check that the job exists in the indicated scheduling table. For further actions, see message WKJ A59E FORCEJOB FAILED FOR JOB jobName IN TABLE tableName FROM dsn.

**WKJ 43EW** JOB jobName (OID=orderId) HUNG IN SUBMISSION

**Explanation:** The jobName job is used to trigger a Control-O or CMEM ON JOBARRIV rule that contains a DO FORCEJOB command. However, the jobName job has been hung in submission status for several seconds.

Control-M does not order and submit the job identified in the DO FORCEJOB command.
**Corrective Action:** Consider manually forcing the job identified in the DO FORCEJOB command.

**WKJ 43FI TRIGGER JOB jobName (jobId) NOT FORCED**

**Explanation:** The jobName job is used to trigger a Control-O or CMEM ON JOBARRIV rule that contains a DO FORCEJOB command. However, the jobName job is one of the following:

- a cyclic job found on the Active Jobs file
- hung in submission status
- currently being handled by one of the local sysplex monitors

Control-M does not order and submit the job identified in the DO FORCEJOB command.

**Corrective Action:** Do the following:

1. Check to see if JES is hung. If it is, find out why, and address that problem.
2. Consider how to act in relation to
3. the jobName job, that is, the job that is hung
4. the job identified in the DO FORCEJOB command

**WKJ 440I CONTROL-M MONITOR IS READY TO RECEIVE CMEM REQUESTS**

**Explanation:** This information message indicates that the CMEM facility in the Control-M monitor was successfully initialized and the Control-M monitor is ready to accept requests from Control-O or from CMEM subsystem functions.

**Corrective Action:** No action is required.

**WKJ 441E CONTROL-M MONITOR CMEM FACILITY IS DEACTIVATED AS A RESULT OF A FAILURE**

**Explanation:** Highlighted, unrollable message.

A severe error has occurred while processing requests from one of the following:

- Control-O
- CMEM subsystem functions
- Control-M DO FORCEJOB

Information about the error which caused the deactivation of the On Spool Jobs Facility was previously displayed on the operator console.

Control-M monitor stops processing requests from:

- Control-O
- CMEM subsystem functions
- Control-M DO FORCEJOB.

Other parts of Control-M monitor will not be affected.

**Corrective Action:** Look for previous error messages. Correct the error, shut down the Control-M monitor and start it again.
WKJ442E ERROR WHILE LOADING CTMJOB\CTMMEM FOR CMEM PROCESSING

Explanation: Highlighted, unrollable message.
The CTMJOB or CTMMEM module could not be loaded by the Control-M monitor.
Load for the CTMJOB or CTMMEM module failed for one of the following reasons:

- Insufficient storage.
- The module or modules could not be found in the libraries specified in the STEPLIB DD statement or in the Linklist.

Control-M monitor will not process requests from:

- Control-O
- CMEM subsystem functions
- Control-M DO FORCEJOB

Corrective Action: Correct the error, shut down the Control-M monitor and start it again.

WKJ443E OPEN ERROR OCCURRED DURING CMEM PROCESSING, DSN=dsn

Explanation: The Control-M monitor has encountered an open error while processing CMEM or Control-O requests.
An open error occurred on one of the Control-M communication data sets. Possible causes are:

- An incorrect communication file was defined.
- A security product failed the open request.

Control-M monitor stops processing CMEM or Control-O requests.

Corrective Action: No action is required.
1. Check that CTMPARM points to the correct communication file.
2. Check the communication file dsn, and make sure that it is properly defined, formatted and cataloged.
3. Make sure that no restrictions are imposed by MVS, a security package, and so on.
4. Correct the error, shut down the Control-M monitor and start it again.

WKJ444E I/O ERROR OCCURRED DURING CMEM PROCESSING, DSN=dsn

Explanation: The Control-M monitor has encountered an I/O error while processing CMEM/Control-O requests.
An I/O error occurred on one of the Control-M communication data sets.
Control-M monitor stops processing CMEM/Control-O requests.

Corrective Action: No action is required.
1. Check the communication file dsn, and make sure that it is properly defined and formatted.
2. Check that CTMPARM points to the correct communication file. If the file and CTMPARM appear correct:
   a. Check the MVS LOGREC file for a physical disk error.
   b. Reallocate and reformat the communication file dsn. After correcting the error, stop the Control-M monitor and start it again.

WKJ 445E DYNAMIC ALLOCATION ERROR, RC=rc, REASON CODE=rsn, DSN=dsn

Explanation: The Control-M monitor has encountered a dynamic allocation error while processing CMEM or Control-O requests.

A dynamic allocation error occurred on one of the Control-M communication data sets. Possible reasons for this failure include:
- The communication file dsn is not cataloged on the correct disk.
- The communication file dsn is cataloged in a catalog which cannot be accessed by the Control-M monitor.
- The wrong communication file name, or no communication file name, was specified in IOACPRM.
- The MVS allocation exit failed the allocation request.
- A security product failed the allocation.

For information regarding the return code rc and the reason code rsn, see the IBM manual MVS Programming: Authorized Assembler Services Guide. Reallocate and format or re-catalog the file if necessary.

The Control-M monitor stops processing CMEM or Control-O requests.

Corrective Action: Check the definitions in IOACPRM and correct as necessary. After the error is corrected, stop the Control-M monitor and start it again.

WKJ 446W SYSPLEX TABLE MISSING - SYSTEM LOGGER INTERFACE DISABLED

Explanation: Control-M attempted to read the Sysplex Table and failed.

Control-M could not find the Sysplex Table or encountered errors while reading the Sysplex Table. This could be due to one of the following:
- Sysplex Table not present in the STEPLIB concatenation of load libraries.
- Sysplex Table has an invalid internal format.
- Sysplex Table has no valid, active table entries.

Control-M attempts to allocate, open and use the subsystem-to-monitor (S2M) communication files to implement CMEM-Control-M communication.

Corrective Action: Check why the Sysplex Table is not in the load library or has an invalid format. Correct the problem and recycle Control-M.

WKJ 447E SYSTEM LOGGER REQUEST req FAILED: R15=r15 RETURN=rc REASON=rsn

Explanation: A System Logger request failed.
One of the following System Logger requests failed:

<table>
<thead>
<tr>
<th>Request</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFCFS, IXGINVNT</td>
<td>(define coupling facility structure)</td>
</tr>
<tr>
<td>DEFLGS, IXGINVNT</td>
<td>(define log stream)</td>
</tr>
<tr>
<td>CONLGS, IXGCONN</td>
<td>(connect to log stream)</td>
</tr>
<tr>
<td>WRI TEL, IXGWRITE</td>
<td>(write a log stream log block)</td>
</tr>
<tr>
<td>BRWSEL, IXGBRWSE</td>
<td>(browse a log stream log block)</td>
</tr>
<tr>
<td>DELET L, IXGDELET</td>
<td>(delete a log stream log block)</td>
</tr>
<tr>
<td>DISLGS, IXGCONN</td>
<td>(disconnect from log stream)</td>
</tr>
<tr>
<td>DELLGS, IXGINVNT</td>
<td>(delete log stream)</td>
</tr>
<tr>
<td>DELCFS, IXGINVNT</td>
<td>(delete coupling facility structure)</td>
</tr>
</tbody>
</table>

R15 is provided by Control-M and is one of the following:

<table>
<thead>
<tr>
<th>R15</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>08</td>
<td>Minor System Logger request error</td>
</tr>
<tr>
<td>12</td>
<td>Intermediate System Logger request error</td>
</tr>
<tr>
<td>16</td>
<td>Major System Logger request error</td>
</tr>
<tr>
<td>20</td>
<td>Permanent System Logger request error</td>
</tr>
<tr>
<td>24</td>
<td>Internal Control-M error</td>
</tr>
<tr>
<td>28</td>
<td>Operating system does not support System Logger interface</td>
</tr>
<tr>
<td>32</td>
<td>Internal Control-M error</td>
</tr>
</tbody>
</table>

The return code $rc$ and the reason code $rsn$ are documented in the IBM manual *MVS Programming: Assembler Services Reference*. Check that publication for the system action relevant to the return code and reason code in the message. Each System Logger request is in a separate section of the guide. The return and reason codes are described in the topic “Return and Reason Codes” for each System Logger request.

**Corrective Action:** When a System Logger error occurs, check the system log or the console that displays error messages for the IXLOG System Logger address space for further details. If the problem persists, prepare the Control-M monitor full output and contact BMC Customer Support.
WKJ 448W CMEM LOST \( num \) TRANSACTIONS FROM THE CPU WITH SMFID=\( smfid \)

**Explanation:** Control-M was down, or stopped processing CMEM or Control-O requests.

During the time the Control-M monitor was inactive (due to a problem or daily maintenance), the CMEM subsystem functions or Control-O wrote to the Communication files more records than size allowed. Therefore the oldest CMEM or Control-O requests were overwritten and lost.

No additional action is performed.

**Corrective Action:** To prevent this situation from recurring, do one of the following:
- Make sure that the Control-M monitor will not remain inactive for a long time.
- Increase the size of the Communication files.

WKJ 449E MISSING TABLE \( tableName \) IN \( lib \)

**Explanation:** Table \( tableName \) was not found in the library \( lib \), or the table was empty.

A FORCEJOB request for a scheduling table or a specific job failed.

This message is followed by message WKJ A59E, which contains more details about the error.

This message may also be issued in the following situations:
- the library in which the member resides is being compressed
- the disk volume on which the library resides on is being reorganized or defragmented

These actions should be avoided during job ordering periods.

No additional action will be taken for the failed job or table order.

**Corrective Action:** Check that the table exists in the indicated library. Refer to message WKJ A59E for further actions.

WKJ 44AI SYSTEM LOGGER INTERFACE ACTIVATED

**Explanation:** This information message indicates that Control-M has successfully initialized the System Logger interface. Control-M can now begin communicating with CMEM.

**Corrective Action:** No action is required.

WKJ 44BE SYSTEM LOGGER NOT SUPPORTED ON THIS OPERATING SYSTEM

**Explanation:** Control-M cannot utilize the System Logger interface on the host operating system.

The host operating system does not support the System Logger interface.

The CMEM facility is deactivated.

**Corrective Action:** Change the parameters in the appropriate IOA PARM library members to use the Subsystem-to-Monitor (S2M) communication files to implement communication between CMEM or Control-O and Control-M.
WKJ 44CI ATTEMPTING TO RECONNECT TO MVS SYSTEM LOGGER

**Explanation:** Control-M has detected an MVS System Logger error, and is attempting to reconnect to the MVS System Logger.

Control-M tries several times to reconnect to the MVS System Logger.

**Corrective Action:** No action is required.

WKJ 44DE ATTEMPT TO RECONNECT TO MVS SYSTEM LOGGER FAILED

**Explanation:** Control-M detected an MVS System Logger error, and attempted several times to reconnect to the MVS System Logger, without success.

**Corrective Action:** No action is required.

WKJ 44EE MVS SYSTEM LOGGER ERROR - CMEM FEATURE DISABLED

**Explanation:** Control-M detected an MVS System Logger error. Either this error was so severe as not to be recoverable, or Control-M attempted several times to reconnect to the MVS System Logger, without success.

Control-M has stopped attempting to reconnect to the MVS System Logger. The CMEM facility is deactivated.

**Corrective Action:** If and when the MVS System Logger becomes operational, stop and restart the Control-M monitor.

WKJ 44FI TRIGGER JOB jobName (jobId) FOUND ON AJF. JOB NOT FORCED

**Explanation:** This information message refers to a Control-O or CMEM ON JOBARRIV or ON JOBEND rule with a DO FORCEJOB command. The job used to trigger this DO FORCEJOB was found on the Active Jobs file.

Control-M does not order and submit the DO FORCEJOB.

**Corrective Action:** No action is required.

WKJ 44GA REPLY "ABORT", "CONTINUE", OR "RETRY"

**Explanation:** After displaying a CMEM-related error message, Control-M disables communication between CMEM or the Control-O monitor and Control-M. Control-M then displays message CTM44GA giving the user the choice of how to continue.

The subtask is suspended until a response to this message is received.

**Corrective Action:** Enter one of the following responses:

- ABORT - terminate the Control-M monitor
- CONTINUE - disable communication between CMEM or the Control-O monitor and Control-M, but allow the Control-M monitor to continue processing
- RETRY - retry the failed dynamic allocation request
Messages WKJ A00 through WKJ Axx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

WKJ A56E MEMBER memName READ ERROR RC=rc IN dsn

**Explanation:** While processing a Control-M DO FORCEJOB, CMEM or Control-O request, the Control-M monitor encountered an error while reading table *memName* in data set *dsn*.

This message is followed by additional messages which identify the failed action.

No additional action will be taken for the failed job or table order.

**Corrective Action:** For a description of return code *rc*, see the DOCIMEM member in the IOA DOC library.

WKJ A57E MEMBER memName IS EMPTY IN dsn

**Explanation:** While processing CMEM or Control-O request, the Control-M monitor encountered an empty table *memName* in data set *dsn*.

This message is followed by message WKJ A59E which identifies the failed action.

No additional action will be taken for the failed job or table order.

**Corrective Action:** Make sure that table *memName* contains valid scheduling information.

WKJ A58E ABEND abCode WHILE PROCESSING dsn

**Explanation:** While processing a CMEM/Control-O request for data set *dsn*, the Control-M monitor encountered an abend condition *abCode*.

This message is followed by message WKJ A59E which identifies the failed action.

No additional action will be taken for the failed job/table order.

**Corrective Action:** Record the abend code, prepare the Control-M monitor full output, and contact BMC Customer Support.

WKJ A59E FORCEJOB FAILED FOR JOB jobName IN TABLE tableName FROM dsn

**Explanation:** An error occurred while processing a FORCEJOB request for the *jobName* job, or, in the case where *jobName* is blank, for the complete scheduling table *tableName*.

The source of the request may be:

- a Control-O request for a DO FORCEJOB.
- a Control-M request for a DO FORCEJOB.
- a CMEM FORCEJOB action.

This message is preceded by another message, which gives more details of the cause of the error.
Control-M may try again to execute the job or table, depending on the values set for the FORCE#RT and FORCE#WI installation parameters. For more information, see the customization chapter of the INCONTROL for z/OS Installation Guide.

**Corrective Action:** Correct the error as detailed in the preceding message. If scheduling is still required for the job or table for which the error occurred, then the job or table should be ordered manually. If the specification in the original request was incorrect, correct it and reload, if necessary. Reload the CMEM table or reorder the Control-O rule.

**WKJ A5AE** ANOTHER MONITOR ALREADY READING FROM LOG STREAM

**STR=**structureName **L/S=logStreamName**

**Explanation:** This error message is issued when an attempt is made to read an MVS System Logger log stream which is currently being read by another Control-M monitor. To avoid a loop of FORCEJOB jobs, the same MVS System Logger log stream should not be read simultaneously by more than one Control-M monitor. Should a second Control-M monitor attempt to read the same log stream, this error message is issued. The CMEM facility is deactivated for this Control-M monitor.

**Corrective Action:** If and when the other Control-M monitor terminates, this monitor can be restarted. Make sure only one Control-M monitor is reading the same MVS System Logger log stream simultaneously.

**WKJ A5BE** FREEMAIN (storage_add /len) FAILED AT POINT ref_point

**Explanation:** A Control-M component attempted to free a block of working storage, but failed to do so. The source of the DO FORCEJOB request may be any of the following:

- storage_add - the working storage address
- len - the length of the working storage
- ref_point - the reference point in the Control-M component

No additional action is performed.

**Corrective Action:** If this is a recurring problem, prepare the Control-M monitor full output and contact BMC Customer Support. If ignored, this may cause severe insufficient storage problems.
WKJ A5DI FORCEJOB SUCCEEDED AFTER RETRIES FOR JOB jobName IN TABLE tableName FROM dsn

Explanation: After failing to execute a DO FORCEJOB request because a scheduling table was in use, Control-M retried the request and succeeded in executing it, in accordance with the values set for the FORCE#RT and FORCE#WI installation parameters.

The source of the DO FORCEJOB request was one of the following:

- a Control-O request for a DO FORCEJOB
- a Control-M request for a DO FORCEJOB
- a CMEM DO FORCEJOB action

Corrective Action: No action is required.

WKJ A5EI CONTROL-M WILL RETRY PROCESSING DATASET TRIGGER: trigger_dsn

Explanation: During the processing of a CONNECT DIRECT request, no successfully triggered events were processed, and a data set-in-use condition occurred.

The probable source of the CONNECT DIRECT request is the IOADCC utility.

Control-M queues the DO FORCEJOB request, and will try again to execute it, in accordance with the values set for the FORCE#RT and FORCE#WI installation parameters.

For more information on the FORCE#RT and FORCE#WI installation parameters, see the customization chapter of the INCONTROL for z/OS Installation Guide.

Corrective Action: No action is required.

WKJ A5FE SCHEDULE LIBRARY schedLib IS MIGRATED

Explanation: A DO FORCEJOB command was issued for a table in the schedLib scheduling library, which has been migrated. An attempt was made to RECALL the library. An additional message follows describing whether the RECALL action was successful or not.

Corrective Action: Look for the following messages, which inform about the success of the RECALL action.
WKJ A5GE RECALL OF LIBRARY schedLib FAILED RC rc REASON rsn

Explanation: A DO FORCEJOB command was issued for a table in the schedLib scheduling library, but the action could not be completed because the library, which was migrated, could not be recalled.

Corrective Action: Do the following:

- Ensure that the RECLRQST parameter is set (in the CTMPARM member of the IOA PARM library).
- Check the rc and rsn codes in the section about the IOAMEM assembler macro in the INCONTROL for z/OS Administrator Guide, and take the appropriate action.

WKJ A5HI SCHEDULE LIBRARY schedLib HAS BEEN RECALLED

Explanation: This information message indicates that a DO FORCEJOB command was issued for a table in the schedLib scheduling library. To complete this action, the library, which was migrated, has been RECALLed.

Corrective Action: No action is required.

WKJ A5IE CONTROL-M WILL NO LONGER RETRY THE REQUEST

Explanation: When a schedule table is not available because the data set is in use by another address space, Control-M retries the request several times based on the FORCE#RT parameter in CTMPARM. When this number of retries is exhausted and Control-M no longer retries the request, this message is displayed.

Corrective Action: Determine why the data set is in use and retry the request manually. Messages CTMC53E and CTMA59E give details about the job name, table name, and schedule library name.

WKJ A5JE POST ERROR NOTIFICATION STAGE stage FAILED

Explanation: A DO FORCEJOB action triggered by this job failed. An attempt to specify the post-error indication in the job image failed.

Corrective Action: Do the following:

- Locate the failed DO FORCEJOB command and manually order the job.
- Notify BMC Software Customer Support about the error. The stage specified in the message is required for BMC error analysis.

Messages WKJ C00 through WKJ Cxx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

WKJ C39E action FAILED FOR cond

Explanation: An error occurred while processing a request to add or delete the condition.

The source of the request may be:
WKJC50E INSUFFICIENT STORAGE FOR CMEM PROCESSING

Explanation: Highlighted, unrollable message.

Insufficient storage for CMEM processing initialization in the Control-M monitor.
The Control-M monitor stops processing CMEM/Control-O requests.

Corrective Action: Increase the REGION size specified for the Control-M monitor.

WKJC50W Control-M MONITOR CMEM FACILITY IS NOT INSTALLED

Explanation: Control-M has determined that the CMEM facility is not installed.

Communication between CMEM or the Control-O monitor and Control-M is not established, but the
Control-M monitor continues processing.

Corrective Action: No action is required.

WKJC51E INSUFFICIENT STORAGE FOR TABLE tableName FROM lib

Explanation: Insufficient storage for loading table tableName into storage.

This message is followed by message WKJA59E, which contains more details about the error.
Job order fails. No additional action taken.

Corrective Action: Increase the REGION size specified for the Control-M monitor; or define a smaller
table if possible, for example, if only one job is ordered from the table. For further actions, see message
WKJA59E.

WKJC52E DATASET IS NOT A LIBRARY, DSN=dsn

Explanation: While processing a CMEM/Control-O request, the Control-M monitor encountered a data
set dsn which is not a partitioned data set.

This message is followed by message WKJA59E or WKJC39E which identifies the failed action.
No additional action will be taken for the failed job or table order.

Corrective Action: Specify the name of a partitioned data set containing one or more valid scheduling
tables.
WKJC53E DATASET IN USE, DSN=dsn

Explanation: While processing a CMEM/Control-O request, the Control-M monitor encountered a data set dsn which is currently used by another job.

This message is followed by message WKJA59E which identifies the failed action.

No additional action will be taken for the failed job/table order.

Corrective Action: Determine which job has allocated the data set with disposition OLD and resolve the conflict.

WKJC54E DATASET IS NOT CATALOGED, DSN=dsn

Explanation: While processing a Control-M DO FORCEJOB, CMEM or Control-O request, the Control-M monitor encountered a data set dsn which is not cataloged.

This message is followed by additional messages which identify the failed action.

No additional action will be taken for the failed job/table order.

Corrective Action: Make sure that the SCHLIB library specified in the CMEM table entry refers to a cataloged data set.

WKJC55E DYNAMIC ALLOCATION ERROR, DSN=dsn

Explanation: While processing a CMEM or Control-O request, the Control-M monitor encountered a dynamic allocation error.

This message is followed by message WKJA59E which identifies the failed action.

No additional action will be taken for the failed job or table order.

Corrective Action: Record the problem, prepare the Control-M monitor full output, and contact BMC Customer Support.

WKJC56E M2S FILE IS FOR QNAME qName. IT DOES NOT MATCH IOA QNAME qName DSN=dsn

Explanation: Control-M could not allocate the monitor to the Monitor to Subsystem (M2S) file of another IOA environment.

During initialization the Control-M monitor compares the QNAME in the IOA environment with the QNAME in the M2S file. They should match.

Message CTM441E is issued.

Corrective Action: Check the IOACPRM member and do one of the following:
If it points to the wrong file, correct the name, compile the member and start a new monitor.

If there is no problem in the IOACPRM member, the M2S file was created in a different IOA environment. Delete the file and create a new M2S file using the correct IOA environment.

**WKJC57E** S2M FILE IS FOR SMFID *smfid* QNAME *qName*. IT DOES NOT MATCH IOA QNAME *qName* DSN=dsn

**Explanation:** The Control-M monitor could not allocate the subsystem to the Subsystem to Monitor (S2M) file of another IOA environment.

During initialization the Control-M monitor compares the qname in the IOA environment with the qname in the S2M file. They should match.

Message CTM441E is issued.

**Corrective Action:** Check the CTMPARM member and do one of the following:

- If it points to the wrong file, correct the name, compile the member and start a new monitor.
- If there is no problem in the CTMPARM member, the S2M file was created in a different IOA environment. Delete the file and create a new S2M file using the correct IOA environment (IOAPARM).

**WKJC58I** M2S FILE FOR IOA QNAME *qName*. DSN=dsn

**Explanation:** This information message identifies the Monitor-to-Subsystem (M2S) file that the Control-M monitor allocated for communication with the Control-O or the CMEM monitor.

*qName* is defined in the M2S file with the data set name *dsn*.

**Corrective Action:** No action is required.

**WKJC59I** S2M FILE FOR SMFID *smfid* QNAME *qName* DSN=dsn

**Explanation:** This information message identifies the Subsystem-to-Monitor (S2M) file that the Control-M monitor allocated for communication with the Control-O or the CMEM monitor.

*qName* is defined in the S2M file with the data set name *dsn*.

**Corrective Action:** No action is required.

**WKJC5AE** SMFID *smfid* NOT FOUND IN M2S DSN=dsn

**Explanation:** The SMFID is not in the Monitor-to-Subsystem (M2S) file.

During initialization the Control-M monitor checks that every SMFID required for CMEM functions is defined in the M2S file.

Message Control-M issues the CTM441E message and CMEM functions becomes inactive.

**Corrective Action:** Add the missing SMFID to the M2S file, and restart the Control-M monitor.

For more information on adding the SMFID to the M2S file, see the section on reformatting communication files for only one SMFID in the INCONTROL for z/OS Installation Guide.
WKJ C5BE INVALID BLOCK SIZE FOR FILE TYPE type

Explanation: The record length of the communication file between Control-M and CMEM was incorrect. The record size for the file was defined incorrectly. As a result, no records are written to the file.

The file type is either M2S or S2M:

- For an M2S file, the correct record length is 1000 decimal.
- For an S2M file, the correct record length is 80 decimal.

Job processing continues, but CMEM processing is ignored.

Corrective Action: Reformat the file with the correct record size.

WLM messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages WLMW00 through WLMWxx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

WLMW00E INVALID PARAMETER PASSED TO CTMWLM; WLM SRVCLASS REQUEST ABORTED

Explanation: CTMWLM, the Control-M workload management service class processing module, received an incomplete or incorrect parameter list.

The specific service class request is aborted.

Corrective Action: Prepare the Control-M monitor full output and contact BMC Customer Support.

WLMW01E IOAMEM GETMEM ERROR. RETURN=rc REASON=rsn

Explanation: CTMWLM, the Control-M workload management service class processing module, was unable to read the WLMSCTBL table in the CTM PARM library.

The specific service class request is aborted.

Corrective Action: Note the values of rc and rsn, prepare the Control-M monitor full output, and contact BMC Customer Support.

WLMW02E GETMAIN FOR INTERNAL TABLE FAILED. LEN=len R15=r15

Explanation: CTMWLM, the Control-M workload management service class processing module, was unable to acquire enough storage to build the internal table which represents the WLMSCTBL table in the CTM PARM library.

The specific service class request is aborted.
**Corrective Action:** Note the values of `len` and `r15`, prepare the Control-M monitor full output, and contact BMC Customer Support.

WLMW03E FREEMAIN OF OLD INTERNAL TABLE FAILED. LEN=\(\text{len}\) PTR=\(\text{ptr}\)

**Explanation:** CTMWLM, the Control-M workload management service class processing module, was unable to free previously-acquired storage.

**Corrective Action:** Note the values of `len` and `ptr`, prepare the Control-M monitor full output, and contact BMC Customer Support.

WLMW04I WLM SRVCLASS TABLE {LOADED | RELOADED} SUCCESSFULLY WITH \(\text{num}\) ENTRIES

**Explanation:** CTMWLM, the Control-M workload management service class processing module, successfully loaded or reloaded the WLMSCTBL table from the CTM PARM library.

**Corrective Action:** No action is required.

WLMW05W INTERNAL WLM SRVCLASS TABLE HAS NO VALID ENTRIES

**Explanation:** CTMWLM, the Control-M workload management service class processing module, successfully loaded or reloaded the WLMSCTBL table from the CTM PARM library but found no valid entries.

All subsequent service class requests are effectively ignored.

**Corrective Action:** Correct or add entries to the WLMSCTBL table in the CTM PARM library.

WLMW06E ENTRY \(\text{rec}\) PARSING ERROR: \(\text{jobNameapplNamefromTime toTime}\)

**Explanation:** CTMWLM, the Control-M workload management service class processing module, detected a parsing error in this entry in the WLMSCTBL table in the CTM PARM library.

The variables in this message are:

- \(\text{rec}\) - the record number
- \(\text{jobName}\) - the name of the job in the WLMSCTBL table entry
- \(\text{applName}\) - the name of the application in the WLMSCTBL table entry
- \(\text{fromTime}\) - the start time of the range
- \(\text{toTime}\) - the end time of the range

The table entry is ignored.

**Corrective Action:** Correct the entry in the WLMSCTBL table in the CTM PARM library.
WLMW07I  {COMMAND | MACRO} ISSUED TO RESET JOB TO SRVCLASS servClass

Explanation: CTMWLM, the Control-M workload management service class processing module, attempted to reset the service class of the job to servClass.

Corrective Action: No action is required.

WLMW08E IWMRESET MACRO ERROR. SRVCLASS=servClass RETURN=rc REASON=rsn

Explanation: CTMWLM, the Control-M workload management service class processing module, attempted to reset the service class of the job to servClass but failed.

The specific service class request is unsuccessful.

Corrective Action: For information about the return and reason codes, see the explanation of IWMRESET in the IBM manual MVS Programming: Workload Management Services.

WTO messages

This group includes messages for the Control-O product.

Messages WTO200 through WTO2xx

This group includes messages for the Control-O product.

WTO280E ERROR EXECUTING DO stmt_type

Explanation: An error occurred while executing the indicated type of DO statement. The DO action fails.

Corrective Action: Correct the DO statement in the rule.

WTO282I text (usr)

Explanation: This information message indicates that a user message was activated by the SHOUT Facility. user is the user ID of the job order requesting the SHOUT statement.

Corrective Action: No action is required.

WTO283E AUTOEDIT FAILED, RC=rc, REASON=rsn. PROCESSING OF THIS RULE IS ABORTED

Explanation: An AutoEdit symbol within a DO statement in a Control-O rule definition could not be resolved.
DO statements within a rule definition are processed sequentially. If AutoEdit resolution of a symbol with a DO statement fails, the DO statement, and any subsequent DO statements within the rule definition, are cancelled. This default processing can be overridden by using the %%%RESOLVE NO control statement in a previous DO SET statement. The statement will be resolved as far as possible before performing the DO statements.

The DO action in which the AutoEdit resolution failed, and any subsequent DO actions, are cancelled.

**Corrective Action:** Check the return code ($rc$) and reason code ($rsn$) in the following tables to determine the reason for the failure. Correct the symbol in the rule definition, and reorder the table. If the return code or reason code is not listed, the error is an internal error, and you should notify BMC Software Customer Support. (HIDDEN TEXT - same as API565E, CTO565E, XAM565E, and table used elsewhere also, inc. CTO145S, MTO145S)

</tbody>
</table>
WTO284E AUTOEDIT FAILED FOR TEXT: *text*

**Explanation:** During rule processing, Control-O failed to resolve an AutoEdit variable, either because of a syntax error or because the AutoEdit variable was not found. This message is usually followed by message WTO283E, which explains the reason for the error. The rule is aborted.

**Corrective Action:** Check message WTO283E to determine why the AutoEdit variable did not resolve, and correct the problem accordingly.

WTO285W RULE *rule* REACHED THRESHOLD *num* SUSPENDED, TABLE *table* LIB *library*

**Explanation:** The rule identified in the message was suspended because it reached the rule threshold limit.

The rule threshold limit determines the maximum number of times a rule may be triggered. This limit is defined in one of the following ways:

- in the THRSHOLD parameter in the CONTROL section of the CTOPARM member in the IOA PARM library
- in the THRSHOLD field of the rule

The rule is suspended.

**Corrective Action:** Determine why the rule reached the limit, and if there is a problem correct it. Adjust the threshold limit value, if necessary, or use the Rule Status screen to release the rule from its SUSPEND state.

WTO287E DO WAIT INVALID IN COMMAND RESPONSE MODE

**Explanation:** A DO WAIT statement was encountered while in Command-Response mode. A DO WAIT statement is invalid when a rule is executing a DO COMMAND in the Command-Response mode. The rule is aborted or ignored.

**Corrective Action:** Correct the rule so that it does not encounter a DO WAIT statement when in Command-Response mode.

WTO288E MAXIMUM NUMBER OF ‘DO’ STATEMENTS EXCEEDED

**Explanation:** A rule executed more than 10,000 DO statements. This message is followed by another message containing the name of the problematic rule. In order to avoid an infinite loop, only a limited number of DO statements can be executed. The default setting for this limit is 10,000. You can override this default by setting %DOLIMIT to a higher value. The rule is aborted.

**Corrective Action:** Either correct the rule to perform less than 10,000 DO statements, or set %DOLIMIT to a higher value.
WTO289E GLOBAL DATE IS NOT SUPPORTED FOR ADD CONDITION REQUESTS

Explanation: The dateref field in the DO COND statement contains wildcard symbols ($$$ or ****).
The rule is aborted or ignored.

Corrective Action: Specify a distinct date in the dateref field.

WTO28AE MAXIMUM NUMBER OF NESTED RULES EXCEEDED

Explanation: The maximum number of nested rules executed in response to a DO RULE statement has been exceeded. Rules can be nested up to 20 deep.
The rule at the twenty-first level is aborted or ignored.

Corrective Action: Correct the logic so that there are no more than 20 nesting levels for rules.

WTO28BE INVOKED RULE NOT FOUND

Explanation: The rule invoked using a DO RULE statement was not found in the specified, or default, table.
The rule is aborted or ignored.

Corrective Action: Correct the DO RULE statement to contain a rule defined in the specified or default table, or define the rule in the specified table.

WTO28CW RULE IS IN "WAIT ACTIVATION" STATUS. "DO RULE" IS IGNORED

Explanation: A rule invoked another rule by using the DO RULE statement did not satisfy the Runtime Scheduling criteria.
Processing continues. The invoked rule is ignored.

Corrective Action: If this is not intentional, correct the invoked rule definition so that it satisfies the Runtime Scheduling criteria.

WTO28DE RULE=rulename ABORTED. TABLE=tableName LIBRARY=dsn

Explanation: A rule aborted because of an error. This message is preceded by another message that describes the cause of the error.
The rule is aborted at the point of error.

Corrective Action: Correct the error according to the preceding message.

WTO28EW RULE=rulename IGNORED. TABLE=tableName LIBRARY=dsn

Explanation: This warning message indicates that a problem occurred when processing a rule. This message is preceded by another message that describes the problem.
The rule is ignored. Processing continues.

Corrective Action: Correct the problem according to the preceding message.
WTO28FE {CTOCON | CONVCON} R15 rc

Explanation: A nonzero return code was received from a called program or routine. During execution, detection of a nonzero return code caused this message to be issued.

Execution of the rule terminates

Corrective Action: Send a screen print of the rule and the a trace of its execution to BMC Software Customer Support.

WTO2A1E NO FREE WAIT ELEMENT AVAILABLE

Explanation: A rule that was required to wait could not, because no Wait element was available for it. A rule requires a Wait element to wait. In this case, the maximum number of Wait elements defined in the WAITPR# parameter of CTOPARM was already being used.

The rule is aborted.

Corrective Action: Adjust the WAITPR# and NUMCONS parameters in CTOPARM according to the instructions in the Control-O chapter of the INCONTROL for z/OS Installation Guide.

WTO2A2E WAIT ELEMENT IS TOO SMALL

Explanation: A rule that was required to wait could not, because the Wait element was too small. A waiting rule stores its data in a Wait element. In this case, the Wait element is not large enough to store the rule data.

Rule is aborted.

Corrective Action: Either split the rule into two rules, or use less AUTOEDIT variables in it. When splitting the rule, do not define the second rule as an ON RULE, because it will use the same Wait element as the first rule.

XAM messages

This group includes messages for the Control-O product.

Messages XAM500 through XAM5xx

This group includes messages for the Control-O product.

XAM561E REQUESTED FUNCTION NOT SUPPORTED

Explanation: The requested function is not in the list of supported XAM functions.

The XAM interface returns a return code of 08 to the calling routine. The final System Action depends on the calling environment.

Corrective Action: Check the syntax and spelling of the requested function. If necessary, contact your INCONTROL administrator.
XAM562E INTERNAL RESOURCES EXHAUSTED

Explanation: The space in an internal table is exhausted. The XAM interface keeps an internal table of all XAM activities in the address space. The table can contain a maximum 256 concurrent TCBs requesting XAM services. There is no address space for a new XAM user.

Some TSO, REXX, or CLISTs running in the address space probably did not execute the TERM(inate) function, which releases the acquired XAM resources.

The XAM interface returns a return code of 16 to the calling routine. The final System Action depends on the calling environment.

Corrective Action: Determine why there is insufficient space, and correct the problem accordingly.

XAM563E IOA SUBSYSTEM subsys INACTIVE. INTERFACE CANNOT BE USED

Explanation: A request has been received through the XAM interface that needs the Control-O monitor, but Control-O is not active.

The requested activity is aborted.

Corrective Action: Check why Control-O is not active. Once the Control-O monitor is active again, re-issue the request.

XAM564E CTO ENVIRONMENT NOT PROPERLY INITIALIZED

Explanation: The XAM interface did not find the control blocks belonging to the calling routine. Every requester of XAM services uses a set of control blocks to provide the necessary AutoEdit Environment. The XAM interface did not find the blocks belonging to this requester.

The XAM interface returns a return code of 16 to the calling routine. The final system action depends on the calling environment.

Corrective Action: Execute the INIT function of XAM under the current requester.

XAM565E SETOLOC/SETOGLB ERROR CODE = rc REASON = rsn, TEXT=text

Explanation: XAM is unable to execute the AutoEdit request. XAM detected an error while trying to resolve or set an AutoEdit expression.

The XAM interface returns a return code of 16 to the calling routine. The final System Action depends on the calling environment.

Corrective Action: Ensure that the AutoEdit expression in the SETOLOC, SETOGLB or RESOLVE functions is correctly written.

The following table shows possible values for the error code (rc) and reason code (rsn), with the explanation of each:

<table>
<thead>
<tr>
<th>Error Code (rc)</th>
<th>Reason Code (rsn)</th>

**XAM566E IOA SUBSYSTEM subsys NOT RESPONDING TO REQUESTS**

**Explanation:** The IOA subsystem subsys did not terminate rule execution within the expected time frame. The XAM requester waits up to two minutes for a DORULE request to terminate the rule. If no such request is received within two minutes, this message is displayed.

The XAM interface returns a return code of 16 to the calling routine. The final system action depends on the calling environment.

**Corrective Action:** Review the rule execution results for errors and rectify as appropriate.

**XAM567E IOA SUBSYSTEM subsys INACTIVE**

**Explanation:** The requested service cannot be provided because the IOA subsystem subsys is not up.

The XAM interface returns a return code of 16 to the calling routine. The final system action depends on the calling environment.

**Corrective Action:** Start the Control-O monitor.

**XAM568E IOA SUBSYSTEM subsys DETECTED AN ERROR**

**Explanation:** An internal error was detected by the IOA subsystem subsys during the execution of a XAM DORULE request.
The XAM interface returns a return code of 16 to the calling routine. The final System Action depends on the calling environment.

Corrective Action: Do the following:
1. Collect information about the functions requested by the XAM interface.
2. Determine whether or not the Control-O monitor is properly running for ongoing automation which is not related to XAM.

XAM569E IOA SUBSYSTEM $subsys$ RETURNED AN INVALID RETURN CODE

Explanation: Due to an internal error, an invalid return code was returned by the subsystem $subsys$ during the execution of a XAM DORULE request.

The XAM interface returns a return code of 16 to the calling routine. The final System Action depends on the calling environment.

Corrective Action: Do the following:
1. Collect information about the functions requested by the XAM interface.
2. Determine whether or not the Control-O monitor is properly running for ongoing automation which is not related to XAM.

XAM56AW SOME LOCAL VARIABLES NOT COPIED FROM XAM TO RULE, REASON=$rsn$

Explanation: A request was made to execute a Control-O rule by means of the DORULE function of the XAM interface. However, by the time the request was made, the XAM program that was executing had created an excessive number of local AutoEdit variables. The XAM service cannot share all these local AutoEdit variables with the Control-O rule, so some are discarded before the rule is given control.

In this message, $rsn$ is an internal reason code used by BMC Software Customer Support.

The DORULE function continues, and control is given to the rule, but some local AutoEdit variables that cannot be copied to the rule environment are discarded. These discarded local AutoEdit variables are not available to the executed rule, nor are they available to the original XAM program once execution of the rule is complete.

Corrective Action: Use less local AutoEdit variables in the XAM program. You may be able to achieve this by using global, rather than local, AutoEdit variables.

If the problem persists, contact BMC Software Customer Support.

XAM56BW SOME LOCAL VARIABLES NOT COPIED BACK FROM RULE TO XAM, REASON=$rsn$

Explanation: A request was made to execute a Control-O rule by means of the DORULE function of the XAM interface. However, by the time the rule finished executing, an excessive number of local AutoEdit variables had been created. The XAM service cannot share all these local AutoEdit variables with the original environment (the calling XAM program), so some are discarded before returning from the rule.

In this message, $rsn$ is an internal reason code used by BMC Software Customer Support.
Execution of the DORULE request is completed, and control returns to the calling XAM program. However, some of the local AutoEdit variables that cannot be copied to the environment of the calling program are discarded. These discarded local AutoEdit variables are then no longer available to the original XAM program.

**Corrective Action:** Use less local AutoEdit variables in the XAM program and in the Control-O rule that you were executing. You may be able to achieve this by using global, rather than local, AutoEdit variables. If the problem persists, contact BMC Software Customer Support.

**XAM56EW** CONTROL-O MONITOR IS NOT ACTIVE. IOA SUBSYSTEM **subsystem_name**

**Explanation:** XAM discovered that Control-O monitor is not active.

The XAM function failed.

**Corrective Action:** Validate that Control-O monitor is active in the system that the XAM is executing. If Control-O monitor is not active, request the operator to start it and then perform the XAM function again.

**XAM56FW** CONTROL-O MONITOR INTERFACE ERROR RC=##. IOA **subsystem_name**

**Explanation:** This is an internal error that might be created when the XAM interface returns a return code greater than 4. In most cases it occurs when the XAM function is performed when Control-O monitor did not complete its startup or it started its shutdown.

The XAM function failed.

**Corrective Action:** Validate that Control-O monitor is active in the system that the XAM is executing. If Control-O monitor is not active, request the operator to start it and then perform the XAM function again.

**XCF messages**

This group includes messages for the Control-O product.

**Messages XCF200 through XCF2xx**

This group includes messages for the Control-O product.

**XCF2B2I** XCF QUERY ERROR RC=rc REASON=rsn

**Explanation:** This information message indicates that an error was detected while Control-O was querying XCF.

Control-O issued macro IXCQUERY. The macro returned return code rc and reason code rsn.

**Corrective Action:** Review the macro return code and reason code. If necessary, correct the problem and restart Control-O.
XMM messages

This group includes messages for the IOA (infrastructure) product.

Messages XMM600 through XMM6xx

This group includes messages for the IOA (infrastructure) product.

XMM645I MONITOR USER PGM APPL ID TERMINAL START LASTUSED ST

Explaination: After an operator DISPLAY command to one of the Online monitors, this header message for message XMM646I is issued.

Corrective Action: No action is required.

XMM646I monName user pgm applId terminal start lastUsed st

Explaination: After an operator DISPLAY command to one of the Online monitors, this message is displayed for each active user.

The variables in this message are:

- monName - the name of the monitor started task
- user - the user name (ID)
- pgm - the program name
- applId - the application ID
- terminal - VTAM terminal ID
- start - user sign-on time
- lastUsed - time stamp of last user entry
- st - Valid values are:
  - W (Waiting for user data)
  - A (Active user is waiting for response)

Corrective Action: No action is required.

XMM647E monName - LOAD OF pgm FAILED. SIGNON OF USER usr FAILED

Explaination: Load for a module requested during user sign-on to the Online facility failed. The user main program as specified by Online monitor sign-on exit or by default (CTMXMAN, CTMXMAND, CTDXMAN, or CTDXMANU) cannot be found in the Online monitor STEPLIB libraries.

Sign-on to the specified IOA Online monitor is terminated.

Corrective Action: Contact your INCONTROL administrator to find out why the program is missing. If the problem is not resolved, call BMC Software Customer Support.
XMM648S *monName* - ONLINE MONITOR ENDED WITH ERROR

**Explanation:** Highlighted, unrollable message.

A severe error has occurred. IOA Online monitor shutting down.

Detailed information on this error is available in the messages which were previously displayed on the operator console.

The specified IOA Online monitor is shutting down.

**Corrective Action:** Check the system log for additional messages.

XMM649E *monName* - INVALID MODIFY PARAMETERS. VALID PARAMETERS ARE:

**Explanation:** An invalid parameter was passed to the specified IOA Online monitor by an operator modify command (F). A list of valid modify parameters will appear on the operator console following this message.

The modify command is rejected.

**Corrective Action:** Enter a correct modify parameter.

Messages XMM700 through XMM7xx

This group includes messages for the IOA (infrastructure) product.

XMM770I INVALID TRACE LEVEL WAS SPECIFIED: xxxxxxxxxxxxxxx

**Explanation:** This information message is issued when the trace is turned on for the IOA online monitor and the trace level is invalid.

When the command F IOA- *monName*, TRACE= nnn,ON or OFF is used to turn the trace ON or OFF, and the trace level is invalid, this message is issued. The trace level may be set to any value from 1 through 256.

The system ignores the command and continues processing.

**Corrective Action:** Reset the trace level to a valid value and try again.

XMM775I *monName* - validModifyParm

**Explanation:** This information message follows message CTM649E, which is issued when a MODIFY parameter is invalid.

**Corrective Action:** No action is required.

XMM776I *monName* - SHUT DOWN UPON REQUEST FROM OPERATOR

**Explanation:** This information message indicates that the specified Online monitor is shutting down based on an operator's request.

**Corrective Action:** No action is required.
**XMM777I monName - ONLINE MONITOR INITIALIZATION STARTED**

**Explanation:** This information message indicates that the specified Online monitor was started and is currently building the required internal environment.

**Corrective Action:** No action is required.

**XMM778I monName - ONLINE MONITOR INITIALIZATION COMPLETED**

**Explanation:** This information message indicates that the specified Online monitor is ready to serve the user’s sign-on request.

**Corrective Action:** No action is required.

**XMM779E monName - ONLINE MONITOR INITIALIZATION FAILED RC rc IN STEP step#**

**Explanation:** The specified Online monitor initialization has encountered an internal error in the step and has returned the return code rc.

The following step numbers and return codes can appear in the message:

<table>
<thead>
<tr>
<th>Step No. (step#)</th>
<th>Explanation</th>
<th>Return Code (rc)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0001</td>
<td>Subsystem initialization error.</td>
<td>04</td>
<td>IOA component already active.</td>
</tr>
<tr>
<td></td>
<td>Subsystem initialization error.</td>
<td>08</td>
<td>Subsystem name not supplied.</td>
</tr>
<tr>
<td></td>
<td>Subsystem initialization error.</td>
<td>12</td>
<td>Subsystem executor not found.</td>
</tr>
<tr>
<td></td>
<td>Subsystem initialization error.</td>
<td>16</td>
<td>Insufficient storage.</td>
</tr>
<tr>
<td></td>
<td>Subsystem initialization error.</td>
<td>20</td>
<td>Subsystem already active for a different IOA release.</td>
</tr>
<tr>
<td></td>
<td>Subsystem initialization error.</td>
<td>24</td>
<td>IOAOMON already active for a different IOA release.</td>
</tr>
<tr>
<td></td>
<td>Subsystem initialization error.</td>
<td>28</td>
<td>Invalid parameters passed to the initialization routine.</td>
</tr>
<tr>
<td></td>
<td>Subsystem initialization error.</td>
<td>32</td>
<td>Internal error.</td>
</tr>
<tr>
<td>0002</td>
<td>ECBLIST could not be obtained in CSA/ECSA</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0003</td>
<td>Cross-memory environment establishment error AXSET).</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0004</td>
<td>Cross-memory environment establishment error (LXRES).</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Step No. (step#) | Explanation
---|---
0005 | (ETCRE).
0006 | (ETCON).
0007 | IOAOMON could not be made non-swappable.
0009 | There is only one return code for this step:

<table>
<thead>
<tr>
<th>Return Code (rc)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>08</td>
<td>IOAOMON could not find its own ASCB.</td>
</tr>
</tbody>
</table>

The specified online monitor will shut down.

**Corrective Action:** Act according to the step number and return code as follows:

<table>
<thead>
<tr>
<th>Step Code</th>
<th>Return Code (rc)</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>0001</td>
<td>08</td>
<td>Verify that the subsystem name is defined.</td>

<tr>
<td></td>
<td>32</td>
<td>Forward problem to IOA representative.</td>
</tr>
<tr>
<td>0002</td>
<td></td>
<td>Try again.</td>
</tr>
<tr>
<td>0003 through 0009</td>
<td></td>
<td>Forward problem to your IOA representative.</td>
</tr>
</tbody>
</table>

**XMM77AI USER userId WAS CANCELED DUE TO TIMEOUT**

**Explanation:** This information message indicates that the communication session with the specified user was terminated because no data was transmitted during a period of time which exceeded the time-out interval.

This message is generated by CTMXSND which communicates with the OMON cross-memory monitor.
**Corrective Action:** No action is required.

**XMM780I monName - NO USER IS SIGNED ON TO THIS ONLINE MONITOR**

**Explanation:** This information message is displayed when the operator inquires about active users in the specified Online monitor but there are none.

**Corrective Action:** No action is required.

**XMM781E monName - INSUFFICIENT STORAGE FOR USER usr. SIGN-ON FAILED**

**Explanation:** Insufficient virtual storage in the Online monitor address space. User sign-on request is terminated.

**Corrective Action:** Increase the REGION size of the Online monitor. If the problem persists, reduce the number of users allowed to sign on to the Online monitor by lowering the value of the MAXSESS parameter of the specific monitor in IOAXPRM. For more details, see the advice on installing the IOA Online monitor in the *INCONTROL for z/OS Installation Guide*.

**XMM782E monName - INSUFFICIENT STORAGE FOR INITIALIZATION.**

**Explanation:** Highlighted, unrollable message.

Insufficient memory for the online monitor. The specified online monitor shuts down.

**Corrective Action:** No action is required.

**XMM784E monName - AN ONLINE MONITOR WITH THE SAME STC NAME IS ALREADY ACTIVE**

**Explanation:** The operator entered a START command in order to activate monitor. Control-D and Control-M online monitors may work simultaneously provided that each monitor uses a unique name. The newly started online monitor terminates.

**Corrective Action:** If an additional online monitor is needed, define another JCL procedure with a different name to support it.

**XMM785I EXISTING USERS (IF ANY) ARE NOT USING A TREE**

**Explanation:** This information message is generated if a DISPLAY TREES inquiry is made, but no users are using a Control-D Recipient Tree.

**Corrective Action:** No action is required.

**XMM786I monName - NEW TREE LOADED. NEW USERS WILL BE SIGNED ON TO THE NEW TREE**

**Explanation:** This information message indicates that the operator has modified the Online monitor with the LOADTREE command.
A new tree was loaded from the data set (member) allocated to the DATREE DD statement. The new tree will be in effect for all users who sign on from this point in time.

**Corrective Action:** No action is required.

**XMM787W monName - MAXIMUM NUMBER OF TREES LOADED. A TREE MUST BE FREED IN ORDER TO LOAD A NEW ONE**

**Explanation:** The operator entered a LOADTREE command but there are already five trees in storage. Only five tree copies can be loaded.

**Corrective Action:** Wait and retry. A tree is freed when the last user working with an old tree leaves the user screen, or is cancelled.

**XMM788I monName - THE FOLLOWING USERS ARE SIGNED ON TO TREE NUMBER num**

**Explanation:** This information message is the result of a DISPLAY TREES inquiry to one of the online monitors. It acts as a header for message CTM789I. The message is displayed for each Recipient Tree that is loaded in the online monitor.

**Corrective Action:** No action is required.

**XMM789I monName - userId ...**

**Explanation:** This information message displays the result of a DISPLAY TREES inquiry to one of the online monitors. It is displayed for each group of six users.

The variables in this message are:

- `monName` - The name of the online monitor started task.
- `userId` - User ID that is using the Recipient Tree.

**Corrective Action:** No action is required.

**XMM78AE ioaomon stc name INITIALIZATION OF THE LIBRARY ddName FAILED**

**Explanation:** The IOA online monitor could not process the library referenced by the `ddName` DD statement. The error occurred when the IOA online monitor address space attempted to initialize processing for the library or a member within the library.

The IOA online monitor terminates with a return code of 8.

**Corrective Action:** Check for the presence of the `ddName` DD statement, the library referenced by it and/or the member name in the ALC allocation member and in the JCL for the monitor. Add the missing entry or correct the entry in error. Restart the IOA online monitor.
XMM78BE  *ioaomon stc name MEMBER PRMXMM WITH COMMON COMMANDS AND PFKEYS IS NOT FOUND*

**Explanation:** The IOA online monitor did not find the PRMXMM member in the IOA PARMCMD library. The library referenced by the DACMDCU DD statement under the IOA online monitor does not contain the PRMXMM member, which internally defines common COMMANDS and PFKEYS.

The IOA online monitor terminates with a return code of 8.

**Corrective Action:** Insure that the DACMDCU DD statement correctly refers to the IOA PARMCMD library. Ensure that the PRMXMM member exists in the library. If the problem persists, contact BMC Software Customer Support.

XMM78CI  *ioaomon stc name MEMBER memName WITH COMMANDS OR PFKEYS IS NOT FOUND*

**Explanation:** This information message indicates that the IOA online monitor did not find the COMMAND or PFKEYS member in the IOA PARMCMD library. The libraries referenced by the DACMDCU and DAPFCMD DD statement under the IOA online monitor do not contain the COMMAND or PFKEYS member associated with the currently displayed screen.

The IOA online monitor continues execution. Problems may occur when attempting to execute commands entered on the user’s screen.

**Corrective Action:** Ensure that the DACMDCU and DAPFCMD DD statement correctly refer to the IOA PARMCMD library. Ensure that all necessary COMMAND and PFKEYS members exist in the library. If the problem persists, contact BMC Software Customer Support.

XMM78DE  *jobName JOBNAME NOT DEFINED IN IOAXPRM*

**Explanation:** When starting up, the IOA Online monitor *jobName* was not found in IOAXPRM (either explicitly, or by mask).

The IOA Online monitor terminates.

**Corrective Action:** Use a valid job name, or make the necessary changes to IOAXPRM, and restart the monitor.

XMM78EE  *jobName WRONG LEVEL OF IOAXPRM*

**Explanation:** The eye-catcher of the IOAXPRM member was not found in storage.

The probable cause is that the eye-catcher was overwritten by another module.

The startup of the IOA monitor stops.

**Corrective Action:** Contact your INCONTROL administrator. If no solution can be found for the problem, contact BMC Software Customer Support.

XMM793I  *monName - ONLINE MONITOR SHUTTING DOWN*

**Explanation:** Highlighted, unrollable message.

This information message is generated when the specified Online monitor is shutting down.

**Corrective Action:** No action is required.
XMM794I monName - USER user NOT FOUND

Explaination: This information message indicates that an inquiry in the format DISPLAY USER=user was entered with a user name which is not active in the specified Online monitor.

Corrective Action: No action is required.

XMM795I monName - USER usr CANCELLED

Explaination: This information message indicates that the specified Online user was cancelled upon operator’s request. User session will be terminated.

Corrective Action: No action is required.

XRB messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages XRBH00 through XRBHxx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

XRBH01I CREATION OF PRINT CONTROL RECORDS STARTED

Explaination: This information message indicates that the CTDBLXRP utility has begun processing.

The CTDBLXRP utility rebuilds Print Control Records in the Active User Report List file.

Corrective Action: No action is required.

XRBH02I CREATION OF PRINT CONTROL RECORDS ENDED OK

Explaination: This information message indicates that the CTDBLXRP utility has successfully completed execution.

The CTDBLXRP utility rebuilds Print Control Records in the Active User Report List file.

The CTDBLXRP utility terminates with a condition code of 0.

Corrective Action: No action is required.

XRBH03S CREATION OF PRINT CONTROL RECORDS ENDED WITH ERRORS

Explaination: The CTDBLXRP utility, which rebuilds Print Control Records in the Active User Report List file, encountered a critical error during execution.

The utility terminates with a condition code of 8 or higher.

Corrective Action: Check the IOA Log file and system log for previous messages associated with the error. Correct the problem and re-execute the utility.
**XRBH04I WAITING FOR ANOTHER CTDDELRP OR CTDBLXRP OR RESTORE JOB TO TERMINATE**

**Explanation:** This information message indicates that the CTDBLXRP utility, which rebuilds Print Control Records in the Active User Report List file, detected another job that requires CTDBLXRP to wait before resuming processing.

To insure data integrity, the CTDBLXRP utility will not run concurrently with another CTDBLXRP, CTDDELRP or Restore Mission job.

The CTDBLXRP utility waits until the contending job terminates and then resumes processing.

**Corrective Action:** No action is required.

**XRBH05I WAITING FOR ANOTHER TASK TO FINISH**

**Explanation:** This information message indicates that the CTDBLXRP utility, which rebuilds Print Control Records in the Active User Report List file, detected another currently executing task that requires CTDBLXRP to wait before resuming processing.

To insure data integrity, the CTDBLXRP utility will not run concurrently while a Print Plan file is being built by a subtask in the Control-D monitor address space.

The CTDBLXRP utility waits until the contending task terminates and then resumes processing.

**Corrective Action:** No action is required.

**XRBH06I LAST WAIT IS COMPLETE**

**Explanation:** This information message indicates that the CTDBLXRP utility, which rebuilds Print Control Records in the Active User Report List file, has resuming processing after waiting for another job or task to complete.

This message follows messages XRBH04I and/or XRBH05I.

**Corrective Action:** No action is required.

**XRBH07E "FE" PRINT SUPPORT ERROR. RETURN CODE rc FUNCTION func**

**Explanation:** While performing function *func*, the CTDBLXRP utility, which rebuilds Print Control Records in the Active User Report List file, encountered an error and produced the return code *rc*.

The error associated with each return code is identified below.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>008</td>
<td>Memory shortage.</td>
</tr>
<tr>
<td>012</td>
<td>Memory shortage.</td>
</tr>
<tr>
<td>016</td>
<td>Invalid function.</td>
</tr>
<tr>
<td>020</td>
<td>Database I/O error.</td>
</tr>
</tbody>
</table>
Return Code | Explanation
---|---
024 | Open error.

**Corrective Action:** Check the IOA Log file and system log for additional messages associated with the error. Determine the cause of the error. Correct the problem and re-execute the utility. If the problem persists, contact BMC Software Customer Support.

**XRBH08W ORPHAN INP RECORD. PRINT MISSION: prtmis, REPORT KEY: rep_key**

**Explanation:** This warning message indicates that the CTDBLXRP utility encountered an orphan INP record. The INP record points to the User record with the ID `rep_key`, which is missing from the User file. The orphan INP record is deleted from the User file. The pointer to this record is not included in the record created by the utility print control. The utility continues to work.

**Corrective Action:** No action is required.

**XRBH09E INVALID PARAMETER: FILE= val**

**Explanation:** The `val` value of the FILE parameter specified in the EXEC statement for the utility CTDBLXRP is not valid. The valid values are ACT or MIG. The utility stops.

**Corrective Action:** Correct the invalid parameter value in the JCL and rerun the job.

**XRBH0AI SCANNING OF file USER FILE STARTED**

**Explanation:** This information message indicates that the CTDBLXRP utility started to scan the `file` Control-D User file. The following values are available for `file`:

- ACT - Active User file
- MIG - Main Migrated User file partition
- MIGN - Migrated User file partition n, where n can be from 1 to 9

**Corrective Action:** No action is required.
A - User abends

This section includes information relating to INCONTROL products user abends.

On occasion, the INCONTROL products produce user abends. The following abends are documented, by product:

- Control-D abends
- Control-M abends
- Control-M/Tape abends
- Control-O abends

Control-D abends

The following table contains abends related to the Control-D product.

<table>
<thead>
<tr>
<th>Abend</th>
<th>Explanation/ Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>U0005</td>
<td><strong>Explanation:</strong> A secondary abend occurred in the IOADUMP routine when printing a diagnostic dump after the original abend. &lt;br&gt;<strong>Corrective Action:</strong> Check for the cause of the original abend from the SYSABEND file, and correct accordingly.</td>
</tr>
<tr>
<td>U0006</td>
<td><strong>Explanation:</strong> This abend is issued by the Control-D main task after an abend occurred in one of its subtasks. &lt;br&gt;<strong>Corrective Action:</strong> Check for the cause of the subtask abend, and correct accordingly.</td>
</tr>
<tr>
<td>U3005, U3006, U3007</td>
<td><strong>Explanation:</strong> These abends indicate that a structure in the index of a user file became corrupt. &lt;br&gt;<strong>Corrective Action:</strong> Rebuild the index using the CTDUFDI job.</td>
</tr>
<tr>
<td>U3010, U3011, U3012, U3013</td>
<td><strong>Explanation:</strong> These abends indicate an internal error in the IOA access method when blocks in the user files are updated. &lt;br&gt;<strong>Corrective Action:</strong> Restart the program and pass the dump to the system administrator.</td>
</tr>
</tbody>
</table>
Control-M abends

The following table contains abends related to the Control-M product.

<table>
<thead>
<tr>
<th>Abend</th>
<th>Explanation/ Corrective Action</th>
</tr>
</thead>
</table>
| U0006 | **Explanation:** This abend is issued by the Control-M main task after an abend occurred in one of its subtasks.  
**Corrective Action:** Check for the cause of the subtask abend, and correct accordingly. |
| U0008 | **Explanation:** An error occurred in a Control-M file.  
**Clarification:** This abend is always preceded by message RUN119S.  
**Corrective Action:** Check for any additional messages relating to the abend and correct accordingly. |
| U0020 | **Explanation:** The Jobs Order procedure detected that the contents of the Active Jobs file were invalid.  
**Clarification:** This is usually because the file is improperly formatted.  
**Corrective Action:** Reallocate and reformat the Active Jobs file. |
| U0040 | **Explanation:** A severe internal error occurred in the Control-M monitor when processing a job order.  
**Clarification:** This abend always follows message SPY252S which displays details of the job order. Additional messages relating to the problem can be found in the IOA Log file.  
**Corrective Action:** Check message SPY252S and any other messages relating to the problem in the IOA Log file, and correct accordingly. |

Control-M/Tape abends

The following table contains abends related to the Control-M/Tape product.
Abend U0242

**Explanation:** Control-M/Tape abended the task.

The task is abended. Control-M/Tape does not record any information about the tape's data set.

The cause of the abend is detailed in a preceding message. The reason code appearing in the abend message points to the preceding message as follows:

<table>

B - Control-D Transformation Messages

In Control-D, transformation is the process of extracting data from print stream reports (such as AFP, Xerox, Postscript, or PDF) and converting them into a viewable format (such as TEXT, PDF or HTML).

While Control-D is transforming a report (during decollation with ON TRNCLASS, ON TRNDSN, or during a STORE=Y print mission), the following message template is used to generate messages:

```
REP26DW variableTextMsg
```

where `variableTextMsg` is a sub-message directly related to the event that produced it, providing specific information about that event.

This section documents the sub-messages of REP26DW.

Resource error and warnings messages

This section includes transformation messages for the Control-D product.

**BMCDAL0009E TCL.Size : Missing resource resourceName (Type: resourceType)**

**Explanation:** This message is issued under message REP26DW when a resource is missing, where `resourceName` is one of the following:

- the name of the resource that failed
- (if transformation of the entire report failed) the Document name

and `resourceType` is described in the table `Resource type (resourceType)` for BMCDAL0009E.

The system action is according to the specific error code. There are 3 options:

- The transformation fails.
- The transformation continues without the failed resource. A default resource will be used instead.
- The transformation ends OK, for example, when the error code is 198312.

**Corrective Action:** If the transformation fails, do one of the following:

1. Try transforming again.
2. Correct the problem indicated by the error code description and try transforming again.
3. Set the Report Clique parameter FailOnMissingResources to Never and try transforming again.
4. Check the resources to determine if they were corrupted during the file transfer and try transforming again.

BMCDAL0614E TransformObject.ConvertObject: ConvObject_Create Create resource failed: resourceName (Type resourceType), rc= returnCode

**Explanation:** This message is issued under message REP26DW when a resource is missing or the conversion of a resource to the internal format fails, where resourceName is one of the following:

- the name of the resource that failed
- (if transformation of the entire report failed) the Document name

resourceType is described in the table Resource type (resourceType) for BMCDAL0614E, and returnCode is described in the table Resource message return codes and text.
The system action is according to the specific error code. There are 3 options:

- The transformation fails.
- The transformation continues without the failed resource. A default resource will be used instead.
- The transformation ends OK. For example when the error code is 198312.

**Corrective Action:** If the transformation fails, do one of the following:

1. Try transforming again.
2. Correct the problem indicated by the error code description and try transforming again.
3. Set the Report Clique parameter FailOnMissingResources to Never and try transforming again.
4. Check the resources to determine if they were corrupted during the file transfer and try transforming again.

BMCDAL0679E Xerox error cdpXerox returnCode: messageText

Explanation: This error message is issued under message REP26DW when transforming a Xerox report. The supported returnCode and messageText values are listed in the table Xerox error messages. Transformation stops and ends with an error.

Corrective Action: Correct the error as described in the message.
