2. If the IOACPRM definition appears correct, check the SMF ID defined in SYS1.PARMLIB.
3. In a multi-CPU computer, issue from the console the MVS command D M=CPU to receive a listing of all CPU serial numbers, and compare them with the PARMLIB definition.

**CTO120I** CONTROL-O MONITOR SHUTTING DOWN

**Explanation:** This information message is produced by Control-O or CMEM when shutting down the Control-O or CMEM monitor by a P command, or on certain internal Control-O or CMEM events.

The IOA Log usually contains additional messages concerning the reason for the Control-O or CMEM shutdown.

Control-O or CMEM monitor shuts down.

**Corrective Action:** No action is required.

**CTO121S** CONTROL-O MONITOR ENDED WITH ERROR

**Explanation:** Highlighted, unrollable message.

A severe error has occurred. Control-O or CMEM monitor is shutting down.

The IOA and systems logs usually contain additional messages concerning the reason for the Control-O or CMEM shutdown.

Control-O or CMEM monitor shuts down. Before shutting down, the Control-O or CMEM monitor attempts to start a new CONTROLO or CMEM monitor to replace itself. If it cannot start after a few attempts, Control-O or CMEM gives up.

**Corrective Action:** Check the IOA and systems logs for additional messages, and take appropriate corrective action.

**CTO122S** NOT ENOUGH STORAGE IN EXTENDED CSA FOR *blockname*.

RETURN CODE= *rc*

**Explanation:** Control-O or CMEM was unable to acquire enough storage in ECSA for the specified control block (*blockname*).

Control-O acquires storage in ECSA for its working areas (WSC), and for wait elements (PND). The number of wait elements is specified by the WAITPR# parameter in the CTOPARM member.

CMEM acquires storage in ECSA for its working areas (WSC).

In this message, *rc* is the return code issued by the failed GETMAIN call.

Control-O or CMEM terminates.
Corrective Action: Check ECSA utilization of the system. For Control-O, if necessary, reduce the number of wait elements specified by the WAITPR# parameter in the CTOPARM member.

CTO123I CONTROL-O INTERVAL IS SET TO \textit{nn} SECONDS

Explanation: This information message is a result of setting a Control-O or CMEM sleeping interval by an operator command.

For more information, see the section on modifying the Control-O or CMEM sleeping interval in the \textit{INCONTROL for z/OS Administrator Guide}.

Control-O or the CMEM monitor will “wake up” every \textit{nn} seconds and check on time-related events.

Corrective Action: No action is required.

CTO124E INTERVAL MUST BE A TWO DIGIT NUMBER BETWEEN 01-99 SECONDS

Explanation: An invalid Control-O or CMEM sleeping interval was specified in an operator modify (F) command. The Control-O or CMEM sleeping interval must be a 2-digit number of seconds, from 01 through 99 seconds. For more information, see the section on modifying the Control-O or CMEM sleeping interval in the \textit{INCONTROL for z/OS Administrator Guide}.

Corrective Action: No action is required.

CTO124W CONTROL-O PARAMETER \textit{parmName}= \textit{parmValue}\{ > | < \} \textit{parmDefault}: USING DEFAULT VALUE

Explanation: When the Control-O monitor starts, it checks to ensure that the values of the parameters in CTOPARM are within the valid range. One of the parameters (\textit{parmName}) is set to a value (\textit{parmValue}) that is either too high (>) or too low (<).

Control-O resets the value of \textit{parmName} to the default value for that parameter, and the monitor continues its startup.

Corrective Action: Correct the value of \textit{parmName} in CTOPARM. If required, stop and restart the Control-O monitor.

CTO125I \textit{parmList}

Explanation: This information message provides a list of valid modify parameters that can be passed to the Control-O or CMEM monitor by an operator modify (F) command. This message appears after header message CTO125I.

Corrective Action: No action is required.

CTO126W LOAD OF IOADEST TABLE FAILED: DO SHOUT WILL NOT BE SUPPORTED

Explanation: During the startup of the Control-O monitor or the execution of a NEWDEST command, the Dynamic Destination table was not successfully loaded or renewed.

Monitor startup or operation continues. The Dynamic Destination table is not loaded or renewed. DO SHOUT requests will not be performed.
Corrective Action: Contact your INCONTROL administrator.

CTO127I NEWDEST COMMAND ACCEPTED

Explanation: This information message is a result of the acceptance of an operator NEWDEST command passed to the Control-O or CMEM monitor.

A new dynamic destination table is loaded. The next time that the Control-O or CMEM monitor sends a message using the SHOUT facility, it will use the new destination table.

Corrective Action: No action is required.

CTO128I RULE TYPE TABLE STATUS LIBRARY PRIORITY

Explanation: Normal response of the Control-O or CMEM monitor after the DISPLAY command is issued. This information message is the header of the list of rules being shown in response to the DISPLAY command.

Corrective Action: No action is required.

CTO129I ruleName type tableName status lib priority

Explanation: Messages sent by the Control-O or CMEM monitor to the console in response to the DISPLAY command. Each message describes a rule. These information messages are preceded by the MTO128I or CTO128I message, which supplies the header for each field.

Corrective Action: No action is required.

CTO12BI WISH WO0949 IS {ENABLED | DISABLED} - CICS LONG MESSAGES SUPPORT

Explanation: This information message is issued by the Control-O monitor when it enables or disables optional wish WO0949.

Corrective Action: No action is required.

CTO12CI WISH WO0975 IS ENABLED - MONITOR WILL WAIT UNTIL MIGRATED LIBRARIES WILL BE RESTORED

Explanation: This information message is issued by the Control-O monitor when it enables optional wish WO0975.

Corrective Action: No action is required.

CTO12DI WISH WO0975 IS DISABLED - MONITOR WILL IGNORE MIGRATED LIBRARIES

Explanation: This information message is issued by the Control-O monitor when it disables optional wish WO0975.

Corrective Action: No action is required.
CTO12EI  WISH WO0976 IS ENABLED - MESSAGES HANDLED AS IS

Explanation: This information message is issued by the Control-O monitor when it enables optional wish WO0976.

Corrective Action: No action is required.

CTO12FI  WISH WO0976 IS DISABLED - MESSAGES HANDLED IN UPPER CASE

Explanation: This information message is issued by the Control-O monitor when it disables optional wish WO0976.

Corrective Action: No action is required.

CTO130I  IN cond/Name date

Explanation: Messages sent by the Control-O monitor to the console in response to the DISPLAY command. The message describes the prerequisite conditions necessary for the rule to become eligible.

Corrective Action: No action is required.

CTO131I  TIME FROM hhmm UNTIL hhmm INTERVAL interval

Explanation: Messages sent by the Control-O monitor to the console in response to the DISPLAY command. This information message describes the time dependencies required by the specific rule in order to become eligible.

Corrective Action: No action is required.

CTO132I  REQUEST TO STOP THE CONTROL-M API ACCEPTED

Explanation: The Control-O monitor accepted an F CONTROLO,CTMAPISTOP command. The monitor confirms it received the command for execution.

Corrective Action: No action is required.

CTO133I  CONTROL-M API STOPPED

Explanation: The Control-O monitor successfully processed an F CONTROLO,CTMAPISTOP command. The monitor confirms it executed the command.

Corrective Action: No action is required.

CTO134I  {CONTROL-O | CTMCMEM} WORKING DATE HAS CHANGED FROM old_date TO new_date

Explanation: This information message is displayed when Control-O or CMEM changes the working date. In Control-O, the time is set according to the DAYTIMEO parameter in the CTOPARM member. In CMEM, the time is set according to the DAYTIMEO parameter in the CMMPARM member, which must be the same as the DAYTIMEM parameter in the CTMPARM member.

Control-O or CMEM monitor displays the new date.
**Corrective Action:** No action is required.

**CTO135I** {CONTROL-O | CTMCMEM} DEBUG LEVEL IS SET TO lvl

**Explanation:** This information message indicates that the Control-O or CMEM debug level was set by an operator modify (F) command.

The DEBUG level is set to a new level. Each debug level activates the trace option on different components of Control-O or CMEM.

**Corrective Action:** No action is required.

**CTO136E** DEBUG LEVEL MUST BE A NUMBER BETWEEN 0-255

**Explanation:** An invalid DEBUG level has been entered in the modify (F) operator command to activate Control-O or CMEM debugging facilities. Valid DEBUG levels are from 0 through 255. 0 specifies no debugging.

Issue the command with the correct debugging level. The required debugging level should be supplied by BMC Software Customer Support.

**Corrective Action:** No action is required.

**CTO136I** THE CONTROL-M API WILL BE RESTARTED WITH THE FIRST API REQUEST

**Explanation:** The Control-O monitor successfully processed anF CONTROLO,CTMAPISTART command.

**Corrective Action:** The monitor confirms that it executed the command, and that the next API request will reallocate the API resources (such the Control-M Active Job File or Control-M Resources file).

**CTO137S** INVALID PARAMETERS (parmList) PASSED TO THE {CONTROL-O | CTMCMEM} MONITOR

**Explanation:** One or more parameters passed to the Control-O or CMEM monitor in a start command are invalid.

The Control-O or CMEM monitor shuts down.

**Corrective Action:** For additional information regarding starting a Control-O or CMEM monitor, see the INCONTROL for z/OS Administrator Guide. Check and correct the parameters, and start the Control-O or CMEM monitor again.

**CTO138I** CONTROL-O OPERATING MODE IS opermode

**Explanation:** This is one of two messages with the same ID, but different text. This information message indicates that the command MODE=RESUME,CANCEL, the command MODE=RESUME,CONTINUE, or a query about Control-O current status was issued.

Control-O resumes automatic processes.

**Corrective Action:** No action is required.
CTO138I CANNOT START THE CONTROL-M API - FIRST REQUEST
ALREADY PROCESSED

Explanation: This is one of two messages with the same ID, but different text.
The Control-O monitor successfully processed an F CONTROLO,CTMAPISTART command, but failed.
Either the monitor has already processed this command and also processed its first API request, or the
monitor processed a CTMAPISTOP command since it was started, and it already has processed API
requests.
Corrective Action: No action is required.

CTO139I {CONTROL-O | CTMCMEM} SUBSYSTEM subsys IS ALREADY
ACTIVE

Explanation: This information message indicates that the subsystem cannot be activated or initialized
because it has already been activated. This is a normal message during subsystem initialization, when
Control-O or CMEM determines that a subsystem was already activated by a previous monitor.
A new subsystem is not activated.
Corrective Action: No action is required.

CTO13AI WISH WO0986 IS NO LONGER SUPPORTED. USE MESSAGE
REROUTING FEATURE TO GET THE SAME SERVICE.

Explanation: Wish WO0986 was used in earlier Control-O releases to suppress message LDT507I from
being written to the IOALOG. As of Control-O 6.2.01, the same functionality is obtained using the
standard IOA Messages routing function.
The wish is ignored and Control-O or CMEM monitor starts. If you do not perform the following steps,
message LDT507I will be written to the IOALOG.
Corrective Action: Perform one of the following options:

- In order to prevent the message from being written to the IOALOG, add the following card to the
MSGROUT member in IOA.V620.PARM: MSGCODE=LDT507I, ROUT=(OUT)
- The constraint created by message LDT507I in previous releases can be prevented by increasing the
value of RQC# in CTOPARM. Generally, increase the RQC# by 10%.

CTO140I CONTROL-O OPERATING MODE IS opermode

Explanation: Highlighted, unrollable message
This information message indicates that Control-O issued a MODE=FREEZE, MODE=LOGONLY or
MODE=TRIGGERONLY command. The Control-O internal log indicates any rules that failed to run.
Control-O automatic processes act as follows:

- FREEZE - Control-O stops operating
- LOGONLY - Control-O continues logging but stops triggering new rules
- TRIGGERONLY - Control-O continues but only simulates the triggering of new rules.
Corrective Action: Possible responses are:
Stop Control-O and start a new Control-O monitor (recommended).

Issue command RESUME,CONTINUE. Control-O ignores rules in wait mode and continues.

Issue command RESUME,CANCEL. Control-O cancels rules in wait mode and continues.

CTO141W {CONTROL-O | CTMCMEM} MONITOR WAS CANCELLED BY OPERATOR

Explanation: Highlighted, unrollable message.

This message is issued when the Control-O or CMEM monitor is cancelled by an operator MVS cancel command.

The Control-O or CMEM monitor is shut down.

Corrective Action: No action is required.

CTO142S CONTROL-O MONITOR DETECTED AN INTERNAL abCode ABEND

Explanation: This message is issued when Control-O or CMEM has detected certain internal system abend codes during operation.

The Control-O or CMEM monitor shuts down. Before shutting down, the Control-O or CMEM monitor attempts to start a new Control-O or CMEM monitor to replace itself. If it cannot start after a few attempts, Control-O or CMEM ceases trying.

Corrective Action: Call your systems programmer for assistance. If the problem is not resolved, call BMC Software Customer Support for assistance.

CTO143I A NEW {CONTROL-O | CTMCMEM} MONITOR IS INITIATED

Explanation: This information message occurs after Control-O or CMEM detected an internal problem and started a new monitor as a recovery measure.

A new Control-O or CMEM monitor is started, and takes control over the current one.

Corrective Action: Check for additional messages in the IOA and system logs detailing the cause of the abend.

CTO144E INVALID ORDER/FORCE PARAMETERS

Explanation: An invalid syntax of ORDER or FORCE commands was passed to the Control-O or CMEM monitor by an operator modify (F) command. See the INCONTROL for z/OS Administrator Guide for additional information regarding the parameters of the ORDER or FORCE command.

The command is not executed.

Corrective Action: Correct the syntax of the ORDER or FORCE command.

CTO145S AUTOEDIT FAILED, RC= rc, REASON= rsn

Explanation: The Control-O or CMEM monitor failed to perform an AutoEdit function.

The problem was probably caused by a failure to read or write the global AutoEdit member, or invalid data in the global AutoEdit member.

The AutoEdit function is not performed.
**Corrective Action:** Consult the table of return codes and reason codes in the following table to determine the cause of the error, and correct accordingly. If the return code or reason code is not in the table, the cause of failure is an internal error. In this case, contact BMC Software Customer Support.

<table>

**CTO146W MISSING GLOBAL AUTOEDIT LIBRARY/MEMBER**

**Explanation:** During Control-O initialization, a Global AutoEdit member or its library was not found.

When Control-O is started, it reads the $GLOBAL member. A different Global library (in which a $GLOBAL AutoEdit member resides) is used for each computer (SMF ID) on which Control-O operates. Each unique library name is composed of the prefix defined in the GLBPREF parameter of the Control-O installation parameters, and as the last data set name qualifier, the letters CPU followed by the SMF ID of the specified computer.

Although Control-O will process Global variables, it will not read or write to this particular Global member/library.

**Corrective Action:** Check the designation of the GLBPREF parameter in the Control-O installation parameters. You must allocate a Global AutoEdit library for every computer in which Control-O runs. See “Control-O Operational Parameters” in the Control-O chapter of the *INCONTROL for z/OS Installation Guide*. 
CTO147I CONTROL-O INITIALIZATION COMPLETE. TYPE= type SUB= subsys RUN#= nnnn

Explanation: This information message indicates that Control-O or CMEM initialization has completed successfully and Control-O or CMEM facilities are active.

The variables in this message are:
- `type` - the type of the startup which was passed to Control-O or CMEM as a parameter in the START command. If no TYPE value was passed to Control-O or CMEM, the default is TYPE=REGULAR.
- `subsys` - the name of the subsystem that started Control-O or CMEM (JES2, JES3, MSTR, and so on)
- `nnnn` - the number of times Control-O was replaced by a new Control-O or CMEM

Control-O or CMEM facilities are now active.

Corrective Action: No action is required.

CTO148W CONTROL-O STATISTICS ALREADY ACTIVE

Explanation: Control-O received the F CONTROLO,STARTSTAT command to start the Message Statistics facility, but the facility was already active.

The STARTSTAT command is ignored.

Corrective Action: No action is required.

CTO149W CONTROL-O STATISTICS NOT ACTIVE

Explanation: Control-O received the F CONTROLO,STOPSTAT command to stop the Message Statistics Facility, but the facility was not active.

The STOPSTAT command is ignored.

Corrective Action: No action is required.

CTO14AE INVALID `modifyCommand` COMMAND KEYWORD = keyword

Explanation: Control-O or the CMEM monitor received the `modifyCommand` command with an invalid keyword.

The `modifyCommand` command is rejected.

Corrective Action: Correct the invalid command and reissue it.

CTO14BI SVC DUMP `keyword` NOW ENABLED

Explanation: This information message is in response to the modify SVCDUMP command, and indicates that a valid keyword has been enabled.

Corrective Action: No action is required.

CTO14CI SVC DUMP `keyword` NOW DISABLED

Explanation: This information message is in response to the modify SVCDUMP command, and indicates that a valid keyword has been disabled.
**Corrective Action:** No action is required.

**CTO14DW** SHUTDOWN IS DELAYED DUE TO XES SYSTEM-MANAGED REBUILD PROCESS. TO CANCEL THE DELAY REPLY "FORCE"

**Explanation:** Control-O or CMEM cannot shut down when an XAE structure is unavailable due to system-managed rebuild. Control-O will resume its termination process when the system-managed process finishes and the structure becomes available again.

When FORCE is replied, Control-O or CMEM will continue termination without waiting for the system-managed process to finish and the XAE structures to become available. Beware that after forcing immediate termination, the following may occur:

- Abends in processes accessing the IOA Global variables (subsystem environment, online, and so on.).
- Further delays in Control-O termination due to requests issued to the XAE structures when writing the IOA Global pools to the databases as part of the termination process may be deferred by the system-managed process in progress.

**Corrective Action:** None, unless immediate termination is required. If immediate termination is required, reply FORCE.

See System action for considerations before replying FORCE.

**CTO14EW** monitor INITIALIZATION IS CANCELLED. START monitor WHEN XAE STRUCTURES ARE AVAILABLE

**Explanation:** The operator replied CANCEL to message IOAFBCW to cancel Control-O or CMEM initialization, after connection to an XAE structure was prevented.

Control-O or CMEM terminates.

**Corrective Action:** Start Control-O or CMEM after making sure that:

- The coupling facility required for XAE structures is available.
- XAE structures, if already allocated, are available.

**CTO150I** SNAP COMMAND WAS PERFORMED. SNAP ID= *id*

**Explanation:** This information message indicates that Control-O or CMEM successfully executed the F CONTROLO,SNAP or F CMEM,SNAP command.

In this message, *id* is the snap ID as shown in the snap title.

A set of diagnostic snapshots is printed.

**Corrective Action:** No action is required.

**CTO151W** IOA LOG UPDATE FAILED. SOME MESSAGES MAY BE LOST

**Explanation:** Control-O or CMEM was unable to write messages to the IOA Log file. This message follows other messages indicating the cause of the error.

Processing continues. Some messages to the IOA Log file may be lost.

**Corrective Action:** Check the preceding messages and act accordingly.
CTO152I STANDALONE FACILITY ENABLED, rsn

**Explanation:** This information message indicates that Control-O is now entering standalone mode and will now update the IOA Log file.

When Control-M is active, update of the IOA Log file is performed by Control-M. When Control-M is not installed or inactive, update of the IOA Log file is performed by Control-O.

Control-O enters standalone mode and updates the IOA Log file.

**Corrective Action:** No action is required.

CTO153I STANDALONE FACILITY DISABLED, rsn

**Explanation:** This information message indicates that Control-O is exiting standalone mode.

When Control-O is in standalone mode, it updates the IOA Log file. When Control-M becomes active, Control-M takes over the updating of the IOA Log file.

Control-O exits standalone mode and Control-M takes over the updating of the IOA Log file.

**Corrective Action:** No action is required.

CTO154E CONTROL-O CANNOT START. CONTROL-M IS NOT INSTALLED

**Explanation:** Control-O was set to run with SMODE set to N, but Control-M, which must execute some activities on behalf of Control-O, is not installed. If the SMODE (Stand Alone mode) installation parameter is set to N, Control-M must be installed. If Control-M is not installed, SMODE must be set to Y.

Control-O terminates.

**Corrective Action:** Either install Control-M, or set the SMODE installation parameter to Y.

CTO155W SWAP OF addr CHAIN ERROR, TYPE= type RC= rc

**Explanation:** Control-O is unable to pass internal request blocks to the new Control-O monitor. This message indicates an internal error.

The old Control-O monitor terminates with an error. The new monitor, however, will continue processing. Some requests may be lost.

**Corrective Action:** Contact BMC Software Customer Support.

CTO156W AUTOMATION LOG STATUS UNCHANGED

**Explanation:** This warning message is issued in response to an invalid AUTOLOG MODIFY command. Either the specified parameter is invalid, or the user specified a MODIFY command (F CONTROLO,AUTOLOG=YES/NO) designed to set the Automation Log status to a status that it already had.

The status of writing to the Automation Log is unchanged.

**Corrective Action:** Verify the command and retry if necessary.
CTO157I action SERVER serverId REQUESTED

Explanation: This information message indicates that Control-O has begun performing the action requested in a SERVER MODIFY command.

Corrective Action: No action is required.

CTO158W action SERVER serverId FAILED - rsn

Explanation: Control-O was unable to execute the requested SERVER MODIFY command (action). Processing continues. The status of the server remains unchanged.

Corrective Action: Check the reason specified in the message and proceed accordingly.

CTO159E INVALID SERVER MODIFY COMMAND - cmd

Explanation: This message is issued in response to a SERVER MODIFY command with invalid parameters.

Processing continues. The command is ignored.

Corrective Action: Specify the MODIFY command with valid parameters.

CTO15AE INVALID SNAP KEYWORD = keyName

Explanation: The operator specified an invalid SNAP keyword in an F CONTROLO,SNAP/F CTMCMEM,SNAP command.

The CTOMTO program ignores this keyword. If there was only one keyword, no SNAP request is performed.

Corrective Action: Specify an F CONTROLO,SNAP/F CTMCMEM,SNAP command with valid keywords. For more information, see the SNAP command in the INCONTROL for z/OS Administrator Guide.

CTO15AI INTERNAL CONTROL-O DUMMY MESSAGE

Explanation: This information message is an internal message generated by Control-O.

An internal Control-O process is triggered.

Corrective Action: No action is required.

CTO15BE INVALID LOG KEYWORD = keyName

Explanation: The CTOMTO program detected an invalid keyword for the LOG request. Valid keywords are:

- ALL
- DEFAULT
- TRIGGER

The CTOMTO program ignores this LOG command request.

Corrective Action: Resubmit the F CONTROLO,LOG/F CTMCMEM,LOG command with a valid keyword.
CTO15CI RULE LOGGING MODE WAS SET TO modeType

**Explanation:** This information message indicates that Control-O or CMEM have successfully executed the F CONTROLO,LOG command. Rules will be traced according to the new log mode.

**Corrective Action:** No action is required.

CTO15DI WATERMARK INFORMATION: FREE= freeNum PND= waitNum EVC= execNum WSC= wscNum

**Explanation:** This Control-O or CMEM message displays statistics in response to a WATERMARKS command.

The variables in this message are:

- **freeNum**: the lowest number of RQC blocks that have been free simultaneously since the monitor was started. RQC blocks are used when information is being transferred from various address spaces to the address space of the monitor. A total of 20,000 RQC blocks are available.

- **waitNum**: the highest number of PND blocks that have been in use simultaneously since the monitor was started. PND blocks store information about rules that are in Wait mode, meaning rules that are in execution and waiting to be redispached. The allocation of PND blocks is controlled by the WAITPR# parameter.

- **execNum**: the number of events (meaning messages, commands, and so on) that have been handled by the monitor since it was started. This number is reset to zero each time it reaches 1,000,000.

- **wscNum**: the number of WSC blocks that are allocated for use by the monitor. WSC blocks store temporary information while handling events. The allocation of WSC blocks is controlled by the WSC# parameter.

**Note:**

The WATERMARKS command is currently supported for compatibility reasons only. More detailed statistical information about the usage of internal resources is available by means of the USAGESTATS command. For more information, see the **INCONTROL for z/OS Administrator Guide**.

**Corrective Action:** No action is required.

CTO15DW LOAD OF EXIT exitName FAILED, USER CHECKING IS NOT PERFORMED

**Explanation:** Loading of the exitName Control-O user exit by Control-O failed. Possible causes are:

- The installation is not using the exitName user exit, and erased the default exit supplied with Control-O.

- IOA Load library is not in the load modules search list of the job (STEPLIB and Linklist).

- There is insufficient storage to load the exit.

- Another system oriented reason which can be found in the MVS system log.

As a result, no user checking is performed for the rule order.
**Corrective Action:** Contact your INCONTROL administrator. This is a potential security risk. Someone may be attempting to violate security.

**CTO15EI type** USAGE: CURRENTLY currp%, HIGHEST highp%( curr AND high OUT OF total)

**Explanation:** This message displays usage statistics relating to internal Control-O or CMEM resources in response to a USAGESTATS command.

The variables in this message are:

- `type`: the type of resource to which the displayed usage statistics relate
  - Valid values are:
    - PND - PND blocks, also known as "wait elements" PND blocks hold information about rules that are in Wait mode, meaning rules that are in execution and waiting to be redispached. The allocation of PND blocks is controlled by the WAITPR# parameter.
    - RQC - RQC blocks, also known as "request elements" RQC blocks transfer information from various address spaces to the address space of the monitor. A total of 20,000 RQC blocks are available.
    - WSC - WSC blocks, also known as "work buffers" WSC blocks hold temporary information while handling events. The allocation of WSC blocks is controlled by the WSC# parameter.

- `currp%`: the percentage of the allocated `type` resources that are currently in use

- `highp%`: the highest percentage of `type` resources that have been in use simultaneously since the monitor was started

- `curr`: the amount of `type` resources currently in use

- `high`: the highest amount of `type` resources that have been in use simultaneously since the monitor was started

- `total`: the total amount of `type` resources currently allocated

**Corrective Action:** In normal circumstances, `highp%` should remain below 50%. If you notice higher usage percentages, contact your INCONTROL administrator. Possible causes are:

- There are rules in the system that consume excessive amounts of internal resources.
- Some parameters require adjustment to accommodate the workload of the system.

**CTO15FE INVALID USAGESTATS KEYWORD =arg**

**Explanation:** A USAGESTATS command was issued, to display usage statistics relating to internal Control-O or CMEM resources. However, the command contained an invalid argument.

In this message, `arg` is the invalid argument of the USAGESTATS command.

Valid arguments of the USAGESTATS command are:

- PND - requests statistics relating to PND blocks, also known as "wait elements" PND blocks hold information about rules that are in Wait mode, meaning rules that are in execution and waiting to be redispached. The allocation of PND blocks is controlled by the WAITPR# parameter.
- RQC - requests statistics relating to RQC blocks, also known as "request elements" RQC blocks transfer information from various address spaces to the address space of the monitor. A total of 20,000 RQC blocks are available.
• WSC - requests statistics relating to WSC blocks, also known as "work buffers". WSC blocks hold temporary information while handling events. The allocation of WSC blocks is controlled by the WSC# parameter.

• ALL - requests statistics relating to all resource types supported by the USAGESTAT command. The response to the command when this option is used is a series of CTO15EI messages.

  Alternatively, the USAGESTATS command can be issued with no argument, which is equivalent to issuing the command with the argument ALL.

For more information on the USAGESTATS command, see the *INCONTROL for z/OS Administrator Guide*.

**Corrective Action:** Reissue the command in a valid format.

CTO15LE SERVER *server* IS NOT DEFINED

**Explanation:** A modify command F CONTROLO,SERVER=*server*,command has been issued for a server which has not been defined.

The command is ignored.

**Corrective Action:** Specify the correct server name.

CTO160I {CONTROL-O | CTMCMEM} SELECTOR STARTED

**Explanation:** This information message indicates the start of the Control-O Selector task, which controls the runtime selection criteria for rules.

**Corrective Action:** No action is required.

CTO161I {CONTROL-O | CTMCMEM} SELECTOR ENDED

**Explanation:** This information message indicates normal termination of the Control-O Selector task that controls the runtime selection criteria for rules.

**Corrective Action:** No action is required.

CTO162I INTERNAL CONTROL-O EVENT TRIGGERED

**Explanation:** This internal message triggers an ON EVENT rule after the criteria for triggering the rule have been satisfied. The text may include unprintable characters.

**Corrective Action:** No action is required.

CTO163I *cmd/Name* COMMAND COMPLETED

**Explanation:** This information message indicates the successful completion of a Control-O ORDER, FORCE, DELETE, READGLOBAL, or WRITEGLOBAL command.

**Corrective Action:** No action is required.

CTO163S OPEN FAILED FOR DDNAME "DARESF" OR "DASINC"

**Explanation:** Open of IOA Conditions or Resources file failed (the DARESF or DASINC DD statement).

Possible causes are:
The DARESF DD statement is missing.
The DASINC DD statement is missing.
The data set described by the DARESF DD statement is not the IOA Conditions or Resources file.
The data set described by the DASINC DD statement is not the Control-O Conditions or Resources Synchronization file.
The data set described by the DARESF DD statement is the Control-O Conditions or Resources file, but it is of a different version or of a different Control-O monitor.
The volume of this data set cannot be accessed by the Control-O monitor.
The data set is not on the volume specified in the Control-O procedure.
Control-O monitor shuts down with error message.

**Corrective Action:** Correct the JCL for the Control-O procedure, and restart the monitor.

CTO164S INTERNAL ERROR PROCESSING RESOURCE FILE FOR CONDITION `cond`

**Explanation:** An internal error occurred while the `cond` condition was being processed.
The Control-O monitor is terminated.

**Corrective Action:** Contact BMC Software Customer Support.

CTO166W COND `name date` NOT UPDATED BY CONTROL-O - NO MORE SPACE. NOTIFY THE IOA ADMINISTRATOR

**Explanation:** Highlighted, unrollable message.

There is no more space for adding output conditions to the IOA Conditions file.
The record for the specified day of the month is full. For example, if a condition with date reference of January 3rd cannot be added, an entry in the conditions file which contains conditions for January 3rd, February 3rd, March 3rd, and so on, is full.
The format for the date specified in this message is `mmdd`.
The condition is not added. A highlighted message is displayed on the operator console. Control-O or CMEM continues to function, but the rules that depend on the condition may not be triggered.

**Corrective Action:** Perform the following immediate actions and then perform the long term actions described below.

**Immediate actions:**

1. Enter the IOA Conditions list (Screen 4).
2. Look for conditions with the same day (but with a different month) as the condition that could not be added. Delete them manually if they are not needed.
3. Add the failing condition manually in order to maintain production flow.
4. Report the event to your System Programmer.

**Long term actions:**
Run the IOACLCOND utility more often.

Increase the record length of the IOA Conditions file. For more information on how to do this, see the description of expanding IOA files in the INCONTROL for z/OS Administrator Guide.

CTO168I COND name date ALREADY action

Explanation: This information message indicates that the user requested an action that has already been performed.

The user either tried to add a condition that already exists or tried to delete a condition that had already been deleted.

Corrective Action: No action is required.

CTO169W COND name date NOT ADDED BY CONTROL-O - GLOBAL DATE ADDITION IS NOT SUPPORTED

Explanation: A DO COND statement in a rule requested the addition of the specified condition with date **** or $$$$. This date specification is valid only when conditions are being deleted.

The DO COND request is not performed.

Corrective Action: Correct the DO COND statement.

CTO171S STATISTICS FILE OVERFLOW

Explanation: All Statistics file index entries are in use. No new statistics can be accumulated.

The Statistics Facility could not accumulate statistics because the number of message ID’s exceeds the maximum number of allowable entries in the Statistics file.

Statistics accumulation stops.

Corrective Action: Please review the following recommendations; then format the Statistics file and restart the Statistics Facility:

1. Enlarge the Statistics file by using the following procedure:
   a. Increase the value of the STREC# parameter in CTOPARM.
   b. Delete or rename the old Statistics file to allow a new Statistics file allocation.
   c. Allocate and format a new Statistics file.

2. Use AutoEdit option %%%STATID to customize message ID determination. This option can be used to decrease the number of message IDs that are generated. See the INCONTROL for z/OS Administrator Guide for more information.

CTO172S STATISTICS FILE IS NOT FREE

Explanation: The Statistics file is locked.

Either the Statistics file is in use by another Control-O monitor or utility, or Control-O abended previously while updating the Statistics file.

Statistics accumulation is not performed.
Corrective Action: Check if another Control-O monitor or utility uses this Statistics file. If this is not the case, then reformat the Statistics file and restart the Statistics Facility.

CTO173S OPEN OF STATISTICS FILE FAILED
Explanation: The Control-O Statistics facility attempted to open the Statistics file but did not succeed. Failure to open the Statistics file may be due to the following:
- The data set allocated to DD statement DASTF was not formatted as a Control-O Statistics file.
- The data set allocated to DD statement DASTF was formatted as a Control-O Statistics file by a different version of Control-O.
- The data set allocated to DD statement DASTF belongs to a different installation of Control-O.
Statistics accumulation is not performed.
Corrective Action: Look for previous MVS error messages regarding the opening of the Statistics file. Correct the error and rerun the job.

CTO174S FILE ALLOCATED TO DDNAME "DASTF" IS NOT A CONTROL-O STATISTICS FILE
Explanation: The Control-O Statistics Facility attempted to read the file allocated to DD name DASTF, but it is not a formatted Statistics file.
Statistics accumulation is not performed.
Corrective Action: Format the Statistics file and restart the Statistics Facility.

CTO175E RELEASE OF THE STATISTICS FILE IS NOT SUPPORTED BY THIS RELEASE
Explanation: The format of the Statistics file is not supported by the current release of Control-O. The Statistics file could not be read by the Control-O Statistics Facility.
The Statistics file was formatted by an earlier release of Control-O.
Statistics accumulation is not performed.
Corrective Action: Format the Statistics file in the currently supported format, and restart the Statistics Facility.

CTO176E THE STATISTICS FILE BELONGS TO A DIFFERENT CONTROL-O MONITOR
Explanation: The assigned ID of the Statistics file does not match the ID of the Control-O monitor.
When a Statistics file is formatted, it is associated with a particular Control-O monitor. The CTOMFST Statistics Formatting utility takes the ID of the Control-O monitor from the QNAME parameter of CTOPARM, and assigns it to the Statistics file.
The ID of the active Control-O monitor does not match the assigned ID of the Statistics file. The likely cause of the error is that the value of QNAME was changed without reformatting the Statistics file.
Statistics accumulation is not performed.
Corrective Action: Format the Statistics file with the correct Control-O ID and restart the Statistics Facility.

CTO177S CONTROL-O STATISTICS SEVERE INTERNAL ERROR, ID= code
Explanation: The Control-O Statistics Facility encountered an internal error.
In this message, code is the internal error code.
Statistics accumulation stops.
Corrective Action: Look for previous messages to identify the cause of the problem and contact BMC Software Customer Support.

CTO178S STORAGE ALLOCATION FOR STATISTICS FAILED
Explanation: Storage allocation for the Control-O Statistics Facility failed because the Statistics Facility could not obtain enough working storage for processing.
Statistics accumulation is not performed.
Corrective Action: Increase the Control-O region size and restart a new Control-O monitor.

CTO179S I/O ERROR ACCESSING THE STATISTICS FILE
Explanation: A READ/WRITE error occurred when accessing the Statistics file.
Statistics accumulation stops.
Corrective Action: Look for previous MVS error messages regarding Statistics file I/O errors, and correct accordingly. If MVS messages do not clarify the error, please contact BMC Software Customer Support.

CTO180S CONTROL-O STATISTICS FILE INTERNAL ERROR. RECORD TYPE MISMATCH
Explanation: The Statistics Facility has encountered a corruption in the Statistics file. The Statistics file cannot be processed.
Statistics accumulation stops.
Corrective Action: Contact BMC Software Customer Support.

CTO181S CONTROL-O STATISTICS INTERNAL ERROR. WRITE FAILED FOR SECTION section
Explanation: Due to an internal error, update of the Statistics file failed while writing a section of the Statistics file.
Statistics accumulation stops.
Corrective Action: Contact BMC Software Customer Support.

CTO182S CLOSE OF CONTROL-O STATISTICS FILE FAILED
Explanation: During termination, the Control-O Statistics Facility failed to close the Statistics file.
The Statistics Facility continues terminating without closing the Statistics file.
Corrective Action: Check the system log for previous error messages. If none are found, please contact BMC Software Customer Support.

CTO184I  CONTROL-O STATISTICS ACCUMULATION STARTED
Explanation: This informative message indicates that the Control-O Statistics Facility initialization completed successfully and that Control-O statistics are being accumulated.
Corrective Action: No action is required.

CTO185S  CONTROL-O STATISTICS INITIALIZATION ERROR
Explanation: Control-O Statistics Facility did not initialize successfully.
Statistics accumulation is not performed.
Corrective Action: Look for previous error messages in the IOA Log to determine the cause of the error, and then correct accordingly.

CTO186E  STATISTICS ACCUMULATION ERROR WHILE PROCESSING SUBSYSTEM REQUESTS
Explanation: The Statistics Facility detected an error while processing requests from the Control-O subsystem.
Statistics accumulation stops.
Corrective Action: Look for previous error messages in the IOA Log to determine the cause of the error, and then correct accordingly.

CTO187E  STATISTICS ACCUMULATION ERROR DURING FILE UPDATE
Explanation: The Statistics Facility detected an error while updating the Statistics file.
Statistics accumulation stops.
Corrective Action: Look for previous error messages in the IOA Log to determine the cause of the error, and then correct accordingly.

CTO189I  CONTROL-O STATISTICS ACCUMULATION ENDED
Explanation: This informative messages is issued after normal termination of the Statistics Facility.
Statistics accumulation is discontinued.
Corrective Action: No action is required.

CTO190S  CONTROL-O STATISTICS TERMINATION ERROR
Explanation: Control-O Statistics Facility did not terminate successfully.
The Statistics Facility continues the termination process.
Corrective Action: Look for previous error messages in the IOA Log to determine the cause of the error, and then correct accordingly.
CTO191S STATISTICS ACCUMULATION ERROR WHILE PROCESSING USER REQUESTS

**Explanation:** The Statistics Facility detected an error while processing a SHOW, EXCLUDE or RESET online user request.

Statistics accumulation stops.

**Corrective Action:** Look for previous error messages in the IOA Log to determine the cause of the error, and correct accordingly.

CTO192E STATISTICS REQUEST FOR MESSAGE ID msgId FAILED - MESSAGE ID NOT FOUND

**Explanation:** A SHOW, EXCLUDE or RESET request for message ID msgId failed.

An online user requested a SHOW/EXCLUDE/RESET for message ID msgId. This message ID was not found in the Statistics file.

The online request is not performed. The Statistics Facility continues processing.

**Corrective Action:** Notify BMC Software Customer Support of the problem.

CTO193E STATISTICS REQUEST FOR MESSAGE ID msgId FAILED - INVALID REQUEST

**Explanation:** Due to an internal error, the user’s online request regarding message ID msgId was not recognized.

The request is not performed. The Statistics Facility continues processing.

**Corrective Action:** Notify BMC Software Customer Support.

CTO194W WAITING FOR THE STATISTICS FILE. FILE IN USE

**Explanation:** Control-O is attempting to access the Statistics file, but it is in use by another Control-O monitor or Control-O utility.

Control-O waits and attempts to access the Statistics file again.

**Corrective Action:** This message is not necessarily the result of an error. It may be issued while generating a statistics report or when the Online Facility attempts to access the Statistics file. If the Statistics file is not freed in a reasonable period of time, check what job is using it and free it.

CTO195E RESET OF STATISTICS FOR MESSAGE ID msgId FAILED

**Explanation:** An online user requested a RESET of the statistics for message ID msgId, but due to internal error, the request could not be performed by Control-O.

The RESET request is not performed. The Statistics Facility continues processing.

**Corrective Action:** Notify BMC Software Customer Support.

CTO196S STATISTICS FILE DYNAMIC ALLOCATION ERROR rc/rsn/dsn

**Explanation:** Dynamic allocation of Statistics file dsn failed with return code rc and reason code rsn.
Statistics accumulation is not performed.

**Corrective Action:** See the IBM manual *MVS Programming: Authorized Assembler Services Guide* to determine this cause of the error, and correct the error accordingly. If not successful, contact BMC Software Customer Support.

**CTO197I** CONTROL-O STATISTICS GLOBAL RESET COMPLETE

**Explanation:** This information message indicates that the global statistics reset command F CONTROLO, RESETSTAT was issued and performed successfully.

**Corrective Action:** No action is required.

**CTO198E** RESET OF DATE FOR MESSAGE ID msgId FAILED

**Explanation:** Statistics for message ID msgId were reset as requested, but due to an internal error, update of the last reset date was not successful.

Statistics are reset. The Statistics Facility continues processing, but the indicated last reset date is incorrect.

**Corrective Action:** Notify BMC Software Customer Support.

**CTO1A0E** INVALID PARAMETERS, OR NULL COMMAND

**Explanation:** No command or mask was specified as selection criteria for display in the Option COMMAND window.

The selection window remains displayed.

**Corrective Action:** Specify a mask or operator command to be displayed.

**CTO1A1E** INTERNAL ERROR: ONLY ACTIONS "GETLINES" OR "END" ARE SUPPORTED

**Explanation:** The CTOTMCS Automation Options program was invoked with an invalid action. This message indicates an internal error.

The option is not performed.

**Corrective Action:** Contact BMC Software Customer Support.

**CTO1A3E** INVALID TIME INTERVAL PARAMETER

**Explanation:** The PARM menu definition statement for this option specifies an invalid time interval. The PARM statement for a menu option can specify the time interval between the issuing of the command and the collection of response messages.

The option is not performed.

**Corrective Action:** Correct the menu definition, and choose the menu option again.

**CTO1A6E** CONSOLE ERROR. R15 = rc, REASON- CODE = rsn

**Explanation:** The MVS Extended MCS Console facilities used by Option COMMAND detected an error. The return code rc and reason code rsn are returned by the MCSOPER MVS macro.
The option is not performed.

**Corrective Action:** For an explanation of rc and rsn, see the appropriate IBM manuals.

**CTO1A8E CONSOLE name IN USE. TRY AGAIN LATER**

**Explanation:** The MVS Extended MCS Console specified in the message is being used by another user. The console name is the same as the user name used by the IOA Online Facility. Either the same user name is being used by different users, or a previous console session was not closed correctly.

The option is not performed.

**Corrective Action:** Use operator command DISPLAY CONSOLES to determine who is using the console. If under TSO, log off from TSO and log on again to free any previous session.

**CTO1ABE COMMAND INVOCATION DENIED BY SECURITY EXIT**

**Explanation:** The user requested an operator command that cannot be issued by the Control-O Automation Options Facility because security exit IOASE07 detected a security violation.

The command is not issued.

**Corrective Action:** Contact your security administrator.

**CTO1ACE VM COMMAND NOT ISSUED; MVS NOT RUNNING UNDER VM**

**Explanation:** A VM command was requested by means of the Automation Options facility. Such a command can be issued only when MVS runs under VM.

The command is not issued.

**Corrective Action:** No action is required.

**CTO1ADW VM COMMAND OUTPUT TRUNCATED**

**Explanation:** The response of the IOA VM command interface exceeded the 4096 bytes that the buffer can hold. The remainder of the response is truncated.

**Corrective Action:** Change the command so it can be held in the available buffer of 4096 bytes.

**CTO1B2E INTERNAL ERROR: ONLY ACTIONS "GETLINES" OR "END" ARE SUPPORTED**

**Explanation:** Option CONSOLE was invoked with an invalid action. This message indicates an internal error.

The option is not performed.

**Corrective Action:** Contact BMC Software Customer Support.

**CTO1B3E MCS CONSOLE IS INACTIVE OR NOT FOUND**

**Explanation:** The console name or console ID specified for option CONSOLE could not be found.

The option is not performed.

**Corrective Action:** Do the following:
1. Verify the console name and ID. You can use the MVS operator command DISPLAY CONSOLES to do this.

2. Specify the option with a valid console name or ID.

Messages CTO200 through CTO2xx
This group includes messages for the Control-O product.

CTO200I {CONTROL-O | CTMCMEM} EXECUTOR STARTED

**Explanation:** This information message is the normal start message of the Control-O or CMEM Executor task that handles tasks that cannot be executed by the Control-O or CMEM subsystem. Certain of these actions require communication with other IOA products.

**Corrective Action:** No action is required.

CTO201I {CONTROL-O | CTMCMEM} EXECUTOR ENDED

**Explanation:** This information message is the normal termination message of the CONTROLO or CMEM Executor task that handles tasks that cannot be executed by the CONTROLO or CMEM subsystem. Certain of these actions require communication with other IOA products.

**Corrective Action:** No action is required.

CTO202S ERROR ALLOCATING THE SUBSYSTEM-TO-MONITOR COMMUNICATION DATASET

**Explanation:** The CONTROLO or CMEM monitor failed to allocate the subsystem-to-monitor communication file. The communication file links the CONTROLO or CMEM and Control-M monitors.

Possible causes are:

- The communication file is not cataloged on the correct disk.
- The communication file is cataloged in a catalog that cannot be accessed from the local CPU.
- The MVS allocation exit failed the allocation request.
- A security product failed the allocation request.
- The data set was not specified correctly in the Control-M CPU installation parameter in the IOACPRM member.
- The data set was never allocated. That is, the Control-M Console Subsystem was not installed in the current computer.

The Control-O or CMEM monitor shuts down.

**Corrective Action:** Check the potential reasons for the error listed above. Correct as necessary, and restart the Control-O or CMEM monitor.
**CTO203S** THE SUBSYSTEM-TO-MONITOR COMMUNICATION DATASET COULD NOT BE OPENED

**Explanation:** The Control-O monitor failed to open a subsystem-to-monitor communication file. The communication file links the Control-O or CMEM and Control-M monitors. Possible causes are:

- A communication file was incorrectly defined.
- The MVS DADSM exit failed the open request.
- A security product failed the open request.

The Control-O or CMEM monitor shuts down.

**Corrective Action:** Check the communication files that are in use, and make sure that they were properly defined, formatted, and cataloged. In addition, make sure that no restrictions are imposed, for example by MVS or a security package, and the like.

---

**CTO204S** I/O ERROR WHILE READING THE MONITOR-TO-SUBSYSTEM COMMUNICATION DATASET

**Explanation:** The Control-O monitor could not read a monitor-to-subsystem communication file due to an I/O error. The communication file links the Control-O or CMEM and Control-M monitors. The Control-O monitor-to-subsystem communication file may not have been formatted correctly during Control-M Installation Procedure, or may have been incorrectly modified.

The Control-O or CMEM monitor shuts down.

**Corrective Action:** For formatting information, see the section that describes how to install the Control-M Event Manager Subsystem (CMEM) in the Control-M chapter of the *INCONTROL for z/OS Installation Guide*. Reformat or restore as necessary, and restart the Control-O or CMEM monitor.

---

**CTO205S** ERROR ALLOCATING THE MONITOR-TO-SUBSYSTEM COMMUNICATION DATASET

**Explanation:** The Control-O monitor failed to allocate the monitor-to-system communication file. The communication file links the Control-O or CMEM and Control-M monitors.

Possible causes are:

- The communication file is not cataloged on the correct disk.
- The communication file is cataloged in a catalog that cannot be accessed from the local CPU.
- The MVS allocation exit failed the allocation request.
- A security product failed the allocation request.
- The data set was not specified correctly in the Control-M CTM2SBS installation parameter in IOACPRM.

The Control-O or CMEM monitor shuts down.

**Corrective Action:** Check the potential reasons for the error listed above. Correct as necessary, and restart the Control-O or CMEM monitor.
CTO206S THE MONITOR-TO-SUBSYSTEM COMMUNICATION DATASET COULD NOT BE OPENED

Explanation: The Control-O or CMEM monitor failed to open a monitor-to-subsystem communication file. The communication file links the Control-O or CMEM and Control-M monitors. Possible causes are:

- A communication file was incorrectly defined.
- The MVS DADSM exit failed the open request.
- A security product failed the open request.

The Control-O or CMEM monitor shuts down.

Corrective Action: Check the communication files that are in use, and make sure that they were properly defined, formatted and cataloged. In addition, make sure that no restrictions are imposed by MVS, a security package, and so on.

CTO207S I/O ERROR WHILE READING THE SUBSYSTEM-TO-MONITOR COMMUNICATION DATASET

Explanation: The Control-O or CMEM monitor could not read a subsystem-to-monitor communication file due to an I/O error. The communication file links the Control-O or CMEM and Control-M monitors. The Control-O or CMEM subsystem-to-monitor communication file may not been formatted correctly during Control-M Installation procedure, or may have been incorrectly modified.

The Control-O or CMEM monitor shuts down.

Corrective Action: For formatting information, see the section that describes how to install the Control-M Event Manager Subsystem (CMEM) in the Control-M chapter of the INCONTROL for z/OS Installation Guide. Reformat or restore as necessary, and restart the Control-O or CMEM monitor.

CTO208S INVALID FORMAT OF THE SUBSYSTEM-TO-MONITOR COMMUNICATION DATASET

Explanation: The Control-O or CMEM subsystem-to-monitor communication file has not been formatted correctly during the Control-M Installation Procedure or may have been incorrectly modified.

The Control-O or CMEM monitor shuts down.

Corrective Action: For formatting information, see the section that describes how to install the Control-M Event Manager Subsystem (CMEM) in the Control-M chapter of the INCONTROL for z/OS Installation Guide. Reformat or restore as necessary, and restart the Control-O or CMEM monitor.

CTO209S OPEN OF THE CONTROL-O TRACE FILE FAILED. DDNAME DAACTLOG

Explanation: The Control-O monitor failed to open the trace file used when Control-O is operating in LOG and TEST modes.

The Control-O monitor shuts down.

Corrective Action: Make sure that DD name DAACTLOG is allocated to the Control-O monitor, or if no trace is required, to DUMMY.
CTO20BE SYSTEM LOGGER REQUEST \textit{req} FAILED: \textit{R15= r15 RETURN= rc REASON= rsn}

**Explanation:** One of the following System Logger requests failed:

- DEFCFS, IXGINVNT - Define coupling facility structure.
- DEFLGS, IXGINVNT - Define log stream.
- CONLGS, IXGCONN - Connect to log stream.
- WRI/TEL, IXGWRITE - Write a log stream log block.
- BRW/SEL, IXGBRWSE - Browse a log stream log block.
- DELETL, IXGDELET - Delete a log stream log block.
- DISLGS, IXGCONN - Disconnect from log stream.
- DELLGS, IXGINVNT - Delete log stream.
- DELCFS, IXGINVNT - Delete coupling facility structure.

CMEM issues $r15$. Possible values of $r15$ are:

- 08 - Minor System Logger request error.
- 12 - Intermediate System Logger request error.
- 16 - Major System Logger request error.
- 20 - Permanent System Logger request error.
- 24 - Internal CMEM error
- 28 - Operating system does not support System Logger interface.
- 32 - Internal CMEM error.

To determine the system action, check the descriptions of return and reason codes in the IBM manual *MVS Programming: Assembler Services Reference*, where they are described for each System Logger request separately.

**Corrective Action:** If you cannot correct the problem, call BMC Software Customer Support.

CTO20CW IOACPRM NOT DEFINED. CMEM FUNCTION IS NOT SUPPORTED

**Explanation:** During Control-O or CMEM start up, the IOACPRM member was not found in the IOA PARM library, and therefore could not be loaded.

Initiation of CMEM fails CMEM functions DO FORCEJOB and DO RESOURCE cannot be executed by Control-M.

**Corrective Action:** Have the INCONTROL administrator check if the situation is valid. If not, create the IOACPRM member in the IOA PARM library and restart the Control-O or CMEM monitor.
CTO20DW NO CPU ENTRY FOR THIS SYSTEM WAS DEFINED. CMEM FUNCTION IS NOT SUPPORTED

Explanation: During Control-O or CMEM start up, the IOACPRM member in the IOA PARM library does not contain the definition for the system where the Control-O or CMEM monitor is active.

Initiation of CMEM fails. CMEM functions DO FORCEJOB and DO RESOURCE cannot be executed by Control-M.

Corrective Action: Have the INCONTROL administrator check if the situation is valid. If not, add the definitions for the current system to IOACPRM, and restart the Control-O or CMEM monitor.

CTO20EW S2M FILE WAS NOT DEFINED IN CPU ENTRY. CMEM FUNCTION NOT SUPPORTED

Explanation: During Control-O or CMEM start up, Control-O or CMEM could not allocate the Subsystem-to-Monitor file S2M, because the name of the file is missing from the definition of the current system in the IOACPRM.

Initiation of CMEM fails. CMEM functions DO FORCEJOB and DO RESOURCE cannot be executed by Control-M.

Corrective Action: Call the INCONTROL administrator to check if the situation is valid. If not, add the name of the Subsystem-to-Monitor file S2M and the definitions for the current system to the IOACPRM in the IOA PARM library, and restart the Control-O or CMEM monitor.

CTO20FE NO CMMPLEX MEMBER. CMEM FUNCTION NOT SUPPORTED

Explanation: During Control-O or CMEM start up, the CMEM Logger facility was required, but the CMMPLEX member that should contain the definition of the logger was not found.

Initiation of CMEM fails. CMEM functions DO FORCEJOB and DO RESOURCE cannot be executed by Control-M.

Corrective Action: No action is required.

CTO210E INVALID DATE date IN A DO COND STATEMENT

Explanation: An invalid date reference format was used in a DO COND statement.

Valid date reference formats are:

- ODAT - Control-O or CMEM working date (default)
- DATE - Current Gregorian computer date
- PREV - Previously scheduled activation date for rule
- NEXT - Next scheduled activation date for rule
- mmdd - Month and day of the scheduling date
- ddmm - Day and month of the scheduling date
- %% xx - An AutoEdit symbol.

Corrective Action: Correct the date format, and reorder the rule table.
CTO211I INTERNAL TIMEOUT DETECTED BY CONTROL-O

**Explanation:** This information message indicates that a rule remained in Command-Response mode or Wait mode for longer than specified in the TIMEOUT subparameter.

The rule continues executing.

**Corrective Action:** No action is required.

CTO212W CONTROL-O WAITING FOR SUBSYSTEM CONSOLE

**Explanation:** A Command-Response rule could not obtain a subsystem console because all valid subsystem consoles were in use by other Command-Response rules.

Command execution is delayed until the next Control-O interval, when a new attempt to obtain a subsystem console will be made.

**Corrective Action:** Check the Status screen for Command-Response rules which are executing. Verify that the number of Command-Response rules with a status of EXECUTING matches the number of subsystem consoles.

If this message is issued frequently, there may be an insufficient number of subsystem consoles to handle the Command-Response rules. In this case, increase the number of subsystem consoles in CTOPARM, and define new subsystem consoles to MVS accordingly. For details about subsystem console definition, see the Control-O chapter of the *INCONTROL for z/OS Installation Guide*.

CTO213E NO VALID SUBSYSTEM CONSOLE EXISTS

**Explanation:** A Command-Response rule could not obtain a subsystem console because no valid subsystem consoles were allocated by Control-O. The cause of the problem is probably in the subsystem console definition.

The command is not executed.

**Corrective Action:** Make sure that the NUMCONS parameter in CTOPARM is greater than zero, and that the correct number of subsystem consoles is defined in MVS. For details about subsystem console definition, see the Control-O chapter of the *INCONTROL for z/OS Installation Guide*.

If the console subsystem definition does not seem to be the cause of the problem, check for previous console allocation error messages, and contact BMC Software Customer Support.

CTO214E MAXIMUM NUMBER OF DO TSO/KSL REQUESTS WAS EXCEEDED. TSO/KSL PROCESSING IS ABORTED

**Explanation:** In the process of executing DO TSO or DO KSL requests, all of the TSP (TSO PARM) blocks in CSA or ECSA were used. Possible causes are:

- A JCL error in the TSO or KSL procedure.
- Started tasks in the system are not being processed due to system corrective measures, such as auxiliary storage shortage.

Further TSO or KSL requests are temporarily suspended until at least one TSP is available.

**Corrective Action:** If started tasks are not processed due to system corrective measures, wait until they run and their corresponding TSP blocks are freed.
If a started task failed due to a JCL error, perform the following recovery action:

1. Correct the JCL error.
2. Manually reissue the START command that Control-O previously issued, that is, S O2TTSCOM,PARM=parm, where parm is in the console log or the Control-O JES log.

This action frees one TSP, and message CTO215I is issued when the next TSO or KSL request is processed. TSPs also become available when Control-O is brought down after a standard shutdown or an IPL.

CTO215I TSO/KSL PROCESSING IS RESUMED

**Explanation:** This information message indicates that normal TSO or KSL processing resumed. TSO or KSL processing was suspended as a result of a shortage of TSP blocks. For more details see message CTO214E.

**Corrective Action:** No action is required.

CTO216W REQUEST PROCESSING BYPASSED DUE TO CONTROL-O STANDALONE MODE

**Explanation:** A DO RESOURCE or DO FORCEJOB request was made when Control-M was not installed. These statements are not supported if Control-M is not installed.

The rule is not ordered.

**Corrective Action:** Correct the rule or install Control-M.

CTO217E COND name date NOT action BY {CONTROL-O | CTMCMEM} - SECURITY VIOLATION

**Explanation:** Control-O issued a DO COND request, but the prerequisite condition was not added or deleted. There is no authorization by the security exit to add or delete this condition in the IOA Conditions file.

The DO COND request is ignored and the rule continues execution.

**Corrective Action:** Contact your INCONTROL administrator.

CTO218E COMMAND cmdName NOT ISSUED BY {CONTROL-O | CTMCMEM} - SECURITY VIOLATION

**Explanation:** There is no authorization for the requested DO COMMAND statement. Security exit IOASE012 detected a violation. This exit is invoked for each command issued by a rule in which value OWNER or TRIGGER was specified for the RUNITSEC parameter.

The DO COMMAND statement is ignored and the rule continues execution.

**Corrective Action:** Contact your INCONTROL administrator.

CTO219E RUNTIME SECURITY CACHE INITIALIZATION ERROR - rsn

**Explanation:** This message indicates an internal error.

Control-O or CMEM continues to perform security checks without a security cache.
Corrective Action: Contact BMC Software Customer Support.

CT021AE M2S FILE IS OF ANOTHER INSTALLATION QNAME qname1. IOA QNAME qName2 DSN dsn

Explanation: The Control-O or the CMEM monitor could not allocate the monitor to the Monitor-to-Subsystem (M2S) file of another IOA environment. During initialization the Control-O or the CMEM monitor compares the QNAME in the IOA environment with the QNAME in the M2S file. They should match.

CMEM stops. Control-O issues the CTO21FS and CTO21SE messages.

Corrective Action: Respond to the CTO21SE message. Then check the CTMPARM member and do one of the following:

- If it points to the wrong file, correct the name and start a new monitor.
- If there is no problem in the CTMPARM member, the M2S file was created in a different IOA environment. Delete the file and create a new M2S file using the correct IOA environment (IOAPARM).

CT021BE S2M FILE IS FOR SMFID smfid QNAME qName1. IT DOES NOT MATCH IOA QNAME qName2 DSN dsn

Explanation: The Control-O or the CMEM monitor could not allocate the subsystem to the Subsystem-to-Monitor (S2M) file of another IOA environment. During initialization the Control-O or the CMEM monitor compares the qName1 in the IOA environment with the qName2 in the S2M file. They should match.

CMEM stops. Control-O issues the CTO21FS and CTO21SE messages.

Corrective Action: Respond to the CTO21SE message. Then check the IOACPRM member and do one of the following:

- If it points to the wrong file, correct the name, compile the member and start a new monitor.
- If there is no problem in the IOACPRM member, the S2M file was created in a different IOA environment. Delete the file and create a new S2M file using the correct IOA environment.

CTO21CI M2S FILE FOR IOA QNAME qName. DSN= dsn

Explanation: This information message identifies the Monitor-to-Subsystem (M2S) file that the Control-O or the CMEM monitor allocated for communication with the Control-M monitor. qName is defined in the M2S file with the DSN dsn.

Corrective Action: No action is required.

CTO21DI S2M FILE FOR SMFID smfid QNAME qName DSN= dsn

Explanation: This information message identifies the Subsystem-to-Monitor (S2M) file that the Control-O or the CMEM monitor allocated for communication with the Control-M monitor. QNAME is defined in the S2M file with the DSN dsn.

Corrective Action: No action is required.
CTO21EE REPLY ABORT, CONTINUE OR TERMINATE

**Explanation:** The error described in message CTO21ES prevents communication between the Control-O monitor and Control-M. The response to this message determines the next action. The subtask is suspended until a response to this message is received.

**Corrective Action:** Select one the following responses:

- **ABORT** - Abend the Control-O monitor.
- **CONTINUE** - Disable communication with Control-M.
- **TERMINATE** - End Control-O monitoring with a return code of 8.

CTO21EI THE REPLY TO MESSAGE EX021EE WAS: *reply*

**Explanation:** The information message echoes the response to message CTO21EE.

**Corrective Action:** No action is required.

CTO21ES SUBSYSTEM TO CONTROL-M MONITOR FUNCTION DISABLED

**Explanation:** An error occurred during initialization of Subsystem-to-Monitor (S2M) communication for the Control-O monitor. Initialization checks failed for the function that communicates with the Control-M monitor. For details, see previously issued error messages in the JOBLOG or IOA Log file.

Control-O issues the CTO21EE message.

**Corrective Action:** Respond to the CTO21EE message.

CTO21FE SUPPORT FOR 'DO FORCEJOB' AND 'DO RESOURCE' IS DISABLED

**Explanation:** Either Control-O disabled communication with Control-M because of a CONTINUE response to message CTO21EE, or a DO FORCEJOB or DO RESOURCE statement was encountered during execution of a Control-O rule with communication disabled. DO FORCEJOB, DO RESOURCE and NEWCONLIST requests from Control-M are ignored.

**Corrective Action:** No action is required.

CTO220I CONTROL-O ALLOCATED *num* SUBSYSTEM CONSOLES

**Explanation:** This information message indicates that during Control-O startup, Control-O allocated *num* subsystem consoles for use by the DO COMMAND with WAITRESP Y. The number *num* must be equal to the value of the NUMCONS parameter in the CTOPARM member in the IOA PARM library.

Control-O acquires the allocated subsystem consoles and uses them for the DO COMMAND with RESPMODE set to Y.

**Corrective Action:** If the value of *num* is less than the number defined in CTOPARM by the NUMCONS= *num* statement, define more subsystem consoles in the system. For information on how to do this, see the description of the NUMCONS parameter in CTOPARM and subsystem consoles in the Control-O Installation chapter of the *INCONTROL for z/OS Installation Guide*.
INCONTROL for z/OS Messages Manual

CTO221I CONTROL-O RELEASED THE SUBSYSTEM CONSOLES

Explanation: This information message is the normal message issued during Control-O termination if subsystem consoles were allocated.

The subsystem consoles that were allocated to Control-O are freed during termination of the Control-O monitor.

Corrective Action: No action is required.

CTO222W NO CONSOLES ARE AVAILABLE FOR CONTROL-O

Explanation: Control-O could not allocate subsystem consoles during initialization, as specified in the NUMCONS parameter in the CTOPARM member.

No subsystem consoles are allocated.

Corrective Action: Define a sufficient number of MVS consoles for Control-O use. If other products use a subsystem console, calculate the number of subsystem consoles required for all products. For more details, see the Control-O installation chapter in the INCONTROL for z/OS Installation Guide, and to the relevant MVS manuals.

CTO223W INSUFFICIENT NUMBER OF CONSOLES ARE AVAILABLE FOR CONTROL-O

Explanation: Control-O attempted to allocate subsystem consoles during initialization but not enough consoles are available.

All the available subsystem consoles are allocated by Control-O. This message is followed by message CON220I which details how many consoles were allocated for Control-O use.

Corrective Action: Decrease the number of consoles required for Control-O (the NUMCONS parameter in CTOPARM), or define a sufficient number of consoles for Control-O use in MVS. If other products use a subsystem console, calculate the number of subsystem consoles required for all products. For more details, see the Control-O installation chapter in the INCONTROL for z/OS Installation Guide, and the relevant MVS manuals.

CTO224E ERROR IN SUBSYSTEM CONSOLE SERVICE ROUTINE. FUNCTION= func RC= rc. A SNAP IS PRODUCED

Explanation: Control-O attempted to perform an OBTAIN or RELEASE function on a subsystem console. The subsystem console service routine failed to perform the requested function.

The system action varies, depending on whether Control-O was initializing or terminating at the time of its issue, as follows:

- If the message was issued during Control-O initialization, Control-O does not use subsystem consoles.
- If the message was issued during Control-O termination, Control-O stops releasing the subsystem consoles. If not all the subsystem consoles were released, they remain allocated until a new Control-O monitor is started or until an IPL is performed.

Snap dumps are produced with the relevant control blocks.

Corrective Action: Save the snap dumps and call your INCONTROL administrator for assistance.
CTO225E INSUFFICIENT STORAGE FOR THE CONSOLE func FUNCTION

Explanation: There is insufficient storage in the Control-O address space to perform the OBTAIN or RELEASE subsystem console function.

The system action varies, depending on whether Control-O was initializing or terminating at the time of its issue, as follows:

- If the message was issued during Control-O initialization, Control-O does not use subsystem consoles.
- If the message was issued during Control-O termination, Control-O stops releasing the subsystem consoles. If not all the subsystem consoles were released, they remain allocated until a new Control-O monitor is started or until an IPL is performed.

Corrective Action: Increase the region size specified in the Control-O procedure.

CTO226E INSUFFICIENT STORAGE IN (EXTENDED) CSA. CANNOT_ALLOCATE SUBSYSTEM CONSOLES

Explanation: This message is issued during Control-O initialization when there is insufficient space in CSA or ECSA for Control-O console-related control blocks.

Control-O initialization continues without using subsystem consoles.

Corrective Action: Check if the storage defined for CSA or ECSA is large enough. If not, increase the CSA or ECSA size.

CTO227E ERROR IN SUBSYSTEM CONSOLE PROCESSING. REQUEST= reqCode FUNCTION= func ERRCODE={ abCode|rsn }

Explanation: The subsystem console service routine abended when attempting to perform the OBTAIN or RELEASE function for a subsystem console, and the function was not performed or was performed partially.

The system action varies, depending on whether Control-O was initializing or terminating at the time of its issue, as follows:

- If the message was issued during Control-O initialization, Control-O will not use subsystem consoles.
- If the message was issued during Control-O termination, Control-O stops releasing the subsystem consoles. If all the subsystem consoles were not released, they remain allocated until a new Control-O monitor is started or until an IPL is performed.

Abend and snap dumps are produced.

Corrective Action: Save the abend and snap dumps and call your INCONTROL administrator for assistance.

CTO228I CONTROL-O ALLOCATED num EMCS CONSOLES

Explanation: This information message indicates that Control-O allocated a total of num EMCS CONSOLES according to the definitions in the CTOPARM member.

Corrective Action: No action is required.
CTO229I CONTROL-O ALLOCATED num EMCS CONSOLES WITH MIG IDS

Explanation: This information message indicates that Control-O allocated a total of num EMCS CONSOLES with migration IDs according to the definitions in the CTOPARM member.

Corrective Action: No action is required.

CTO22AE CONTROL-O ALLOCATED EMCS CONSOLE ERROR. IOAMCS RC= rc REASON= rsn CONSOLE= consoleName

Explanation: Control-O failed to allocate an EMCS CONSOLE. The MCSOPER service ended with an error. When this happens, Control-O attempts to allocate an EMCS CONSOLE in order to issue a command or message. However, the attempt failed.

Control-O ignores the console.

Corrective Action: Do the following:
1. Record the return code (rc), reason number (rsn), and console name (consoleName). For information about MCSOPER, see the manual for the IBM authorized macro services.
2. Correct the definitions of the EMCS CONSOLE in the CTOPARM EMCSCONS.
3. STOP the Control-O monitor and start a new monitor.

CTO22BE CONTROL-O ALLOCATED EMCS CONSOLE ERROR. CONVCON RC= rc REASON= rnum CONSOLE= consoleName

Explanation: Control-O failed to allocate an EMCS CONSOLE. CONVCON service ended with an error. When this happens, Control-O attempts to allocate an EMCS CONSOLE in order to issue a command or message. However, the attempt failed.

Control-O ignores the console.

Corrective Action: Do the following:
1. Record the return code (rc), reason number (rsn), and console name (consoleName). For information about CONVCON, see the manual for the IBM authorized macro services.
2. Correct the definitions of the EMCS CONSOLE in the EMCSCONS parameter in the CTOPARM member.
3. STOP the Control-O monitor and start a new monitor.

CTO230E SUBSYSTEM subsys INITIALIZATION FAILED - JES COMMAND SUPPRESSION NOT ACTIVATED

Explanation: During Control-O initialization, Control-O failed to activate the Control-O subsystem that suppresses JES2 commands. To suppress JES2 commands, Control-O uses the subsystem whose name is specified in the statement JCMDSSN= subsys in the CTOPARM member in the IOA PARM library.

Control-O initialization continues, but the JES2 command suppression function is disabled.

Corrective Action: Notify the INCONTROL administrator.
CTO231E SUBSYSTEM subsys WAS NOT PRE-DEFINED - JES COMMAND SUPPRESSION NOT ACTIVATED

Explanation: During Control-O initialization, Control-O failed to activate the Control-O subsystem that suppresses JES2 commands, because the subsystem was not properly predefined. To suppress JES2 commands, Control-O uses the subsystem whose name is specified in the statement JCMDSSN= subsys in the CTOPARM member in the IOA PARM library. This subsystem should be, but was not, defined in SYS1.PARMLIB(IEFSSN xx), and activated in the last IPL before Control-O is started.

Control-O initialization continues, but the JES2 command suppression function is disabled.

Corrective Action: Notify the INCONTROL administrator.

CTO234W SUBSYSTEM subsys ALREADY INACTIVE

Explanation: During Control-O termination, Control-O tried to deactivate the IOA subsystem and the Control-O subsystem currently in use, but the subsystem identified in the message was already inactive.

Control-O termination continues.

Corrective Action: Notify the INCONTROL administrator.

CTO235W subsys ALREADY ACTIVE

Explanation: During Control-O initialization, Control-O tried to activate the IOA subsystem and the Control-O subsystem, but the subsystem identified in the message was already active.

Control-O initialization continues.

Corrective Action: Notify the INCONTROL administrator.

CTO236E SUBSYSTEM NAME IS NOT SPECIFIED IN IOAPARM

Explanation: The subsystem initialization routine found a blank subsystem name definition in the IOAPARM member.

Corrective Action: Correct the SSNAME parameter in the IOAPARM member to specify a valid subsystem name, and check that the other subsystem-related parameters were defined correctly.

If Control-D subsystem functions are requested, check the AMNAME parameter in CTDPARM and correct if necessary.

CTO237E ERROR WHILE ATTEMPTING TO LOCATE (BLDL) ONE OF THE SUBSYSTEM FUNCTION ROUTINES

Explanation: Control-O could not find at least one of the alternate subsystem function routines.

While attempting to activate the alternate subsystem, Control-O could not find at least one of the alternate subsystem function routines in the STEPLIB library or concatenation of libraries.

Control-O continues without activating the alternate subsystem.

Corrective Action: Verify that these modules exist in the STEPLIB library or concatenation of libraries and reactivate Control-O.
CTO238E ERROR WHILE ATTEMPTING TO LOAD ONE OF THE SUBSYSTEM FUNCTION Routines

**Explanation:** Control-O could not load at least one of the alternate subsystem function routines. While attempting to activate the alternate subsystem, Control-O could not find at least one of the alternate subsystem function routines in the STEPLIB library or concatenation of libraries. Control-O continues without activating the alternate subsystem.

**Corrective Action:** Verify that these modules exist in the STEPLIB library or concatenation of libraries and reactivate Control-O.

CTO239E ERROR WHILE ATTEMPTING TO ACQUIRE STORAGE FOR SUBSYSTEM FUNCTION ROUTINES OR THE SSVT

**Explanation:** Control-O could not acquire enough CSA (Common Service Area) storage to load alternate subsystem function routines or to build the SSVT for the alternate subsystem. Control-O continues without activating the alternate subsystem.

**Corrective Action:** If storage defined for CSA is not large enough, increase the CSA size and perform an IPL.

CTO23AI ALTERNATE SUBSYSTEM `subsys` SUCCESSFULLY INITIALIZED

**Explanation:** This information message indicates that the CTOSSO module successfully activated the alternate subsystem.

**Corrective Action:** No action is required.

CTO240I NEWCONLIST COMMAND RECEIVED. THE CMEM TABLE WAS RELOADED SUCCESSFULLY

**Explanation:** This information message indicates that the Control-M or Control-O subsystem functions received the NEWCONLIST request from the Control-M monitor, and accordingly reloaded (refreshed) the CMEM table. The Control-M or Control-O subsystem functions reloaded the CMEM table.

**Corrective Action:** No action is required.

CTO240W STATISTICS FILE NEARLY FULL - percentage USED

**Explanation:** Highlighted, unrollable message.

The Statistics file is approaching its maximum capacity. The Statistics file continues accumulating statistics until it becomes full.

**Corrective Action:** The user can do one of the following:
Reformat the Statistics file using the DEFSTAT installation job. This deletes all saved statistics and restarts the tracking process.

Enlarge the Statistics file using the CTOCSF utility. This retains the existing statistics and increases the space available for the tracking of new message IDs.

Do nothing. If the Statistics file becomes full, statistics of message IDs which exist in the file will continue to be tracked, but new message IDs will not be added to the file.

CTO241E STATISTICS FILE IS FULL. NEW MESSAGE IDS WILL BE LOST

Explanation: Highlighted, unrollable message.

The Statistics file is full.

All statistics records according to the number (STREC#) set in the CTOPARM parameter file have been utilized.

Control-O continues to collect statistics for existing messages, but the statistics for new message IDs are not saved.

Corrective Action: The user can do one of the following:

- Reformat the Statistics file using the DEFSTAT installation job. This deletes all saved statistics and restarts the tracking process.
- Enlarge the Statistics file using the CTOCSF utility. This retains the existing statistics and enables new message IDs to be tracked.
- Do nothing. Statistics of message IDs which exist in the file will continue to be tracked. Statistics of new message IDs will not be tracked.

CTO250E RUNTIME SECURITY CLEANUP FAILED, RC= rc

Explanation: An error occurred during interface with the locally used security product.

Control-O or CMEM continues working.

Corrective Action: Contact BMC Software Customer Support.

CTO251I RUNTIME SECURITY REFRESH ENDED OK

Explanation: This information message indicates a normal response to operator command F CONTROLO,NEWSECDEF or F CTMCMEM,NEWSECDEF. The runtime security cache containing previously handled security definitions was successfully refreshed.

If security definitions were changed, the new definitions are used.

Corrective Action: No action is required.

CTO252I SNMP REQUEST HOST=hostname PORT=portNumber SEVERITY=s TEXT=msgText

Explanation: This information message is an audit message that logs a DO SNMP request executed by Control-O.

Corrective Action: No action is required.
CTO253E SNMP REQUEST ERROR, RETURN CODE=$rc$, REASON CODE=$rsn$

**Explanation:** Control-O tried to send an SNMP request using a DO SNMP statement, but the request contained an error.

Possible return and associated reason codes are described in the following table:

<table>
<thead>
<tr>
<th>Return Code ( rc )</th>
<th>Reason Code ( rsn )</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>00</td>
<td>Successful completion, minor errors discovered.</td>
</tr>
<tr>
<td></td>
<td>04</td>
<td>SHL value exceeds 70, truncated.</td>
</tr>
<tr>
<td>08</td>
<td>04</td>
<td>Failed to get local IP address.</td>
</tr>
<tr>
<td></td>
<td>08</td>
<td>Failure to get storage for an SNMP trap.</td>
</tr>
<tr>
<td></td>
<td>12</td>
<td>Allocation storage has failed.</td>
</tr>
<tr>

The DO SNMP request is not sent, and fails.

**Corrective Action:** Notify the INCONTROL administrator.

CTO254E {CONTROL-O | CTMCMEM} SECURITY ENVIRONMENT CLEANUP FAILED BY USER EXIT RC= rc REASON= rsn

**Explanation:** The IOASECUR security module was unable to delete the security environment. This message indicates an internal error.

**Corrective Action:** Contact BMC Software Customer Support.

CTO255W CONTROL-O SERVER ERROR. SERVER id reason

**Explanation:** A server action cannot be performed because the server is not in the expected status. An action was attempted on a server that is either stuck or has disappeared.

Server status is set to IN ERROR.

**Corrective Action:** Do the following:
1. Check the sysout of the server in error for the cause of the error.
2. Correct the detected errors, for example, errors in the JCL.
3. Restart the server.
CTO25FW MONITOR USE SYSPRINT SYSOUT INSTEAD OF ACTLOG SYSOUT

Explanation: Control-O monitor or CMEM monitor tries to write a message to ACTLOG sysout. The DD card ACTLOG is missing from the Control-O or CMEM procedure.

The monitor writes the message to the SYSPRINT sysout. In the monitor address space this may cause ABEND S02A with a return code of 0C in some cases. Since the Monitor can recover itself from the abend, the monitor is not immediately terminated.

Corrective Action: Add the following DD statement to the Control-O procedure (CTOTROLO) and the CMEM procedure (CTMCME):

```
//ACTLOG DD &OUTLIST,SYSOUT=&OUT
```

CTO260E EXECUTION OF VM/CP COMMAND ABORTED. RC= rc

Explanation: A DO COMMAND statement specifying a VM CP command failed. The return code indicates the cause of the error, as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>MVS not running under VM.</td>
</tr>
<tr>
<td>8</td>
<td>Insufficient space (GETMAIN failed).</td>
</tr>
<tr>
<td>12</td>
<td>IOAVMC not APF authorized.</td>
</tr>
<tr>
<td>16</td>
<td>FREEMAIN error.</td>
</tr>
</tbody>
</table>

The specified command is ignored.

Corrective Action: The recommended action depends on the return code, as follows:

- 4 - Correct the rule containing this DO COMMAND statement.
- 8 - Increase the region size of the Control-O monitor.
- 12 or 16 - Contact BMC Software Customer Support for assistance.

CTO261I ATTEMPTING TO RECONNECT TO MVS SYSTEM LOGGER DUE TO ERROR rsn

Explanation: Control-O or CMEM has detected an MVS System Logger error, and is attempting to reconnect to the MVS System Logger.

In this message, rsn is a reason code that is documented in the IBM manual "MVS Programming: Assembler Services Reference." Check that publication for the system action relevant to the reason code in the message. Each System Logger request is in a separate section of the guide. The reason codes are described in the topic “Return and Reason Codes” for the IXGWRITE System Logger request.

Control-O or CMEM tries several times to reconnect to the MVS System Logger.

Corrective Action: No action is required.
CTO262E  ATTEMPT TO RECONNECT TO MVS SYSTEM LOGGER FAILED

Explanation: Control-O or CMEM detected an MVS System Logger error, and attempted several times to reconnect to the MVS System Logger, without success.

Corrective Action: No action is required.

CTO263E  MVS SYSTEM LOGGER ERROR - CMEM FEATURE DISABLED

Explanation: Control-O or CMEM detected an MVS System Logger error. Either this error was so severe as not to be recoverable, or Control-O or CMEM attempted several times to reconnect to the MVS System Logger, without success.

Control-O or CMEM has stopped attempting to reconnect to the MVS System Logger. The CMEM facility is deactivated.

Corrective Action: If and when the MVS System Logger becomes operational, stop and restart the Control-O or CMEM monitor.

CTO26AI  text

Explanation: Ignore this message. It is an internal message used by Control-O to pass information to Control-M/Links for Distributed Systems executing in a WINDOWS NT machine using MVS console emulation, when Control-O processes a DO CTOPCMSG statement. The message text contains the event that should trigger the rule on Control-M/Links for Distributed Systems.

Corrective Action: No action is required.

CTO26BI  text

Explanation: Ignore this message. It is an internal message used by Control-M/Links for Distributed Systems in a WINDOWS NT machine to satisfy the ON CTOPCMSG event that triggers the rule. Control-M/Links for Distributed Systems passes the information in this message to Control-O using its MVS console emulation.

Corrective Action: No action is required.

CTO271I  text

Explanation: Ignore this message. It is an internal message used by the CTOJ FRQ Control-O IEFJ FRQ exit module to trigger a SYSOUT event. The text may include unprintable characters.

Corrective Action: No action is required.

CTO272I  CTOJ FRQ EXIT POINT SUCCESSFULLY REMOVED

Explanation: This information message indicates that as part of its termination process, the Control-O monitor successfully disabled and removed dynamic exit IEFJ FRQ, which uses the CTOJ FRQ module. Control-O uses the CTOJ FRQ module for ON SYSOUT and/or JES2 command suppression function.

Corrective Action: No action is required.
CTO273W CTOJ FRQ EXIT POINT NOT REMOVED RC = rc REASON CODE = rsn

**Explanation:** Upon termination, the Control-O monitor failed to disable and remove dynamic the exit IEFJ FRQ that uses the CTOJ FRQ module. This exit should have been disabled and removed upon monitor termination. Control-O uses the CTOJ FRQ module for ON SYSOUT and/or JES2 command suppression function.

Control-O terminates without removing the dynamic exit IEFJ FRQ that uses the CTOJ FRQ module. This may cause an S0C4 code in various jobs under the subsystem interface. In this case, MVS automatically disables the dynamic exit IEFJ FRQ that uses the CTOJ FRQ module.

**Corrective Action:** Inform the system programmer, and check the return code and reason code of macro CSVDYNEX in the IBM manual *MVS Programming: Authorized Assembler Services Reference*.

CTO274E ERROR WHILE LOADING CTOJ FRQ EXIT POINT

**Explanation:** When Control-O monitor started, it failed to load and enable the IEFJ FRQ dynamic exit, which uses the CTOJ FRQ module. This exit should have been loaded at monitor startup. Control-O uses the CTOJ FRQ module for ON SYSOUT and JES2 command suppression function.

Control-O starts without enabling the IEFJ FRQ dynamic exit that uses the CTOJ FRQ module. As a result, ON SYSOUT and JES2 command suppression functions will not be active.

**Corrective Action:** Inform your system programmer.

CTO275E CTOJ FRQ EXIT POINT NOT INSTALLED RC = rc REASON CODE = rsn

**Explanation:** When the Control-O monitor started, it failed to load and activate the dynamic exit IEFJ FRQ that uses the CTOJ FRQ module. This exit should have been loaded and activated at monitor startup. Control-O uses the CTOJ FRQ module for ON SYSOUT and/or JES2 command suppression function.

Control-O starts without enabling the dynamic exit IEFJ FRQ that uses the CTOJ FRQ module. Therefore, ON SYSOUT and/or JES2 command suppression functions will not be active.

**Corrective Action:** Inform your system programmer and check the RC and REASON CODE of the CSVDYNEX macro in the *IBM OS/390 Authorized Macros and Services Guide*.

CTO276I CTOJ FRQ EXIT POINT SUCCESSFULLY INSTALLED

**Explanation:** This information message indicates that when the Control-O monitor started, it successfully enabled the dynamic exit IEFJ FRQ that uses the CTOJ FRQ module. Control-O uses the CTOJ FRQ module for ON SYSOUT and/or JES2 command suppression function.

**Corrective Action:** No action is required.

CTO281I usr msg

**Explanation:** This information message displays the message issued from a Control-O rule.

(Note: CTO281I cannot be trapped with an ON MESSAGE rule and therefore it cannot trigger any rule.)

**Corrective Action:** No action is required.
CTO282I text (userId)

Explanation: Highlighted, unrollable message.
This information message is activated by the SHOUT facility.
In this message, userId is the user ID of the job order requesting the SHOUT.

Corrective Action: No action is required.

CTO284I text

Explanation: Ignore this message. It is an internal message used by the CMEM executor module to trigger a CMEM event using ON DSNEVENT and ON STEP. The text may include unprintable characters.

Corrective Action: No action is required.

CTO285E OID= orderId JOB TERMINATED BY CONTROL-O DUE TO ‘STOPJOB’ REQUEST

Explanation: Control-O stopped job execution due to a DO STOPJOB statement. This message is issued for all DO STOPJOB statements for events, except data set events for an NCT2 disposition.
The steps following the current step are not executed.

Corrective Action: No action is required.

CTO285W RULE ruleName SUSPENDED AT THRESHOLD num. TABLE table LIB library

Explanation: The rule identified in the message was suspended because it reached the rule threshold limit, which determines the maximum number of times a rule may be triggered. The rule threshold limit is defined in the THRESHOLD parameter in the CONTROL section of the CTOPARM member in the IOA PARM library.
The rule is suspended.

Corrective Action: Check why the rule reached the limit, and if there is a problem correct it. Adjust the threshold value, if needed, or use the Rule Status screen to release the rule from its SUSPEND state.

CTO286E ALL REQUEST ELEMENTS IN USE. REQUEST ABORTED

Explanation: Control-O could not obtain a free element. Control-O has an internal queuing request mechanism that obtains a request from a free chain, and puts it on one of various work chains. Once processing is complete, the request is returned to the free chain. This message is issued when trying to obtain a free request element, and there are none available.
The request is aborted.

CTO288E MAXIMUM NUMBER OF ‘DO’ STATEMENTS EXCEEDED.

Explanation: A rule executed more than 10,000 DO statements. This message is followed by another message containing the name of the problematic rule.
In order to avoid an infinite loop, only a limited number of DO statements can be executed. The default setting is 10,000. You can override this default by setting `%DOLIMIT` to a higher value.

The rule is aborted.

**Corrective Action:** Either correct the rule to perform less than 10,000 DO statements, or set `%DOLIMIT` to a higher value.

**CTO289E GLOBAL DATE IS NOT SUPPORTED FOR ADD CONDITION REQUESTS**

**Explanation:** The `dateref` field in the DO COND statement contains wildcard symbols (##### or *****).

The rule is aborted or ignored.

**Corrective Action:** Specify a distinct date in the `dateref` field.

**CTO28AE MAXIMUM NUMBER OF NESTED RULES EXCEEDED**

**Explanation:** The maximum number of nested rules executed in response to a DO RULE statement has been exceeded. Rules can be nested up to 20 deep.

The rule at the twenty first level is aborted or ignored.

**Corrective Action:** Correct the logic so that there are no more than 20 nesting levels for rules.

**CTO28BE INVOKED RULE NOT FOUND**

**Explanation:** The rule invoked by means of a DO RULE statement was not found in the specified, or default, table.

The rule is aborted or ignored.

**Corrective Action:** Correct the DO RULE statement to contain a rule defined in the specified or default table, or define the rule in the specified table.

**CTO28CW RULE IS IN "WAIT ACTIVATION" STATUS. "DO RULE" IS IGNORED**

**Explanation:** A rule invoked another rule by using the DO RULE statement did not satisfy the Runtime Scheduling criteria.

Processing continues. The invoked rule is ignored.

**Corrective Action:** If this is not intentional, correct the invoked rule definition so that it satisfies the Runtime Scheduling criteria.

**CTO28DE RULE= ruleName ABORTED. TABLE= tableName LIBRARY= dsn**

**Explanation:** A rule aborted because of an error. This message is preceded by another message that describes the cause of the error.

The rule is aborted at the point of error.

**Corrective Action:** Correct the error according to the preceding message.
CTO28EW RULE= ruleName IGNORED. TABLE= tableName LIBRARY= dsn

**Explanation:** This warning message indicates that a problem occurred when processing a rule. This message is preceded by another message that describes the problem.
The rule is ignored. Processing continues.

**Corrective Action:** Correct the problem according to the preceding message.

CTO290I {CONTROL-O | CTMCMEM} AUTOMATION LOG STARTED

**Explanation:** This information message indicates that the Automation Log subtask began.

**Corrective Action:** No action is required.

CTO291E AUTOMATION LOG ERROR WHILE PROCESSING REQUESTS

**Explanation:** The Automation Log subtask detected an error while processing requests.
The subtask and the Control-O or CMEM monitor shut down. Before shutting down, the Control-O or CMEM monitor attempts to start a new Control-O or CMEM monitor to replace itself. If it does not succeed after a few attempts, Control-O or CMEM ceases trying.

**Corrective Action:** Contact your INCONTROL administrator.

CTO292S {CONTROL-O | CTMCMEM} AUTOMATION LOG TERMINATION ERROR

**Explanation:** The Automation Log subtask terminated after an error was detected.
The subtask and the Control-O or CMEM monitor shut down. Before shutting down, the Control-O or CMEM monitor attempts to start a new Control-O or CMEM monitor to replace itself. If it does not succeed after a few attempts, Control-O or CMEM ceases trying.

**Corrective Action:** Contact your INCONTROL administrator.

CTO293I CONTROL-O AUTOMATION LOG ENDED

**Explanation:** This information message indicates that the Automation Log subtask terminated successfully.
The subtask and the monitor shut down.

**Corrective Action:** No action is required.

CTO294E OPEN OF AUTOMATION LOG FAILED. LOG SWAPPED

**Explanation:** The Automation Log subtask attempted to open the Automation Log file but failed.
Control-O continues working but now works as if AUTOMLOG was set to N in the CTOPARM member. Subsequent traces of rules are written to the DAACTLOG sysout of the Control-O monitor.

**Corrective Action:** Do the following:
Check the CTOPARM member in the IOA PARM library.

Check to see if the Automation Log file exists for this CPU.

CTO295S OPEN OF DAACTLOG FAILED

Explanation: The Automation Log subtask failed to open the file referenced by the DAACTLOG DD statement.

The subtask and the Control-O or CMEM monitor shut down. Before shutting down, the Control-O or CMEM monitor attempts to start a new Control-O or CMEM monitor to replace itself. If it does not succeed after a few attempts, Control-O or CMEM ceases trying.

Corrective Action: Check the JCL of your Control-O or CMEM starting procedure to verify that the DAACTLOG DD statement exists. If the problem is not resolved, contact your INCONTROL administrator.

CTO296E ERROR DETECTED DURING ADDF. LOG SWAPPED

Explanation: The Automation Log subtask was unable to write to the Automation Log file.

Control-O continues working but now works as if AUTOMLOG was set to N in the CTOPARM member. Subsequent traces of rules are written to the DAACTLOG sysout of the Control-O monitor.

Corrective Action: Contact your INCONTROL administrator.

CTO297I AUTOMATION LOG STATUS CHANGE COMPLETED

Explanation: This information message indicates that the Automation Log subtask completed the change of Automation Log status.

This message is displayed in response to the operator command F CONTROLO,AUTOLOG=YES/NO.

The Automation Log subtask writes to the new destination.

Corrective Action: No action is required.

CTO298E ERROR DETECTED DURING ENQ. LOG SWAPPED

Explanation: The Automation Log subtask detected an error while trying to ENQUEUE the Automation Log file.

Control-O continues working but now works as if AUTOMLOG was set to N in the CTOPARM member. Subsequent traces of rules are written to the DAACTLOG sysout of the Control-O monitor.

Corrective Action: Contact your INCONTROL administrator.

CTO299E ERROR DETECTED DURING DEQ. LOG SWAPPED

Explanation: The Automation Log subtask detected an error while trying to dequeue the Automation Log file.

Control-O continues working but now works as if AUTOMLOG was set to N in the CTOPARM member. Subsequent traces of rules will be written to the DAACTLOG sysout of the Control-O monitor.

Corrective Action: Contact your INCONTROL administrator.
CTO2A6S SEVERE WSC SHORTAGE DETECTED FOR MONITOR mon (subsys) - WSC USAGE: CURRENTLY 100%

**Explanation:** Highlighted, unrollable message.

The Control-O or CMEM monitor detected a severe shortage of WSC blocks. All WSC blocks were in use simultaneously. This is a severe condition, and must be avoided, because the operation of Control-O may be affected in unexpected ways.

Possible causes are:

- There are rules in the system that consume excessive quantities of WSC blocks.
- The WSC# parameter requires adjustment to accommodate the workload of the system.
- This can be done dynamically by using the MODIFY SETPARM command.

The availability of WSC blocks is essential for the monitor to be able to process system events.

This message is issued only the first time there is no free WSC. After the CTO2A7I message indicates that the shortage has been relieved, the CTO2A6S message is deleted and can be issued again.

This message is highlighted, and will be deleted when message CTO2A7I is issued.

The variables in this message are:

- **mon** - the name of the Control-O or CMEM monitor
- **subsys** - the IOA subsystem associated with mon

For more information, see the description of the USAGESTATS command in the *INCONTROL for z/OS Administrator Guide*.

As long as all WSC blocks remain in use, the Control-O or CMEM monitor cannot react to events. However, the Control-O or CMEM monitor continues to function and is not terminated.

**Corrective Action:** Contact your INCONTROL administrator.

CTO2A7I WSC SHORTAGE RELIEVED FOR MONITOR mon (subsys)

**Explanation:** Highlighted, unrollable message.

A severe shortage of WSC blocks was previously detected by the Control-O or CMEM monitor, and the CTO2A6S message was displayed. As of the last check, at least 25% of the WSC blocks are free. The check is performed every minute, or longer if the Control-O/CMEM INTERVAL parameter is greater than 1 minute.

This message is highlighted, but if another WSC shortage occurs and is then relieved, the message relating to the preceding shortage is deleted.

The variables in this message are:

- **mon** - the name of the Control-O or CMEM monitor
- **subsys** - the IOA subsystem associated with mon

For more information, see the description of the preceding CTO2A6S message and the description of the USAGESTATS command in the *INCONTROL for z/OS Administrator Guide*.

Control-O or CMEM resumes normal operation. However, it is possible that information was lost during the period of the shortage, and the shortage may have unexpected effects.
Corrective Action: Contact your INCONTROL administrator.

CTO2A9W nnnnnnnn EVENT(S) LOST FOR MONITOR mon (subsys) DUE TO 100% WSC USAGE

Explanation: One or more system events occurred of a type which is usually tracked by the Control-O or CMEM monitor. However, because a severe shortage of WSC blocks existed at the time of the events (as indicated by the display of the CTOA6S message), the events are ignored by the Control-O or CMEM monitor.

The variables in this message are:
- nnnnnnnn - the number of events lost during the last minute interval, or longer if the Control-O/CMEM INTERVAL parameter is greater than 1 minute.
- mon - the name of the Control-O or CMEM monitor
- subsys - the IOA subsystem associated with mon

For more information, see the description of the preceding CTOA6S and CTOA7I messages and the description of the USAGESTATS command in the INCONTROL for z/OS Administrator Guide.

The events are ignored, and future events might also be ignored until the shortage of WSC blocks is relieved.

Corrective Action: Contact your INCONTROL administrator.

CTO2AAW 85% xxx UTILIZATION DETECTED FOR MONITOR mon (subsys)

Explanation: Highlighted, unrollable message.

WSC, RQC, or PND might be soon exhausted, causing serious Control-O/CMEM functional impairment, as follows:
- WSC - See message CTO2A6S for more details.
- RQC - If exhausted, unexpected results might occur.
- PND - Rules that use wait mode will not be triggered if there are no free PNDs available.

The variables in this message are:
- xxx - WSC/RQC/PND
- mon - the name of the Control-O or CMEM monitor
- subsys - the IOA subsystem associated with mon

Corrective Action: Contact your INCONTROL administrator.

A Control-O rule may be written so that WSC allocation is increased automatically using the MODIFY SETPARM,WSC#= command. See the INCONTROL for z/OS Administrator Guide.

Also, the WSC#, RQC# and WAITPR# parameters can be increased in CTOPARM, and Control-O/CMEM recycled. See the INCONTROL for z/OS Installation Guide: Installing.

This message is not re-issued until a corresponding relief message (CTO2ABI) for the resource type (WSC/RQC/PND) is issued.
CTO2ABI  xxx SHORTAGE RELIEVED FOR MONITOR mon (subsys)

**Explanation:** 85% utilization of WSC/RQC/PND blocks was previously detected by the Control-O or CMEM monitor, and the CTO2AAW message was displayed. As of the last check, at least 25% of the WSC/RQC/PND blocks are free. The check is performed every minute, or longer if the Control-O/CMEM INTERVAL parameter is greater than 1 minute.

This message is highlighted, but if another WSC/RQC/PND 85% utilization condition occurs and is then relieved, the message relating to the preceding shortage is deleted.

The variables in this message are:
- xxx - WSC/RQC/PND
- mon - the name of the Control-O or CMEM monitor
- subsys - the IOA subsystem associated with mon

For more information, see the description of the preceding CTO2AAW message and the description of the USAGESTATS command in the *INCONTROL for z/OS Administrator Guide*.

**Corrective Action:** Contact your INCONTROL administrator.

CTO2B5E XCF GETMAIN ERROR RC= rc

**Explanation:** Control-O failed to activate XCF support. Control-O detected this error while allocating internal storage by means of a STORAGE OBTAIN operation.

In this message, rc is the contents of register R15 from macro STORAGE OBTAIN.

The CTOXCF Control-O program ends with an error.

**Corrective Action:** Based on the return code, determine the cause of the error, and fix the problem. Restart Control-O to activate XCF support.

CTO2B6E XCF FREEMAIN ERROR RC= rc

**Explanation:** Control-O detected an error during a STORAGE RELEASE operation. STORAGE RELEASE operations are used to free internal storage.

In this message, rc is the contents of register R15 from the STORAGE RELEASE macro.

The CTOXCF program ends with an error. Control-O fails to start or terminate XCF support.

**Corrective Action:** Based on the return code, determine the cause of the error, and fix the problem. Restart Control-O.

CTO2B7E CONTROL-O HAS NOT INITIALIZED XCF SESSION

**Explanation:** Control-O attempted to initialize an XCF session. The attempt failed. When Control-O begins initializing an XCF session, it observes the session start. If the session starts with status XCF-LOCAL, this message is issued and Control-O does not connect to XCF.

**Corrective Action:** None, if Sysplex configuration is not needed. However, if Sysplex configuration is needed, configure the session as MONOPLEX or SYSPLEX. For more information, see MVS documentation on initialization and tuning.
Messages CTO300 through CTO3xx

This group includes messages for the Control-O product.

CTO300S INTERNAL ERROR - REASON = rsn. NOTIFY THE IOA ADMINISTRATOR

Explanation: Control-O detected an internal Control-O error. The Control-O monitor shuts down.

Corrective Action: Record the reason, and have your system programmer call BMC Software Customer Support.

CTO303S {CONTROL-O | CMEM} AUTOMATION LOG INITIALIZATION ERROR

Explanation: The Automation Log subtask detected an error while initializing. The subtask and the Control-O or CMEM monitor shuts down. Before shutting down, the Control-O or CMEM monitor attempts to start a new Control-O or CMEM monitor to replace itself. If it does not succeed after a few attempts, Control-O or CMEM ceases trying.

Corrective Action: Contact your INCONTROL administrator.

CTO304S CONTROL-O AUTOMATION LOG SWAPPING ERROR

Explanation: The Automation Log subtask detected a problem when swapping the log. If the subtask handled the problem, Control-O continues to work as if AUTOMLOG was set to N in the CTOPARM member. Subsequent traces of rules will be written to the DAACTLOG sysout of the Control-O monitor.

If the subtask could not handle the problem, the subtask and the monitor may shut down. Before shutting down, the Control-O monitor attempts to start a new Control-O monitor to replace itself. If it does not succeed after a few attempts, Control-O gives up.

Corrective Action: Contact your INCONTROL administrator.

CTO305S {CONTROL-O | CMEM} AUTOM. LOG SEVERE INTERNAL ERROR ID= err

Explanation: The Automation Log subtask detected an internal logic problem. In this message, err is the identifying number of the error. The subtask and the Control-O or CMEM monitor shut down. Before shutting down, the Control-O or CMEM monitor attempts to start a new Control-O or CMEM monitor to replace itself. If it does not succeed after a few attempts, Control-O or CMEM ceases trying.

Corrective Action: Report the value of err to your INCONTROL administrator.

CTO306S ERROR DETECTED DURING LOGGING

Explanation: The Automation Log subtask detected an internal error while logging a record.
The subtask continues to work, but some records may be lost from the Automation Log.

**Corrective Action:** Contact your INCONTROL administrator.

### CTO307E PROBLEMS WITH WRITEF. LOG SWAPPED

**Explanation:** The Automation Log subtask detected a problem while trying to commit changes in the Automation Log file.

Control-O continues to work as if AUTOMLOG was set to N in the CTOPARM member. Subsequent traces of rules are written to the DAACTLOG sysout of the Control-O monitor.

**Corrective Action:** Contact your INCONTROL administrator.

### CTO308E AUTOMATION LOG I/O ERROR. RC = rc

**Explanation:** The Automation Log subtask detected an I/O error while trying to perform an operation on the Automation Log file.

In this message, rc is the return code generated by the error.

If the subtask handled the problem, Control-O continues to work as if AUTOMLOG was set to N in the CTOPARM member. Subsequent traces of rules are written to the DAACTLOG sysout of the Control-O monitor.

If the subtask cannot handle the problem, the subtask and the monitor may shut down. Before shutting down, the Control-O monitor attempts to start a new Control-O monitor to replace itself. If it does not succeed after a few attempts, Control-O ceases trying.

**Corrective Action:** Check MVS messages detailing the return code (rc) and the cause of the error (for example, disk failure, incorrect data set, or incorrect name or allocation parameters). Correct the cause of the error accordingly.

### CTO321S ERROR OPENING REPORT FILE

**Explanation:** The CTOCSF program was unable to open the file specified in the SYSPRINT DD statement. The SYSPRINT DD statement is either not specified in the JCL, or is specified incorrectly.

The CTOCSF program ends with a return code of 08.

**Corrective Action:** Check and correct the JCL job.

### CTO322S ERROR OPENING STATISTICS INPUT FILE

**Explanation:** The source Statistics file cannot be opened. The CTOCSF program is unable to open the file referenced by the DASTF DD name.

This problem may be due to one of the following:

- The SMF ID of the current CPU does not match the SMF ID included as part of the name of the Statistics file.
- The Statistics file may have been corrupted or moved from the expected location.

The CTOCSF program ends with a return code of 08.

**Corrective Action:** Do either or both of the following:
Examine and correct the JCL.
Examine any associated MVS messages for additional information, and correct any errors they may disclose.

**CTO323S INSUFFICIENT SPACE IN TARGET FILE**

**Explanation:** The new Statistics file is not large enough to contain all the records listed in the source Statistics file.
The CTOCSF program ends with a return code of 08.
**Corrective Action:** Create a larger Statistics file and resubmit the job.

**CTO324W ERROR CLOSING STATISTICS INPUT FILE**

**Explanation:** An internal error was encountered while closing the source Statistics file referenced by DD name DASTF.
The CTOCSF program ends with a return code of 08.
**Corrective Action:** Call your system programmer for assistance. If the problem is not resolved, contact your INCONTROL administrator.

**CTO325S ERROR OPENING STATISTICS OUTPUT FILE**

**Explanation:** Control-O was unable to open the target Statistics file specified in the CTOPARM member.
The CTOCSF program ends with a return code of 08.
**Corrective Action:** Check the JCL and the CTOPARM member for errors. Resubmit the job.

**CTO326S STATISTICS FILE DYNAMIC ALLOCATION ERROR rc/rsn/dsn**

**Explanation:** Dynamic allocation of the $dsn$ Statistics file failed with a return code of $rc$ and a reason code of $rsn$.
The CTORSTM Statistics Report utility terminates with a return code of 08.
**Corrective Action:** See the IBM manual *MVS Programming: Authorized Assembler Services Guide* to determine the cause of the error, and correct the error accordingly. If not successful, contact your INCONTROL administrator.

**CTO327W ERROR CLOSING STATISTICS OUTPUT FILE**

**Explanation:** An internal error was encountered while closing the target Statistics file. This message may be accompanied by an MVS message explaining the error. If such a message is issued, your system programmer may be able to fix the problem.
The CTOCSF program ends with a return code of 08.
**Corrective Action:** Call your system programmer for assistance. If the problem is not resolved, contact your INCONTROL administrator.
CTO328I COPY OF STATISTICS FILE ENDED OK

Explanation: This information message indicates that the Statistics file was successfully copied by the CTOCSF utility.

Corrective Action: No action is required.

CTO329I COPY OF STATISTICS FILE STARTED

Explanation: This information message indicates that the CTOCSF utility has begun copying the Statistics file.

Corrective Action: No action is required.

CTO333S ERROR FORMATTING AUTOMATION LOG FILE

Explanation: An I/O error was detected. The CTODVB program failed to execute an I/O operation with the Automation Log file.

Formatting of the Automation Log ends with a return code of 08.

Corrective Action: Check associated MVS messages detailing the cause of the error, for example, disk failure, incorrect data set, incorrect name or allocation parameters.

CTO334I FORMATTING OF AUTOMATION LOG FILE STARTED

Explanation: This information message indicates that formatting of the Automation Log file has begun.

Corrective Action: No action is required.

CTO335I FORMATTING OF AUTOMATION LOG FILE ENDED

Explanation: This information message indicates that formatting of the Automation Log file has ended successfully.

Corrective Action: No action is required.

CTO336S AUTOMATION LOG FILE WAS NOT BUILT

Explanation: Formatting of the Automation Log file failed. This message follows other messages detailing the problem.

The formatting of the Automation Log ends with a return code of 08.

Corrective Action: Consult previous messages detailing the reason for the error.

CTO337S AUTOMATION LOG DYNAMIC ALLOCATION ERROR rc/rsn/dsn

Explanation: A dynamic allocation problem occurred. The CTODVB program attempted to dynamically allocate the Automation Log file but failed.

Formatting of the Automation Log file ends with a return code of 08.

Corrective Action: Do the following:

1. For an explanation of return-code (rc) and the reason (rsn), see the IBM OS/390 Authorized Assembler Services Guide, and proceed accordingly.
2. Check the CTOPARM member.
3. Verify that an Automation Log file already exists for this CPU.

**CTO338S INVALID PARAMETERS PASSED TO PROGRAM**

*Explanation:* The CTODVB program detected an error in the parameters passed to it. Formatting of the Automation Log file ends with a return code of 08.

*Corrective Action:* Check the parameters passed to the program and correct them.

**CTO339S NULL PARAMETERS PASSED TO PROGRAM**

*Explanation:* The CTODVB program was called with no parameters. Formatting of the Automation Log file ends with a return code of 08.

*Corrective Action:* Check and correct the JCL.

**CTO341S AUTOMATION LOG FILE LEVEL INCONSISTENT WITH LEVEL OF CONTROL-O**

*Explanation:* The Automation Log file is not compatible with this release of Control-O. While opening an Automation Log file, the CTODVL program checks the file validity and usability. A mismatch was found between the release number of the Automation Log file and the release number of the program accessing it.

Action fails. The Automation Log file is not accessed.

*Corrective Action:* Do any or both of the following:

- Check if the libraries specified in the STEPLIB and LINKLIST concatenation contain modules from different releases.
- Check the Automation Log file data set name. If you are using an older release of the program or an old file, correct the error.

**CTO342S ERROR OPENING AUTOMATION LOG FILE**

*Explanation:* This is one of two messages with the same ID, but different text.

The CTODVL program was unable to open the Automation Log file.

The action fails. The Automation Log file is not accessed.

*Corrective Action:* Do any or all of the following:

- Check the definitions in the CTOPARM member.
- Check the JCL for errors.
- Check the data set name for the Automation Log file.

**CTO342S ERROR OPENING OPERLOG FILE**

*Explanation:* This is one of two messages with the same ID, but different text.
The user tried to access the OPERLOG in a SYSPLEX environment. However, the OPERLOG could not be opened.
The system rejects the request and continues.

**Corrective Action:** Record the message and contact your system programmer.

CTO343S AUTOMATION LOG DYNAMIC ALLOCATION ERROR \( rc/rsn/dsn \)

**Explanation:** The CTODVL program was unable to dynamically allocate the Automation Log file.
Action fails. The Automation Log file is not accessed.

**Corrective Action:** Do any or all of the following:
- See documentation on dynamic allocation in the IBM authorized guide to Assembler services for explanations of the return code (\( rc \)) and the reason code (\( rsn \)), and proceed accordingly.
- Check the CTOPARM member.
- Ensure that an Automation Log file exists for this CPU.

CTO344S AUTOMATION WRITE ERROR

**Explanation:** An I/O error occurred. The CTODVL program did not succeed in performing an I/O operation on the Automation Log file.
Action fails. The Automation Log file is not accessed.

**Corrective Action:** If you cannot determine the reason for this I/O error (for example, a disk failure), contact BMC Software Customer Support.

CTO345S ERROR EXECUTING RDJ FCB

**Explanation:** The CTODVL program received a non-zero return code from system service RDJ FCB. The CTODVL program failed to read the J FCB of the dynamically allocated Automation Log file.
Action fails. The Automation Log file is not accessed.

**Corrective Action:** Contact BMC Software Customer Support.

CTO346S ABEND \( abCode \) INTERCEPTED WHILE PROCESSING THE AUTOMATION LOG

**Explanation:** This is one of two messages with the same ID, but different text.
The CTODVL program intercepted an abend while processing the Automation Log.
The action fails. The Automation Log file is not accessed.

**Corrective Action:** Contact BMC Software Customer Support.

CTO346S ABEND \( abCode \) INTERCEPTED WHILE PROCESSING THE OPERLOG

**Explanation:** This is one of two messages with the same ID, but different text.
The user tried to access the OPERLOG in a SYSPLEX environment but an abend was generated.
For information about abCode, see the IBM Abend Codes manual.

The system terminates the requested action.

**Corrective Action:** Take appropriate corrective action.

**CTO347S THE AlLOCATED AUTOMATIOn LOG FILE BELONGS TO ANOTHER CONTROL-O INSTALLATION**

**Explanation:** This is one of two messages with the same ID, but different text.

The specified Automation Log file refers to another Control-O. While opening an Automation Log file, the CTODVL program checks the validity and usability of the file being opened. A mismatch was found between the current value specified for the CTOQNAME parameter in the CTOPARM member and the value of that parameter when the Automation Log file was formatted.

Action fails. The Automation Log file is not accessed.

**Corrective Action:** Do either or both of the following:

- Ensure that you are not using load libraries that belong to another installation of Control-O.
- Check if the CTOPARM member has changed.

**CTO347S ERROR RETURN CODE FROM A SYSTEM LOGGER REQUEST rc**

**Explanation:** This is one of two messages with the same ID, but different text.

The user issued the OPER command in the OL screen to access the OPERLOG in a SYSPLEX environment. However, the request failed and the rc SYSTEM LOGGER return code was issued.

The system rejects the request.

**Corrective Action:** For information about the error, note the value of rc and see IBM LOGGER services (IXGxxx macros) in the Sysplex service manual.

**CTO348S FILE NOT AN AUTOMATION LOG FILE**

**Explanation:** This is one of two messages with the same ID, but different text.

The specified file is not a Control-O Automation Log file. While opening an Automation Log file, CTODVL checks the validity and usability the file. The specified file was not an Automation Log file.

Action fails. The Automation Log file is not accessed.

**Corrective Action:** Check if the formatting of the Automation Log file ended successfully. If it failed, redefine (reformat) the Automation Log.

**CTO348S OPERLOG IS EMPTY**

**Explanation:** This is one of two messages with the same ID, but different text.

The user issued the command OPER in the OL screen to access the OPERLOG in a SYSPLEX environment. In response, the system logger informed Control-O that the OPERLOG was empty.

The system rejects the request.

**Corrective Action:** For more information about the error, note the message and contact your system programmer.
CTO349S AUTOMATION LOG FILE IS BEING FORMATTED IT CANNOT BE ACCESSED

Explanation: This is one of two messages with the same ID, but different text.

The specified Automation Log file is currently being formatted. While opening the Automation Log file, the CTODVL program checks the validity and usability of the file. The specified file has a status incompatible with the requirements of the program.

Action fails. The Automation Log is not accessed.

Corrective Action: Check if the formatting of the Automation Log file ended successfully. If it failed, redefine (reformat) the Automation Log.

CTO349S OPERLOG END OF FILE IS REACHED

Explanation: This is one of two messages with the same ID, but different text.

The user attempted to access the OPERLOG in a SYSPLEX environment and reached the end of the OPERLOG. However, no more data was available in the OPERLOG.

The system rejects the request.

Corrective Action: Reattempt access to the OPERLOG.

CTO350E ERROR FREEING STORAGE. ADDR= addr LEN= length SP= subpool RELATED = rel

Explanation: An internal error was detected.

During termination, Control-O or CMEM frees internal control blocks and work areas. An error occurred while this was being done.

Control-O or CMEM continues termination.

Corrective Action: Contact BMC Software Customer Support.

CTO352W SERVER serverId DID NOT RESPOND TO STOP REQUESTS. SERVER STATUS OVERRIDDEN

Explanation: Server serverId did not respond to a STOP request.

When Control-O executes a server STOP request, it waits for acknowledgment from the server. If the server does not respond within thirty seconds, this message is displayed.

The specified server is given the status ENDED WITH AN ERROR.

Corrective Action: Check output and messages issued by the problem server. If necessary, bring down the server and start a new one.

CTO353I module RELOADED. OLD: datetime1 NEW: datetime2

Explanation: This information message indicates that the RELOAD command completed execution successfully.

This message provides the installation date and time of the old and newly-replaced modules in mm/dd/yy hh.mm format.
InControl for z/OS Messages Manual

- **module** - the name of the module that was successfully reloaded
- **datetime1** - the assembly date of the old module
- **datetime2** - the assembly date of the newly installed module

**Corrective Action:** No action is required.

**CTO354I SERVER STCID TYP QLN STIME STATUS**

**Explanation:** This information message is the normal response of the Control-O monitor to the F CONTROLO,SERVER= serverId,DISPLAY operator command.

This message is the header for information in messages CTO355I and MTO355I.

**Corrective Action:** No action is required.

**CTO355I serverId jobId type queueLength statusTime status**

**Explanation:** The Control-O monitor sends this information message to the console in response to the command:

```
F CONTROLO,SERVER=serverId,DISPLAY
```

Each occurrence of this message describes a server defined to Control-O. These messages are preceded by message CTO354I or MTO354I that provides the header. The information in this message is in the same format as the Option SERVERS screen of the Automation Options facility.

For more information, see the Control-O User Guide.

**Corrective Action:** No action is required.

**CTO356I modifyCmdText**

**Explanation:** This information message displays the text of the submitted modify command.

**Corrective Action:** No action is required.

**CTO357I COMMAND ENDED SUCCESSFULLY**

**Explanation:** This information message indicates that the last modify command ended successfully.

**Corrective Action:** No action is required.

**CTO358W LIMIT OF LINES REACHED. FURTHER LINES NOT DISPLAYED**

**Explanation:** More than 1,000 lines were issued in response to a MODIFY command specified with the DISPLAY parameter.

When more than 1,000 lines are issued to the operator's console, Control-O terminates the command which is creating the lines, to avoid a shortage of space in the console's buffer.

Only the first 1,000 lines are displayed.

**Corrective Action:** No action is required.
CTO359W CONTROL-O COSMOS IS NOT ACTIVE

**Explanation:** The user attempted to stop COSMOS while it was not active. The COSMOSSTOP command is ignored.

**Corrective Action:** No action is required.

CTO35AW CONTROL-O COSMOS IS ALREADY ACTIVE

**Explanation:** The user attempted to start COSMOS while it was active. The COSMOSSTART command is ignored.

**Corrective Action:** No action is required.

CTO35BI OBJECTDB METHODDB MODE

**Explanation:** This information message is the header for data provided in message CTO35CI. This message is the normal response of Control-O to the `F CONTROLO,COSMOS=cosmosdb,DISPLAY` operator command.

This command displays general information about COSMOS Object databases.

**Corrective Action:** No action is required.

CTO35CI objectDb methodDb mode

**Explanation:** This information message is the normal response of Control-O to the `F CONTROLO,COSMOS=cosmosdb,DISPLAY` operator command.

Each occurrence of this message describes an Object database under COSMOS control. Message CTO35BI generates the message header.

The variables in this message are:

- `objectDb` - the working COSMOS object database
- `methodDb` - the COSMOS Method database
- `mode` - the current COSMOS database mode

**Corrective Action:** See COSMOS commands in the Control-O User Guide.

CTO35DW INVALID COSMOS MODIFY COMMAND - errorText

**Explanation:** The user issued a COSMOS command with invalid parameters.

In this message, `errorText` describes the error.

The command is ignored. Processing continues.

**Corrective Action:** Specify the COSMOS command with valid parameters. For more information, see “Control-O/COSMOS Commands” in the Control-O/COSMOS User Guide.

CTO35EW action COSMOS id FAILED - text

**Explanation:** The specified action (action) on the id COSMOS ID failed.
An invalid syntax, action or ID was specified.
The system ignores the command.
Corrective Action: Correct the syntax, action, or ID and reissue the command.

CTO35FW MODIFY COMMAND REJECTED
Explanation: The user attempted to issue an invalid modify command to the Control-O monitor.
The system rejects the command.
Corrective Action: Correct the command syntax and reenter the command

CTO360E ERROR IN RELOAD INITIALIZATION
Explanation: The RELOAD modify command encountered a problem with the Control-O SSVT or one of its function routines.
The internal control block structure has been corrupted.
The RELOAD modify command is terminated.
Corrective Action: Bring down and restart Control-O. RELOAD is not necessary.

CTO360S AUTOMATION LOG DYNAMIC ALLOCATION ERROR rc/rsn/dsn
Explanation: SVC 99 failed during allocation or dealllocation of the Automation Log file. The CTOALI program uses SVC 99 to dynamically allocate and dealllocate the Automation Log file.
For explanations of the return code (rc) and reason code (rsn) displayed as part of this message, see the IBM manual MVS Programming: Authorized Assembler Services Guide.
The CTOALI programs ends with a return code of 08.
Corrective Action: No action is required.

CTO361E ERROR IN RELOAD PRELIMINARY PHASE
Explanation: The RELOAD modify command encountered a problem with an MVS macro instruction.
The user tried to reload the CTOWTO Control-O module in storage but this module was not found in the Control-O STEPLIB libraries.
The RELOAD modify command is terminated.
Corrective Action: No action is required.

CTO361S ERROR WHILE LOADING MODULE IDCAMS
Explanation: Loading of the IDCAMS module failed. The CTOALI program failed to link to IDCAMS to define a VSAM linear data set.
The CTOALI program ends with a return code of 08.
Corrective Action: Determine why the IDCAMS module cannot be loaded from STEPLIB or LINKLST, correct the problem, and resubmit the job.
CTO362E ERROR IN RELOAD PROCESSING

**Explanation:** The RELOAD modify command encountered a problem with an MVS macro instruction. There may not be enough CSA (Common Service Area) storage available to load the new CTOWTO module. The RELOAD modify command is terminated.

**Corrective Action:** Bring down and restart Control-O. RELOAD is not necessary.

CTO362S INVALID PARAMETERS PASSED TO THE PROGRAM

**Explanation:** The CTOALI program was called with invalid parameters, either using the PARM parameter in the JCL, or using the program that called the CTOALI program. The CTOALI program ends with a return code of 08.

**Corrective Action:** Call your system programmer for assistance. If the problem is not resolved, contact your INCONTROL administrator.

CTO363E ERROR IN RELOAD BACK-END PROCESSING

**Explanation:** In response to the RELOAD modify command, Control-O encountered a problem when attempting to deallocate a routine. The internal control block structure has been corrupted. The RELOAD modify command is completed, but cleanup processing is aborted.

**Corrective Action:** No action is required.

CTO363S NO PARAMETERS PASSED TO THE PROGRAM

**Explanation:** The CTOALI program was called with null parameters, either using the PARM parameter in the JCL, or using the program that called CTOALI. The CTOALI program ends with a return code of 08.

**Corrective Action:** Call your system programmer for assistance. If the problem is not resolved, contact your INCONTROL administrator.

CTO364E ALTERNATE SUBSYSTEM SSCT ENTRY NOT FOUND

**Explanation:** The alternate subsystem SSCT entry specified in the ALTSSN CTOPARM parameter is not in the system. Control-O monitor failed to find the SSCT prior to activating the alternate subsystem. Control-O monitor routine continues without activating the alternate subsystem.

**Corrective Action:** Add the alternate subsystem name to the IEFSSNxx member in the SYS1.PARMLIB library and then IPL the system. The alternate subsystem cannot be activated until after the IPL.

CTO364S ERRORS IN IDCAMS PROCESSING

**Explanation:** The IDCAMS module ended with a non-zero return code. The CTOALI program links to IDCAMS to define VSAM linear data sets.
The CTOALI program ends with a return code of 08.

**Corrective Action:** Check the job printout to see why IDCAMS did not end successfully. It may be necessary to edit the DIVSKEL member in the INSTWORK library to change the MODELM statements of the IDCAMS SYSIN. Correct and resubmit the job.

---

CTO365S VOLUME PARAMETER MUST BE SPECIFIED FOR DIV DATASETS

**Explanation:** The volume was not specified for a VSAM linear data set.

The CTOALI program ends with a return code of 08.

**Corrective Action:** Specify a volume and resubmit the job.

---

CTO366E CONTROL-O COSMOS IS NOT INSTALLED

**Explanation:** The user attempted to enter a COSMOS command. However, Control-O COSMOS was not installed.

Control-O ignores the command and processing continues.

**Corrective Action:** Install Control-O COSMOS.

---

CTO367E SMODE VALID VALUES ARE F, Y, AND N

**Explanation:** An invalid value was specified for the SMODE parameter in an operator command.

Valid values for SMODE (stand alone mode) are:

- **F (Forced)** - Each Control-O copy is responsible for updating the IOA Log file. Default. BMC Software recommends that you do not change this default.
- **Y (Yes)** - Each Control-O copy passes requests to write to the IOA Log file to Control-M by means of the communications file, except for requests initiated by the New Day procedure (which are treated as if SMODE is set to F). Setting SMODE to Y causes less ENQ contention for the IOA Log file but increases pressure on the Control-M monitor.
- **N (No)** - Control-O always passes requests to write to the IOA Log file to Control-M by means of the communications file.

The operator command is ignored.

**Corrective Action:** Specify a valid value for the SMODE parameter and reissue the command. For more information, see SMODE in the relevant appendix of the *INCONTROL for z/OS Administrator Guide*.

---

CTO36GW CTOWTO CANNOT BE RELOADED BECAUSE XES SYSTEM-MANAGED REBUILD IS IN PROGRESS. TRY TO RELOAD LATER.

**Explanation:** CTOWTO cannot be reloaded until the system-managed process ends.

The RELOAD command is rejected.

**Corrective Action:** Wait for the system-managed process to end and reissue the RELOAD command.
CTO36HE INVALID MODULE NAME SPECIFIED IN RELOAD COMMAND.

Explanation: A REALOD modify command has been issued for an invalid module name. The module name is either not a module or not a reloadable module. The invalid module name appears in the previous CTO356I message, which echoed the modify command.
The command is ignored.
Corrective Action: Issue the command again with the correct reloadable module name.

CTO370I COPY OF CONTROL-O AUTOMATION LOG STARTED

Explanation: This information message indicates that the CTOALOCP utility has begun copying the Automation Log file.
Corrective Action: No action is required.

CTO371I COPY OF CONTROL-O AUTOMATION LOG ENDED

Explanation: This information message indicates that the CTOALOCP utility has successfully completed copying the Automation Log file.
Corrective Action: No action is required.

CTO372S COPY OF CONTROL-O LOG ENDED WITH ERRORS

Explanation: The CTOALOCP utility abended. This message follows a message describing the cause of the error detected.
The CTOALOCP utility ends with a return code of 08.
Corrective Action: See the previous message for the cause of the error, correct the problem, and resubmit the job.

CTO384S AUTOM. LOG SEQ. DYNAMIC ALLOCATION ERROR rc/rsn/dsn

Explanation: Dynamic allocation (SVC 99) of a sequential Automation Log file failed. The CTOALOCP utility uses SVC 99 to dynamically allocate and deallocate file dsn which is a sequential source or target Automation Log file.
The CTOALOCP utility ends with a return code of 08.
Corrective Action: Examine the return and reason codes and take appropriate corrective action.

CTO390S OPEN OF DDNAME ddName FAILED.

Explanation: Open of the ddName DD name failed. Possible causes are:
- The ddName DD statement is missing.
- The data set described by the ddName DD statement does not exist.
Execution stops.
Corrective Action: Correct the JCL of the job and rerun.
CTO392S OPEN OF DDNAME ddName FAILED

**Explanation:** The opening of the data set referenced by the DD name *ddName* failed.

Possible causes are:
- the DD statement referring to the data set referenced by the DD name *ddName* is missing.
- The data set referenced by the DD statement *ddName* does not exist.

System action depends on the calling program. Execution may continue, or it may stop with a condition code of 08, 12, or 16.

**Corrective Action:** Correct the JCL and rerun.

Messages CTO400 through CTO4xx

This group includes messages for the Control-O product.

CTO403I text

**Explanation:** This information message is an internal message used by the Control-O or CMEM USS (UNIX Services for OS/390) interface module to trigger a CMEM event using ON DSNEVENT and ON STEP in the USS address space. The message indicates that a forked process started. The text may include unprintable characters.

This message cannot be suppressed from the Automation Log.

**Corrective Action:** No action is required.

CTO410I ALLOCATION OF GLOBAL AUTOEDIT LIBRARY STARTED

**Explanation:** This information message indicates the normal start of the CTODFG program that allocates the Global library.

**Corrective Action:** No action is required.

CTO411E INVALID PARAMETERS: parms

**Explanation:** The CTODFG program detected invalid parameters.

The program terminates with a return code of 08.

**Corrective Action:** Verify the parameters, correct them, and resubmit the utility.

CTO412E THIS CPU HAS SMFID cpuSmfId AND NOT parmSmfId

**Explanation:** The SMF ID of the CPU on which the CTODFG program is running does not match the SMF ID passed as a parameter to the program.

The variables in this message are:
- *cpuSmfId* - the SMF ID of the CPU on which the CTODFG program is running
- *parmSmfId* - the SMF ID passed as a parameter to the program

The program terminates with a condition code of 08.
**Corrective Action:** Verify the SMF ID of the CPU on which Control-O is running, and resubmit the utility with the correct parameter.

CTO416E DYNAMIC ALLOCATION ERROR RC=rc,ERROR=rsn, DSN=dsn

**Explanation:** The CTODFG program failed while attempting to dynamically allocate the Global library. The CTODFG program terminates with a condition code of 08.

**Corrective Action:** For an explanation of the return and reason codes, see the IBM OS/390 Authorized Assembler Services Guide.

CTO417E CTMMEM ERROR, RC= rc

**Explanation:** The CTODFG program received return code rc from the CTMMEM module while attempting to update the Global library. The error occurred when the CTODFG program attempted to create the $$GLOBAL member in the Global library.

Possible causes indicated by values of rc:
- 08 - The region size is too small.
- 28 - The data set is in use.
- 32 - Internal error.
- 56 - The library is full or an abend occurred.
- 64 - The member already exists.

The CTODFG program terminates with a condition code of 08.

**Corrective Action:** If possible, correct the problem with the library, and resubmit the utility. If the error persists, contact BMC Software Customer Support.

CTO418E ALLOCATION OF GLOBAL AUTOEDIT LIBRARY FAILED

**Explanation:** Allocation of the Global library failed. This error message, which is issued by the CTODFG program, is preceded by another message detailing the reason for the failure.

The CTODFG program terminates with a condition code of 08.

**Corrective Action:** See the preceding message.

CTO419I ALLOCATION OF GLOBAL AUTOEDIT ENDED

**Explanation:** This information message indicates that the CTODFG program successfully allocated the Global library.

**Corrective Action:** No action is required.

CTO421I CTOCPS STARTED

**Explanation:** This information message indicates that the CTOCPS program, which compresses or verifies the Global AutoEdit library, started.

**Corrective Action:** No action is required.
CTO422S COMPRESS REQUIRED FOR GLOBAL AUTOEDIT VARIABLES LIBRARY

**Explanation:** The Global AutoEdit library needs to be compressed but automatic compression was disabled. Control-O does not automatically compress the Global AutoEdit library because N is specified for the GLBCOMP parameter in the CTOPARM member.

The library is not compressed. Command WRITEGLOBAL fails.

**Corrective Action:** Do one of the following:
- Use site compression procedures to compress the Global AutoEdit library. Ensure that the Global AutoEdit library is large enough to prevent D37 abends between periodic compressions.
- For information on how to set automatic compression, see the Control-O installation chapter in the INCONTROL for z/OS Installation Guide.

CTO423S DYNAMIC ALLOCATION ERROR DURING COMPRESS, ERROR=rc/rsn/dsn

**Explanation:** Dynamic allocation (SVC 99) failed. The CTOCPS program uses SVC 99 to dynamically allocate and deallocate the Global AutoEdit library and its copy file.

The variables in this message are:
- rc - the return code of the error
- rsn - the reason for the failure
- dsn - the name of the data set that cannot be allocated

The CTOCPS program ends with a return code of 08. The WRITEGLOBAL command fails.

**Corrective Action:** For an explanation of the return code (rc) and the reason code (rsn), see the IBM manual MVS Programming: Authorized Assembler Services Guide. Until this problem is resolved, use site compression procedures to compress the Global AutoEdit library.

CTO424I FIRST COMPRESSION PHASE STARTED - LIBRARY UNLOAD

**Explanation:** This information message indicates that the backup phase of the CTOCPS program has begun.

**Corrective Action:** No action is required.

CTO425I SECOND COMPRESSION PHASE STARTED - COMPRESS IN PLACE

**Explanation:** This information message indicates that the compress in place phase of the CTOCPS program has begun.

**Corrective Action:** No action is required.

CTO426I CTOCPS ENDED

**Explanation:** This information message indicates that the CTOCPS program has successfully completed compressing the Global AutoEdit library.

**Corrective Action:** No action is required.
CTO427S IEBCOPY RETURNED A NON-ZERO COMPLETION CODE

Explanation: IEBCOPY could not complete its task. IEBCOPY is invoked internally by the CTOCPS program to copy or compress a data set.

The CTOCPS program ends with a return code of 08. The WRITEGLOBAL command fails.

Corrective Action: If your system programmer cannot resolve the problem, contact your INCONTROL administrator. Until this problem is resolved, use site compression procedures to compress the Global AutoEdit library.

CTO428S CTOCPS RECEIVED AN INVALID PARAMETER LIST

Explanation: The CTOCPS program received a parameter list with an unexpected format. This message indicates an internal error.

The CTOCPS program ends with a return code of 08. The WRITEGLOBAL command fails.

Corrective Action: Contact BMC Software Customer Support. Until this problem is resolved, use site compression procedures to compress the Global AutoEdit library.

CTO429S PREVIOUS COMPRESS FAILED. GLOBAL LIBRARY CANNOT BE RESTORED FROM BACKUP

Explanation: Compression cannot be performed because the Global AutoEdit library was corrupted during the last compression and no valid backup exists.

During CTOCPS processing, the $$COMPST control member is repeatedly updated to track completed operations. The contents of this control member indicate that the last time CTOCPS ran, Control-O did not successfully compress the Global AutoEdit library. As a result, there is no usable backup. Therefore, the Global AutoEdit library cannot be restored.

Control-O stops loading Global variables.

Corrective Action: If you are unable to restore the Global AutoEdit library, run the NEWGLOB job, which renames the corrupted Global AutoEdit library, and creates a new one with the old name using Global variable information from memory. The NEWGLOB job is in the INSTWORK library.

For more information, see the section on automatic compression of the global AutoEdit library in the INCONTROL for z/OS Administrator Guide.

CTO430S ERROR READING AUTO-COMPRESS CONTROL-MEMBER $$COMPST

Explanation: The CTOCPS program was unable to read the $$COMPST control member. The $$COMPST member is defined by the NEWGLOB job during installation of Control-O. The CTOCPS program checks the $$COMPST control member to determine if the last automatic compression was successfully completed.

The CTOCPS program ends with a return code of 08. Commands READGLOBAL and WRITEGLOBAL are ignored.

Corrective Action: Ensure that the $$COMPST control member exists in the Global AutoEdit library, and if the NEWGLOB job was not run during installation, submit this job. If the problem is not resolved, contact your INCONTROL administrator.
CTO431S ERROR WRITING AUTO-COMPRESS CONTROL-MEMBER $$COMPST

**Explanation:** The CTOCPS program was unable to write the $$COMPST control member. The $$COMPST member is defined by the NEWGLOB job during installation of Control-O.

The CTOCPS program ends with a return code of 08.

**Corrective Action:** Ensure that the $$COMPST control member exists in the Global AutoEdit library, and if the NEWGLOB job was not run during installation, submit this job. If the problem is not resolved, contact your INCONTROL administrator.

CTO432I RESTORE OF GLOBAL VARIABLES LIBRARY STARTED

**Explanation:** This information messages indicates that the CTOCPS program has begun restoring the Global AutoEdit library. The CTOCPS program was unable to read the Global AutoEdit library, but the backup file is intact.

CTOCPS restores the Global AutoEdit library from the backup file.

**Corrective Action:** No action is required.

CTO433S ABEND *abCode* INTERCEPTED DURING COMPRESS

**Explanation:** Recovery routine ESTAE intercepted an abend during execution of a READGLOBAL or WRITEGLOBAL command.

The READGLOBAL or WRITEGLOBAL command is ignored.

**Corrective Action:** Check and correct the names of the Global AutoEdit library and the backup copy. If these libraries are corrupt (for example, by a disk crash), restore them from a backup.

CTO434I COMPRESS OF GLOBAL VARIABLES LIBRARY STARTED

**Explanation:** This information message indicates that the CTOCPS program has begun compressing the Global AutoEdit library.

**Corrective Action:** No action is required.

CTO440I READ/WRITE GLOBAL VARIABLES STARTED

**Explanation:** This information message indicates that the CTOVPL program, which is responsible for loading and writing global variables, has begun read/write to the Control-O global pools.

**Corrective Action:** No action is required.

CTO441S INVALID PARAMETERS

**Explanation:** The CTOVPL program received an incorrect parameter list while executing a LOADGLOBAL or WRITEGLOBAL command.

This message indicates an internal error.

**Corrective Action:** Contact BMC Software Customer Support.
CTO442S ERROR OPENING DAGLBLST

**Explanation:** The CTOVPL program was unable to open the Global Pool List during execution of a LOADGLOBAL or WRITEGLOBAL command.

The Global Pool List is defined by the DAGLBLST DD name in the procedure of the Control-O monitor.

The LOADGLOBAL/WRITEGLOBAL command is ignored.

**Corrective Action:** Check and correct the DD name and related data set specifications in the Control-O monitor procedure.

CTO443S POOL poolid - GETMAIN ERROR

**Explanation:** The user issued a LOADGLOBAL command with the specified Variable Global pool. However, the variables in this pool could not be loaded.

There is insufficient storage in ECSA for loading Global variables from the specified Global variable pool.

Command LOADGLOBAL is ignored.

**Corrective Action:** Increase the size of ECSA storage.

CTO444S POOL poolid - ERROR LOADING GLOBAL VARIABLES

**Explanation:** Control-O could not load variables from the specified Global variable pool.

This message is preceded by messages describing the cause of the error.

Command LOADGLOBAL is ignored.

**Corrective Action:** See the accompanying messages for details about the cause of the error and possible solutions.

CTO445S POOL poolid - ERROR WRITING GLOBAL VARIABLES

**Explanation:** Control-O could not write variables to the specified Global pool.

This message is preceded by messages describing the cause of the error.

Command WRITEGLOBAL is ignored.

**Corrective Action:** See the accompanying messages for details about the cause of the error and possible solutions.

CTO446S POOL poolid - NOT FOUND IN MEMORY

**Explanation:** The user specified a LOADGLOBAL/WRITEGLOBAL command, but Control-O could not locate the specified pool.

Control-O could not locate the specified pool while executing a LOADGLOBAL/WRITEGLOBAL command and could not locate the control block for the specified pool name. This usually happens when either the specified pool name is not defined in the Global Pool List member (DAGLBLST) or the specified member was never loaded.

Command LOADGLOBAL/ WRITEGLOBAL command is ignored.

**Corrective Action:**

1. Define the pool in the DAGLBLST member.
2. Use the LOADGLOBAL command to load the pool.

Cto447s Freemain Internal Error

Explanation: The CTovpl program was unable to free internal control blocks while executing a LOADGLOBAL or WRITEGLOBAL command.

This message indicates an internal error.

Corrective Action: Contact BMC Software Customer Support.

Cto448s Error Freeing Auto-Edit Internal Blocks

Explanation: The CTovpl program was unable to free internal control blocks while executing a LOADGLOBAL or WRITEGLOBAL command.

This message indicates an internal error.

Corrective Action: Contact BMC Software Customer Support.

Cto449s Error Freeing Global Member Internal Blocks

Explanation: Control-O could not free internal control blocks of a Global variable pool.

Control-O could not free internal control blocks while executing a LOADGLOBAL/WRITEGLOBAL command.

This message indicates an internal error.

Corrective Action: Contact BMC Software Customer Support.

Cto44as Error Releasing Coupling Facility Resources

Explanation: Old data was not successfully deleted from the Coupling facility.

When newly loaded variables became effective after a LOAGLOBAL operation for an XAE (SYSPLEX-wide AutoEdit) database, Control-O or CMEM failed to delete the old copy of the AutoEdit databases from the Coupling facility.

Old data from the Coupling facility structure is not deleted.

As a result, unnecessary data may accumulate in the space allocated for the Coupling facility structure until the space is exhausted.

Corrective Action: Shut down all Control-O or CMEM monitors as soon as possible and restart them, one at a time.

In addition, send the sysout files for your monitor to BMC Software Customer Support for analysis.

Cto44be Error Switching Coupling Facility Information

Explanation: During an attempt to switch to the new version of XAE database variables that were being loaded, an error occurred.

XAE variables are loaded in three steps. They are loaded to ECSA, copied to the Coupling facility and then marked effective in the Coupling facility. This message indicates a failure during the third step.

During the implicit LOADGLOBAL operation at startup, Control-O initialization fails. During ongoing operations, only the LOADGLOBAL operation fails.
**Corrective Action:** Send all the Control-O syosout files and the contents of the DAGLBLST library member to BMC Software Customer Support for analysis.

**CTO44CE request (X' code') FOR STRUCTURE structureName FAILED.**

**REASON:** rsn

**Explanation:** A request to the XAE structure failed. The message details the request name and code, and the reason for the failure.

Additional information is written to DATRACE.

**Corrective Action:** Check that all XAE structures are allocated and that Control-O or CMEM did not lose a connection to them. If a connection was lost, restart Control-O or CMEM. Otherwise, contact BMC Software Customer Support for assistance.

**CTO450S POOL poolid IS NOT SPECIFIED IN DAGLBLST**

**Explanation:** Control-O could not locate the poolid pool in the DAGLBLST Global Variable Pool List member.

This message is normally issued in response to a failure of a LOADGLOBAL/ WRITEGLOBAL command in the DAGLBLST Global Pool List member.

The LOADGLOBAL/WRITEGLOBAL command is ignored.

**Corrective Action:** Do the following:
1. Define the pool in the DAGLBLST Global Pool List member.
2. Use the LOADGLOBAL command to load the pool.

**CTO451S INVALID CARD IN DAGLBLST**

**Explanation:** The CTOVPL program detected an invalid statement in the Global Pool List.

The Global Pool List is defined in the DAGLBLST DD statement in the Control-O monitor procedure.

The LOADGLOBAL/ WRITEGLOBAL command is ignored.

**Corrective Action:** Check and correct the Global Pool List member.

**CTO452S POOL poolid IS PROTECTED. IT CANNOT BE UPDATED**

**Explanation:** Control-O cannot execute a WRITEGLOBAL command for the poolid Global Variable pool.

The poolid pool name is defined in the DAGLBLST Global Variable Pool List member as protected or temporary.

The WRITEGLOBAL command is ignored.

**Corrective Action:** Check the definition of the pool in the DAGLBLST member and correct the definition if necessary.

**CTO453S pooling ERROR HANDLING PNX BLOCKS**

**Explanation:** This message indicates an internal error.

**Corrective Action:** Contact BMC Software Customer Support.
CTO454S POOL poolid - AUTOEDIT ERROR, RC= rc, REASON= rsn

**Explanation:** Control-O detected an invalid AutoEdit expression in the poolid Global Variable pool at startup or while executing the LOADGLOBAL command.

The poolid Global variable specified in the AutoEdit expression was not loaded. The error was caused for one of the following reasons:

- A mistake was made when the POOL member was manually edited.
- There was an internal error.

Depending on poolid type, the pool is stored in one of two locations: the Global Variables Library or a Control-O AutoEdit Variable database.

The AutoEdit statement is ignored. The LOADGLOBAL command continues with the next line in the DAGLBLST member.

**Corrective Action:**

1. For an explanation of the return code and reason code included in this message, see the following table.
2. Check the source of the AutoEdit expression.
3. Correct the error and reissue command LOADGLOBAL.
4. If the problem is due to an internal error, contact BMC Software Customer Support.

</table>

**CTO455I** POOL poolid HAS BEEN LOADED TYPE= pool_type ROWS= loaded_variables / max_variables_allowed

**Explanation:** This information message indicates that the Global Variable pool poolid was successfully loaded. If pool_type starts with DB, S1 or S2 the numbers in ROWS= are the loaded value and the maximum variables allowed. In other cases the values will be 0.

**Corrective Action:** No action is required.

**CTO457W DATABASE database NOT FOUND IN DATABASES FILE**

**Explanation:** During Control-O or CMEM initialization, Control-O or CMEM failed to load the Global AutoEdit Variable database because the database does not exist in the Global AutoEdit Variable Database file. The member pointed to by the DAGLBLST DD statement contains a list that specifies the Control-O Load Global AutoEdit Variable databases and the IOA Load Global AutoEdit Variable database. The required database that appears in the list does not exist in the Global AutoEdit Variable Database file.

Control-O or CMEM initialization continues.

**Corrective Action:** Notify the INCONTROL administrator

**CTO458S POOL poolid - ERRORS WHILE READING POOL**

**Explanation:** Control-O could not read the poolid Global variable pool during execution of command LOADGLOBAL.

The poolid pool is not loaded.

**Corrective Action:** Verify that the Global pool is in the Global AutoEdit library and that the library is not corrupted.

**CTO459I** READ/WRITE GLOBAL VARIABLES ENDED

**Explanation:** This information message indicates that the CTOVPL program successfully completed execution of command LOADGLOBAL/WRITEGLOBAL.

**Corrective Action:** No action is required.

**CTO45AW WARNING! poolName CONVERTED FROM Stype TO DBtype**

**Explanation:** There is a conflict between inconsistent IOAPLEX and DAGLBLST settings, as follows:

- In IOAPLEX, the ENABXES parameter or ENABXAE parameter is set to N.
- In DAGLBLST, the XAE database is specified as S1 type and S2 type, where type is one of the following database types:
  - TEMP
  - PROT
Control-O loads the database as a standard, or non-XAE, database. Database loading continues.

**Corrective Action:** Check whether, and how, the reduced capability affects any applications that use the downgraded XAE pool.

**CTO45BE -- MEMBER TYPE ERROR ---**

**Explanation:** Control-O or CMEM monitor encounter an invalid POOL TYPE in control record in the DAGLOBAL list file.

**Corrective Action:** No action is required.

**CTO45CE --- KEYWORD NOT RECOGNIZED ---**

**Explanation:** Control-O or CMEM monitor encounter an invalid keyword in a record in the DAGLOBAL list file.

**Corrective Action:** No action is required.

**CTO45DE --- ALL BLANKS - ERROR ---**

**Explanation:** Control-O or CMEM monitor the control record in the DAGLOBAL list file is all blank.

**Corrective Action:** No action is required.

**CTO45EE --- NO BLANKS - ERROR ---**

**Explanation:** Control-O or CMEM monitor encounter an empty control record format in the DAGLOBAL list file.

**Corrective Action:** No action is required.

**CTO45FE --- LESS THAN ZERO ---**

**Explanation:** Control-O or CMEM monitor encounter an invalid control record value in the DAGLOBAL list file.

**Corrective Action:** No action is required.

**CTO45GE --- INVALID CARD FORMAT ---**

**Explanation:** Control-O or CMEM monitor encounter an invalid control record format in the DAGLOBAL list file.

**Corrective Action:** No action is required.

**CTO45HE RECORD= record**

**Explanation:** Control-O or CMEM monitor encounter an error in the DAGLOBAL list file the previous error messages.

The record has been rejected.
Corrective Action: Correct the record and LOADGLOBAL or WRITEGLOBAL as necessary.

CTO45IE MAXIMUM NUMBER OF ROWS $max-num-rows$ EXCEEDED WHILE LOADING POOL $pool-name$. LOAD STOPPED.

Explanation: During LOADGLOBAL of AutoEdit POOL $pool-name$, excessive rows were encountered beyond the maximum number of defined rows $max-num-rows$ in screen IV.

The loading stops.

Corrective Action: If the unloaded AutoEdit variable is required, increase the maximum number of rows for the pool using the screen IV and re-issue the LOADGLOBAL command.

CTO45JI XAE TYPE 2 POOL $pool-name$ HAS NOT BEEN LOADED BECAUSE ANOTHER LPAR HAS ALREADY LOADED IT.

Explanation: During initial loading of AutoEdit POOLS, loading of the POOL $pool-name$, has been skipped because the POOL has already been loaded by Control-O/CMEM on another LPAR.

Corrective Action: No action is required.

Messages CTO500 through CTO5xx
This group includes messages for the Control-O product.

CTO500I INPUT LEN= $inplen$ REC= $inputRecordMsg$

Explanation: This information message is generated when the CTOTEST Control-O utility is invoked.

Corrective Action: This message is sent to CTOTEST. It echoes the input record.

CTO501I func OF RULE TABLE(S) STARTED

Explanation: This information message indicates that the function $func$ started on the rule tables.

Corrective Action: No action is required.

CTO501S OPEN FAILED FOR DDNAME CMDMSGFL

Explanation: The attempt to open input file CMDMSGFL failed.

Possible causes are:
- The CMDMSGFL DD statement is misspelled.
- The data set (member) referenced by the CMDMSGFL DD statement does not exist.

CTOTEST execution terminates.

Corrective Action: Check if the CMDMSGFL DD statement is present in the JCL.

CTO502S INPUT PARAMETER ERROR

Explanation: The subsystem name input parameter is invalid or missing.
CTOTEST execution terminates.

**Corrective Action:** Check if PARM= subsystemName is present in the parameter string.

**CTO503I RC rc LEN= len REC= msgText**

**Explanation:** This information message is generated when the CTOTEST Control-O utility is invoked. The variables in this message are:

- **rc** - the return code
- **len** - the new message length
- **msgText** - the new message text

**Corrective Action:** No action is required.

**CTO503S RULE ORDER LIST IS EMPTY. DDNAME="DARULLST"**

**Explanation:** Open of rule list data set failed (the DARULLST/DACTMLST DD statement). The message may be due to one of the following reasons:

- The DARULLST/DACTMLST missing.
- Data set described by the DARULLST/DACTMLST DD statement cannot be opened for sequential read or record length is not 80.

The Control-O/CMEM monitor shuts down or continues processing according to the status of the monitor.

**Corrective Action:** Correct the JCL and restart the Control-O/CMEM monitor.

**CTO504S INVALID DATA IN RULE ORDER LIST CARDS**

**Explanation:** Invalid data has been found in the rule order list. See INCONTROL for z/OS Administrator Guide for valid format information.

**Corrective Action:** Check the format of the rule list in the PARM library; correct and restart the Control-O/CMEM monitor.

**CTO505S MEMBER memName NOT FOUND IN LIBRARY lib**

**Explanation:** The memName member in the rule order was not found in library lib.

The member (rule table) may be specified incorrectly or may be missing from the library. The rule table is not ordered.

**Corrective Action:** Check and correct the member specification; reorder the rule table.

**CTO506S ORDER OF TABLE tableName RULE ruleName FAILED**

**Explanation:** The order of rule ruleName from table tableName failed. Prior messages usually explain why the rule table could not be ordered.

The rule is not be ordered.
**Corrective Action:** Check earlier messages for reasons the rule order failed. Correct as necessary, and reorder the rule table.

CTO507I LOAD ENDED FOR TABLE *table* LIBRARY *lib*

**Explanation:** This information message indicates that after ordering or forcing a Control-O rule table, loading of rules from the table ended.

**Corrective Action:** No action is required.

CTO508I \{ORDER | FORCE\} OF RULE TABLE(S) ENDED

**Explanation:** This information message indicates that Order or Force of the Control-O rule table ended.

**Corrective Action:** No action is required.

CTO509I NUMBER OF TABLES *numtbl* PROCESSED. *numrul1* RULES LOADED AND *numrul2* RULES REJECTED

**Explanation:** This information message indicates the number of tables processed, and the number of rules that were loaded or deleted (not loaded) as a result of an ORDER or FORCE request. This information can be used for manual verification purposes.

**Corrective Action:** Check the results to ensure that the rule loading was performed correctly.

CTO50BE HOLD BY *jobId* ASID *asid* ON SYSTEM *systemId*

**Explanation:** An ORDER or FORCE command to the Control-O or CMEM monitor to load a table or tables of rules failed, because the library is held by the job *jobId* with the ASID *asid* on system *systemId*. The command fails.

**Corrective Action:** Try to determine why the library is held. If possible, release it, and try again to ORDER or FORCE the table or tables.

CTO50CE LIBRARY WAS MIGRATED BY HSM DSNAME=

**Explanation:** An ORDER or FORCE command to the Control-O or CMEM monitor to load a table or tables of rules failed, because the library had been migrated by HSM. The command fails.

**Corrective Action:** If possible, restore or recall the library, then try again to ORDER or FORCE the table or tables.

CTO50FI *text*

**Explanation:** This information message displays the control record from the DARULLST or DACTMLST DD statement.

**Corrective Action:** No action is required.
CTO516S ERROR IN RULE DATA - MANDATORY stmt_type CARD IS EITHER MISSING OR IN AN INCORRECT ORDER

**Explanation:** A `stmt_type` statement is either missing or in the wrong order in a rule definition member.

Someone may have tampered with the rule definition data; the data do not conform to a valid Control-O or CMEM format.

The rule is not ordered.

**Corrective Action:** Restore the table to its original state from a backup copy, and reorder the rule table.

CTO517S RULE DATA NOT AVAILABLE: MEMBER memName IS EMPTY

**Explanation:** A member designated in the rule list is empty. This error message is issued by the CTOLDT program, which loads tables when a new Control-O or CMEM monitor is activated.

The table is not ordered.

**Corrective Action:** Check that the specification of the member in the rule list is correct. If so, check why the member is empty. Correct, and reorder the rule table.

CTO518S INVALID SCHEDULING DATE - date

**Explanation:** An invalid scheduling date format was used in the rule list or in a order/force request.

Valid `date` formats are:

- ddmmyy - Day, month, and year
- mmddyy - Month, day, and year
- * (Asterisk) - Current Control-O or CMEM working date.

The requested table order fails.

**Corrective Action:** Correct the date. Reorder the rule table.

CTO523S ERROR IN RULE DATA: INVALID IF-THEN-ELSE NESTING

**Explanation:** This message is issued during the ordering of the rule. The rule definition contains an invalid IF-ELSE-ENDIF nesting.

The rule is not ordered.

**Corrective Action:** Correct the rule definition and order it again.

CTO524S RULE TABLE(S) ENDED WITH ERROR

**Explanation:** The indicated function of the CTOLDT program ended with errors. This program loads rule tables when a new Control-O/CMEM monitor is activated, and performs order/force of rule tables.

The IOA Log should contain prior messages concerning the errors.

Depending on when it fails, either the Control-O/CMEM monitor shuts down, or the table is not ordered.

**Corrective Action:** No action is required.
CTO525I RULE TABLE(S) ENDED

**Explanation:** This information message is a normal message issued when the indicated function of the CTOLDT program has terminated successfully. This program loads rule tables when a new Control-O or CMEM monitor is activated, or performs an ORDER or FORCE of rule tables.

**Corrective Action:** No action is required.

CTO526S **** ERROR IN RULE CARDS. CHECK THE FOLLOWING CARDS ***

**Explanation:** The rule definition has been corrupted and the data do not conform to a valid Control-O/CMEM format.

This message is followed by one or more LDT527S messages describing all statements belonging to the damaged rule order. An asterisk (*) appears in the line under the erroneous data.

The rule is not ordered.

**Corrective Action:** Using the Online Viewing Facility, or by editing the member, restore the table to its original state, and reorder the rule table.

CTO527S CARD = card

**Explanation:** The rule definition has been corrupted.

This message follows message LDT526, and displays each statement in the damaged rule in the scheduling table. An asterisk * appears in the line under a damaged statement.

**Corrective Action:** Restore the table to its original state.

CTO528I RULE ruleName rule_type TABLE tableName LIBRARY lib ODATE odate LOADED

**Explanation:** This information message is a normal message when a rule order is successfully loaded by the Control-O/CMEM monitor.

The rule is now in Control-O/CMEM memory.

**Corrective Action:** No action is required.

CTO529I TABLE tableName LIBRARY lib DELETED

**Explanation:** This information message indicates that rule table `tableName` has been deleted from the Control-O/CMEM monitor as a result of an F CONTROLO,D=... operator command.

**Corrective Action:** No action is required.

CTO530E TABLE tableName LIBRARY lib REQUESTED DELETED NOT FOUND

**Explanation:** A request to delete a rule table from the Control-O/CMEM monitor has failed. Table `tableName` has not been found under Control-O/CMEM.

The table may be specified incorrectly or it may never have been ordered.
The table is not deleted.

**Corrective Action:** If the table specification incorrect, check and correct the table specification and issue the delete request again. If the table was never ordered, there is no reason to attempt to delete it.

**CTO531I** NO RULE WAS LOADED - TABLE `tableName` LIBRARY `lib`

**Explanation:** This information message indicates that the Control-O monitor did not load new rules from the `tableName` table in the `lib` library.

While ordering or forcing a rule library, Control-O found no rules that matched the Basic Scheduling parameters.

No rule is loaded.

**Corrective Action:** No action is required.

**CTO532E** MASK `mask` DOES NOT MATCH IN DSN=`dsn`

**Explanation:** The specified mask does not match any members in the rule library.

During rule ordering, the Control-O monitor found no members matching the specified mask.

No rule is loaded.

**Corrective Action:** Check and correct the parameters specified in the ORDER/FORCE command or in the rule list.

**CTO536S** SEVERE ERROR IN RULE DATA CARDS

**Explanation:** Severe error was found in the rule definition data statements. It is followed with additional messages regarding the error.

The rule table is not ordered.

**Corrective Action:** Check for additional messages concerning the errors in the systems and IOA Log and Control-O or CTMCMEM sysprint; correct the error and reorder the table.

**CTO537S** INSUFFICIENT STORAGE IN (EXTENDED) CSA. CANNOT LOAD TABLE

**Explanation:** Insufficient storage in the Extended Common Service Area (CSA) to load the rule table.

If any rules have been previously loaded, the Control-O/CMEM monitor proceeds without loading the table. If no rules were previously loaded, the Control-O/CMEM monitor shuts down.

**Corrective Action:** Check why there is insufficient CSA. You may need to contact your systems programmer. After correcting the problem, reload the table, or restart Control-O/CMEM, as necessary.

**CTO539W** ORDER CANCELLED BY USER EXIT: RULE `ruleName` TABLE `tableName` LIBRARY `lib`

**Explanation:** The specified rule order failed as a result of a user exit check.

The IOA Log should contain prior messages concerning the reason for failure.

The rule order is not ordered/loaded by the Control-O/CMEM monitor.
Corrective Action: Check the IOA Log for further information.

CTO545E DO-MISSION NOT SUPPORTED WITHOUT CONTROL-D INSTALLED

Explanation: An attempt was made to order a rule specifying DO MISSION, but Control-D is not installed. DO MISSION is supported only if Control-D is installed.

The rule is not ordered.

Corrective Action: Either remove this statement from the rule or install Control-D.

CTO548E SEVERE ERROR IN CALENDAR calName OR YEAR NOT FOUND IN CALENDAR

Explanation: Severe error in the IOA calendar calName, or the year not found in the calendar.

Either the year is not defined in the calendar or the calendar has been incorrectly modified.

The rule is not ordered.

Corrective Action: Check the contents of the rule order and the calendar. Correct and reorder the rule.

CTO54DE RULE TYPE IS INCORRECT. TABLE tableName LIBRARY dsn

Explanation: The user attempted to order or force a CMEM rule table from Control-O screen OR, or a Control-O rule table from CMEM screen C.

Control-O rules can only be ordered or forced from Control-O screen OR. CMEM rules can only be ordered or forced from CMEM screen C.

The table specified in the message is not loaded.

Corrective Action: If you issued the command from screen OR, issue it from screen C, or vice versa.

CTO54FW RULE WAS NOT LOADED: \{SYSTEM | SMF ID\}
{rul_sysname|rul_smfid} DOES NOT MATCH \{cur_sysname|cur_smfid\}

Explanation: Control-O did not load a rule because the environment specified for that rule does not match the current environment.

When Control-O loads a table of rules during startup or as a result of an order, it does not load rules whose specified environment does not match the current one.

The Control-O monitor sends this message to SYSPRINT and to the IOALOG, and does not load the rule.

Corrective Action: To load a rule, make the environment specified for it match the current one and reload the table containing the rule.

CTO555S INSUFFICIENT STORAGE. INCREASE THE REGION SIZE

Explanation: There was insufficient memory to perform a task.

The action that could not be performed accompanies this message. It may vary depending on the environment in which the message was issued.
Corrective Action: For jobs, increase the REGION size. For TSO, log on again using a larger SIZE parameter or exit one of the screens.

CTO560I ENVIRONMENT INITIALIZATION COMPLETE.
Explanation: This information message is issued when the Control-O API first connects with the Control-O or CMEM monitor and completes the initialization process.
Corrective Action: No action is required.

CTO561E REQUESTED FUNCTION NOT SUPPORTED
Explanation: The requested function is not in the list of supported XAM or Control-O API functions.
The XAM interface or Control-O API returns a return code of 08 to the calling routine. The final System Action depends on the calling environment.
Corrective Action: Check the syntax and spelling of the requested function. If necessary, contact your INCONTROL administrator.

CTO562E INTERNAL RESOURCES EXHAUSTED
Explanation: The space in an internal table is exhausted. The XAM interface keeps an internal table of all XAM activities in the address space. The table can contain a maximum 256 concurrent TCBs requesting XAM services. There is no address space for a new XAM user.
Some TSO, REXX, or CLISTs running in the address space probably did not execute the TERM(inate) function, which releases the acquired XAM resources.
The XAM interface returns a return code of 16 to the calling routine. The final System Action depends on the calling environment.
Corrective Action: Determine why there is insufficient space, and correct the problem accordingly.

CTO563E I OA SUBSYSTEM subsys INACTIVE. INTERFACE CANNOT BE USED
Explanation: A request has been received through the XAM interface, or the Control-O API, that needs the Control-O or CMEM monitor, but Control-O or CMEM is not active.
The requested activity is aborted.
Corrective Action: Check why Control-O or CMEM is not active. Once the Control-O or CMEM monitor is active again, re-issue the request.

CTO565E SETOLOC/SETOGLB ERROR CODE=rc REASON=rsn, TEXT=text
Explanation: Either XAM or the Control-O API is unable to execute the AutoEdit request. XAM or the API detected an error while trying to resolve or set an AutoEdit expression.
The XAM interface or the Control-O API returns a return code of 16 to the calling routine. The final System Action depends on the calling environment.
Corrective Action: Ensure that the AutoEdit expression in the SETOLOC, SETOGLB or RESOLVE functions is correctly written.
The following table shows possible values for the error code \((rc)\) and reason code \((rsn)\), with the explanation of each:

<table>
<thead>
<tr>
<th>Error Code (rc)</th>
<th>Reason Code (rsn)</th>
<th>Explanation</th>

CTO566E I OA SUBSYSTEM *subsys* NOT RESPONDING TO REQUESTS

**Explanation:** The IOA subsystem *subsys* did not terminate rule execution within the expected time frame. The XAM requester, or the Control-O API, waits up to two minutes for a DORULE request to terminate the rule. If no such request is received within two minutes, this message is displayed.

The XAM interface, or the Control-O API, returns a return code of 16 to the calling routine. The final system action depends on the calling environment.

**Corrective Action:** Review the rule execution results for errors and rectify as appropriate.

CTO567E I OA SUBSYSTEM *subsys* INACTIVE

**Explanation:** The requested service cannot be provided because the IOA subsystem *subsys* is not up.

The XAM interface, or the Control-O API, returns a return code of 16 to the calling routine. The final system action depends on the calling environment.

**Corrective Action:** Start the Control-O monitor.

CTO568E I OA SUBSYSTEM *subsys* DETECTED AN ERROR

**Explanation:** An internal error was detected by the IOA subsystem *subsys* during the execution of a XAM DORULE, or Control-O API, request.
The XAM interface, or Control-O API, returns a return code of 16 to the calling routine. The final System Action depends on the calling environment.

**Corrective Action:** Do the following:

1. Collect information about the functions requested by the XAM interface or the Control-O API.
2. Determine whether or not the Control-O monitor is properly running for ongoing automation which is not related to XAM or the Control-O API.

CTO569E IOA SUBSYSTEM *subsys* RETURNED AN INVALID RETURN CODE

**Explanation:** Due to an internal error, an invalid return code was returned by the subsystem *subsys* during the execution of a XAM DORULE request or a Control-O or CMEM request.

The XAM interface, or the Control-O API, returns a return code of 16 to the calling routine. The final System Action depends on the calling environment.

**Corrective Action:** Do the following:

1. Collect information about the functions requested by the XAM interface or the Control-O API.
2. Determine whether or not the Control-O monitor is properly running for ongoing automation which is not related to XAM or the Control-O API.

CTO56AE ERROR IN INAREA FIELDS ADDR=*add1*, *add2* LENGTH *len* DATA=*data_val*

**Explanation:** This diagnostic error message appears when an error has occurred while calling an AutoEdit variable service.

The system action is aborted.

**Corrective Action:** Contact your INCONTROL administrator.

CTW56AW SOME LOCAL VARIABLES NOT COPIED FROM XAM TO RULE, REASON=rsn

**Explanation:** A request was made to execute a Control-O rule by means of the DORULE function of the XAM interface. However, by the time the request was made, the XAM program that was executing had created an excessive number of local AutoEdit variables. The XAM service cannot share all these local AutoEdit variables with the Control-O rule, so some are discarded before the rule is given control.

In this message, rsn is an internal reason code used by BMC Software Customer Support.

The DORULE function continues, and control is given to the rule, but some local AutoEdit variables that cannot be copied to the rule environment are discarded. These discarded local AutoEdit variables are not available to the executed rule, nor are they available to the original XAM program once execution of the rule is complete.

**Corrective Action:** Use less local AutoEdit variables in the XAM program. You may be able to achieve this by using global, rather than local, AutoEdit variables. If the problem persists, contact BMC Software Customer Support.
CTO56BE ERROR IN RESULT FIELDS ADDR=addr, LENGTH len DATA=data_val.

**Explanation:** This diagnostic error message appears when an error has occurred while calling an AutoEdit variable service.
The system action is aborted.
Contact your INCONTROL administrator.

**Corrective Action:** No action is required.

CTO56BW SOME LOCAL VARIABLES NOT COPIED BACK FROM RULE TO XAM, REASON=r

**Explanation:** A request was made to execute a Control-O rule by means of the DORULE function of the XAM interface. However, by the time the rule finished executing, an excessive number of local AutoEdit variables had been created. The XAM service cannot share all these local AutoEdit variables with the original environment (the calling XAM program), so some are discarded before returning from the rule.
In this message, rsn is an internal reason code used by BMC Software Customer Support.
Execution of the DORULE request is completed, and control returns to the calling XAM program. However, some of the local AutoEdit variables that cannot be copied to the environment of the calling program are discarded. These discarded local AutoEdit variables are then no longer available to the original XAM program.

**Corrective Action:** Use less local AutoEdit variables in the XAM program and in the Control-O rule that you were executing. You may be able to achieve this by using global, rather than local, AutoEdit variables.
If the problem persists, contact BMC Software Customer Support.

CTO56CE INAREA LENGTH+RESULT=xxxx +xxxx =xxxx > 255.

**Explanation:** This diagnostic error message appears when an error has occurred while calling an AutoEdit variable service.
The system action is aborted.

**Corrective Action:** Contact your INCONTROL administrator.

CTO56EE CHECKPOINT GLOBAL VARIABLE DATABASE ioavar TIMED OUT AFTER num SECONDS.

**Explanation:** CHECKPOINT was requested in order to save disk changes made in memory to the ioavar variable database. A time-out occurred while the request was being processed.
The CHECKPOINT request is terminated before completion. However, the changes made to the ioavar database are retained in memory, and a subsequent CHECKPOINT request will write them to disk.

**Corrective Action:** No action is required.
CTO56FE CHECKPOINT GLOBAL VARIABLE DATABASE ioavar ENDED WITH ERROR. RC=16

Explanation: CHECKPOINT was requested in order to save disk changes made in memory to the ioavar variable database. An error occurred while the request was being processed.

The CHECKPOINT request is terminated before completion. However, the changes made to the ioavar database are retained in memory, and a subsequent CHECKPOINT request will write them to disk.

Corrective Action: No action is required.

CTO570I INITIALIZATION ENVIRONMENT COMPLETED.

Explanation: This information message indicates that Control-O API initialization finished.

Corrective Action: No action is required.

CTO573E IOA SUBSYSTEM subsys INACTIVE. INTERFACE CANNOT BE USED

Explanation: A request that requires the Control-O or CMEM monitor was issued by means of Control-O API, but the monitor is not active.

The action is aborted.

Corrective Action: Activate the Control-O or CMEM monitor, and reissue the request.

CTO575E SETOLOC/SETOGLB ERROR CODE = rc REASON = rsn, TEXT=text

Explanation: A request to set a local or global variable failed.

The action is aborted.

Corrective Action: Check the return code (rc) and reason code (rsn) in the following table to determine the reason for the failure. Correct the symbol in the rule definition, and reorder the table. If the return code or reason code is not listed, the error is an internal error, and you should notify BMC Software Customer Support. (same as WTO283E, API575E)

**CTO576E IOA SUBSYSTEM subsys NOT RESPONDING TO REQUESTS**

**Explanation:** A request from the Control-O or CMEM monitor by means of the Control-O API failed due to time-out, but the subsystem is active.

The action is aborted.

**Corrective Action:** Check the status of the Control-O or CMEM monitor. If the timeout was the result of a termination process, the problem can be ignored. Otherwise, check for other error messages in the monitor JOBLOG, SYSPRINT or IOALOG, and respond accordingly.
CTO577E I OA SUBSYSTEM **subsys** INACTIVE

**Explanation:** A request from the Control-O or CMEM monitor failed because the Control-O or CMEM monitor is not active.

The action is aborted.

**Corrective Action:** Start the Control-O or CMEM monitor and reissue the request.

CTO578E I OA SUBSYSTEM **subsys** DETECTED AN ERROR

**Explanation:** A request from the Control-O or CMEM monitor failed because the CTOWTO Control-O or CMEM executor module detected an error. The request was issued using the Control-O API.

The action is aborted.

**Corrective Action:** Check the Control-O or CMEM job log or syslog for error messages, and correct accordingly.

CTO579E I OA SUBSYSTEM **subsys** RETURNED AN INVALID RETURN CODE

**Explanation:** A request from the Control-O or CMEM monitor failed because the CTOWTO Control-O or CMEM executor module returned an invalid return code. The request was issued by means of the Control-O API.

The action is aborted.

**Corrective Action:** Notify BMC Software Customer Support.

CTO57AE ERROR IN INAREA FIELDS ADDR= *add1*, *add2* LENGTH *len* DATA= *value*

**Explanation:** An internal error occurred in the INAREA fields while calling an API service.

The action is aborted.

**Corrective Action:** Notify BMC Software Customer Support.

CTO57BE ERROR IN RESULT FIELDS ADDR= *add*, LENGTH *len* DATA= *value*

**Explanation:** An internal error occurred in the RESULTS fields while calling an API service.

The action is aborted.

**Corrective Action:** Notify BMC Software Customer Support.

CTO57CE INAREA LENGTH *length1* + RESULT LENGTH *length4* > 255.

**Explanation:** Due to an internal error, the sum of the INAREA LENGTH and the RESULT LENGTH exceeded the maximum allowable data length of 255 characters when calling the API service.

The action is aborted.

**Corrective Action:** Notify BMC Software Customer Support.
CTO57EE CHECKPOINT GLOBAL VARIABLE DATABASE dbName ENDED DUE TO TIMEOUT AFTER num SECONDS

**Explanation:** A timeout occurred during checkpoint processing of the Global Variables database. The checkpoint request terminated.

**Corrective Action:** Check the Control-O or CMEM monitor job log for additional messages that explain the cause of the problem. If the request ended OK after the timeout occurred, ignore the problem. Otherwise, respond accordingly.

CTO5A0E SERVER serverId, SECURITY ENVIRONMENT CREATION FAILED RC=rc REASON=rsn

**Explanation:** The IOASECUR security handling module failed to establish the security environment. In rules in which value OWNER or TRIGGER has been specified for the RUNTSEC parameter, the IOASECUR module runs a security check on every DO KSL/TSO request included in the rule. This message is often accompanied by the SRV5A1I or CTO281I message, which contains the error message returned by the locally active security product. The KSL/TSO request is not performed.

**Corrective Action:** See the DOCSECUR member in the IOA DOC library for a description of rc and reason. Correct the security definitions, and/or verify changes made to the IOASECUR security module. Additional information is provided in the CTO5A1I or CTO281I message (if issued).

CTO5A1I ERROR MESSAGE = text

**Explanation:** This information message indicates that the IOASECUR security module failed to establish the security environment. In rules in which the value OWNER or TRIGGER has been specified for the RUNTSEC parameter, the IOASECUR module runs a security check on every DO KSL/TSO request included in the rule. In this message, text is the error message returned by the security product active at the site. The KSL/TSO request is not performed.

**Corrective Action:** Depending on the message text, correct the security definitions and verify changes made to the IOASECUR security module.

CTO5A2W SERVER serverId, SECURITY ENVIRONMENT CLEANUP FAILED RC=rc REASON=rsn

**Explanation:** The IOASECUR security handling module failed to reset the security environment. In rules in which value OWNER or TRIGGER has been specified for the RUNTSEC parameter, the IOASECUR module runs a security check on every DO KSL/TSO request included in the rule. This message is often accompanied by message SRV5A1I which contains the error message text returned by the locally active security product.

Depending on the rc and reason, the DO KSL/TSO request may or may not be performed.
Corrective Action: See the DOCSECUR member in the IOA DOC library for a description of rc and rsn.
Correct the security definitions, and/or verify changes made to the IOASECUR security module. More information is provided in the CTO5A1I or CTO281I message (if issued).

CTO5A3I CONTROL-O SERVER serverId STARTED
Explanation: This information message indicates that the specified Control-O server has been successfully started.
Corrective Action: No action is required.

CTO5A4I CONTROL-O SERVER serverId ENDED
Explanation: This information message indicates that the specified Control-O server has been successfully terminated.
Corrective Action: No action is required.

CTO5A5E SERVER serverId SEVERE ERROR - details
Explanation: The specified server detected an internal error. The server is terminated.
Corrective Action: Contact BMC Software Customer Support.

CTO5A9S CONTROL-O SERVER serverId HAS ABENDED. ABEND CODE = abCode
Explanation: The server detected an internal abend. This message indicates an internal error. Server serverId is terminated.
Corrective Action: Contact BMC Software Customer Support for assistance.

Messages CTO600 through CTO6xx
This group includes messages for the Control-O product.

CTO600E ERROR RUNNING CTOCMCK RC=rc
Explanation: The CTOGATE communication facility failed to initialize. CTOGATE called the CTOCMCK module and then ended with an error. This message follows a CTOGATE error message generated by the CTOCMCK module. CTOGATE aborts.
Corrective Action: Correct and re-initialize CTOGATE.
CTO601E STORAGE ALLOCATION FOR COMMUNICATION FAILED, MODULE modName RC=rc

**Explanation:** During communication initialization for the `modName` module, the storage allocation failed with a return code of `rc`. Storage allocation for the Control-O communication facility failed because the CTOGATE communication facility could not obtain enough working storage for processing.

Control-O ends.

**Corrective Action:** Increase the region size and restart Control-O. If increasing the region size does not resolve the problem, record the return code and contact BMC Software Customer Support.

CTO601S CTOTCOS INTERNAL ERROR - `errorText`

**Explanation:** An internal error was detected when a COSMOS Object Status screen option was activated. The option is not performed.

**Corrective Action:** Contact BMC Software Customer Support.

CTO602E ACTION `actionName` IS NOT SUPPORTED

**Explanation:** An invalid command was specified in the COSMOS Object Status screen. The command is ignored.

**Corrective Action:** See options of the Object Status Screen in the *Control-O/COSMOS User Guide* for a list of valid commands in COSMOS online screens.

CTO603E ERROR IN CTMMEM RC=rc ABEND=abCode

**Explanation:** Initialization of communication facility CTOGATE failed to load the parameter member. The error occurred when CTMMEM attempted to load the network map into memory. CTMMEM failed with a return code.

Valid values of `rc` are:

<table>
<thead>
<tr>
<th>rc</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>Not enough memory</td>
</tr>
<tr>
<td>12</td>

</tr>
</tbody>
</table>
### CTO603I object action objectDb objectcpu

**Explanation:** This information message indicates that the user entered a valid line command in the COSMOS Object Status screen.

One of the COSMOS prepackaged rules is triggered to perform the task and this message is suppressed.

**Corrective Action:** No action is required.

### CTO604E ERROR FREEING STORAGE, PROGRAM pgm, RC=rc

**Explanation:** An internal error was detected when a request was made to end Control-O. When Control-O ends, the Control-O communication module frees internal control blocks and work areas. The error occurred during this operation.

The CTOCMCK program ends with a return code. Control-O fails to end.

**Corrective Action:** Record the message and the return code. Contact BMC Software Customer Support.

### CTO606E UNRESOLVED SYSTEM NAME IN RULE

**Explanation:** An invalid Communication ID was defined in the rule. The Communication module did not find the Communication ID name in the network map or as a SYSPLEX system partner. See the MVS SYSPLEX definitions.

The CTOCMCK program ends.

**Corrective Action:** Define your SYSTEM ID in the communication network map member or as a Sysplex system partner in the MVS PARMLIB. For more information, see the chapter on IOA installation in the *INCONTROL for z/OS Installation Guide*.

CTO607E COMMUNICATION CANNOT [BE] PERFORMED. IT WAS NOT INITIALIZED

Explanation: Control-O was not initialized with the Communication option. A system ID was specified in the rule, but the communication option was not active.

No communication rule is performed.

Corrective Action: To perform the rule, do one of the following:

- Start Control-O with the CTOGATE communication parameter in the CTOPARM member set to YES.
- If Control-O was started with CTOGATE set to YES, check if Control-O was stopped by the modify option, STOPCOMM. If Control-O was stopped by STOPCOMM, restart Control-O with STARTCOMM.

CTO609S BLDL/LOAD FAILED FOR THE MODULE modName

Explanation: Loading Control-O Application Server modName failed. The modName module did not exist in the library specified in DD statement STEPLIB or in the LINKLIST concatenation.

The Application Server (CTOGATE) ends.

Corrective Action: Verify that the correct library is specified in DD statement STEPLIB or in the LINKLIST concatenation.

CTO60AS MBX mbxopt TIME OUT ERROR

Explanation: Control-O Gateway used MBX option mbxopt and timed out. IOAGATE issues a message with a return code indicating when the time out was issued. Other messages in the IOAGATE message job log help explain the problem.

The Application Server subtask (CTOGATE) ends.

Corrective Action: Check the messages in the IOAGATE message job log. Correct the error and restart CTOGATE.

CTO60BS MBX mbxopt TERMINATION ERROR

Explanation: Control-O detected an internal error when the user specified MBX option mbxopt. IOAGATE issued a return code indicating the internal error.

Application server subtask CTOGATE ends.

Corrective Action: Check the IOAGATE message job log for messages connected with this problem. Contact BMC Software Customer Support.

CTO60CS MBX mbxopt GTW SHUT DOWN ERROR

Explanation: IOAGATE issued a time out after the user specified MBX option MBXOPT. IOAGATE issues a return code indicating the reason for the shutdown.

The Application Server subtask CTOGATE ends.

Corrective Action: Restart IOAGATE and the Application Server CTOGATE.
CTO60DS MBX *mbxopt* INTERNAL ERROR OCCURRED

**Explanation:** The Application Server CTOGATE ended due to an unrecoverable error. Preceding messages contain information about the error.

The Application Server subtask CTOGATE ends.

**Corrective Action:** Check preceding messages, correct the problem, and restart the Application Server CTOGATE.

CTO60ES INTERNAL COMMUNICATION ERROR OCCURRED, RC=rc, DATA=data

**Explanation:** The Application Server CTOGATE ended due to an unrecoverable error. Preceding messages contain information about the error.

The Application Server subtask CTOGATE ends.

**Corrective Action:** Correct the problem and restart the Application Server CTOGATE. If the problem is not resolved, record the return code and contact BMC Software Customer Support.

CTO610W CONTROL-O IS NOT ACTIVE SUBSYSTEM subsys NOT ACTIVE

**Explanation:** CTOGATE attempted to access Control-O. However, Control-O was not active. CTOGATE checks whether or not Control-O functions of the IOA subsystem subsys are activated. The Application Server did not find the subsystem ready for use.

CTOGATE waits for Control-O to be started.

**Corrective Action:** Start the Control-O monitor.

CTO611S CTOTDBS INTERNAL ERROR - errorText

**Explanation:** This is one of two messages with the same ID, but different text.

An internal error was detected when a COSMOS Database Status screen option was activated. The option is not performed.

**Corrective Action:** Contact BMC Software Customer Support.

CTO611S GETRQC INTERNAL ERROR, RC=rc

**Explanation:** This is one of two messages with the same ID, but different text.

An internal error caused the Application Server to fail to retrieve messages from the Control-O request chain.

The Application Server subtask CTOGATE issues a return code and ends.

**Corrective Action:** Restart the Application Server. If the problem persists, record all messages and return code and contact BMC Software Customer Support.

CTO612E ACTION actionName IS NOT SUPPORTED

**Explanation:** An invalid line command was specified in the COSMOS Database Status screen. The line command is ignored.
**Corrective Action:** For a list of valid line commands in COSMOS online screens, see the description of the options of the Object Status Screen in the [Control-O/COSMOS User Guide](https://example.com).

**CTO613I** object action objectDb objectcpu

**Explanation:** This information message indicates that the user entered a valid line command in the COSMOS Database Status screen. One of the COSMOS prepackaged rules is triggered to perform the task, and this message is suppressed. 

**Corrective Action:** No action is required.

**CTO613S** modName INTERNAL ERROR, R15=rsn, RC=rc

**Explanation:** An internal error was detected in the `modName` module. The Application Server becomes unstable. 

**Corrective Action:** Stop and restart IOAGATE and the Application Server CTOGATE. If the error persists, contact BMC Software Customer Support.

**CTO614W** CONTROL-O IS NOT ACTIVE

**Explanation:** CTOGATE attempted to access Control-O. However, Control-O was not active. 

**Corrective Action:** Start the Control-O monitor.

**CTO615I** CONTROL-O control IS ACTIVE. APPLICATION SERVER IS READY.

**Explanation:** This information message indicates that CTOGATE detected that Control-O has started. Control-O communication via CTOGATE starts.

**Corrective Action:** No action is required.

**CTO616I** COMMUNICATION WAS ALREADY STARTED.

**Explanation:** The user attempted to start communication. However, it was already operating. 

**Corrective Action:** No action is required.

**CTO617I** COMMUNICATION WAS ALREADY STOPPED.

**Explanation:** The user attempted to stop communication. However, it had already been stopped. 

**Corrective Action:** No action is required.

**CTO619I** COMMUNICATION CANNOT BE ACTIVATED.

**Explanation:** This information message indicates that the user was unable to activate Control-O communication. STARTCOMM modify command cannot be performed. Control-O was started with the CTOGATE parameter set to NO. 

Control-O communication is not activated.
Corrective Action: Start Control-O with the CTOGATE parameter in the CTOPARM member set to YES.

CTO61FI CONTROL-O COMMUNICATION IS ACTIVE. NETWORK NAME=sysname, NETWORK MAP=memName'
Explanation: This information message indicates that Control-O communication initialization is complete. Communication is operating using system name sysname and communication network map memName.
Corrective Action: No action is required.

CTO620I CONTROL-O COSMOS INITIALIZATION STARTED. CTOCOS release APAR apar
Explanation: Control-O issues the message when starting the Control-O Status Monitoring System (COSMOS) and displays the version and the level of the COSMOS main module CTOCOS.
Corrective Action: No action is required.

CTO621I CONTROL-O COSMOS STARTED
Explanation: This information message indicates that the Control-O Status Monitoring System (COSMOS) has been started in response to an operator command or as part of the Control-O startup process.
Corrective Action: No action is required.

CTO622S CONTROL-O COSMOS TERMINATION ERROR
Explanation: COSMOS terminated after an error was detected. This message is accompanied by other messages which explain the cause of the error.
COSMOS ends with errors.
Corrective Action: See the accompanying messages for the cause of the problem and correct it accordingly.

CTO623I CONTROL-O COSMOS ENDED
Explanation: This information message indicates COSMOS terminated in response to an operator command or as part of the Control-O shutdown process.
Corrective Action: No action is required.

CTO624S OPEN OF DDNAME ddName FAILED
Explanation: COSMOS was unable to open the file referenced by the ddName DD statement.
Possible causes are:
- The ddName DD statement is misspelled.
- The data set (member) described by the ddName DD statement does not exist.
COSMOS ends with errors.
**Corrective Action:** Check the Control-O starting procedure JCL to verify that the DD statement and the file referenced by it exist.

**CTO625S READ ERROR FOR **ddName**

**Explanation:** COSMOS is unable to read the file referenced by the **ddName** DD statement. Possible causes are:

- The **ddName** DD statement is misspelled.
- The data set (member) described by the **ddName** DD statement does not exist.

COSMOS ends with errors.

**Corrective Action:** Check that the appropriate file name is referenced correctly.

**CTO626S CONTROL-O COSMOS INITIALIZATION ERROR**

**Explanation:** An error was detected during COSMOS initialization. This message is accompanied by other messages that describe the error that occurred.

COSMOS shuts down.

**Corrective Action:** See the accompanying messages for more information about the initialization error.

**CTO627S CONTROL-O COSMOS MISSING OBJECT PLB**

**Explanation:** The pool of AutoEdit variables containing the Objects cannot be found. A search is made for this pool during COSMOS initialization.

COSMOS shuts down.

**Corrective Action:** Check if the object pool defined in the COSMOLST member was defined in DAGLBLST and exists in memory.

**CTO628S CONTROL-O COSMOS MISSING METHOD PLB**

**Explanation:** The pool of AutoEdit variables containing the Methods cannot be found. A search is made for this pool during COSMOS initialization.

COSMOS shuts down.

**Corrective Action:** Check if the method pool defined in the COSMOLST member was defined in DAGLBLST and exists in memory.

**CTO629S CONTROL-O COSMOS MISSING PREREQ PLB**

**Explanation:** The pool of AutoEdit variables containing the Prerequisites cannot be found. A search is made for this pool during COSMOS initialization.

COSMOS shuts down.

**Corrective Action:** Check if the prerequisites pool defined in the COSMOLST member was defined in DAGLBLST and exists in memory.
CTO630S CONTROL-O COSMOS GETMAIN ERROR FOR CDT

**Explanation:** COSMOS failed to acquire storage for the CDT control block. CDT is a required internal control block for COSMOS.
COSMOS shuts down.

**Corrective Action:** Check if the storage defined for ECSA (Extended Common Service Area) is large enough. If not, increase the ECSA size.

CTO631S CONTROL-O COSMOS GETMAIN ERROR FOR RESTEXT

**Explanation:** COSMOS subtask failed to allocate a working area.
COSMOS terminated. Control-O continues to operate.

**Corrective Action:** Check MVS GETMAIN messages that appear in the SYSLOG and try to solve the problem.

CTO632S CONTROL-O COSMOS POOL *poolname* WAS NOT LOADED GLOBAL VARIABLE DATABASE.

**Explanation:** COSMOS subtask tries to initiate the COSMOS environment but the pool was not loaded.
COSMOS terminated. Control-O continues to operate.

**Corrective Action:**
1. Check that the pool name is correct in COSMOLST and if not, correct it. If the pool name is missing, add it to the DAGLBLST, then load the pool name.
2. Check that pool name is in the DAGLBLST and its characteristics are correct.
If the pool name's characteristics are incorrect stop and start the Control-O monitor. After correcting the error you can restart COSMOS.

CTO633S CONTROL-O COSMOS POOL *poolname* MAX ROW IS ZERO.

**Explanation:** COSMOS subtask tries to initiate the COSMOS environment but the pool cannot be used by COSMOS because it cannot contain any data.
COSMOS terminated. Control-O continues to operate.

**Corrective Action:** Correct the pool definition in IOA Global Variable Database then load it again using LOADGLOBAL=*poolname* modify command.

CTO634I CONTROL-O COSMOS HEADER MODE=*mode*
PRE-REQUISITE=*poolname* OP-FLAGS=*flags* FSM-FLAGS=*flags*

**Explanation:** COSMOS subtask displays record type "H" from COSMOLST.

MODE=*mode* - default status of COSMOS' objects
PRE-REQUISITE=*poolname* - name of prerequisite pool
OP-FLAGS=*flags* - COSMOS operation flags
FSM-FLAGS=*flags* - COSMOS control flags
For details on the flags, refer to the Control-O/COSMOS User Guide.

**Corrective Action:** No action is required.

CTO635I CONTROL-O COSMOS OBJECTS source_pool-operating_pool
METHOD method MODE=mode UP=up DOWN=down UNKNOWN=unknown

**Explanation:** COSMOS subtask displays record type "T" from COSMOLST.

OBJECTS source_pool-operating_pool - name of COSMOS source and its operating pool name
METHOD method - method's pool name for objects of this pair of pools
MODE=mode - default mode for objects of this pair of pools
UP=up - the code used in this pool pair to represent the UP state
DOWN=down - the code used in this pool pair to represent the DOWN state
UNKNOWN=unknown - the code used in this pool pair to represent the UNKNOWN state

**Corrective Action:** No action is required.

CTO636I CONTROL-O COSMOS SYSTEMS a b c d e f g

**Explanation:** COSMOS subtask displays record type "C" from COSMOLST.
a-g are the system names in the record

**Corrective Action:** No action is required.

CTO637S CONTROL-O COSMOS SYSTEM system IS NOT IN COSMOS SYSTEMS LIST

**Explanation:** COSMOS subtask displays the started system whose name is not included in record type "C" from COSMOLST.

COSMOS terminated. Control-O continues to operate.

**Corrective Action:** Add the started system to record type "C" in COSMOLST. Start COSMOS again.

CTO650E STORAGE OBTAIN FAILED WITH RETURN CODE rc

**Explanation:** An attempt to acquire storage for an internal table failed with a return code of rc. The CTOCTI utility requested working storage for an internal table.

The CTOCTI utility terminates.

**Corrective Action:** Increase the region size specified in the JOB or EXEC JCL statement and rerun the job.

CTO651E OPEN FAILED FOR DDNAME OBJFILE

**Explanation:** The CTOCTI utility attempted to open the data set referenced by the OBJFILE DD statement but failed.

Possible causes are:
The OBJFILE DD statement is misspelled.

The data set (member) referenced by the OBJFILE DD statement does not exist.

**Corrective Action:** Verify that the data set exists and is spelled correctly. Rerun the job.

**CTO652S INTERNAL OBJECT TABLE MUST BE ENLARGED**

**Explanation:** The amount of storage allocated for an internal table is insufficient. The system has more started tasks than the CTOCTI utility anticipated. The storage allocated for one of the internal tables is insufficient.

The CTOCTI utility terminates.

**Corrective Action:** Contact your INCONTROL administrator.

**CTO653E ALESERV ADD FAILED FOR addrSpace WITH RETURN CODE rc**

**Explanation:** Function ALESERV was invoked to analyze address space `addrSpace`, but failed with return code `rc`.

Control-O continues its analysis with the next address space.

**Corrective Action:** No action is required.

**CTO654I ADDRESS SPACE addrSpace IS SWAPPED OUT AND WILL BE SKIPPED**

**Explanation:** This information message indicates that Control-O failed to get information from address space `addrSpace`. Function ALESERV was invoked to analyze the address space but failed because the specified address space is swapped out.

Control-O continues its analysis with the next address space.

**Corrective Action:** No action is required.

**CTO655E ALESERV DELETE FAILED FOR addrSpace WITH RETURN CODE rc**

**Explanation:** Control-O acquired information from address space `addrSpace` but the attempt to disconnect from the address space failed.

After analyzing the address space, ALESERV function DELETE tried to disconnect from the address space but failed with return code `rc`.

Control-O continues its analysis with the next address space.

**Corrective Action:** No action is required.

**CTO656I STARTED TASK taskName WILL BE ADDED TO THE DATABASE**

**Explanation:** This information message indicates that started task `taskName` was not specified in the Object file but was active in the system.

The started task is added to the COSMOS database.
Corrective Action: No action is required.

CTO657I  OBJECT_NAME/DESC CLASS_NAME / DESCR ADDRSPAC STATUS

Explanation: This information message is the header for data displayed by message CTO659I. It is generated when invoking the CTOCTI utility.

The J field at the end of this message is usually blank. When J is displayed, it means JOINed, and indicates that the address space is part of a composite address space. For example, CICS monitors use three address spaces: AOR, TOR and FOR.

Corrective Action: No action is required.

CTO658I  text.

Explanation: This information message is an internal message issued by the CTOCTI utility. When running the CTOCTI utility to define started tasks for the Control-O/COSMOS database, a Control-O rule traps these internal messages and creates the required definitions for Control-O/COSMOS.

Corrective Action: No action is required.

CTO659I  objName classname addrSpace status

Explanation: This information message displays the object name (16 characters), class name (16 characters), address space name (8 characters), status (ACTIVE, INACTIVE, EXCLUDED) and J (1 character)

The J field at the end of this message is usually blank. When J is displayed, it means JOINed and indicates that the address space is part of a composite address space. For example, CICS monitors use three address spaces: AOR, TOR and FOR.

Corrective Action: No action is required.

CTO660I  ADDRESS SPACE addrSpace WILL BE PROCESSED NOW

Explanation: This information message indicates that the CTOCTA utility has begun processing the addrSpace address space. The CTOCTA utility will display all programs running.

Corrective Action: No action is required.

CTO661I  ADDRESS SPACE addrSpace IS SWAPPED OUT AND WILL BE SKIPPED

Explanation: This information message indicates that the CTOCTA utility attempted to get information from the addrSpace address space, but failed, because the address space is swapped out. An ALESERV function was invoked to analyze the address space, but failed.

The CTOCTA utility continues its analysis with the next address space.

Corrective Action: No action is required.

CTO662E  ALESERV ADD FAILED WITH RETURN CODE rc

Explanation: The CTOCTA utility was invoked to get information from the address space but failed with return code rc. An ALESERV function was invoked to analyze the address space, but failed.
The CTOCTA utility continues its analysis with the next address space.

**Corrective Action:** No action is required.

**CTO663E** ALESERV DELETE FAILED WITH RETURN CODE \( rc \)

**Explanation:** The CTOCTA utility analyzed information from an address space but the attempt to disconnect from the address space failed. The DELETE ALESERV function was invoked to disconnect from the address space after analyzing it, but failed with a return code of \( rc \).

The CTOCTA utility continues its analysis with the next address space.

**Corrective Action:** No action is required.

**CTO664I** ADDRESS SPACE \( addrSpace \) status

**Explanation:** This information message indicates that address space \( addrSpace \) is ACTIVE or INACTIVE. The CTOCTA utility displays the target address space and its status after completing its analysis of the system.

**Corrective Action:** No action is required.

**CTO665E** INPUT PARAMETER (ADDRESS SPACE NAME) ERROR DETECTED

**Explanation:** An input parameter is missing or is too large. Either the parameter is not present in the invocation JCL, or it is too large.

The CTOCTA utility terminates.

**Corrective Action:** Add or correct the input parameter and rerun the job.

**CTO666I** PROGRAM \( pgm \) FOUND IN THE RB CHAIN

**Explanation:** This information message indicates that the CTOCTA utility found at least one task in the address space running the \( pgm \) program.

**Corrective Action:** No action is required.

**CTO667I** SVC \( svcno \) (TYPE 2 NUCLEUS SVC) FOUND IN AN SVRB

**Explanation:** This information message indicates that the CTOCTA utility found at least one task in the address space running the \( svcno \) SVC number.

**Corrective Action:** No action is required.

**CTO670E** ACB CONTROL BLOCK IS NOT VALID

**Explanation:** The alternate subsystem encountered an ACB control block that does not have a valid identifier.

The Control-O subsystem terminates the connection between the alternate subsystem and the Control-O subsystem.

**Corrective Action:** Contact BMC Software Customer Support.
CTO671E  SSI ROUTINE SUBSYSTEM IS INACTIVE

**Explanation**: The CTODMI alternate subsystem module failed to invoke the Control-O subsystem. Because the Control-O subsystem is not active, there is no connection between the alternate subsystem and the Control-O subsystem.

Communication between the alternate subsystem and the Control-O subsystem fails.

**Corrective Action**: Reactivate Control-O in order to reestablish communication.

CTO672E  SSI ROUTINE DETECTED AN ERROR

**Explanation**: Control-O encountered an internal error (a return code of 16) while attempting to process the SSI request to transmit information from the alternate subsystem to the Control-O subsystem.

The information is not transmitted.

**Corrective Action**: Contact BMC Software Customer Support.

CTO673E  SSI ROUTINE RETURNED AN UNDEFINED RETURN CODE

**Explanation**: Control-O encountered an internal error (a return code of 20) while processing an SSI request. The alternate subsystem was trying to transmit data to the Control-O subsystem.

The data is not transmitted.

**Corrective Action**: Contact BMC Software Customer Support.

CTO674E  CTO SSCT POINTER NOT SET - SSI ROUTINE INVOCATION BYPASSED

**Explanation**: The pointer to the Control-O subsystem SSCT was not set. The initialization process normally sets the pointer to the Control-O subsystem SSCT.

Communication between the Control-O subsystem and the alternate subsystem terminates.

**Corrective Action**: Contact BMC Software Customer Support.

CTO681E  DSN dsn - NOT A LIBRARY

**Explanation**: The requested DSN is not a partitioned data set. Possible causes are:

- New Day procedure - failure to read a calendar from the data set described by the DACAL DD statement.
- Control-M AutoEdit facility - failure to read a symbols member (%%GLOBAL statement, or %%LIBSYM %%MEMSYM statement).
- IOA Online facility - schedule, calendar or rule definition.

The system action depends on the cause, as follows:

- New Day procedure - ends with errors.
- AutoEdit facility - job submission stops.
- IOA Online facility - reading or updating of the table, calendar or rule is not performed.

**Corrective Action**: The appropriate response depends on the cause, as follows:
· New Day procedure - Correct the name of the data set described by the DACAL DD statement to the name of your calendar library.
· AutoEdit facility - Correct the JCL for the job and rerun it.
· Online facility - Correct the library name and retry.

**CTO683E DSN dsn - LRECL NOT 80**

**Explanation:** Record length of the requested DSN is not 80. Possible causes are:
· New Day procedure - failure to read a calendar from the data set described by the DACAL DD statement.
· Control-M AutoEdit facility - failure to read a symbols member (%%GLOBAL statement, or %LIBSYM %MEMSYM statement).
· Control-M Online facility - schedule definition or calendar definition.

The system action depends on the cause, as follows:
· New Day procedure ends with errors.
· AutoEdit facility - job submission stops.
· Online facility - reading or updating of the table calendar is not performed.

**Corrective Action:** The appropriate response depends on the cause, as follows:
· New Day procedure - Correct the name of the data set described by the DACAL DD statement to the name of your calendar library.
· AutoEdit facility - Correct the JCL for the job and rerun it.
· Online facility - Correct the library name and retry.

**CTO684E DSN dsn IN USE (DISP=OLD)**

**Explanation:** The DSN is held exclusively by another user.

Possible causes are:
· Control-M AutoEdit facility - failure to read a symbols member (%%GLOBAL statement, or %LIBSYM %MEMSYM statement).
· IOA Online facility - schedule, calendar or rule definition.
· Control-O initialization.
· CMEM initialization.

The system action depends on the cause, as follows:
· AutoEdit facility - job submission stops.
· IOA Online facility - reading or updating of the table, calendar or rule is not performed.
· Control-O is not started.
· CMEM is not started.

**Corrective Action:** Try again.
CTO686E DSN \textit{dsn} NOT IN CATALOG

\textbf{Explanation:} The requested DSN \textit{dsn} is not in the catalog. Possible causes are:

- Control-M AutoEdit facility - failure to read a symbols member (``GLOBAL statement, or``
  ``LIBSYM MEMSYM statement).``
- IOA Online facility - schedule, calendar or rule definition.
- New Day procedure - failure to read a calendar from the data set described by the DACAL DD
  statement.

The system action depends on the cause, as follows:

- AutoEdit facility - job submission stops.
- IOA Online facility - reading or updating of the table, calendar or rule is not performed.
- New Day procedure ends with errors.

\textbf{Corrective Action:} The appropriate response depends on the cause, as follows:

1. AutoEdit facility - correct the JCL for the job and rerun it.
2. Online facility - correct the library name and retry.
3. New Day procedure - correct the New Day procedure and retry.

CTO687E DSN \textit{dsn} - DYNAMIC ALLOCATION FAILED

\textbf{Explanation:} Dynamic allocation for the requested DSN \textit{dsn} failed. Possible causes are:

- Control-M AutoEdit facility - failure to read a symbols member (``GLOBAL statement, or``
  ``LIBSYM MEMSYM statement).``
- IOA Online facility - schedule, calendar or rule definition.
- This can also happen when the Control-M Online facility is activated under the Control-M Online facility
  (nesting) and you are trying to access the same library in two screens.

The system action depends on the cause, as follows:

- AutoEdit facility - job submission stops.
- IOA Online facility - reading or updating of the table, calendar or rule is not performed.

\textbf{Corrective Action:} Exit the Online facility and retry. If this happens under batch environment or in
Control-M AutoEdit facility, prepare the Control-M monitor full output and contact BMC Customer Support
for assistance.

CTO688E INTERNAL ERROR - INVALID REQUEST TO CTMMEM. INFORM
IOA ADMINISTRATOR

\textbf{Explanation:} Internal IOA error while trying to read a member from a library. Possible causes are:
New Day procedure - failure to read a calendar from the data set described by the DACAL DD statement.

IOA AutoEdit facility - failure to allocate or read a symbols member (a %%GLOBAL statement, or a \%\%LIBSYM \%\%MEMSYM statement, or a \%\%INCLIB \%\%INCMEM statement). When using the \%\%INCMEM DDNAME= \var{ddn} format, ensure that \var{ddn} is allocated by the required procedure (Control-M monitor, IOA Logon procedure, and so on).

IOA Online facility - schedule, calendar or rule definition.

The system action depends on the cause, as follows:

- New Day procedure ends with errors.
- AutoEdit facility - job submission stops.
- IOA Online facility - reading or updating of the table, calendar or rule is not performed.

Corrective Action: Prepare the Control-M monitor full output and contact BMC Customer Support for assistance.

CTO690E INVALID RETURN CODE FORM CTMMEM - INFORM IOA ADMINISTRATOR

Explanation: Internal IOA error while trying to read a member from a library. Possible causes are:

- New Day procedure - Failure to read a calendar from the data set described by the DACAL DD statement.
- IOA AutoEdit facility - Failure to read a symbols member (\%\%GLOBAL statement, or \%\%LIBSYM \%\%MEMSYM statement).
- IOA Online facility - Schedule definition or calendar definition.

The system action depends on the cause, as follows:

- New Day procedure ends with errors.
- AutoEdit facility - Job submission stops.
- Online facility - Reading or updating of the table or calendar is not performed.

Corrective Action: Prepare the Control-M monitor full output and contact BMC Customer Support for assistance.

CTO691E ERROR WHILE PROCESSING DIRECTORY OF LIBRARY

Explanation: Internal Control-M error while trying to read a directory of a library during schedule definition, calendar definition, batch utility, etc.

Online facility - Tables or calendars list is not shown.

Corrective Action: For batch utility, correct the error and rerun the job.
CTO692E LIBRARY OPERATION FAILED. REASON $rsn$

**Explanation:** Internal Control-M error while trying to process a member from a library. Possible causes are shown in the following table:

<table>
<thead>
<tr>
<th>Circumstances</th>
<th>System Action</th>
<th>Possible Cause</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Day procedure</td>
<td>New Day procedure terminates with errors</td>
<td>Failure to read a calendar from the data set described by the DACAL DD statement</td>
</tr>
<tr>
<td>Control-M AutoEdit facility</td>
<td>Job submission is stopped</td>
<td>Failure to read a symbols member ($%GLOBAL statement, or $%LIBSYM $%MEMSYM statement)</td>
</tr>
<tr>
<td>Control-M Online facility</td>
<td>Processing of schedule, mission, rule or calendar definition is not performed</td>
<td>Internal failure to process the schedule, mission, rule or calendar definition</td>
</tr>
</tbody>
</table>

**Corrective Action:** Examine any prior system message. If there is no such message, prepare the Control-M monitor full output and contact BMC Customer Support for assistance.

**Messages CTO700 through CTO7xx**

This group includes messages for the Control-O product.

**CTO720I FORMATTING OF STATISTICS FILE STARTED**

**Explanation:** This informative message is issued when the CTOFST Statistics Formatting utility starts formatting the Statistics file.

**Corrective Action:** No action is required.

**CTO721S STATISTICS FILE DYNAMIC ALLOCATION ERROR $rc/rsn/dsn$**

**Explanation:** Dynamic allocation of the Statistics file dsn failed with the return code $rc$ and the reason code $rsn$.

The CTOFST Statistics Formatting utility terminates with a return code of 08.

**Corrective Action:** See the IBM manual *MVS Programming: Authorized Assembler Services Guide* to determine the cause of the error, and correct the error accordingly. If not successful, contact BMC Software Customer Support.

**CTO722S STATISTICS FILE ALLOCATION ERROR - ACTIVE SMF ID DOES NOT MATCH PARAMETER SMF ID**

**Explanation:** The SMF ID specified for the CTOFST Statistics Formatting utility does not match the active MVS SMF ID. The SMF ID for the CTOFST utility is specified in the input PARM string. The current MVS SMF ID is specified in IEASMFxx of SYS1.PARMLIB. These SMF IDs should match.
The CTOFST utility terminates with return code of 08.

Corrective Action: Correct the PARM string to reflect the active SMF ID, and rerun the job.

CTO723S STATISTICS FILE IN USE. FORMATTING CANNOT BE PERFORMED

Explanation: The CTOFST Statistics Formatting utility failed to format the Statistics file because the file is allocated to another user. The CTOFST Statistics Formatting utility attempts to allocate the Statistics file with DISP set to OLD.

The utility terminates with a return code of 08.

Corrective Action: Make sure that no user is allocated to the Statistics file, and rerun the job.

CTO724E OPEN OF STATISTICS FILE FAILED

Explanation: The CTOFST Statistics Formatting utility could not successfully open the Statistics file.

The utility terminates with a return code of 08.

Corrective Action: Look for previous MVS error messages regarding the opening of the Statistics file. Correct the error and rerun the job.

CTO725E OPEN OF MESSAGES FILE FAILED

Explanation: The CTOFST Statistics Formatting utility unsuccessfully attempted to open the Messages file specified in the SYSPRINT DD statement. An OPEN request was issued to the Messages file but was unsuccessful. A possible cause is that the SYSPRINT DD statement may not have been specified in the job stream.

The utility terminates with a return code of 08.

Corrective Action: Look for earlier MVS error messages regarding the opening of the Messages file. Correct the error, and rerun the job.

CTO726S FORMATTING OF STATISTICS FILE ENDED WITH ERROR

Explanation: The formatting of the Statistics file was unsuccessful.

The CTOFST Statistics Formatting utility terminates with a return code of 08.

Corrective Action: Look for earlier error messages to determine the cause of the error. Correct the error and rerun the job.

CTO729S WRITE OPERATION TO THE STATISTICS FILE FAILED

Explanation: A WRITE request failed during the formatting of the Statistics file.

The CTOFST Statistics Formatting utility terminates with a return code of 08.

Corrective Action: Delete the Statistics file. Then rerun the job, specifying smfid volser and unit. Earlier MVS error messages regarding the Statistics file may indicate the cause of the error.
CTO730I FORMATTING OF STATISTICS FILE ENDED SUCCESSFULLY

Explanation: This information message is issued when the CTOFST Statistics Formatting utility completes with no errors.
Corrective Action: No action is required.

CTO731E INVALID PARAMETERS

Explanation: The DEFSTAT utility was called with incorrect parameters. The utility terminates with a return code of 08.
Corrective Action: Correct the parameters and rerun the utility.

CTO742S ERROR IN OPEN OF INPUT FILE

Explanation: The CTORSTM Statistics report utility could not open the input file specified in the DAREPIN DD statement. An OPEN request was issued to the input file, but was unsuccessful. A possible cause of the problem is that the DAREPIN DD statement may not have been specified in the job stream. The utility terminates with a return code of 08.
Corrective Action: Look for previous MVS error messages regarding the opening of the input file. Correct the error and rerun the job.

CTO743S INTERNAL ERROR - errorText

Explanation: The CTORSTM Statistics report utility encountered internal error errorText. The utility terminates with a return code of 08.
Corrective Action: Contact BMC Software Customer Support.

CTO744S ERROR IN OPEN OF REPORT FILE

Explanation: The CTORSTM Statistics report utility could not open the report file specified in the SYSPRINT DD statement. An OPEN request was issued to the REPORT file, but was unsuccessful. A possible cause of the problem is that the SYSPRINT DD statement may not have been specified in the job stream. The utility terminates with a return code of 08.
Corrective Action: Look for previous MVS error messages regarding the opening of the report file. Correct the error and rerun the job.

CTO745S ERROR IN OPEN OF STATISTICS FILE

Explanation: The CTORSTM Statistics report utility could not open the Statistics file. Failure to open the Statistics file may have been caused by one of the following:
The data set allocated to the DASTF DD statement was not formatted as a Control-O Statistics file.

The data set allocated to the DASTF DD statement was formatted as a Control-O Statistics file by a different version of Control-O.

The data set allocated to the DASTF DD statement belongs to a different installation of Control-O.

The utility terminates with a return code of 08.

**Corrective Action:** Look for previous MVS error messages regarding the opening of the Statistics file. Correct the error and rerun the job.

**CTO746S STATISTICS FILE DYNAMIC ALLOCATION ERROR rc/rsn/dsn**

**Explanation:** Dynamic allocation of Statistics file dsn failed with return code rc and reason code rsn.

The CTORSTM Statistics Report utility terminates with a return code of 08.

**Corrective Action:** See the IBM manual *MVS Programming: Authorized Assembler Services Guide* to determine the cause of the error and correct the error accordingly. If not successful, contact BMC Software Customer Support.

**CTO747W ERROR IN CLOSE OF STATISTICS FILE**

**Explanation:** The CTORSTM Statistics file utility could not successfully close the Statistics file.

The utility terminates with a return code of 08.

**Corrective Action:** If no MVS error messages clarifying the error were issued, this is probably an internal error. In this case, please report it to BMC Software Customer Support.

**CTO750E NO ROOM AVAILABLE TO INSERT LINE HERE**

**Explanation:** There was an attempt to insert a row in a Variable database, but no row number is available at the point of insertion. Variable database rows are originally numbered by thousands. Rows added later are assigned numbers in the gaps. This message is generated if a suitable row number is not available at the location where a new row is to be inserted. See the description of the IOA Variable Database facility in the *Control-O User Guide* for an explanation of how database row numbers are assigned.

The row is not added to the Variable database.

**Corrective Action:** Renumber the existing rows in the database, as follows:

1. Unload the Variable Database Variables file by means of the CTOVARUL job in the Control-O JCL library. This job invokes the IOADUL utility.
2. Reload this file by means of the CTOVARLD job in the Control-O JCL library. This job invokes the IOADLD utility. Be sure the RENUM parameter is included.

For more information about the IOADUL and IOADLD utilities, see the *INCONTROL for z/OS Utilities Guide*.

**CTO754E NO AUTHORIZATION FOR PERFORMING THIS OPERATION**

**Explanation:** The user is unauthorized to perform the requested insert or update on the variable.

The variable is not created or updated.
Corrective Action: To be authorized to perform the attempted operation, contact your INCONTROL administrator.

CTO756E INSUFFICIENT SPACE IN THE VARIABLES FILE

Explanation: An attempt was made to create a new variable, but there is insufficient space in the Variables file. New variables cannot be defined until sufficient space is provided.

The new variable is not created.

Corrective Action: Provide more free space in the Variables file. For information about increasing the size of IOA Access Method files and about compressing the data in such files, see the INCONTROL for z/OS Administrator Guide.

CTO757E INSUFFICIENT SPACE IN THE MODELS FILE

Explanation: An attempt was made to create a new column, but there is insufficient space in the Columns file. New columns cannot be defined until sufficient space is provided.

Corrective Action: Provide more free space in the Columns file. For information about increasing the size of IOA Access Method files and about compressing the data in such files, see the INCONTROL for z/OS Administrator Guide.

CTO758E INSUFFICIENT SPACE IN THE INDEX FILE

Explanation: An attempt was made to create a new variable, but there is insufficient space in the Variables database index file. New variables cannot be defined until sufficient space is provided.

The new variable is not created.

Corrective Action: Provide more free space in the Variables database index file. For information about increasing the size of IOA Access Method files and about compressing the data in such files, see the INCONTROL for z/OS Administrator Guide.

CTO759E COLUMN ALREADY EXISTS. IT CANNOT BE CREATED

Explanation: An attempt was made to create a column, but a column with that name already exists in the database. The column cannot be created, because it already exists. It cannot be saved, because it was specified by means of command Insert.

The Exit Option Window is closed. The database Column Definition screen remains displayed.

Corrective Action: Either specify a database column name that does not currently exist in the database, or use the CANCEL command to exit without saving the database column definition.

CTO75AE UPDATE OF COLUMN DEFINITION FAILED

Explanation: An error occurred while attempting to update a column in the variable database Column Definition screen.

The variable database column definition is not updated.

Corrective Action: Have your INCONTROL administrator notify BMC Software Customer Support.
CTO75CE OPERATION FAILED. ERROR DURING FILE ACCESS RC=rc, FUNCTION=func

**Explanation:** An internal error occurred while trying to update the columns definition of the Global Variable database.

The update is not performed.

**Corrective Action:** Call your INCONTROL administrator.

CTO780I INITIALIZATION OF OPENEDITION ENVIRONMENT STARTED

**Explanation:** This information message is the normal start message issued during initialization of Control-O or the CMEM monitor when using OS/390 version 2.4 or later.

Control-O or the CMEM monitor detected an environment which supports the MVS OpenEdition interface with Control-O and began initializing the OpenEdition environment.

**Corrective Action:** No action is required.

CTO781I OPENEDITION INTERFACE MODULE SUCCESSFULLY LOADED

**Explanation:** This information message is the normal start message issued during initialization of Control-O or the CMEM monitor when using OS/390 version 2.4 or later.

Control-O or the CMEM monitor loaded the OpenEdition interface module into storage. This message is issued only for the first Control-O or CMEM monitor in the system.

**Corrective Action:** No action is required.

CTO782I SUBSYSTEM REGISTERED WITH OPENEDITION INTERFACE

**Explanation:** This information message is the normal start message issued during initialization of Control-O or the CMEM monitor when using OS/390 version 2.4 or later.

The current Control-O or CMEM subsystem has registered itself (meaning, recorded its name) with the OpenEdition interface in order to receive OpenEdition events from the interface.

**Corrective Action:** No action is required.

CTO783I INITIALIZATION OF OPENEDITION ENVIRONMENT ENDED SUCCESSFULLY

**Explanation:** This information message is the normal start message issued during initialization of Control-O or the CMEM monitor when using OS/390 version 2.4 or later.

OpenEdition support for the current Control-O or CMEM monitor is successfully installed. Control-O or CMEM will trigger rules based on OpenEdition events.

**Corrective Action:** No action is required.

CTO784W OS/390 VERSION IS 2.4 OR HIGHER BUT PTF LEVEL IS TOO LOW

**Explanation:** Control-O or CMEM tried to install OpenEdition support but found an incompatible PTF level.
Control-O or CMEM support for OpenEdition events is required for OS/390 version 2.4 and later. The PTF level in MVS is too low to install the OpenEdition interface.

The following system actions occur:

1. Initialization of the OpenEdition interface fails.
2. Initialization of Control-O or the CMEM monitor continues.
3. Control-O or the CMEM monitor will not be able to handle OpenEdition events such as data set triggering based on FTP transmissions.

**Corrective Action:** Install IBM PTF for APAR OW36163, which enables Control-O or CMEM support for OpenEdition.

CTO785W UNABLE TO REGISTER WITH OPENEDITION INTERFACE: LOCK CANNOT BE OBTAINED

**Explanation:** The Control-O or CMEM subsystem could not register with the OpenEdition interface during initialization because Control-O or the CMEM monitor cannot acquire the OpenEdition interface lock, which is required for registration.

Initialization of the OpenEdition interface fails. Initialization of Control-O or the CMEM monitor continues. Control-O or the CMEM monitor will not be able to handle OpenEdition events, such as data set triggering based on FTP transmissions.

**Corrective Action:** Restart the current monitor. If the problem persists, call your INCONTROL administrator.

CTO786W LOAD OF OPENEDITION INTERFACE MODULE FAILED: LOAD TO PRIVATE FAILED

**Explanation:** During initialization of the OpenEdition interface, Control-O or CMEM could not load the OpenEdition support module because Control-O or CMEM monitor could not load the OpenEdition support module in its own private region.

The following system actions occur:

- Initialization of the OpenEdition interface fails.
- Initialization of Control-O or the CMEM monitor continues.
- Control-O or the CMEM monitor will not be able to handle OpenEdition events such as data set triggering based on FTP transmissions.

**Corrective Action:** Determine the cause of the failure using previous messages. Possible causes are:

- The Control-O or CMEM region is too small.
- The CTOAODT module is not in the Control-O CMEM STEPLIB.

CTO787E INITIALIZATION OF OPENEDITION ENVIRONMENT FAILED

**Explanation:** Control-O or CMEM tried to install the OpenEdition interface but an error occurred during initialization of the interface.

The following system actions occur:
1. Initialization of the OpenEdition interface fails.
2. Initialization of Control-O or the CMEM monitor continues.
3. Control-O or the CMEM monitor will not be able to handle OpenEdition events such as data set triggering based on FTP transmissions.

**Corrective Action:** Look for previous messages which explain the cause of the failure. Call your INCONTROL administrator.

**CTO788I SUBSYSTEM ALREADY REGISTERED WITH OPENEDITION INTERFACE**

**Explanation:** This information message indicates that Control-O or the CMEM monitor tried to register with the OpenEdition interface but found the subsystem was already registered.

A possible cause is a previous uncompleted termination of CMEM or Control-O.

Initialization of the OpenEdition interface continues.

**Corrective Action:** No action is required.

**CTO789W OPENEDITION ADDRESS SPACE HAS NOT COMPLETED INITIALIZATION**

**Explanation:** During Control-O startup, Control-O tried to activate OPENEDITION (UNIX for MVS) support. The attempt failed for one of the following reasons:

- The system is earlier than OS/390 version 2.4.
- IBM APAR OW36163 is missing.

The preconditions for using Control-O/OPENEDITION (UNIX for MVS) are:

- The system must be at OS/390 version 2.4 or later.
- IBM APAR OW36163 must be applied.

The Control-O startup process completes but does not support OPENEDITION.

**Corrective Action:** If the system is earlier than OS/390 version 2.4, ignore this message. Otherwise, apply IBM APAR OW36163.

**CTO78BW UNABLE TO REGISTER WITH OPENEDITION INTERFACE: NO PROPER ENTRY IN SSTABLE**

**Explanation:** The Control-O or CMEM subsystem could not register with the OpenEdition interface during initialization because Control-O or the CMEM monitor cannot locate its entry in the INCONTROL internal subsystems table.

The following system actions occur:
Initialization of the OpenEdition interface fails.
Initialization of Control-O or the CMEM monitor continues.
Control-O or the CMEM monitor will not be able to handle OpenEdition events such as data set
triggering based on FTP transmissions.

Corrective Action: Restart the current monitor. If the problem persists, call your INCONTROL
administrator.

CTO78CW LOAD OF OPENEDITION INTERFACE MODULE FAILED: CSA
GETMAIN FAILED

Explanation: During initialization of the OpenEdition interface, Control-O or CMEM could not load the
OpenEdition support module because Control-O or CMEM monitor could not acquire storage in the
Common Service Area (CSA) for the OpenEdition support module.

The following system actions occur:
- Initialization of the OpenEdition interface fails.
- Initialization of Control-O or the CMEM monitor continues.
- Control-O or the CMEM monitor will not be able to handle OpenEdition events such as data set
  triggering based on FTP transmissions.

Corrective Action: Make sure that the CSA has at least 8K of free storage, then restart the Control-O or
CMEM monitor.

CTO78DW LOAD OF OPENEDITION INTERFACE MODULE FAILED: LOAD TO
CSA FAILED

Explanation: During initialization of the OpenEdition interface, Control-O or CMEM could not load the
OpenEdition support module because Control-O or CMEM monitor could not load the OpenEdition support
module to the Common Service Area (CSA).

The following system actions occur:
- Initialization of the OpenEdition interface fails.
- Initialization of Control-O or the CMEM monitor continues.
- Control-O or the CMEM monitor will not be able to handle OpenEdition events such as data set
  triggering based on FTP transmissions.

Corrective Action: Use the contents of previous messages to determine the cause of the failure.

CTO790I DEACTIVATION OF OPENEDITION ENVIRONMENT STARTED

Explanation: This information message is the normal message issued during termination of Control-O or
the CMEM monitor when using OS/390 version 2.4 or later.

Control-O or the CMEM monitor detected an active OpenEdition interface environment and started its
termination procedure.

Corrective Action: No action is required.
CTO791I SUBSYSTEM REMOVED FROM OPENEDITION INTERFACE

**Explanation:** This information message is the normal message generated during termination of Control-O or the CMEM monitor when using OS/390 version 2.4 or later.

The current Control-O or CMEM subsystem removed itself from the OpenEdition interface in order to stop receiving OpenEdition events.

**Corrective Action:** No action is required.

CTO792I OPENEDITION INTERFACE MODULE REMOVED

**Explanation:** This information message is the normal message issued during termination of Control-O or the CMEM monitor when using OS/390 version 2.4 or later.

Control-O or the CMEM monitor removed the OpenEdition support module from storage. This message is displayed only during termination of the last Control-O or the CMEM monitor in the system.

**Corrective Action:** No action is required.

CTO793I DEACTIVATION OF OPENEDITION ENVIRONMENT ENDED SUCCESSFULLY

**Explanation:** This information message is the normal message issued during termination of the CMEM monitor or Control-O when using OS/390 version 2.4 or later.

The OpenEdition interface for the current Control-O or CMEM monitor has been successfully removed.

**Corrective Action:** No action is required.

CTO794W DEACTIVATION OF OPENEDITION ENVIRONMENT FAILED

**Explanation:** Control-O or CMEM tried to remove OpenEdition support but encountered an error.

An error occurred during termination of the OpenEdition interface.

Termination of Control-O or the CMEM monitor continues. Warnings may be issued the next time Control-O or CMEM is activated.

**Corrective Action:** Look for previous messages which explain the cause of the failure. Verify successful initialization the next time Control-O or CMEM is activated.

CTO795W OPENEDITION INTERFACE MODULE NOT INSTALLED

**Explanation:** Control-O or the CMEM monitor could not find the OpenEdition interface module during termination.

During termination Control-O or CMEM detected an environment which supports the OpenEdition interface but could not find the OpenEdition support module which should have been installed during initialization.

Termination of Control-O or the CMEM monitor continues. Warnings may be issued the next time Control-O or CMEM is activated.

**Corrective Action:** Look for previous messages which explain the cause of the failure. Verify successful initialization the next time Control-O or CMEM is activated.
CTO796W SUBSYSTEM NOT REMOVED FROM OPENEDITIION INTERFACE:

**Explanation:** Control-O or CMEM could not remove its subsystem name from the OpenEdition interface during termination.

If reason is SUBSYSTEM NOT FOUND, Control-O or CMEM could not find its subsystem name registered with the OpenEdition interface.

If reason is LOCK CANNOT BE OBTAINED, Control-O or the CMEM monitor could not get the OpenEdition interface lock it needs to remove its name.

Termination of Control-O or the CMEM monitor continues. Warnings may be issued the next time Control-O or CMEM is activated.

**Corrective Action:** Look for previous messages which explain the cause of the failure. Verify successful initialization the next time Control-O or CMEM is activated.

CTO797E EINVAL REFRESH SUBPARAMETERS. VALID PARAMETER is: XCF

**Explanation:** The user issued the command F Control-O, REFRESH= *parm* to refresh the Control-O communication definitions, but the value of *parm* was invalid.

The valid value of the subparameter is XCF.

Refresh of the Control-O communication definition fails.

**Corrective Action:** Correct and reenter the command.

CTO798E ERROR IN MODIFY-REFRESH PROCESSING

**Explanation:** An error was detected while attempting to refresh the XCF configuration map of Control-O, which defines the MVS image names with which Control-O can work.

Refresh of the Control-O communication definition by the REFRESH command fails.

**Corrective Action:** Examine the earlier accompanying messages in the Control-O JOBLOG or SYSLOG.

CTO7B0E SMSCLASS and SMSMSG are valid in 'ON SMS' only

**Explanation:** An attempt was made to add a DO SMSCLASS or DO SMSMSG in an SMS rule that was not ON. DO SMSCLASS or DO SMSMSG can only be used in ON SMS rules.

The statement is not accepted.

**Corrective Action:** Delete the DO SMSCLASS or DO SMSMSG statement from the rule.

CTO7B1E SMSCLASS and SMSMSG are invalid after ASKOPER, DO COMMAND+WAIT or WAIT

**Explanation:** An attempt was made to add a DO SMSCLASS or DO SMSMSG statement in an invalid location in the Control-O rule. DO SMSCLASS or DO SMSMSG can be used only in an ON SMS rule, and only before any WAIT.

The statement is not accepted.
**Corrective Action:** Delete the DO SMSCLASS or DO SMSMSG from the rule, or move it to a correct location.

CTO7B2E SHARELOC or TIMEOUT are valid if SYSTEM is not set

**Explanation:** The Control-O communication function does not support the sharing of AutoEdit variables or TIMEOUT. Therefore, neither SHARELOC nor TIMEOUT can be used in rule definition when the system field is not null.

The action is rejected.

**Corrective Action:** Correct the DO KSL or DO TSO command.

CTO7B3E SMSCLASS id is between 1 and 15 only

**Explanation:** An attempt was made to add a DO SMSCLASS with an ID value of 0 or greater than 15. To be valid, an ID value must be from 1 through 15.

The value in the ID field is not accepted.

**Corrective Action:** Insert a valid ID value in the DO SMSCLASS, from 1 through 15.

CTO7B4E SIGN OF QUANTITY MUST BE EITHER ",+", ",-", ",?" OR BLANK

**Explanation:** In a DO RESOURCE statement, an invalid sign was entered in the quantity change field.

Valid values for the quantity change subparameter are:

- (Minus) - Decreases the associated quantity by the amount specified.
- + (Plus) - Increases the associated quantity by the amount specified.
- ? (Question mark) - Check the status of the resource.
- ' ' (Blank) - Sets a new associated quantity for the resource.

**Corrective Action:** Correct the value of the quantity change subparameter by entering a valid sign.

CTO7B5E INVALID CONDITION OPTION. USE "+" (ADD), ",-" (DELETE) OR ",?" (QUERY)

**Explanation:** In a DO COND statement, an invalid sign was entered in the condition option field.

Valid values for the condition option subparameter are:

- (Minus) - Delete the prerequisite condition.
- + (Plus) - Add the prerequisite condition.
- ? (Question mark) - Check the status of the condition.

**Corrective Action:** Correct the value of the CONDOPT subparameter by entering a valid sign.

CTO7B6E Valid Priority MNEMONICS: CL, CR, IN, MA, MI, WA or 1 to 6

**Explanation:** In an ON MVALARM statement, an invalid value was entered in the PRIORITY field.

Valid values for the PRIORITY subparameter are (in increasing order of severity):
Corrective Action: Correct the value of the PRIORITY subparameter by entering a valid value.

CTO7B7E INVALID ALARM type. Valid value: Start or End

Explanation: In an ON MVALARM statement, an invalid value was entered in the TYPE field.

Valid values for the TYPE subparameter are:
- **S** - A new MAINVIEW alarm.
- **E** - The end of the MAINVIEW alarm.

Corrective Action: Correct the value of the TYPE subparameter by entering a valid value.

CTO7B8E INVALID RUNTSEC. ON RULE supports "T"-TRIGGER or BLANK

Explanation: In an ON RULE statement, an invalid value was entered in the RUNTSEC field.

Valid values for the RUNTSEC subparameter are:
- **T** (Trigger) - Runtime security checks are carried out using the user ID associated with the started task, TSO use or batch job that issued the message or command that invoked the rule.
- **' '** (Blank) - Runtime security checks are or are not performed, depending on the value set for the RUNTDFT global parameter in the CTOPARM member during the installation of Control-O. Default.

For more information, see the description of the RUNTSEC subparameter in the Control-O User Guide.

Corrective Action: Correct the value of the RUNTSEC subparameter by entering a valid value.

CTO7C1E AT LEAST ONE "DO" STATEMENT MUST BE FILLED IN

Explanation: A DO statement (action) is not complete. At least one DO statement is required in the Rule Definition. The DO statement specifies actions to be performed after Message or Event Selection criteria are fulfilled.

For DO statement requirements, see the parameter descriptions in the Control-O User Guide or the Control-M for z/OS User Guide.

Corrective Action: Complete at least one DO statement.

CTO7C3E PLEASE FILL IN THE FIELD (BLANKS ARE INVALID)

Explanation: The field was left blank, but some data are required. The field is obligatory, and it does not have a default value. An entry must be made.

Corrective Action: Enter a value in the field.
CT07C4E VALID DESCRIPTOR CODE CAN BE FROM 00 TO 16

**Explanation:** An invalid descriptor code was entered in the DESC field of the Rule Definition.

DESC is an optional parameter which specifies the message descriptor code. The DESC parameter value (if specified) must be a valid 1-2 digit descriptor code (00 - 16).

**Corrective Action:** Enter a valid descriptor code in the DESC field or leave it blank.

CT07C5E VALID ROUTE CODE CAN BE FROM 000 TO 255

**Explanation:** The ROUTE field of the Rule Definition has an invalid routing code. ROUTE is an optional parameter. The ROUTE parameter value, if specified, must be a valid 1- to 3-digit route code (000-255).

**Corrective Action:** Enter a valid routing code in the ROUTE field or leave it blank.

CT07CAE VALID COLUMN RANGE IS 001-128

**Explanation:** An invalid range was specified in the COLS subparameter in the ON statement. When specifying a string using the S option in the ON statement, the search for this string may be limited to a specific column range by entering the range in the COLS subparameter.

The format is: COLS fromcol tocol, where fromcol or tocol may be any number from 1-128, and the fromcol value may not be greater than the tocol value.

**Corrective Action:** Enter a valid range, or do not enter a search range.

CT07CBE FROM COL GREATER THAN UNTIL COL

**Explanation:** The specified fromcol range is greater than the specified tocol range in the COLS subparameter of the ON statement. When specifying a string using the S option in the ON statement, the search for this string may be limited to a specific column range by entering the range in the COLS sub-parameter.

The format is: COLS fromcol tocol, where fromcol or tocol may be any number from 1-128, and the fromcol value may not be greater than the tocol value.

**Corrective Action:** Enter a valid search range or do not enter a search range.

CT07CCE BOTH "APPEARED" AND "TIMES IN" MUST BE FILLED IN OR BLANK

**Explanation:** Only one value was provided for the APPEARED n TIMES IN m MINUTES parameter. While entries in the APPEARED n TIMES IN m MINUTES parameter are optional, values must be specified for both n and m, if this parameter is used.

Valid values are:

- n - Appeared n times. Must be a numeric value from 2 through 999.
- m - In m minutes. Must be a numeric value from 1 through 9999.

**Corrective Action:** Specify values for both n and m, or do not specify values for either.
CTO7CDE INVALID "ON". USE M, STR, CO, CT, E, JA, JE, D, STE, OM

**Explanation:** An invalid ON statement is specified in a Control-O rule. ON statements specify Message or Event criteria that must be met before Control-O triggers a rule.

For more information about ON statements, see the parameter descriptions in the *Control-O User Guide.*

The statement is ignored.

**Corrective Action:** Specify a valid ON statement.

CTO7CEE INVALID DATE (USE "DATE", "ODAT", SPECIFIC DATE OR AUTOEDIT VAR)

**Explanation:** An invalid scheduling date was entered in the DATE subparameter of the FORCEJOB parameter. The DATE subparameter specifies the scheduling date for the job or jobs.

Valid date formats are:

- **DATE** - Resolves to the current Gregorian computer date.
- **ODAT** - Resolves to the Control-M original scheduling date of the job.
- **%%%xx** - An AutoEdit symbol may be assigned by a DO SET command in the rule, or it can be a Global variable.
- **ddmm** - Day and month of scheduling date.
- **mmdd** - Month and day of scheduling date (USA format).

**Corrective Action:** Enter a valid date.

CTO7CFE PLEASE FILL IN A VALID AUTOEDIT STATEMENT

**Explanation:** There is an invalid AutoEdit statement or expression in the DO SET statement. The DO SET statement is used to specify AutoEdit variables that are resolved at runtime.

See the *Control-O User Guide* for an explanation of the AutoEdit Facility.

**Corrective Action:** Enter a valid AutoEdit statement.

CTO7D7E INVALID CAPS ON / OFF COMMAND. COMMAND IGNORED

**Explanation:** An attempt was made to use the CAPS primary command in BROWSE mode. The CAPS primary command is not valid in BROWSE mode.

The command is not performed.

**Corrective Action:** No action is required.

CTO7D8I CAPS IS ON / OFF

**Explanation:** This information indicates a change in status of CAPS mode (ON or OFF) after entry of the CAPS primary command. The CAPS mode determines whether characters can be entered only in upper case, or also in lower case.

**Corrective Action:** No action is required.
CTO7DFE INVALID ‘type’ EXPRESSION. RC=rc, REASON CODE=rsn

Explanation: The rule definition contains an invalid evaluation expression of type, where type is IF or WHILE. Probable causes are:
- invalid nesting of parentheses
- invalid AutoEdit expressions
- invalid logical operands

The rule definition is not saved.

Corrective Action: Correct the invalid expression. If necessary, check the return code and reason code in the table in message WTO283E, to determine the reason for the failure.

CTO7DGW MODE CAPS OFF IGNORED. RUNNING IN DBCS MODE

Explanation: User entered CAPS OFF command, but the user is working at a DBCS terminal.

The command is ignored because DBCS terminals do not support lower case.

Corrective Action: No action is required.

CTO7DHI FOUND LOWER CASES. FORCING CAPS OFF

Explanation: User entered a Control-O or CMEM rule and the control program found lower case characters.

CAPS OFF is forced to prevent upper casing by mistake. The user's online profile is not changed when saving and exiting the rule screen.

Corrective Action: No action is required.

CTO7F1E field1 AND field2 ARE MUTUALLY EXCLUSIVE

Explanation: The ON or DO statement combinations are not valid. When defining or updating a Control-O rule, some statement combinations cannot be used together. In this case, the setting of one statement precludes the desired setting of the other statement. Possibly, the logical check picked up statement combinations that were defined, but not rejected in a previous release.

The rule is not saved.

Corrective Action: Correct the rule so that the statement combinations are valid.

CTO7F3E Invalid AND/NOT relations between ‘ON’ statements

Explanation: The AND/OR/NOT field in the ON statement is invalid. Inappropriate definition of AND, OR, or NOT fields connecting ON statements can create logic problems, such as a rule that is never triggered. Control-O checks each rule to ensure that the combination of ON statements and AND/OR/NOT connectors is logical.

For example,
The statement ON MESSAGE X AND ON MESSAGE Y is not logical because the message cannot be both X and Y.

The statement ON JOBARRIV A AND ON JOBEND B is not logical, because the ON statements in a single rule cannot refer to two different EVENTS; these must be in separate rules.

It is possible that the logic problem was detected in a rule that was defined in a previous Control-O release.

The rule is not saved.

**Corrective Action:** Correct the ON statement and then save the rule.

CTO7F4E Invalid AND/NOT relations between 'ON' field1 field2 fields

*Explanation:* Values have been entered into two fields that are mutually exclusive, in that only one of the fields can have a value.

In this message, field1 and field2 are the identities of the two fields that are mutually exclusive.

**Corrective Action:** Enter a value for the field you require, and delete the value in the other field.

CTO7F5E DDNAME or JOBNAME must be specified

*Explanation:* A value must be set for the DDNAME and JOBNAME fields in ON SYSOUT. These fields may not be left blank or contain only the value * (Asterisk).

The rule is not saved.

**Corrective Action:** Correct the ON SYSOUT statement, and save the rule.

CTO7F6E JOBNAME=jobName not allowed in ON SYSOUT

*Explanation:* The JOBNAME fields in ON SYSOUT may not be any of the following:

- ` ' ` (Blank)
- ` * ` (Asterisk)
- JES2
- JES3
- *MASTER*
- CATALOG
- SMS

The rule is not saved.

**Corrective Action:** Correct the JOBNAME field in the ON SYSOUT statement, and then save the rule.

CTO7F7E DDNAME=ddName not allowed when JOBNAME is not specified

*Explanation:* An invalid value was found in the DDNAME parameter in the ON SYSOUT statement. The value in the DDNAME parameter in the ON SYSOUT may not be any of the following:
' ' (Blank)
* (Asterisk)
SYSUT*
SYSUDUMP
SYSMDUMP
SYSABEND
SYSTERM
INTRDR

The rule is not saved.

**Corrective Action:** Correct the value of the DDNAME parameter in the ON SYSOUT statement, and then save the rule.

CTO7F8E DO KSL/TSO/WAIT with WAIT=YES not allowed in ENDMSG block

**Explanation:** The expression WAIT=YES was defined in a DO KSL, DO TSO, or DO WAIT statement for a multi-line block that ends with an ENDMSG statement. WAIT mode actions are not allowed in multiline block processing that ended by ENDMSG.

The rule is not saved.

**Corrective Action:** Delete the expression WAIT=YES, then save the rule.

CTO7F9E DO EXIT valid only with MSG/MESSAGE or WHILE

**Explanation:** Use of DO EXIT in this situation is not valid. DO EXIT can only be used in one of the following cases:

- with MSG or MESSAGE to exit multi-line block processing that ended with ENDMSG
- with WHILE to exit WHILE block processing that ended with ENDWHILE

Rule definition cannot continue until the mistake is corrected.

**Corrective Action:** Correct the mistake, and continue defining the rule.

CTO7FAE DO EXIT invalid - missing 'ENDMSG'

**Explanation:** Exit from the Control-O rule definition failed because a DO EXIT MESSAGE statement is not followed by an ENDMSG statement to indicate the end of the multi-line message processing block. A DO EXIT MESSAGE statement is valid only in a multi-line message processing block, which must be closed by an ENDMSG statement.

The rule cannot be saved.

**Corrective Action:** Do one of the following:
Delete the DO EXIT MESSAGE command.
Add ENDMMSG at the end of the block.

CTO7FBE DO EXIT invalid - no DO WHILE block is open

Explanation: An attempt was made to add a DO EXIT W (while) statement outside of a DO WHILE block. An EXIT W (while) statement is valid only in a DO WHILE block.
The EXIT W statement is rejected.
Corrective Action: Delete the EXIT W statement.

CTO7FCE ACS CALL values are: Management, Data, Storage, All, *

Explanation: The ACS CALL field in an ON SMS statement has an invalid value.
Valid values for the ACS CALL field are:
- MANAGMNT - Management class selection routine
- DATA - Data class selection routine
- STORAGE - Storage class selection routine
- ALL - All of the above
- * (Asterisk) - All of the above (the same as ALL)
The value in the ACS CALL field is rejected.
Corrective Action: Correct the ACS CALL field in the ON SMS statement.

CTO7FDE DSORG values are: PS, SEQ, PO, PDS, VS, or DA

Explanation: The DSORG field in an ON SMS statement has an invalid value. Valid values are:
- PS or SEQ - Sequential file
- PO or PDS - Partitioned data set
- VS - VSAM file
- DA - Direct file
The value in the DSORG field is rejected.
Corrective Action: Correct the DSORG field in the ON SMS statement.

CTO7FEE DS-type values are: GDg or GDs, PERm or Temp

Explanation: The DS-TYPE field in an ON SMS statement has an invalid value. Valid values are:
- GDG or GDS - Generation data set
- PERM - Permanent data set
- TEMP - Temporary data set
The value in the DSORG field is not accepted.
Corrective Action: Correct the DS-TYPE field in the ON SMS statement.
CTO7FFE SMSMSG ID valid number is 1 to 6. BLANK is NOT allowed.

**Explanation:** The ID field in a DO SMSMSG statement contains an invalid value. The value in such a field must be from 1 through 6.

The value is not accepted.

**Corrective Action:** Specify a valid value (from 1 through 6) in the ID field of the DO SMSMSG statement.

**Messages CTO800 through CTO8xx**

This group includes messages for the Control-O product.

**CTO820I INITIALIZATION OF SMS SUPPORT STARTED**

**Explanation:** This information message indicates that Control-O started initializing SMS support.

**Corrective Action:** No action is required.

**CTO821I SMS INTERFACE MODULE SUCCESSFULLY LOADED**

**Explanation:** This information message indicates that a Control-O subsystem loaded the SMS interface module into storage.

The first Control-O subsystem to initialize itself loads the SMS interface.

**Corrective Action:** No action is required.

**CTO822I SUBSYSTEM REGISTERED WITH SMS INTERFACE**

**Explanation:** This information message indicates that the current Control-O subsystem registered itself with the SMS interface.

Control-O subsystems must be registered with the SMS interface to receive SMS events from it.

**Corrective Action:** No action is required.

**CTO823I INITIALIZATION OF SMS SUPPORT ENDED SUCCESSFULLY**

**Explanation:** This information message indicates that SMS support for the current Control-O subsystem was installed successfully.

Control-O requires SMS ACS exit routines to trigger rules based on SMS events.

**Corrective Action:** No action is required.

**CTO824W LOAD OF CAB ALLOCATOR MODULE FAILED**

**Explanation:** Control-O could not load IOACAB.

Control-O needs the IOACAB program to install the SMS interface module.

The following system actions result:
- SMS interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle SMS events.

**Corrective Action:** Check the IOA load library.

**CTO825W UNABLE TO REGISTER WITH SMS INTERFACE *rsn***

**Explanation:** Control-O could not register with the SMS interface during initialization.

The value of *rsn* may be one of the following:

- TOO MANY SUBSYSTEMS - The SMS interface had already registered the maximum number of subsystems.
- LOCK CANNOT BE OBTAINED - Control-O could not get the SMS interface lock that it needs for registration.

All of the following result:

- SMS interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle SMS events.

**Corrective Action:** Do one of the following:

- If the value of *rsn* is TOO MANY SUBSYSTEMS, shut down a different Control-O monitor and restart the current one.
- If the value of *rsn* is LOCK CANNOT BE OBTAINED, restart the current Control-O monitor.

If the problem persists, call your INCONTROL administrator.

**CTO826W LOAD OF SMS INTERFACE FAILED: *rsn***

**Explanation:** Control-O could not load the SMS interface module.

In this message, *rsn* may be one of the following:

- LOAD TO PRIVATE REGION FAILED - Control-O could not load the SMS interface module into its own private region.
- CSA GETMAIN FAILED - Control-O could not get the storage in the Common Service Area (CSA) that it needs for the SMS interface module.
- LOAD TO CSA FAILED - Control-O could not load the SMS interface module into the CSA.

The following system actions result:

- SMS interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle SMS events.

**Corrective Action:** Do one of the following:
If the value of rsn is LOAD TO PRIVATE REGION FAILED, check earlier messages to determine the cause of failure. The following are possible causes:

- The region allocated for Control-O is too small.
- The CTOACS module is not in the Control-O STEPLIB library.
- If the value of rsn is CSA GETMAIN FAILED, make sure that at least 8KB are allocated for the CSA and restart Control-O.
- If the value of rsn is LOAD TO CSA FAILED, check earlier messages to determine the cause of failure.

CTO827E INITIALIZATION OF SMS SUPPORT FAILED

**Explanation:** An initialization error occurred when Control-O tried to install the SMS interface.

The following system actions result:

- SMS interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle SMS events.

**Corrective Action:** Check earlier messages to determine the cause of failure. If necessary, call your INCONTROL administrator.

CTO828I SUBSYSTEM ALREADY REGISTERED WITH SMS INTERFACE

**Explanation:** This information message indicates that the current Control-O subsystem did not register with the SMS interface because it was already registered.

This may be because a previous Control-O subsystem did not end correctly.

SMS interface initialization continues.

**Corrective Action:** No action is required.

CTO829E ALLOCATION OF CVT CUSTOMER ANCHORED BLOCK FAILED

**Explanation:** Control-O could not allocate a block of storage anchored to the z/OS communication vector table (CVT).

Even though the block of storage has not yet been allocated, Control-O could not allocate it.

The following system actions occur:

- MAINVIEW interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle MAINVIEW events.

**Corrective Action:** Check earlier messages to determine the cause of failure. If necessary, call your INCONTROL administrator.
CTO82AW LOAD OF SMS INTERFACE MODULE FAILED: CSA GETMAIN FAILED

**Explanation:** During the Control-O monitor initialization, Control-O failed to GETMAIN the storage in E/CSA, which is required for the CTOACS module, and as a result the Control-O/DFSMS interface is disabled.

**Corrective Action:** Contact your systems programmer for assistance. Control-O requires about 1024 bytes. If the problem is not resolved, call BMC Software Customer Support for assistance and provide the step name indicated in the message.

CTO82BW LOAD OF SMS INTERFACE MODULE FAILED: LOAD TO CSA FAILED

**Explanation:** During the Control-O monitor initialization, Control-O failed to load the CTOACS module into E/CSA, and as a result the Control-O/DFSMS interface is disabled.

**Corrective Action:** Contact your systems programmer for assistance. If the problem is not resolved, contact BMC Software Customer Support.

CTO82CW UNABLE TO REGISTER WITH SMS INTERFACE: NO PROPER ENTRY IN SSTABLE

**Explanation:** This warning message indicates that Control-O detected an internal problem. The Control-O/DFSMS interface is disabled.

**Corrective Action:** Contact BMC Software Customer Support.

CTO830I DEACTIVATION OF SMS SUPPORT STARTED

**Explanation:** This information message indicates that Control-O started deactivating an SMS interface.

**Corrective Action:** No action is required.

CTO831I SUBSYSTEM REGISTRATION REMOVED FROM SMS INTERFACE

**Explanation:** This information message indicates that Control-O removed its registration from the SMS interface.

When a Control-O subsystem is not registered with the SMS interface, it cannot receive SMS events from the SMS interface.

**Corrective Action:** No action is required.

CTO832I SMS INTERFACE MODULE REMOVED

**Explanation:** This information message indicates that Control-O removed the SMS interface module from storage.

The last Control-O subsystem removed unloads the SMS interface module.

**Corrective Action:** No action is required.
CTO833I DEACTIVATION OF SMS SUPPORT ENDED SUCCESSFULLY

Explanation: This information message indicates that SMS support for the current Control-O subsystem was removed successfully.

Corrective Action: No action is required.

CTO834W DEACTIVATION OF SMS SUPPORT FAILED

Explanation: An error occurred when Control-O tried to remove the SMS interface module.

The following system actions result:
- Control-O termination continues.
- The next attempt to activate Control-O may produce warnings.

Corrective Action: Do both of the following:
- Check earlier messages to determine the cause of the error.
- Check that the next Control-O initialization succeeds.

CTO835W SMS INTERFACE MODULE NOT INSTALLED

Explanation: Control-O could not find the SMS interface module to delete it.

Control-O detected an environment that supports the SMS interface. However, it could not find the SMS interface module that should have been installed during initialization.

The following system actions result:
- Control-O termination continues.
- The next attempt to activate Control-O may produce warnings.

Corrective Action: Do both of the following:
- Check earlier messages to determine the cause of the error.
- Check that the next Control-O initialization succeeds.

CTO836W SUBSYSTEM NOT REMOVED FROM SMS INTERFACE: LOCK CANNOT BE OBTAINED

Explanation: Control-O could not remove its subsystem name from the SMS interface because Control-O could not get the SMS interface lock that it needs to remove its registration.

The following system actions occur:
- Control-O termination continues.
- The next attempt to activate Control-O might produce warnings.

Corrective Action: Do both of the following:
• Check earlier messages to determine the cause of the error.
• Check that the next Control-O initialization succeeds.

CTO837W SUBSYSTEM NOT REMOVED FROM SMS INTERFACE: SUBSYSTEM NOT FOUND

Explanation: Control-O could not remove its subsystem name from the SMS interface because the name of the current Control-O subsystem is not registered in the SMS interface.

The following system actions occur:
• Control-O termination continues.
• The next attempt to activate Control-O might produce warnings.

Corrective Action: Do both of the following:
• Check earlier messages to determine the cause of the error.
• Check that the next Control-O initialization succeeds.

CTO83AI INITIALIZATION OF AUTOOPERATOR SUPPORT STARTED

Explanation: This information message indicates that Control-O started initializing AutoOPERATOR support.

Corrective Action: No action is required.

CTO83BW UNABLE TO REGISTER WITH AUTOOPERATOR INTERFACE: LOCK CANNOT BE OBTAINED

Explanation: Control-O could not register with the AutoOPERATOR interface during initialization because Control-O could not obtain the AutoOPERATOR interface lock that it needs for registration.

The following system actions occur:
• AUTOOPERATOR interface initialization fails.
• Control-O initialization continues.
• Control-O does not handle AutoOPERATOR events.

Corrective Action: Restart the current Control-O monitor. If the problem persists, call your INCONTROL administrator.

CTO83CI AUTOOPERATOR INTERFACE MODULE SUCCESSFULLY LOADED

Explanation: This information message indicates that Control-O successfully loaded the AutoOPERATOR interface module.

Corrective Action: No action is required.
CTO83DW UNABLE TO REGISTER WITH AUTOOPERATOR INTERFACE: NO PROPER ENTRY IN SSTABLE

Explanation: Control-O could not register with the AutoOPERATOR interface during initialization because Control-O could not locate its entry in the INCONTROL internal subsystems table.

The following system actions occur:
- AutoOPERATOR interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle AutoOPERATOR events.

Corrective Action: Restart the current Control-O monitor. If the problem persists, call your INCONTROL administrator.

CTO83EI SUBSYSTEM REGISTERED WITH AUTOOPERATOR INTERFACE

Explanation: This information message indicates that the current Control-O subsystem registered itself with the AutoOPERATOR interface.

Corrective Action: No action is required.

CTO83FI INITIALIZATION OF AUTOOPERATOR SUPPORT ENDED SUCCESSFULLY

Explanation: This information message indicates that Control-O initialization of the AutoOPERATOR support ended successfully.

Corrective Action: No action is required.

CTO83GE INITIALIZATION OF AUTOOPERATOR SUPPORT FAILED

Explanation: An initialization error occurred when Control-O tried to initialize the AutoOPERATOR interface.

The following system actions occur:
- AutoOPERATOR interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle AutoOPERATOR events.

Corrective Action: Check earlier messages to determine the cause of failure. If necessary, call your INCONTROL administrator.

CTO83HW LOAD OF AUTOOPERATOR INTERFACE MODULE FAILED: LOAD TO PRIVATE FAILED

Explanation: Control-O could not load the AutoOPERATOR interface module because it could not load the module into its own private region.

The following system actions occur:
AutoOPERATOR interface initialization fails.
Control-O initialization continues.
Control-O does not handle AutoOPERATOR events.

Corrective Action: Check earlier messages to determine the cause of failure. The following are possible causes:
- The region allocated for Control-O is too small.
- The CTOAAO module is not in the Control-O STEPLIB library.

CTO83IW LOAD OF AUTOOPERATOR INTERFACE MODULE FAILED: CSA GETMAIN FAILED

Explanation: Control-O could not load the AutoOPERATOR interface module because it could not get the storage in the Common Service Area (CSA) that it needs for the AutoOPERATOR interface module.
The following system actions occur:
- AutoOPERATOR interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle AutoOPERATOR events.

Corrective Action: Check earlier messages to determine the cause of failure.

CTO83JW LOAD OF AUTOOPERATOR INTERFACE MODULE FAILED: LOAD TO CSA FAILED

Explanation: Control-O could not load the AutoOPERATOR interface module because it could not load the AutoOPERATOR interface module to the Common Service Area (CSA).
The following system actions occur:
- AutoOPERATOR interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle AutoOPERATOR events.

Corrective Action: Check earlier messages to determine the cause of failure.

CTO83KI DEACTIVATION OF AUTOOPERATOR SUPPORT STARTED

Explanation: This information message indicates that Control-O started deactivating the AutoOPERATOR interface.

Corrective Action: No action is required.

CTO83LW AUTOOPERATOR INTERFACE MODULE NOT INSTALLED

Explanation: Control-O could not find the AutoOPERATOR interface module to delete it. Control-O detected an environment that supports the AutoOPERATOR interface. However, it could not find the AutoOPERATOR interface module that is usually installed during initialization.
The following system actions occur:
Control-O termination continues.
The next attempt to activate Control-O might produce warnings.

**Corrective Action:** Do both of the following:

- Check earlier messages to determine the cause of the error.
- Check that the next Control-O initialization succeeds.

CTO83MW SUBSYSTEM NOT REMOVED FROM AUTOOPERATOR INTERFACE: LOCK CANNOT BE OBTAINED

**Explanation:** Control-O could not remove its subsystem name from the AutoOPERATOR interface because Control-O could not get the AutoOPERATOR interface lock that it needs to remove its registration.

The following system actions occur:

- Control-O termination continues.
- The next attempt to activate Control-O might produce warnings.

**Corrective Action:** Do both of the following:

- Check earlier messages to determine the cause of the error.
- Check that the next Control-O initialization succeeds.

CTO83NW SUBSYSTEM NOT REMOVED FROM AUTOOPERATOR INTERFACE: NO PROPER ENTRY IN SSTABLE

**Explanation:** When Control-O tried to remove the AutoOPERATOR interface module it could not find its entry in the internal INCONTROL subsystem table.

Control-O termination continues.

**Corrective Action:** Check earlier messages to determine the cause of the error.

CTO83OI SUBSYSTEM REGISTRATION REMOVED FROM AUTOOPERATOR INTERFACE

**Explanation:** This information message indicates that Control-O unregistered the AutoOPERATOR interface.

**Corrective Action:** No action is required.

CTO83PI AUTOOPERATOR INTERFACE MODULE REMOVED

**Explanation:** This information message indicates that Control-O removed the AutoOPERATOR interface module from Common Service Area (CSA).

**Corrective Action:** No action is required.
CTO83QI  DEACTIVATION OF AUTOOPERATOR SUPPORT ENDED SUCCESSFULLY

Explanation: This information message indicates that the Control-O deactivation of the AutoOPERATOR support ended successfully.

Corrective Action: No action is required.

CTO83RW  DEACTIVATION OF AUTOOPERATOR SUPPORT FAILED

Explanation: An error occurred when Control-O tried to remove the AutoOPERATOR interface module. The following system actions occur:

- Control-O termination continues.
- The next attempt to activate Control-O might produce warnings.

Corrective Action: Do both of the following:

- Check earlier messages to determine the cause of the error.
- Check that the next Control-O initialization succeeds.

CTO840E  INITIALIZATION OF SUBSYSTEM TABLE FAILED: LOAD OF CTOSSI FAILED

Explanation: When Control-O starts, it defines the IOA and Control-O subsystems if they were not already defined. During the definition process, the Control-O interface was not successfully loaded. Control-O terminates with a return code of 8.

Corrective Action: Ensure that the Control-O STC is using the correct STEPLIB library, then restart Control-O.

CTO841I  MAINVIEW INTERFACE MODULE SUCCESSFULLY LOADED

Explanation: This information message indicates that a Control-O subsystem loaded the MAINVIEW interface module into storage.

The first Control-O subsystem to initialize itself loads the MAINVIEW interface.

Corrective Action: No action is required.

CTO842I  SUBSYSTEM REGISTERED WITH MAINVIEW INTERFACE

Explanation: This information message indicates that the current Control-O subsystem registered itself with the MAINVIEW interface.

Control-O subsystems must be registered with the MAINVIEW interface to receive MAINVIEW events from it.

Corrective Action: No action is required.
CTO843I INITIALIZATION OF MAINVIEW SUPPORT ENDED SUCCESSFULLY

**Explanation:** This information message indicates that MAINVIEW support for the current Control-O subsystem was installed successfully.

Control-O requires MAINVIEW exit routines to trigger rules based on MAINVIEW events.

**Corrective Action:** No action is required.

CTO844W LOAD OF CAB ALLOCATOR MODULE FAILED

**Explanation:** Control-O could not load IOACAB.

Control-O needs the IOACAB program to install the MAINVIEW interface module.

The following system actions result:
- MAINVIEW interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle MAINVIEW events.

**Corrective Action:** Check the IOA load library.

CTO845W UNABLE TO REGISTER WITH MAINVIEW INTERFACE: LOCK CANNOT BE OBTAINED

**Explanation:** Control-O could not register with the MAINVIEW interface during initialization because Control-O could not get the MAINVIEW interface lock that it needs for registration.

The following system actions occur:
- MAINVIEW interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle MAINVIEW events.

**Corrective Action:** Restart the current Control-O monitor. If the problem persists, call your INCONTROL administrator.

CTO846W LOAD OF MAINVIEW INTERFACE FAILED: LOAD TO PRIVATE FAILED

**Explanation:** Control-O could not load the MAINVIEW interface module because Control-O could not load the MAINVIEW interface module into its own private region.

The following system actions occur:
- MAINVIEW interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle MAINVIEW events.

**Corrective Action:** Check earlier messages to determine the cause of failure. The following are possible causes:
The region allocated for Control-O is too small.

The CTOACS module is not in the Control-O STEPLLIB library.

CTO847E INITIALIZATION OF MAINVIEW SUPPORT FAILED
Explanation: An initialization error occurred when Control-O tried to install the MAINVIEW interface.

The following system actions result:

- MAINVIEW interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle MAINVIEW events.

Corrective Action: Check earlier messages to determine the cause of failure. If necessary, call your INCONTROL administrator.

CTO848I SUBSYSTEM ALREADY REGISTERED WITH MAINVIEW INTERFACE
Explanation: This information message indicates that the current Control-O subsystem did not register with the MAINVIEW interface because it was already registered.

A possible cause is that a previous Control-O subsystem did not end correctly.

MAINVIEW interface initialization continues.

Corrective Action: No action is required.

CTO84AI INITIALIZATION OF MAINVIEW SUPPORT STARTED
Explanation: This information message indicates that Control-O started initializing MAINVIEW support.

Corrective Action: No action is required.

CTO84BI DEACTIVATION OF MAINVIEW SUPPORT STARTED
Explanation: This information message indicates that Control-O started deactivating an MAINVIEW interface.

Corrective Action: No action is required.

CTO84CI SUBSYSTEM REGISTRATION REMOVED FROM MAINVIEW INTERFACE
Explanation: This information message indicates that Control-O removed its registration from the MAINVIEW interface.

When a Control-O subsystem is not registered with the MAINVIEW interface, it cannot receive MAINVIEW events from the MAINVIEW interface.

Corrective Action: No action is required.
CTO84DI  MAINVIEW INTERFACE MODULE REMOVED

**Explanation:** This information message indicates that Control-O removed the MAINVIEW interface module from storage.

The last Control-O subsystem removed unloads the MAINVIEW interface module.

**Corrective Action:** No action is required.

CTO84EI  DEACTIVATION OF MAINVIEW SUPPORT ENDED SUCCESSFULLY

**Explanation:** This information message indicates that MAINVIEW support for the current Control-O subsystem was removed successfully.

**Corrective Action:** No action is required.

CTO84FW  DEACTIVATION OF MAINVIEW SUPPORT FAILED

**Explanation:** An error occurred when Control-O tried to remove the MAINVIEW interface module.

The following system actions result:

- Control-O termination continues.
- The next attempt to activate Control-O may produce warnings.

**Corrective Action:** Do both of the following:

- Check earlier messages to determine the cause of the error.
- Check that the next Control-O initialization succeeds.

CTO84GW  MAINVIEW INTERFACE MODULE NOT INSTALLED

**Explanation:** Control-O could not find the MAINVIEW interface module to delete it.

Control-O detected an environment that supports the MAINVIEW interface. However, it could not find the MAINVIEW interface module that should have been installed during initialization.

The following system actions result:

- Control-O termination continues.
- The next attempt to activate Control-O may produce warnings.

**Corrective Action:** Do both of the following:

- Check earlier messages to determine the cause of the error.
- Check that the next Control-O initialization succeeds.

CTO84HW  SUBSYSTEM NOT REMOVED FROM MAINVIEW INTERFACE: rsn

**Explanation:** Control-O could not remove its subsystem name from the MAINVIEW interface.

Possible values of rsn are:
- **SUBSYSTEM NOT FOUND** - The name of the current Control-O subsystem is not registered in the MAINVIEW interface.
- **LOCK CANNOT BE OBTAINED** - Control-O could not get the MAINVIEW interface lock that it needs to remove its registration.

The following system actions result:
- Control-O termination continues.
- The next attempt to activate Control-O may produce warnings.

**Corrective Action:** Do both of the following:
- Check earlier messages to determine the cause of the error.
- Check that the next Control-O initialization succeeds.

**CTO84IE INITIALIZATION OF SUBSYSTEM TABLE FAILED: CSA GETMAIN FAILED**

**Explanation:** When Control-O starts, it defines the IOA and Control-O subsystems if they were not already defined. During the definition process, the Control-O failed to GETMAIN in CSA.

Control-O terminates with a return code of 8.

**Corrective Action:** Ensure that Control-O has sufficient storage. Control-O requires about 50K in CSA. It might be necessary to restart the system.

**CTO84JE INITIALIZATION OF SUBSYSTEM TABLE FAILED: LOCK CANNOT BE OBTAINED**

**Explanation:** When Control-O starts, it defines the IOA and Control-O subsystems if they were not already defined. During the definition process, the Control-O failed to obtain LOCK.

Control-O terminates with a return code of 8.

**Corrective Action:** The error might be a Control-O internal error. Try to start Control-O again. If the same error occurs, contact BMC Software Customer Support.

**CTO84KE INITIALIZATION OF SUBSYSTEM TABLE FAILED: TOO MANY SUBSYSTEMS**

**Explanation:** When Control-O starts, it defines the IOA and Control-O subsystems, if they were not defined previously. During the definition process, the Control-O failed to define the subsystem, because the number of Control-O and Control-M Event Manager (CMEM) environments defined on the LPAR exceeded the maximum of 20.

Control-O terminates with a return code of 8.

**Corrective Action:** Stop all active Control-O and CMEM monitors, run the IOACABPR (Emergency CAB Control Block Disconnect) utility, and then restart the Control-O and CMEM monitors.
CTO84LW UNABLE TO REGISTER WITH MAINVIEW INTERFACE: NO PROPER ENTRY IN SSTABLE

**Explanation:** Control-O could not register with the MAINVIEW interface during initialization because Control-O could not locate its entry in the INCONTROL internal subsystems table.

The following system actions occur:

- MAINVIEW interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle MAINVIEW events.

**Corrective Action:** Restart the current Control-O monitor. If the problem persists, call your INCONTROL administrator.

CTO84MW LOAD OF MAINVIEW INTERFACE FAILED: CSA GETMAIN FAILED

**Explanation:** Control-O could not load the MAINVIEW interface module because Control-O could not get the storage in the Common Service Area (CSA) that it needs for the MAINVIEW interface module.

The following system actions occur:

- MAINVIEW interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle MAINVIEW events.

**Corrective Action:** Make sure that at least 8KB are allocated for the CSA and restart Control-O.

CTO84NW LOAD OF MAINVIEW INTERFACE FAILED: LOAD TO CSA FAILED

**Explanation:** Control-O could not load the MAINVIEW interface module because Control-O could not load the MAINVIEW interface module into the Common Service Area (CSA).

The following system actions occur:

- MAINVIEW interface initialization fails.
- Control-O initialization continues.
- Control-O does not handle MAINVIEW events.

**Corrective Action:** Check earlier messages to determine the cause of failure.

CTO84OW SUBSYSTEM NOT REMOVED FROM MAINVIEW INTERFACE: NO PROPER ENTRY IN SSTABLE

**Explanation:** When Control-O tried to remove the MAINVIEW interface module it could not find its entry in the internal INCONTROL subsystem table.

Control-O termination continues.

**Corrective Action:** Check earlier messages to determine the cause of failure.
CT08A0I Control-O IS NOT ACTIVE. NO RULES LOADED

Explanation: This information message indicates that the Rule Status screen is empty because the Control-O subsystem is not active. When the Control-O subsystem in inactive, no rules are loaded. No records are shown.

Corrective Action: Check why the subsystem is inactive.

CT08A1E SUBSYSTEM FAILURE - REASON rsn

Explanation: An error in the subsystem was found while trying to access the subsystem tables. The value of rsn indicates what happened.

Possible values of rsn are:

- 08 - Subsystem name incorrectly defined
- 16 - GETMAIN failed
- 24 - Load of executor failed
- 28 - Invalid parms

The program is terminated.

Corrective Action: Notify your INCONTROL administrator.

CT08A2I STATUS SCREEN REBUILT DUE TO RELOADING OF RULES

Explanation: This information message indicates that, after pressing a key that returns control to the program (PFKey, Enter, and the like.), the list of rules was rebuilt according to the information currently residing in the subsystem data lists.

After control returns to the Rule Status screen program (CTOTARF), the program checks to see if it is necessary to rebuild the Active Rule List. If rules have been ordered since the last time control was returned, the rule table is reloaded, and the screen is rebuilt according to the new information.

The Rule Status screen is rebuilt.

Corrective Action: No action is required.

CT08A3E "TO" VALUE MUST BE EQUAL/GREATER THAN "FROM" VALUE, OR BLANK

Explanation: A FROM value larger than a TO value was specified. In the Show Window, you can specify ranges of values for filtering the displayed Active Rule List. The TO value must be larger than the FROM value, or either or both values must be blank. A blank in the FROM field indicates the minimum valid for that field. A blank in the TO field indicates the maximum for that field.

The Show Window is not exited until a valid range is defined.

Corrective Action: Specify a valid range in the TO and FROM fields.

CT08A4E MAXIMUM VALUE OF COUNTER EXCEEDED

Explanation: An ACTIVATION# range greater than, or equal to, 231 was entered in the Show Window. The maximum value allowed for this counter is 1 less than 231.
The Show Window is not exited until a valid range is entered.

**Corrective Action:** Set the ACTIVATION# range to a value less than 231.

CTO8A5I NO INFORMATION AVAILABLE

**Explanation:** This information message indicates that an option was specified for a rule which no longer exists in the Active Rule List. An option was requested for a rule appearing in the screen, but the rule was deleted, or the rule table was reloaded, before the request was processed.

The option is not performed.

**Corrective Action:** Reorder the rule if necessary.

CTO8ABE CANNOT PERFORM "HOLD" OPTION WHEN RULE IS EXECUTING

**Explanation:** A HOLD request was specified for a rule with status EXECUTING. A rule with status EXECUTING cannot be HELD. This status indicates that the rule is executing, and waiting for the completion of an event that is external to Control-O, such as, a TSO or KSL statement in Wait mode, or a DO COMMAND statement in Command-Response mode.

The option is not performed.

**Corrective Action:** Wait until the rule no longer has a status of EXECUTING before specifying the HOLD request.

CTO8ACI RULE ruleName TABLE tableName LIBRARY lib action

**Explanation:** This information message indicates that the action specified in the message has been performed on rule ruleName which is found in table tableName of library lib.

**Corrective Action:** No action is required.

CTO8ADI RULE ruleName TABLE tableName action

**Explanation:** This information message indicates that the action specified in the message was performed on rule ruleName, which is found in table tableName. A longer message (CTO8ACI) is written to the IOA Log. Message CTO8ACI also contains the Rule library name.

**Corrective Action:** No action is required.

CTO8AEE RULE NOT SUSPENDED. 'RESUME' REQUEST IGNORED

**Explanation:** The line command R (RESUME) was entered in the Rule Status screen for a rule that is not in SUSPEND mode. This is invalid because only a suspended rule can be resumed. A rule becomes suspended when its threshold is reached.

The RESUME request is not performed.

**Corrective Action:** No action is required.

CTO8AFE "CANCEL" OPTION SUPPORTED ONLY WHEN RULE IS EXECUTING

**Explanation:** The user attempted to cancel a rule whose present status is not EXECUTING. CANCEL is supported only for rules in status EXECUTING.
The line command is ignored.

**Corrective Action:** No action is required.

**CTO8B9E MONITOR REQUEST BUFFER IS FULL, TRY AGAIN LATER**

**Explanation:** An S (Show), X (Exclude) or R (Reset) line command was specified, but cannot be executed because the Control-O monitor request buffer is full. Line commands are stored in the Control-O monitor request buffer.

The line command is not executed.

**Corrective Action:** Reattempt the line command after a few seconds. If Control-O is not active, start the Control-O monitor so that it may process the previous requests.

**CTO8BAE LEFT AND RIGHT ARE INACTIVE WHEN WRAP IS ON**

**Explanation:** While viewing the Control-O Message Statistics screen in wrap mode, the LEFT (PF10 or PF22) or RIGHT (PF11 or PF23) commands were issued. The LEFT and RIGHT commands are not supported when the text is wrapped, because all the information is already displayed.

The display remains unchanged.

**Corrective Action:** No action is required.

**CTO8BBE STATISTICS FILE IN USE, TRY AGAIN LATER**

**Explanation:** The Control-O Message Statistics screen cannot currently be viewed or refreshed because the Statistics file is in use. Possible causes are:

- The indices of the Statistics file are currently being updated by the Control-O monitor.
- The Statistics file is currently being reformatted.

**Corrective Action:** Try again later.

**CTO8BCE ERROR READING RECORD 0, UPDATE NOT PERFORMED**

**Explanation:** The Control-O Statistics file cannot be updated due to an internal error.

The Statistics file is not updated.

**Corrective Action:** Contact BMC Software Customer Support.

**CTO8BDE ERROR WRITING RECORD 0, UPDATE NOT PERFORMED**

**Explanation:** The Control-O Statistics file cannot be updated due to an internal error.

The Statistics file is not updated.

**Corrective Action:** Contact BMC Software Customer Support.

**CTO8BES ERROR OPENING STATISTICS FILE**

**Explanation:** An error occurred while attempting to allocate or open the Control-O Statistics file. Possible causes are:
- An incorrect prefix was defined for the Control-O Statistics file in CTOPARM (the STTPREF parameter).
- The Statistics file was deleted, or has an incorrect format
- No Statistics file was defined or formatted for this CPU.

The Message Statistics screen is not displayed.

**Corrective Action:** Do one of the following:

- Define the prefix correctly in CTOPARM. For details, see the section on operational parameters in the Control-M chapter of the *INCONTROL for z/OS Installation Guide.*
- Allocate and format a Control-O Statistics file for the CPU. For details, see the section that describes how to allocate and format a Control-O statistics files in the Control-O chapter of the *INCONTROL for z/OS Installation Guide.*

Contact BMC Software Customer Support.

---

**CTO8BFW RULES BEING LOADED, HIT ENTER TO UPDATE SCREEN**

**Explanation:** This warning message indicates that, after pressing a key that returns control to the program, such as PFKey or ENTER, the list of rules is rebuilt, and therefore the screen must be refreshed to update the list.

**Corrective Action:** Press ENTER to update the screen. When the update is completed, the CTO8A2I message is displayed. It is advisable to press PF3 and re-enter 'OS' to display the updated rule list from the beginning.

---

**CTO8C0E CTMMEM ERROR WHILE READING MEMBER memName, RC=rc**

**Explanation:** The Automation Options main program failed while trying to access the `memName` menu definition member in the IOA PARMCMD library.

The requested menu is not displayed.

**Corrective Action:** Check the return code in the following list to determine the reason for the failure. Correct the problem and try again to activate the Automation Options facility.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>Insufficient memory to continue; region is too small, or member is too large.</td>
</tr>
<tr>
<td>12</td>
<td>The member was not found in the library.</td>
</tr>
<tr>
<td>16</td>
<td>The specified data set is not a library.</td>
</tr>
<tr>
<td>20</td>
<td>The specified data set is not in fixed format.</td>
</tr>
<tr>
<td>24</td>
<td>The logical record length is not 80.</td>
</tr>
<tr>
<td>28</td>
<td>The specified data set is in use.</td>

</tbody>
</table>

**CTO8C1E GETMAIN ERROR WHILE READING MEMBER memName, RC=rc**

**Explanation:** The Automation Options Program (AOP) failed to obtain storage. The Automation Options main program failed to obtain main storage while processing the memName menu definition member in the IOA PARMCMD library.

The requested menu is not displayed.

**Corrective Action:** If other options in the IOA Online Facility were active when this message was displayed, exit these options and try again. If the problem persists, increase the region size.

**CTO8C2E INVALID CARD NUMBER stmtNum**

**Explanation:** The Automation Options Program (AOP) detected an invalid menu statement. The stmtNum menu statement in the menu definition member for the requested menu does not follow AOP rules for syntax and order.

The menu is not displayed.

**Corrective Action:** Correct the error in the menu definition member. For more information on correct syntax for menu member definition, see the description of customization of automation options in the INCONTROL for z/OS Administrator Guide.

**CTO8C3E EXCESSIVE CONTINUATION IN CARD NUMBER stmtNum**

**Explanation:** The Automation Options Program (AOP) detected an excessive number of continuation statements. The menu statement number stmtNum surpassed the allowed number of continuation statements.

The menu is not displayed.

**Corrective Action:** Correct the error in the menu definition member. For more information on correct syntax for menu member definition, see the description of customization of automation options in the INCONTROL for z/OS Administrator Guide.

**CTO8C4E OPTION IN CARD NUMBER stmtNum IS DUPLICATE**

**Explanation:** The Automation Options Program (AOP) detected a duplicate option name in the menu definition. No two options in an AOP menu can share the same name.
The menu is not displayed.

**Corrective Action:** Correct the error in the menu definition member.

**CTO8C5E "DESC" IS MISSING, DUPLICATE OR OUT OF SEQUENCE**

**Explanation:** The Automation Options Program (AOP) detected an invalid DESC statement. A DESC (Description) statement must be specified immediately after each option statement. This message indicates that a DESC statement is either missing, or does not conform to AOP menu definition syntax.

The menu is not displayed.

**Corrective Action:** Correct the error in the menu definition member. For more information on correct syntax for menu member definition, see the description of customization of automation options in the *INCONTROL for z/OS Administrator Guide*.

**CTO8C6E "LINECMD" IS MISSING, DUPLICATE OR OUT OF SEQUENCE**

**Explanation:** The Automation Options Program (AOP) detected an invalid or missing LINECMD statement. The LINECMD statement does not follow AOP rules.

The menu is not displayed.

**Corrective Action:** Correct the error in the menu definition member. For more information on correct syntax for menu member definition, see the description of customization of automation options in the *INCONTROL for z/OS Administrator Guide*.

**CTO8C7E "PROGRAM" IS MISSING, DUPLICATE OR OUT OF SEQUENCE**

**Explanation:** The Automation Options Program (AOP) detected an invalid or missing PROGRAM statement. The PROGRAM statement specifies the program to be invoked when an option is selected. The program for the requested option does not follow AOP rules.

The menu is not displayed.

**Corrective Action:** Correct the error in the menu definition member. For more information on correct syntax for menu member definition, see the description of customization of automation options in the *INCONTROL for z/OS Administrator Guide*.

**CTO8C8E TOO MANY "PROMPT" CARDS, OR "PROMPT" CARDS OUT OF SEQUENCE**

**Explanation:** The Automation Options Program (AOP) detected too many PROMPT statements, or PROMPT statements coded out of order. Not more than 14 PARM statements in a row can be specified.

The menu is not displayed.

**Corrective Action:** Correct the error in the menu definition member. For more information on correct syntax for menu member definition, see the description of customization of automation options in the *INCONTROL for z/OS Administrator Guide*.

**CTO8C9E "RETURNS" IS DUPLICATE, OR OUT OF SEQUENCE**

**Explanation:** The Automation Options Program (AOP) detected an invalid RETURNS statement. Either the RETURNS statement is listed twice in the menu definition or the RETURNS statement is not in the position dictated by AOP rules.
The menu is not displayed.

**Corrective Action:** Correct the error in the menu definition member. For more information on correct syntax for menu member definition, see the description of customization of automation options in the *INCONTROL for z/OS Administrator Guide*.

**CTO8CAE "FORMAT" IS DUPLICATE, OR OUT OF SEQUENCE**

**Explanation:** The Automation Options Program (AOP) detected invalid FORMAT statement. Either the FORMAT statement is listed twice in the menu definition or the FORMAT statement is not in the position dictated by AOP rules.

The menu is not displayed.

**Corrective Action:** Correct the error in the menu definition member. For more information on correct syntax for menu member definition, see the description of customization of automation options in the *INCONTROL for z/OS Administrator Guide*.

**CTO8CBE "OPTLIST" IS DUPLICATE, OR OUT OF SEQUENCE**

**Explanation:** The Automation Options Program (AOP) detected invalid OPTLIST statement. Either the OPTLIST statement is listed twice in the menu definition or the OPTLIST statement is not in the position dictated by AOP rules.

The menu is not displayed.

**Corrective Action:** Correct the error in the menu definition member. For more information on correct syntax for menu member definition, see the description of customization of automation options in the *INCONTROL for z/OS Administrator Guide*.

**CTO8CCE INVALID ACTION FOR OPTION**

**Explanation:** The program called by the specified Automation Option was invoked with an invalid action. If the option is supported by a user-written Client Program, that program is probably in error. Otherwise, this is an internal error.

Valid actions are:

- GETLINES
- ACTCMD
- END

The requested option is not performed.

**Corrective Action:** If the problem is in a user-written Client Program, correct the program. Otherwise, contact BMC Software Customer Support.

**CTO8CDE INVALID LDB IN PROGRAM pgm**

**Explanation:** The pgm Automation Options Program was passed an invalid LDB control block. If the pgm program is a user-written Client Program, it is probably in error. Otherwise, this is an internal error.

The selected option is not performed.

**Corrective Action:** If the problem is in a user-written Client Program, then correct the program. Otherwise, contact BMC Software Customer Support.
CTO8CEE INVALID OPTION

**Explanation:** The requested option was not defined as a valid LINECMD (line command) in the menu definition member.

The invalid line command is ignored.

**Corrective Action:** Specify a valid line command.

CTO8CFE GETMAIN ERROR IN PROGRAM pgm

**Explanation:** The pgm Automation Option program failed to obtain main storage to process its request. A return code is returned by GETMAIN.

The pgm program is terminated.

**Corrective Action:** Increase the region size.

CTO8D0E PROGRAM pgm NOT FOUND

**Explanation:** The pgm Client Program could not be found. The program specified in the menu definition for this option could not be located by means of STEPLIB or DALOAD.

The pgm program is not invoked. The main menu remains displayed on the screen.

**Corrective Action:** Correct the error and restart the action.

CTO8D1E ERROR rc IN OPTION

**Explanation:** The Client Program ended with an error. The return code of the Client Program (rc) is included in this message.

**Corrective Action:** If the name of the failed program begins with CTO or IOA, contact BMC Software Customer Support. If not, contact your system programmer.

CTO8D2E PROGRAM pgm MUST RUN UNDER ISPF

**Explanation:** Client Program pgm can only run under ISPF. A selection was made to a program that must run under ISPF. ISPFENV was specified. However, the call was not made under ISPF.

The pgm program is not invoked.

**Corrective Action:** Correct the error, and restart the action.

CTO8D3E TSO CMD ERROR, R15=val, RET-CODE=rc, RS-CODE=rsn, AB-CODE=abCode

**Explanation:** A TSO-command Client Program ended with an error. TSOC丕 was specified.

The variables in this message are:
Corrective Action: For information regarding the error, refer to TSO manuals, and take appropriate corrective action.

CTO8D5E LOAD OF EXIT(S) exitNames FAILED. SECURITY CHECK BYPASSED

Explanation: The security exits specified in this message could not be loaded. These security exits were not found in the STEPLIB DD statement.

No security checks are performed.

Corrective Action: Check why security exits are not found in the STEPLIB DD statement.

CTO8D6E ACCESS DENIED BY SECURITY EXIT

Explanation: The selected Automation Option cannot be performed because security exit CTOSE03 detected a security violation.

The option is not performed.

Corrective Action: Check the security definitions with your IOA Security Administrator.

CTO8D7E AUTOEDIT ERROR, R15=rc, REASON- CODE=rsn

Explanation: An AutoEdit error was encountered in the PARM statement of the menu definition member for the selected option.

The option is not performed.

Corrective Action: For a description of rc and rsn, see the following table. Correct the PARM statement accordingly.

<table>

</tbody>
</table>

**CTO8D8E INVALID PARAMETER. ONLY SINGLE PROMPT ALLOWED**

**Explanation:** A TSOCP program was defined with multiple PROMPT statements in an Automation Options menu definition. TSOCP programs cannot be invoked with more than one prompt statement.

The option is not performed.

**Corrective Action:** Correct the menu definition for this option. Define either a single PROMPT statement, or use a PARM statement to build the single parameter for the TSOCP program.

**CTO8D9E PROG=pgm ABEND CODE=Scode/Ucode OFFSET=offset R15=val**

**Explanation:** An Automation Options Client Program abended. This message displays the abend information.

The variables in this message are:
- **pgm** - the program name
- **Scode** - the system code
- **Ucode** - the user code
- **offset** - the offset
- **r15** - the value in general register 15

The option that calls this Client Program cannot be selected.

**Corrective Action:** If the problem is in a user-written Client Program, correct the program. Otherwise, contact BMC Software Customer Support.

**CTO8DAE INVALID APF ENVIRONMENT FOR OPTION <option >**

**Explanation:** The user has no APF authorization for the selected Automation Option (where < option > is the specific option selected by the user). The LOAD library used by this option (DD name DALOAD) should be APF authorized.

The option is not performed.

**Corrective Action:** Check the APF authorization of the DALOAD library.
CTO8DBE CONTROL-O MUST BE ACTIVE FOR OPTION <option>

**Explanation:** The user selected an Automation Option (where <option> is the specific option selected by the user) requiring the Control-O monitor but the monitor is inactive. The selected Automation Option needs services provided by the Control-O monitor.

The option is not performed.

**Corrective Action:** Verify that the Control-O monitor is active before selecting this option.

CTO8DCE INVALID PARAMETER PASSED TO OPTION <option>

**Explanation:** Automation Option (where <option> is the specific option selected by the user) was invoked with invalid parameters.

The option is not performed.

**Corrective Action:** Check and correct the PARM and PROMPT parameters specified in the menu definition for this option.

CTO8DEE COSMOS WAS NOT INSTALLED - CHECK CTOPARM

**Explanation:** The user tried to enter screen OC, but COSMOS was not installed. The definition in CTOPARM is COSMOS=N

The system rejects the request.

**Corrective Action:** Record the message code and message. Contact your INCONTROL administrator to check if Control-O/COSMOS is properly installed.

CTO8E0E INTERNAL ERROR: ONLY ACTIONS "GETLINES" OR "END" ARE SUPPORTED

**Explanation:** The CTOTGES Automation Options program was invoked with an invalid action. This message indicates an internal error.

The option is not performed.

**Corrective Action:** Contact BMC Software Customer Support.

CTO8E2E INVALID TIMING PARAMETER. SPECIFY Y OR N

**Explanation:** An incorrect value was specified for the TIMING parameter in the ENQINFO option. Valid values are Y (Yes) and N (No).

The option is not performed.

**Corrective Action:** Specify a valid value for the TIMING parameter.

CTO8E6E CONTROL-O MUST BE ACTIVE FOR TIMING=Y

**Explanation:** Value Y (Yes) was specified for the TIMING parameter in the ENQINFO option when the Control-O monitor was inactive. When the ENQINFO option is specified with TIMING set to Y, it needs the services of the Control-O monitor.

The option is not performed.
Corrective Action: Verify that the Control-O monitor is active before using this option.

CTO8E9I {CONTROL-O | CTMCMEM} LOADER TASK STARTED

Explanation: In Control-O, this information message indicates that the task responsible for loading rules and Global variables has begun. In Control-M, this information message indicates that the task responsible for loading CMEM rules has begun.

Corrective Action: No action is required.

CTO8EAE CTORFR DETECTED AN INVALID CHAIN STRUCTURE

Explanation: Control-O detected invalid structure for internal control blocks. This message indicates an internal error. The Control-O monitor terminates.

Corrective Action: Contact BMC Software Customer Support.

CTO8EBI {CONTROL-O | CTMCMEM} LOADER TASK ENDED

Explanation: In Control-O, this information message indicates that the task responsible for loading rules and Global variables has terminated successfully. In Control-M, this information message indicates that the task responsible for loading CMEM rules has terminated successfully.

Corrective Action: No action is required.

CTO8ECS ERROR ATTACHING CTOCPS - GLOBAL VARIABLES COMPRESSION FEATURE INACTIVE

Explanation: The CTOCPS program, which is responsible for automatic compression of the Global AutoEdit library, could not be loaded. The Automatic Compression Facility is not activated.

Corrective Action: Check associated MVS messages for the reason and for possible corrective actions, such as wrong load library concatenation, or region too small).

CTO8EDS GLOBAL VARIABLES LIBRARY IS NOT IN EXPECTED FORMAT

Explanation: The CTOCPS program detected an error while verifying that the previous LOADGLOBAL/WRITEGLOBAL action ended successfully. When automatic compression is activated, the $$COMPST member in the Global AutoEdit library is checked to see if the previous compress ended successfully. An error was detected by the program that performs the check on the $$COMPST member. This message is preceded by messages that describe the cause of the error.

The LOADGLOBAL/WRITEGLOBAL operation that prompted the verification process is terminated.

Corrective Action: Check preceding messages for the cause of the error and possible corrective actions.
CTO8EES ERROR COMPRESSING GLOBAL VARIABLES LIBRARY

**Explanation:** Compression of the Global AutoEdit library failed.
This message is preceded by messages describing the cause of the error.
The compression process is terminated.
**Corrective Action:** Check preceding messages for the cause of the error and possible corrective actions.

CTO8EFS `cmd` COMMAND FAILED

**Explanation:** The CTORFR program detected an error while executing the `cmd` command.
This message can result from problems while loading variables or tables, or while writing variables to the Global AutoEdit library. This message is preceded by messages describing the cause of the error.
The command specified in this message is terminated.
**Corrective Action:** Check preceding messages for the cause of the error and possible corrective actions.

CTO8F1S CTOTSRV INTERNAL ERROR - `rsn`

**Explanation:** An internal error was detected when Option SERVERS was activated.
The option is not performed.
**Corrective Action:** Contact BMC Software Customer Support.

CTO8F3E SERVER `svr` IS ALREADY `status`

**Explanation:** The user tried to change the server status, by means of a line command, but the server already had the requested status.
The line command is ignored.
**Corrective Action:** No action is required.

CTO8F4E IMMEDIATE SERVER CANNOT BE STARTED

**Explanation:** The user tried to start an Immediate server by means of a line command in the Option Servers screen. An Immediate server is started by Control-O only when a DO KSL/TSO statement with IMMEDIATE Y is performed.
The line command is ignored.
**Corrective Action:** No action is required.

CTO8F5E SERVER `svr` IS NOT IN USE, CANCEL IGNORED

**Explanation:** Line command C (CANCEL) was specified for a server that is not active.
The line command is ignored.
**Corrective Action:** No action is required.

CTO8F7I SERVER `svr` `cmd` WAS REQUESTED

**Explanation:** This information message indicates that command `cmd` was specified for server `svr`. 
Control-O performs the specified command.

**Corrective Action:** No action is required.

**CTO8F8E INVALID SERVER TYPE - ONLY S,G,I ARE SUPPORTED**

**Explanation:** An invalid server type was specified in the server selection window. Valid options are S (Special), G (General), I (Immediate), and blank (All).

The Server Selection Window remains displayed.

**Corrective Action:** Specify a valid server type.

**CTO8F9W NO SERVERS MATCH THE SELECTION CRITERIA**

**Explanation:** Option SERVERS was requested with selection criteria that did not match any server presently defined to Control-O.

The Server Selection Window remains displayed.

**Corrective Action:** Change the selection criteria if necessary.

**CTO8G1W NO GLOBAL VARIABLE POOLS FOUND**

**Explanation:** The user specified a Global variable pool name or mask that did not match any of the existing Global variable pools.

The Option GLOBALS selection window is redisplayed.

**Corrective Action:** Change the selection criteria if necessary.

**CTO8G3W FUNCTION NOT SUPPORTED**

**Explanation:** The requested function that was specified online is not supported.

**Corrective Action:** Check the validity of the value specified in the option field.

**CTO8G8E INTERNAL ERROR TYPE REQUEST=’request/’nfo**

**Explanation:** Option GLOBALS encountered an internal error.

The GLOBALS display is terminated.

**Corrective Action:** Contact BMC Software Customer Support.

**CTO8GCE NO MATCHING GLOBAL VARIABLE POOL FOUND**

**Explanation:** Option GLOBALS was selected with selection criteria not matched by any Global Variable Pool.

The GLOBALS selection window remains displayed.

**Corrective Action:** Change the selection criteria if necessary.

**Messages CTO900 through CTO9xx**

This group includes messages for the Control-O product.
CTO910W PARAMETER NUMCONS IN CTOPARM FORCED TO '0', DUE TO OPERATING SYSTEM RESTRICTIONS

**Explanation:** Control-O changes the NUMCONS parameter, in the CTOPARM member, to zero in z/OS 1.8 or later.

The Control-O startup process continues.

**Corrective Action:** If the CTOPARM member is only used for Control-O in z/OS 1.8 or later, set NUMCONS=0 in the CTOPARM member.

CTO912S ERROR IN CONTROL-x INSTALLATION PARAMETERS - INVALID DAYTIME

**Explanation:** Invalid format of Control- $x$ Installation DAYTIME parameter. DAYTIME is the start time of the Control-M work day in your installation. Valid formats are +hhmm or -hhmm.

For more details see the section that describes installation parameters in the chapter for the appropriate products in the INCONTROL for z/OS Installation Guide.

The requested function terminates.

**Corrective Action:** Call your system programmer to correct the DAYTIME parameter in the CT $x$:PARM member.

CTO913S OPEN OF DDNAME "SYSPRINT" FAILED

**Explanation:** The opening of a print file failed.

Possible causes are:

- The DD statement SYSPRINT is missing.
- The data set described by DD statement SYSPRINT cannot be accessed for sequential write.

The program stops executing.

**Corrective Action:** Correct the JCL and submit again.

CTO915S ERROR IN CONTROL-O INSTALLATION PARAMETERS

**Explanation:** During the startup of the Control-O monitor, an error is encountered in the Control-O installation parameters. The nature of the error is detailed in an accompanying message or messages.

The Control-O monitor terminates.

**Corrective Action:** Contact your INCONTROL administrator.

CTO916S ERROR OCCURRED DURING CONTROL-O INITIALIZATION

**Explanation:** During the startup of the Control-O monitor, an error occurred during Control-O initialization. The nature of the error is detailed in an accompanying message or messages.

The Control-O monitor terminates.

**Corrective Action:** Contact your INCONTROL administrator.
CTO917W PARAMETER J CMDSSN SHOULD DIFFER FROM SSNAME; REPLACED WITH BLANKS

**Explanation:** During the startup of the Control-O monitor, the values of the J CMDSSN and the SSNAME parameters were found to be identical.

The J CMDSSN parameter identifies the JES2 command suppression subsystem name, and is in the CTOPARM member.

The SSNAME parameter identifies the IOA subsystem, and is in the IOAPARM parameter.

The value of the J CMDSSN parameter is replaced with blanks. Monitor startup continues.

**Corrective Action:** Contact your INCONTROL administrator.

CTO918S INSUFFICIENT MEMORY TO RUN CONTROL-O. COMPONENT: *component LENGTH= getmain_length*

**Explanation:** The Control-O component could not be initialized because the getmain in length getmain_length failed.

The specified monitor will shut down.

**Corrective Action:** Increase the REGION size of the specified monitor.

CTO919E *monitor_type name FROM VERSION version IS USING SUBSYSTEM subsys. BRING IT DOWN BEFORE STARTING THIS MONITOR*

**Explanation:** During Control-O or CMEM monitor initialization, it was discovered that the existing subsys subsystem is already activated for the version version of the monitor. The active monitor is shut down.

**Corrective Action:** Determine which monitor (the active one or the newly started) should use the subsystem and act accordingly.

CTO91CW RQC ELEMENTS NUMBER CANNOT BE CHANGED WHILE MONITOR SWITCHING. VALUE xxxx USED.

**Explanation:** The RQC# parameter in the CTOPARM member was changed, and a new Control-O/CMEM was started over a running one. The new RQC# value is not used.

*xxxx - the old RQC# from the previous Control-O execution*

**Corrective Action:** Shut down Control-O/CMEM.

After the started task ends, start a new Control-O/CMEM. Verify that the new RQC# is being used by examining the started task job log.

**Messages CTOC00 through CTOCxx**

This group includes messages for the Control-O product.
CTOC02E INTERNAL ERROR, RC=rc. TD MESSAGE INTERCEPTION STOPPED

**Explanation:** The Control-O CICS Interface cannot intercept new CICS Transient Data (TD) messages due to a Control-O CICS Interface internal error. Transient Data message interception is stopped.

**Corrective Action:** Contact BMC Software Customer Support.

CTOC04I CTO SUBSYSTEM subsys INACTIVE. TD MESSAGES NOT PROCESSED

**Explanation:** This information message indicates that the Control-O CICS Interface was activated but cannot process Transient Data (TD) messages because the Control-O monitor is not active. The Control-O CICS Interface can automate Transient Data messages only when the Control-O monitor is active. Processing of Transient Data messages is discontinued. It will be resumed when Control-O becomes active.

**Corrective Action:** Start the Control-O monitor.

CTOC05I CTO SUBSYSTEM subsys IS NOW ACTIVE. TD MESSAGES ARE PROCESSED

**Explanation:** This informative message indicates that the processing of Transient Data (TD) messages resumes because the Control-O monitor has been activated. The Control-O CICS Interface can automate Transient Data messages only when the Control-O monitor is active. Processing of Transient Data messages resumes.

**Corrective Action:** No action is required.

CTOC06E INTERNAL ABEND= (systemCode,userCode)

**Explanation:** The Control-O CICS Interface detected an internal abend, where systemCode is the system abend code, and userCode is the user abend code. This is the header message for messages CTOC07I, CTOC08I, CTOC09I, and CTOC10I which provide information about the abend.

A dump of the address space is produced on the first abend intercepted by the Control-O CICS Interface, and processing of the current Transient Data (TD) message is stopped. Subsequent Transient Data messages are processed.

**Corrective Action:** Check the dump and the related messages. If the problem is related to CICS customization, or to storage violations due to user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

CTOC07E CICS FUNCTION func RESOURCE res ERROR RESPONSE resp1 resp2.

**Explanation:** The Control-O CICS initialization interface module initialization of the IOA environment failed due to a CICS service error.
The Control-O CICS interface initialization fails. No rule is triggered for messages written to CICS transient 
data queues.

**Corrective Action:** Notify the CICS or INCONTROL administrator.

CTOC07I  PSW AT TIME OF ABEND=psw CTOCTDF EP=add1 CTOEXEC 
EP=add2

**Explanation:** This information message indicates that the Control-O CICS Interface detected an internal 
abend. It describes the PSW at the time of the abend, and the entry points of the related Control-O 
modules. This message follows message CTOC06E and precedes messages CTOC08I, CTOC09I, and 
CTOC10I.

A dump of the address space is produced on the first abend intercepted by the Control-O CICS Interface, 
and processing of the current Transient Data (TD) message stops. Subsequent Transient Data messages 
are processed.

**Corrective Action:** Check the dump and the related messages. If the problem is related to CICS 
customization, or to storage violations due to user transactions, correct the problem. Otherwise, contact 
BMC Software Customer Support.

CTOC08I  REGISTERS AT TIME OF ABEND (R0 - R15):

**Explanation:** This information message indicates that the Control-O CICS Interface detected an internal 
abend. This message is a header for messages CTOC09I and CTOC10I which detail the contents of the 
registers at time of abend. This message is follows messages CTOC06E and CTOC07I.

A dump of the address space is produced on the first abend intercepted by the Control-O CICS Interface, 
and processing of the current Transient Data (TD) message stops. Subsequent Transient Data messages 
are processed.

**Corrective Action:** Check the dump and the related messages. If the problem is related to CICS 
customization, or to storage violations due to user transactions, correct the problem. Otherwise, contact 
BMC Software Customer Support.

CTOC09I register0 register1 ... register7

**Explanation:** This information message indicates that the Control-O CICS Interface detected an internal 
abend. The header for this message is message CTOC08I. This message details the contents of registers 
0 - 7 at time of abend. It is precedes message CTOC10I, which details the contents of registers 8 - 15.)

A dump of the address space is produced on the first abend intercepted by the Control-O CICS Interface, 
and processing of the current Transient Data (TD) message stops. Subsequent Transient Data messages 
are processed.

**Corrective Action:** Check the dump and the related messages. If the problem is related to CICS 
customization, or to storage violations due to user transactions, correct the problem. Otherwise, contact 
BMC Software Customer Support.

CTOC0AE BLDL/LOAD FAILED FOR MODULE modName

**Explanation:** The Control-O CICS interface initialization module CTOCTDT failed to load the modName 
module.
The Control-O CICS interface initialization fails. No rule is triggered for messages written to CICS transient data queues.

**Corrective Action:** Do the following:

1. Verify that the IOA load library is concatenated to CICS STEPLIB. If it is not, do the following, in sequence:
   - Add the IOA load library to the CICS STEPLIB.
   - Stop and restart the CICS.
2. Restart the Control-O CICS interface.

**CTOC0BE** CONTROL-O IS NOT INSTALLED. IOAPARM MUST BE SET TO CTO=Y.

**Explanation:** The Control-O CICS interface module initialization of the IOA environment failed because Control-O is not installed, that is, CTO is not set to Y.

The Control-O CICS interface initialization fails. No rule is triggered for messages written to CICS transient data queues.

**Corrective Action:** Notify the INCONTROL administrator.

**CTOC0CE** CTOPARM WAS NOT INITIALIZED. CHECK ERROR MESSAGES ON THE J O BLOG/SYSLOG.

**Explanation:** The Control-O CICS interface module initialization of the IOA environment failed because CTOPARM is not initialized.

The Control-O CICS interface initialization fails. No rule is triggered for messages written to CICS transient data queues.

**Corrective Action:** Notify the INCONTROL administrator.

**CTOC10I** register8 register9 ... register15

**Explanation:** This information message indicates that the Control-O CICS Interface detected an internal abend. This message follows messages CTOC08I and CTOC09I. This message details the contents of registers 8 - 15 at time of abend.

A dump of the address space is produced on the first abend intercepted by the Control-O CICS Interface, and processing of the current Transient Data (TD) message stops. Subsequent Transient Data messages are processed.

**Corrective Action:** Check the dump and the related messages. If the problem is related to CICS customization, or to storage violations due to user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

**CTOC11I** CONTROL-O CICS INTERFACE INITIALIZATION COMPLETED FOR SUBSYSTEM

**Explanation:** This information message is issued upon successful completion of the Control-O CICS Interface initialization for the specified subsystem.
**Corrective Action:** No action is required.

**CTOC12E ERROR IN SEND TO CICS TERMINAL. EI BRESP=errCode**

**Explanation:** The Control-O CICS Interface could not send a message to the terminal during initialization or termination. Command EXEC CICS SEND failed with error code `errCode`.

**Corrective Action:** Check the error code. If the problem is related to CICS customization, or to storage violations due to user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

**CTOC13E RELEASE MISMATCH. THIS VERSION OF PROGRAM CTOCTDT DOES NOT SUPPORT CICS RELEASE release**

**Explanation:** An installation error due to a release mismatch occurred. Possible errors:
- The wrong version of the CTOCTDT module was copied to the DFHRPL CICS library.
- A CICS release earlier than Release 1.7 is installed.
- CICS was upgraded without upgrading the Control-O CICS Interface.

The Control-O CICS Interface is not initialized.

**Corrective Action:** Copy the version of the CTOCTDT module that corresponds to the CICS release to the DFHRPL CICS library. For details, see the instructions for installing the Control-O CICS Interface, in the Control-O chapter of the `INCONTROL for z/OS Installation Guide`.

**CTOC14E ERROR WHILE TRYING TO DETERMINE CICS LEVEL. EI BRESP=error_code**

**Explanation:** The Control-O CICS Interface could not determine the level of the CICS release. Command EXEC CICS INQUIRE SYSTEM RELEASE failed with error code `errCode`.

The Control-O CICS Interface is not initialized.

**Corrective Action:** Check the error code, and correct accordingly. If necessary, contact BMC Software Customer Support.

**CTOC15E ERROR IN RECEIVE FROM TERMINAL. EI BRESP=error_code**

**Explanation:** The Control-O CICS Interface could not receive from the terminal during initialization or termination. Command EXEC CICS RECEIVE failed with the error code `errCode`.

The Control-O CICS Interface is not initialized or terminated.

**Corrective Action:** Check the error code. If the problem is related to CICS customization, or to storage violations due to user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

**CTOC16W INIT REQUEST INVALID. INTERFACE ALREADY INITIALIZED**

**Explanation:** An initialization request was issued, but the Control-O CICS Interface is already initialized. The request is not processed.
**Corrective Action:** No action is required.

**CTOC17E "PGMIDERR" ERROR IN LOADING CTOCTDF**

**Explanation:** Load of the CTOCTDF program failed due to a program ID error. The EXEC CICS LOAD command failed. The probable cause of the error is that the CTOCTDF program is not defined in the CICS tables.

The Control-O CICS Interface is not initialized.

**Corrective Action:** Make sure that the CTOCTDF program was defined and copied correctly to CICS. For details, see the instructions for installing the Control-O CICS Interface, in the Control-O chapter of the *INCONTROL for z/OS Installation Guide*.

**CTOC18E UNAUTHORIZED TO LOAD CTOCTDF**

**Explanation:** Load of the CTOCTDF program failed because the user is not authorized to load the program.

The Control-O CICS Interface is not initialized.

**Corrective Action:** Perform the necessary CICS customization, or see your CICS security administrator.

**CTOC19E "PGMIDERR" ERROR IN LOADING CTOCTDP**

**Explanation:** Load of the CTOCTDP program failed due to a program ID error. The EXEC CICS LOAD command failed. The probable cause of the error is that the CTOCTDP program is not defined in the CICS tables.

The Control-O CICS Interface is not initialized.

**Corrective Action:** Make sure that the CTOCTDP program was defined and copied correctly to CICS. For details, see the instructions for installing the Control-O CICS Interface, in the Control-O chapter of the *INCONTROL for z/OS Installation Guide*.

**CTOC20E UNAUTHORIZED TO LOAD CTOCTDP**

**Explanation:** Load of the CTOCTDP program failed because the user is unauthorized to load the program.

The Control-O CICS Interface is not initialized.

**Corrective Action:** Perform the necessary CICS customization, or see your CICS security administrator.

**CTOC21I CONTROL-O CICS INTERFACE INITIALIZATION STARTED**

**Explanation:** This informative message is issued at the start of the Control-O CICS Interface initialization.

**Corrective Action:** No action is required.

**CTOC24E ERROR IN EXTRACT EXIT FOR CTOCTDX. EIBRCODE(BYTES 1-2)=errCode**

**Explanation:** The EXEC CICS EXTRACT command failed with error code `errCode`.
The Control-O CICS Interface is not initialized.

**Corrective Action:** Check the error code and correct the problem accordingly; then try to initialize the interface again. If necessary, contact BMC Software Customer Support.

**CTOC25E INTERFACE NOT INITIALIZED. SHUT REQUEST INVALID**

**Explanation:** A SHUT request was issued, but it was invalid since the Control-O CICS Interface was not initialized.

The request is not processed.

**Corrective Action:** No action is required.

**CTOC26I CONTROL-O CICS INTERFACE SHUTDOWN STARTED FOR SUBSYSTEM**

**Explanation:** This information message is issued at start of the Control-O CICS Interface shutdown for the specified subsystem.

**Corrective Action:** No action is required.

**CTOC27I CONTROL-O CICS INTERFACE SHUTDOWN COMPLETED FOR SUBSYSTEM**

**Explanation:** This information message is issued upon completion of the Control-O CICS Interface shutdown.

**Corrective Action:** No action is required.

**CTOC29E "PGMIDERR" ERROR IN RELEASING CTOCTDF**

**Explanation:** The EXEC CICS RELEASE command failed due to a program ID error.

The Control-O CICS Interface is not shut down.

**Corrective Action:** Activate and deactivate the Control-O CICS Interface. If the problem persists, contact BMC Software Customer Support.

**CTOC30E UNAUTHORIZED TO RELEASE CTOCTDF**

**Explanation:** The EXEC CICS RELEASE command failed because the user is unauthorized to release the CTOCTDF program.

The Control-O CICS Interface is not shut down.

**Corrective Action:** Perform the necessary CICS customization so that the user authorized to release the CTOCTDF program, or contact your CICS security administrator.

**CTOC31E "PGMIDERR" ERROR IN RELEASING CTOCTDP**

**Explanation:** The EXEC CICS RELEASE command failed due to a program ID error.

The Control-O CICS Interface is not shut down.
Corrective Action: Activate and deactivate the Control-O CICS Interface. If the problem persists, contact BMC Software Customer Support.

CTOC32E UNAUTHORIZED TO RELEASE CTOCTDP

Explanation: The EXEC CICS RELEASE command failed because the user is unauthorized to release the CTOCTDP program.

The Control-O CICS Interface is not shut down.

Corrective Action: Perform the necessary CICS customization so that the user is authorized to release the CTOCTDF program, or contact your CICS security administrator.

CTOC33E UNRECOGNIZED REQUEST

Explanation: A request was not recognized. The probable cause is a syntax error in a Control-O CICS Interface command issued by the user.

The command is not processed.

Corrective Action: Re-issue the request correctly. For further information, see the instructions for installing the Control-O CICS Interface, in the Control-O chapter of the INCONTROL for z/OS Installation Guide.

CTOC35E ERROR IN ENABLING CTOCTDX FOR XTDOUT EXIT.
EIBRCODE(BYTES 1-2)=errCode

Explanation: Command EXEC CICS ENABLE failed with error code errCode.

The Control-O CICS Interface is not initialized.

Corrective Action: Check the error code and correct the problem accordingly; then try to initialize the interface again. If necessary, contact BMC Software Customer Support.

CTOC36E ERROR IN DISABLING CTOCTDX FOR XTDOUT EXIT.
EIBRCODE(BYTES 1-2)=errCode

Explanation: Command EXEC CICS DISABLE failed with the error code errCode.

The Control-O CICS Interface is not shut down.

Corrective Action: Check the error code and correct the problem accordingly; then try to initialize the interface again. If necessary, contact BMC Software Customer Support.

CTOC37I PSW AT TIME OF ABEND=psw CTOCTDX EP=add CTOEXEC EP=add2

Explanation: This information message indicates that the Control-O CICS Interface detected an internal abend. The message details the PSW at time of abend, and the entry points of the related Control-O modules.

A dump of the address space is produced on the first abend intercepted by the Control-O CICS Interface. Processing of the current Transient Data (TD) message is stopped. Subsequent Transient Data messages are processed.
Corrective Action: Check the dump and the related messages. If the problem is related to CICS customization, or to storage violations due to user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

CTOC38E INTERFACE NOT INITIALIZED. DBG REQUEST INVALID
Explanation: A DBG request was issued, but it was invalid since the Control-O CICS Interface was not initialized.
The request is not processed.
Corrective Action: No action is required.

CTOC39I DBG REQUEST ACCEPTED
Explanation: Informative message issued in response to DBG request.
Corrective Action: No action is required.

Messages CTOF00 through CTOFxx
This group includes messages for the Control-O product.

CTOF90S OPEN OF DDCARD ddName FAILED
Explanation: Open for the ddName DD statement pointing to the password member failed.
Possible causes are:
- The ddName DD statement is missing.
- The file allocated to the ddName DD statement is not a sequential file nor a member in a PDS.
Authorization to access the product is denied.
Corrective Action: Correct the JCL statement for the procedure or the allocations for the CLIST.

CTOF91S PASSWORD MEMBER TOO LARGE (DD ddName)
Explanation: Password member (or sequential data set) has too many lines.
In this message, ddName is the identity of the DD statement that points to the password member.
Authorization to access the product is denied.
Corrective Action: Remove unnecessary lines from the member.

CTOF92S SYNTAX ERROR IN PASSWORD MEMBER (DD ddName)
Explanation: A syntax error was found in the password member. When this message is issued by the monitor, it is generally followed by message CTOF9DS, which describes the erroneous line in the member.
In this message, ddName is the identity of the DD statement that points to the password member.
Authorization to access the product is denied.
Corrective Action: Correct the text in the password member.
CTOF93S VALUE ERROR IN PASSWORD MEMBER (DD ddName)

Explanation: A field in the password member contains invalid data. When this message is issued by the monitor, it is generally followed by message CTOF9DS, which describes the erroneous line in the member.

In this message, ddName is the identity of the DD statement that points to the password member.

Authorization to access the product is denied.

Corrective Action: Correct the text in the password member.

CTOF94S PASSWORD INVALID, PLEASE RECHECK PASSWORD MEMBER (DD ddName)

Explanation: Data in the password member was not consistent with the specified password.

In this message, ddName is the identity of the DD statement that points to the password member.

Authorization to access the product is denied.

Corrective Action: Check the contents of the password member against the text received from BMC Software Customer Support. If it checks, contact the representative.

CTOF95S PASSWORD FOR CONTROL-x IS ABOUT TO EXPIRE IN n DAYS

Explanation: Highlighted, unrollable message.

Password expiration period is about to end.

An expiration date is specified in the password member for the product.

Corrective Action: Contact BMC Software Customer Support for a new password.

CTOF96S PASSWORD FOR CONTROL-x HAS EXPIRED

Explanation: Highlighted, unrollable message.

Password expiration period has ended.

An expiration date is specified in the password member for the product.

Authorization to access the product is denied.

Corrective Action: Contact BMC Software Customer Support for a new password.

CTOF97S INTERNAL ERROR OCCURRED ON DD ddName, PLEASE NOTIFY THE IOA ADMINISTRATOR

Explanation: An internal error has occurred while analyzing the password member pointed to by the ddName DD statement.

Authorization to access the product is denied.

Corrective Action: Notify the IOA administrator.
CTOF98S OBLIGATORY FIELD MISSING FROM PASSWORD MEMBER (DD ddName)

Explanation: An obligatory field is missing from the password member.

In this message, ddName is the identity of the DD statement that points to the password member. The PROD, START, CPUID, PASS and TYPE fields should appear at least once in a password member.

Authorization to access the product is denied.

Corrective Action: Check the contents of the password member against the text received from your INCONTROL administrator.

CTOF9AS PASSWORD FOR CONTROL-x NOT DEFINED IN MEMBER (DD ddName)

Explanation: The member pointed to by the ddName DD statement does not contain the password for the appropriate product.

In this message, ddName is the identity of the DD statement that points to the password member.

Authorization to access the product is denied.

Corrective Action: Check that the specified password member is the correct member for this product.

CTOF9BS AUTHORIZATION PERIOD HAS NOT STARTED YET (DD ddName)

Explanation: The start date of the password has not yet arrived.

In this message, ddName is the identity of the DD statement that points to the password member. The START field contains the starting date of the password.

Authorization to access the product is denied.

Corrective Action: Check that the specified password member is the correct member for this period.

CTOF9CS CPUID/MODEL NOT FOUND IN AUTHORIZED CPU LIST (DD ddName)

Explanation: The current CPU is not defined in the CPU list.

In this message, ddName is the identity of the DD statement that points to the password member. Each entry in the CPU list in the password member contains the CPUID of the CPU and its model.

Authorization to access the product is denied.

Corrective Action: Check that the specified password member is the correct member for this CPU.

CTOF9DS CARD = text

Explanation: This message supplies additional information for a previous error message.

This message may appear after message CTOF92S or CTOF93S which indicates an error has occurred in one of the lines of the password member. Message CTOF9DS displays the erroneous line.

Corrective Action: See messages CTOF92S or CTOF93S.
CTOF9ES PASSWORD DDCARD ddName POINTS TO A NON EXISTING MEMBER (ABEND S013-18)

**Explanation:** The `ddName` DD statement is allocated to a non-existing member in a PDS file.

In this message, `ddName` is the identity of the DD statement that points to the password member. Authorization to access the product is denied.

**Corrective Action:** Correct the name of the member in the DD statement or create a member with the specified name.

CTOF9FS PASSWORD FOR CONTROL-\textit{x} EXPIRED, TEMPORARY AUTHORIZATION GRANTED

**Explanation:** The password for Control-\textit{x} has expired. Nonetheless, Control-\textit{x} can be run on the current date.

Despite password expiration, Control-x can be run on the 28th, 29th, 30th, 31st, 1st, 2nd, and 3rd days of each month for special purposes.

Control-x processing continues.

**Corrective Action:** Contact BMC Software Customer Support to obtain password renewal.

Messages CTOI00 through CTOIxx

This group includes messages for the Control-O product.

CTOI00I CTO SUBSYSTEM `subsys` NOW ACTIVE. IMS AOI MESSAGE PROCESSED

**Explanation:** This information message indicates that the Control-O subsystem `subsys` is now active and as a result the IMS Automated Operator Interface (AOI) messages can now be processed.

**Corrective Action:** No action is required.

CTOI02E CTO SUBSYSTEM `subsys` INACTIVE. IMS AOI MESSAGES NOT PROCESSED

**Explanation:** IMS Automated Operator Interface (AOI) messages cannot be processed because Control-O subsystem `subsys` is not active.

No segments of the current AOI message are processed.

**Corrective Action:** Activate Control-O.

CTOI03E CTO SUBSYSTEM `subsys` DETECTED AN ERROR WHILE PROCESSING AN IMS AOI MESSAGE

**Explanation:** An internal error occurred while processing an IMS Automated Operator Interface (AOI) message.
No segments of the current AOI message are processed.

**Corrective Action:** Contact BMC Software Customer Support.

**CTOI04E** CTO SUBSYSTEM *subsyst* RETURNED AN INVALID RC FOR AN IMS AOI MESSAGE

**Explanation:** An internal error occurred while processing an IMS Automated Operator Interface (AOI) message.

No segments of the current AOI message are processed.

**Corrective Action:** Contact BMC Software Customer Support.

**CTOI06E** INTERNAL ABEND=(systemCode, userCode)

**Explanation:** The Control-O IMS Interface detected an internal abend, where **systemCode** is the system abend code, and **userCode** is the user abend code. This is the header message for messages CTOI07I, CTOI08I, CTOI09I, and CTOI10I which provide information about the abend.

A dump of the address space is produced on the first abend intercepted by the Control-O IMS Interface. Processing of the current IMS Automated Operator Interface (AOI) message is stopped. Subsequent AOI messages are processed.

**Corrective Action:** Check the dump and the related messages. If the problem is related to IMS customization, or to storage violations due to user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

**CTOI07I** PSW AT TIME OF ABEND=psw DFSAOUE0 EP=add1 CTOEXEC EP=add2

**Explanation:** This information message indicates that the Control-O IMS Interface detected an internal abend. The message details the PSW at time of abend, and the entry points of the related Control-O modules. This message follows message CTOI06E and precedes messages CTOI08I, CTOI09I, and CTOI10I.

A dump of the address space is produced on the first abend intercepted by the Control-O IMS Interface. Processing of the current IMS Automated Operator Interface (AOI) message is stopped. Subsequent AOI messages are processed.

**Corrective Action:** Check the dump and the related messages. If the problem is related to IMS customization, or to storage violations due to user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

**CTOI08I** REGISTERS AT TIME OF ABEND (R0 - R15):

**Explanation:** This information message indicates that the Control-O IMS Interface detected an internal abend. This message is a header for messages CTOI09I and CTOI10I which detail the contents of the registers at time of abend. This message follows messages CTOI06E and CTOI07I.

A dump of the address space is produced on the first abend intercepted by the Control-O IMS Interface. Processing of the current IMS Automated Operator Interface (AOI) message is stopped. Subsequent AOI messages are processed.
Corrective Action: Check the dump and the related messages. If the problem is related to IMS customization, or to storage violations due to user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

CTOI09I  register0 register1 ... register7
Explanation: This information message indicates that the Control-O IMS Interface detected an internal abend. The header for this message is message CTOI08I. This message details the contents of registers 0 - 7 at time of abend. (It is followed by message CTOI10I, which details the contents of registers 8 - 15.)

A dump of the address space is produced on the first abend intercepted by the Control-O IMS Interface. Processing of the current IMS Automated Operator Interface (AOI) message is stopped. Subsequent AOI messages are processed.

Corrective Action: Check the dump and the related messages. If the problem is related to IMS customization, or to storage violations due to user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

CTOI10I  register8 register9 ... register15
Explanation: This information message indicates that the Control-O IMS Interface detected an internal abend. This message follows messages CTOI08I and CTOI09I. This message details the contents of registers 8 - 15 at time of abend.

A dump of the address space is produced on the first abend intercepted by the Control-O IMS Interface. Processing of the current IMS Automated Operator Interface (AOI) message is stopped. Subsequent AOI messages are processed.

Corrective Action: Check the dump and the related messages. If the problem is related to IMS customization, or to storage violations due to user transactions, correct the problem. Otherwise, contact BMC Software Customer Support.

CTOI11E FREEMAIN OF ADDRESS add FAILED
Explanation: A FREEMAIN request by the Control-O IMS Interface failed. The probable cause is an internal error.

Corrective Action: Contact BMC Software Customer Support.

CTOI12I CONTROL-O IMS/ ims_region INTERFACE INITIALIZATION COMPLETED FOR SUBSYSTEM subsys IMS
Explanation: This information message indicates that initialization of the DFSAOE00 Control-O IMS module is complete for the IMS DB/DC, DCCTL, or DBCTL address space.

The DFSAOE00 Control-O IMS interface module is ready for requests.

Corrective Action: No action is required.

CTOI13W START REQUEST INVALID. INTERFACE ALREADY STARTED
Explanation: This warning message indicates that a /CTO START command was issued to start or restart the Control-O IMS interface, but the interface is already active.

The START request is rejected.
Corrective Action: No action is required.

CTOI15I CONTROL-O IMS/ims_region INTERFACE STOPPED FOR SUBSYSTEM subsys IMS
Explanation: This information message indicates that the Control-O IMS interface stopped in response to a /CTO STOP command.
Corrective Action: To reactivate the interface, issue the command /CTO START.

CTOI17I TRACE REQUEST ACCEPTED
Explanation: This information message indicates that a /CTO TRACE=ON command to start the Control-O / IMS trace messages was issued and accepted.
TRACE messages may be issued by the DFSAOE00 Control-O IMS interface module.
Corrective Action: To stop the trace, issue the command /CTO TRACE=OFF

CTOI18I text
Explanation: This is an echo message. It shows the text of a /CTO command as received from IMS by the DFSAOE00 interface module.
Corrective Action: No action is required.

CTOI19E INVALID COMMAND - COMMAND IGNORED
Explanation: An invalid /CTO command was issued to Control-O IMS interface. The text of the command appears in the previously issued message CTOI18I.
The command is rejected.
Corrective Action: Correct the command and reissue it.

CTOI20E START REQUEST INVALID. INTERFACE WAS PREVIOUSLY CANCELED
Explanation: The command /CTO START was issued to restart the Control-O / IMS interface, but the interface rejects the command because /CTO CANCEL has already been issued, and this prevents the interface from reactivating.
The request is rejected.
Corrective Action: To restart the Control-O IMS interface, stop IMS, then restart it again.

CTOI21I CONTROL-O IMS/ims_region INTERFACE CANCELED FOR SUBSYSTEM subsys
Explanation: This information indicates that the Control-O IMS interface stopped in response to a /CTO CANCEL command. The interface between IMS and Control-O using IOA subsystem subsys cannot be reactivated for this IMS region.
Corrective Action: To restart the Control-O IMS interface, stop IMS and restart it again.
CTR messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages CTR0 through CTR0xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

CTR001I CONTROL-M/RESTART, REL releaseMaint STARTED FOR JOB jobName

**Explanation:** This information message is issued by the CONTROLR step to indicate that Control-M/Restart processing of the *jobName* job started.

**Corrective Action:** No action is required.

CTR002S INTERNAL ERROR IN CONTROL-M/RESTART MODULE modName

**Explanation:** The CONTROLR step detected an internal error in one of its modules. This message usually follows messages describing the specific error.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the ABNDTYP Control-M/Restart installation parameter in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Have your system programmer call BMC Software Customer Support.

CTR003I processName OF JOB jobName ENDED SUCCESSFULLY

**Explanation:** This information message indicates that the Control-M/Restart process for the *jobName* restarted job (for example, ended OK, abended) is not known at this point.

**Corrective Action:** No action is required.

CTR004I processName processType OF JOB jobName ENDED

**Explanation:** When *processType* is SIMULATION, this information message indicates that Control-M/Restart, working in simulation mode, finished the simulation of the restart (when *processName* is RESTART) or prevent NCT2 (when *processName* is NONCAT2) for this job.

When *processType* is REGISTRATION (and *processName* is blank), this information message indicates that Control-M/Restart finished the collecting of cross-reference statistics for job - data sets.

The job is terminated after the CONTROLR step.

**Corrective Action:** No action is required.
CTR005S CONTROL-M/RESTART STEP MUST BE THE FIRST STEP OF THE JOB

**Explanation:** The CONTROLR step is not the first in this job. The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the ABNDTYP Control-M/Restart installation parameter in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Correct the JCL. The CONTROLR step should always be the first one in the job.

CTR006S INTERNAL ERROR - INVALID CONTROL-M/RESTART PARAMETERS

**Explanation:** The parameters passed to Control-M/Restart in the EXEC statement or in the DAPARMIN DD statement are invalid. The specific errors are generally described in the preceding messages.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the ABNDTYP Control-M/Restart installation parameter in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** If the job was run manually, correct the parameters in error and resubmit the job. If the job was submitted through the Control-M restart or prevent NCT2 processing, have your system programmer call BMC Software Customer Support for assistance.

CTR007S SYNTAX ERRORS IN `processName` CONTROL-STATEMENT(S)

**Explanation:** One or more of the control statements specified in a Restart or Prevent NCT2 Control Parameters member has an invalid syntax. The specific errors are generally described in the preceding messages.

The member in error is either the $DEFAULT member or the one indicated by the MEMNAME subfield in the PARM field of the Control-M/Restart step. The library is the one allocated to the DACTRCTL DD statement.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the ABNDTYP Control-M/Restart installation parameter in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Correct the member in error, and rerun the job.

CTR008I PROCESSING PARAMETERS: `parms`

**Explanation:** This information message shows the contents of the parameters passed to the CONTROLR step either through the EXEC statement or in the DAPARMIN DD statement.

**Corrective Action:** No action is required.

CTR009S `processName` PROCESSING TERMINATED BY THE USER EXIT `exitName`. RC= `rc`

**Explanation:** The Control-M/Restart User Exit CTRX001 returned a return code which signified to Control-M/Restart to stop process processing.
The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the ABNDTYP Control-M/Restart installation parameter in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** No action is required.

**CTR010S processName PROCESSING TERMINATED DUE TO AN INVALID RC= rc FROM exitName EXIT. FUNCTION - func**

**Explanation:** Exit `exitName` was called to perform function. The return code `rc` passed back to Control-M/Restart was not one of the expected return codes. Each Control-M/Restart exit has a defined set of expected return codes. Exit `exitName` returned a code which is not in the set of allowed codes.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the ABNDTYP Control-M/Restart installation parameter. The job terminates after the CONTROLR step.

**Corrective Action:** Correct the exit code in error. Refer to the *INCONTROL for z/OS Administrator Guide* for a description of exit `exitName` and the list of expected return codes.

**CTR011S UNCONDITIONAL SYSOUT READING IS REQUESTED, BUT ERRORS WERE ENCOUNTERED DURING SYSOUT PROCESSING**

**Explanation:** The CONTROLR step, running with SYSOPT parameter R, encountered errors during sysout processing. The specific errors are generally described in the preceding messages.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the ABNDTYP Control-M/Restart installation parameter in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Check the preceding messages and take the recommended steps.

**CTR012W SYSOUTS FROM PREVIOUS RUNS OF JOB ORDER jobOrder WERE NOT FOUND. READING IS BYPASSED**

**Explanation:** The CONTROLR step, running with SYSOPT parameter C, encountered errors during sysout processing. The specific errors are generally described in the preceding messages.

The CONTROLR step continues processing, but will not uncatalog data sets, perform GDG adjustment, and the like.

**Corrective Action:** Check the preceding messages and take the recommended steps.

**CTR013S JOB jobName IS NON RESTARTABLE**

**Explanation:** Some necessary conditions mandatory for the restart of the job were not met. The specific errors are generally described in the preceding messages.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the ABNDTYP Control-M/Restart installation parameter in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Check the preceding messages and take the recommended steps.
CTR014S MISSING CONTROL-M/RESTART REQUIRED PARAMETERS

**Explanation:** One of the mandatory Control-M/Restart parameters is missing.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the ABNDTYP Control-M/Restart installation parameter in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** If the job was run manually, correct the parameters in error and resubmit the job. If the job was submitted through Control-M restart or prevent NCT2 processing, have your system programmer call BMC Software Customer Support for assistance.

CTR015I CONTROL-M/RESTART STEP IS NOT THE FIRST STEP OF THE JOB. ALL STEPS PREVIOUS TO Control-M/RESTART STEP ARE IGNORED

**Explanation:** This message informs the user that Control-M/Restart was not the first step in the job. Control-M/Restart will ignore all steps prior to Control-M/Restart steps, which means that Control-M/Restart will not analyze any steps prior to the Control-M/Restart step.

**Corrective Action:** Validate that the steps prior to the Control-M/Restart step were only environment steps or real steps.

CTR017E MISSING PARAMETER IN THE EXCLUDE STATEMENT

**Explanation:** An obligatory parameter was not specified in the EXCLUDE DSN statement.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the ABNDTYP Control-M/Restart installation parameter in CTRPARM. The job terminates after the CONTROLR step. The statement in error is printed before this message.

**Corrective Action:** Correct the EXCLUDE DSN statement. Refer to the Control-M/Restart User Guide for the description of the EXCLUDE DSN restart control statement.

CTR018E INVALID DSN LENGTH - CONTROL- stmt

**Explanation:** The data set name specified in the EXCLUDE DSN control statement has an invalid length.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the ABNDTYP Control-M/Restart installation parameter in CTRPARM. The job terminates after the CONTROLR step. The problematic RESTART Control-STATEMENT is printed before this message.

**Corrective Action:** Correct the EXCLUDE DSN statement. Refer to the Control-M/Restart User Guide for a description of the EXCLUDE DSN control statement.

CTR019E INVALID TRACE LEVEL VALUE. PLEASE ENTER UP TO EIGHT NUMBERS OF RANGE (1-8), SEPARATED BY COMMAS.

**Explanation:** An error occurred in the Control-M/Restart step of the job. The user tried specified more than 8 numbers when turning on the trace for that specific job in the Control-M/Restart PARM library, with the TRCREST parameter applied for restart and the TRCNCT2 parameter for NCT2.

Example: In MEMBERNAME in Control-M/Restart PARM library add statement for RESTART and NCT2.

```
TRCREST 1,2,3,4,5,6,7,8
TRCNCT2 1,2,3
```
The CONTROLR step terminates with a nonzero condition code or with an abend code, depending on the ABNDTYP Control-M/Restart installation parameter in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Correct the member with the member name in the Control-M/Restart PARM library according to the above example.

**CTR020W processName CONTROL-MEMBER memName IS EMPTY**

**Explanation:** The process Control-MEMBER was found in the library specified by the DACTRCTL DD statement, but it does not contain any process CONTROL statements.

CONTROLR step continues processing.

**Corrective Action:** No action is required.

**CTR021S MISSING "OPERATION TYPE" PARAMETER**

**Explanation:** The obligatory OPERATION TYPE parameter was not specified in the CONTROLR step parameters.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the ABNDTYP Control-M/Restart installation parameter in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** If the JCL for the CONTROLR step was created manually, correct the parameters passed to the CONTROLR job step. Refer to the Control-M/Restart User Guide for a description of the CONTROLR step parameters.

If the CONTROLR step was added to the job by Control-M, contact BMC Software Customer Support for assistance.

**CTR022S INVALID LENGTH OF THE POSITIONAL PARAMETER - parm**

**Explanation:** One of the positional parameters passed to the CONTROLR step has an invalid length.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the ABNDTYP Control-M/Restart installation parameter in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** If the JCL for the CONTROLR step was created manually, correct the parameters passed to the CONTROLR step. Refer to the Control-M/Restart User Guide for a description of the CONTROLR step parameters.

If the CONTROLR step was added to the job by Control-M, contact BMC Software Customer Support for assistance.

**CTR023S INVALID PROCESSING MODE - " type"**

**Explanation:** The PROCESSING MODE positional parameter specified in the parameters for the CONTROLR step is not a valid type of restart.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the ABNDTYP Control-M/Restart installation parameter in CTRPARM. The job terminates after the CONTROLR step.
Corrective Action: If the JCL for the CONTROLR step was created manually, correct the RESTART TYPE parameter passed to the CONTROLR job step. See the Control-M/Restart User Guide for the description of the Control-M/Restart PROCESSING MODE parameter.

If the CONTROLR step was added to the job by Control-M, contact BMC Software Customer Support for assistance.

CTR024W MISSING "$processName CONTROL-MEMBER" NAME PARAMETER

Explanation: The process Control-PARAMETERS member name was not specified in the parameters passed to the CONTROLR step.

CONTROLR step continues processing. The control statements from the $DEFAULT member are used for the current job.

Corrective Action: No action is required.

CTR025S MISSING "RECAPTURE CODES/STEP ADJUSTMENT" PARAMETER

Explanation: The mandatory Recapture Codes or Step Adjustment parameter was not specified in the CONTROLR step parameters.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the ABNDTYP Control-M/Restart installation parameter in CTRPARM. The job terminates after the CONTROLR step has terminated.

Corrective Action: Add to the JCL the Recapture Codes or Step Adjustment parameter passed to the CONTROLR job step.

CTR026W MISSING "ORDERID" PARAMETER

Explanation: The ORDERID was not specified in the parameters passed to the CONTROLR step.

If the READ SYSOUT INDICATOR is R, then the CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the ABNDTYP Control-M/Restart installation parameter in CTRPARM. The job terminates after the CONTROLR step. If the READ SYSOUT INDICATOR is not R, processing continues.

Corrective Action: If the JCL for the CONTROLR step was created manually, correct the parameters passed to the CONTROLR job step. See the Control-M/Restart User Guide for a description of the CONTROLR step parameters.

If the CONTROLR step was added to the job by Control-M, contact BMC Software Customer Support for assistance.

CTR027S INVALID "RECAPTURE ABEND/CONDITION CODE" INDICATOR - val

Explanation: The Recapture Abend or Condition Code indicator specified in the parameters for the CONTROLR step does not contain a valid value.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the ABNDTYP Control-M/Restart installation parameter in CTRPARM. The job stops after the CONTROLR step stops.
Corrective Action: Correct in the JCL the value of the Recapture Codes or Step Adjustment parameter passed to the CONTROLR job step.

CTR028S MISSING "READ SYSOUT INDICATOR" PARAMETER

Explanation: The obligatory READ SYSOUT INDICATOR parameter was not specified in the CONTROLR step parameters.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

Corrective Action: If the JCL for the CONTROLR step was created manually, correct the parameters passed to the CONTROLR job step. Refer to the Control-M/Restart User Guide for a description of the CONTROLR step parameters.

If the CONTROLR step was added to the job by Control-M, contact BMC Software Customer Support for assistance.

CTR029S INVALID "READ SYSOUT INDICATOR" - type

Explanation: The value of the READ SYSOUT INDICATOR positional parameter specified in the parameters for the CONTROLR step is not valid.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

Corrective Action: If the JCL for the CONTROLR step was created manually, correct the parameters passed to the CONTROLR job step. See the Control-M/Restart User Guide for a description of the READ SYSOUT INDICATOR parameter.

If the CONTROLR step was added to the job by Control-M, contact BMC Software Customer Support for assistance.

CTR030S MISSING "FROM PROCSTEP.PGMSTEP" PARAMETER

Explanation: The obligatory FROM PROCSTEP.PGMSTEP parameter was not specified in the CONTROLR step parameters.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

Corrective Action: If the JCL for the CONTROLR step was created manually, correct the parameters passed to the CONTROLR job step. Refer to the Control-M/Restart User Guide for a description of the CONTROLR step parameters.

If the CONTROLR step was added to the job by Control-M, contact BMC Software Customer Support for assistance.

CTR031S INVALID "PROCSTEP.PGMSTEP" COMBINATION USED

Explanation: The PROCSTEP.PGMSTEP positional parameter passed to the CONTROLR step has an invalid syntax.
The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** If the JCL for the CONTROLR step was created manually, correct the parameters passed to the CONTROLR job step. Refer to the *Control-M/Restart User Guide* for the description of the PROCSPEC.PGMSTEP parameter.

If the CONTROLR step has been added to the job by Control-M, contact BMC Software Customer Support for assistance.

**CTR032E REDUNDANT PARAMETER IN THE "EXEC" PARM OF THE RESTART STEP**

**Explanation:** More positional parameters than necessary were specified in the CONTROLR step parameters.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** If the JCL for the CONTROLR step was created manually, correct the parameters passed to the CONTROLR job step. Refer to the *Control-M/Restart User Guide* for the description of the CONTROLR step parameters.

If the CONTROLR step was added to the job by Control-M, contact BMC Software Customer Support for assistance.

**CTR033S ORDERID IS OBLIGATORY WHEN READ SYSOUT INDICATOR IS SET TO "C" OR "R"**

**Explanation:** Reading of all the sysouts of previous runs of the job was requested, but ORDERID was not specified in the CONTROLR step parameters.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** If the JCL for the CONTROLR step was created manually, correct the CONTROLR step parameters. Refer to the *Control-M/Restart User Guide* for the description of the Control-M/Restart READ SYSOUT INDICATOR and ORDERID parameters.

If the CONTROLR step was added to the job by Control-M, contact BMC Software Customer Support for assistance.

**CTR034S INVALID OPERATION TYPE - opn**

**Explanation:** The OPERATION parameter in the PARM field of the CONTROLR step has an invalid value (opn).

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP. The job terminates after the CONTROLR step.

**Corrective Action:** If the JCL for the CONTROLR step was created manually, correct the CONTROLR step parameters. Refer to the *Control-M/Restart User Guide* for the description of the OPERATION subparameter of the MODE parameter.
If the CONTROLR step was added to the job by Control-M, notify BMC Software Customer Support.

**CTR035S READ SYSOUT OPTION IS INCOMPATIBLE WITH OPERATION TYPE. NONCAT2 IS PERFORMED WITHOUT SYSOUT PROCESSING**

**Explanation:** The combination of READ SYSOUT and TYPE parameters is invalid. The operation requested was NONCAT2 and the READ SYSOUT requested was one of the codes specifying that SYSDATA is to be read. The Prevent NCT2 function does not use the SYSDATA from previous runs.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP. The job terminates after the CONTROLR step.

**Corrective Action:** If the JCL for the CONTROLR step was created manually, correct the CONTROLR step parameters. See the Control-M/Restart User Guide for the description of the OPERATION subparameter of the MODE parameter and the READ SYSOUT parameter.

If the CONTROLR step was added to the job by Control-M, notify BMC Software Customer Support.

**CTR036S UNKNOWN DATASET DISPOSITION - val**

**Explanation:** The Control-M/Restart adjustment facility encountered an invalid data set disposition. This message precedes message CTR038I, which describes the data set name.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Contact BMC Software Customer Support for assistance.

**CTR037S MISSING INPUT DATASET(S). JOB IS NOT EXECUTABLE**

**Explanation:** At least one of the input data sets for the job is missing. It cannot be located. The job may fail during execution. The name of any missing data set is in an earlier part of the CONTROLR step output.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Look for previous messages that describe data sets that could not be found. One of the following may be done for each data set:

- If you want to bypass the checking for this data set, use the Restart Control member and the EXCLUDE DSN statement.
- If the data set is needed as input to the job, find out why it is missing, correct the situation, and rerun the job.

**CTR038I DSN= dsn DD= ddName STEP= stepName PROCSTEP= procStep**

**Explanation:** This information message details a data set name and its location in the job. The message always appears after another message that describes the actual problem relating to this data set.

**Corrective Action:** Refer to the previously displayed message in order to determine the problem.
CTR039I  processName STEP ADJUSTMENT PERFORMED. NEW processName STEP stepName PROCSTEP processStepName

Explanation: This information message indicates that the Control-M/Restart automatic step adjustment facility for processName ended successfully. The job will be restarted from the specified step and procstep.

Corrective Action: No action is required.

CTR040W "NEW" DISPOSITION IS REQUESTED FOR DATASET, BUT IT IS ALREADY CREATED BY A PREVIOUS STEP OF THE JOB

Explanation: The data set is specified with a NEW disposition although it is created by a previous step of the job and it is not deleted during the step. This could cause a JCL failure during job execution.

Corrective Action: Check the original JCL.

CTR041I DATASET WILL BE SCRATCHED FROM VOLUME volser

Explanation: This information message indicates that the data set will be scratched from the volume to prevent the failure of the job in duplicate data sets on the same volume.

The data set will be scratched from the volume in the execution phase of the CONTROLR step.

Corrective Action: No action is required.

CTR042I DATASET WILL BE UNCATALOGED

Explanation: This information message indicates that the data set will be uncataloged during the catalog adjustment phase in order to prevent the NOT CATLGD 2 error.

The data set will be uncataloged in the execution phase.

Corrective Action: No action is required.

CTR043E DATASET DOES NOT EXIST FOR THE STEP. STEP ADJUSTMENT IS ATTEMPTED

Explanation: A step that should run in the restarted job contains a data set that does not exist. Control-M/Restart will try to perform a step adjustment. It will find a previous step that creates the required data set, and restart the job from that step.

Corrective Action: No action is required.

CTR044I TAPE DATA SET REFERENCES A VOLUME OF A PREVIOUS STEP. STEP ADJUSTMENT IS ATTEMPTED.

Explanation: Control-M/Restart performs step adjustment to resolve the DD card for a tape data set whose volume is specified by a backward reference (VOL=REF in DD card) to a previous step that is not to be executed during Restart.

The message is followed by message CTR038I, which describes the data set name.
Corrective Action: To make Control-M/Restart avoid step adjustment in case of a VOL=REF referring to a step prior to the Restart step, specify the parameter IGNVOLRF = Y in the CTRPARM member. Then Control-M/Restart attempts to resolve the VOLSER and avoids JCL errors without step adjustment.

CTR045S "NEW" DISPOSITION IS REQUESTED, BUT THE SPACE PARAMETER IS NOT SPECIFIED IN THE JCL

Explanation: The CONTROLR step or the job will have to allocate the data set with a NEW disposition, but the space parameter was not specified in the JCL.

For non-SMS environments, the CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step. Under SMS, the message is not produced.

Corrective Action: Change the disposition of the data set in the JCL, for example from NEW to MOD, and/or add the space parameter.

CTR046W DATASET IS ALREADY CATALOGED BY A PREVIOUS STEP OF THE JOB

Explanation: The data set has to be cataloged, but is already cataloged by a previous step of the job. The message is followed by a CTR038I message that describes the data set name.

Corrective Action: No action is required.

CTR048W "CATALG" DISPOSITION IS SPECIFIED, BUT DATASET IS ALREADY CATALOGED ON OTHER VOLUMES

Explanation: The data set has to be cataloged on a specific volume, but it is already cataloged on another volume. The message is followed by message CTR038I which describes the data set name.

Corrective Action: No action is required.

CTR04AS MISSING INPUT DATA SET dsn

Explanation: An error occurred in the job with a Control-M/Restart step because of missing input data set in the job JCL.

The CONTROLR step terminates with a nonzero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

Corrective Action: Check which data set is missing, correct the job JCL, or allocate the missing file, then rerun or restart the job.

CTR050W "UNCATLG" IS REQUESTED FOR DATASET, BUT THE DATASET IS NOT CATALOGED

Explanation: The data set has to be uncataloged, but it is not cataloged. The message is followed by message CTR038I which describes the data set name.

Corrective Action: No action is required.
CTR051E JOB IS NOT AUTHORIZED TO ACCESS DATASET: dsn (DDNAME: ddName)

**Explanation:** An error occurred in the job with Control-M/Restart step. When the CHKSEC parameter is set to Y in the CTRPARM member in the IOA PARM library, Control-M/Restart calls Security Exit IOASE032 to validate whether the job has authorization to access the data set. This message shows that the problematic job is not authorized to access the data set.

The CONTROLR step terminates with a nonzero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Consult with your system security administrator, add the correct authorization, and rerun or restart the job.

CTR054S OPEN OF DDNAME ddName FAILED

**Explanation:** Open of the ddName data set failed. Possible causes are:

- The ddName DD statement is missing.
- The data set DCB characteristics are not as expected by the CONTROLR step.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Look in the job log for additional system messages that explain the cause of the failure. If the DD statement is missing, correct the Control-M/Restart procedure.

CTR055S processName OF JOB jobName ENDED WITH ERRORS

**Explanation:** Errors were detected during Control-M/Restart processing. The specific errors are generally described in the preceding messages.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Check the preceding messages and take the recommended steps.

CTR056S INVALID LENGTH OF THE EXEC PARM DATA

**Explanation:** The restart parameters data is longer than 255 characters. This might happen only when Control-M/Restart is called internally by another program.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Correct the parameters passed to Control-M/Restart.

CTR057S STARTED TASKS PROCESSING IS NOT SUPPORTED YET

**Explanation:** The CONTROLR step was activated for a started task, and restart of a started task is not supported.
The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Do not use Control-M/Restart for started tasks.

CTR059I ANALYZE PHASE STARTED

**Explanation:** This information message is issued by the CONTROLR step when starting the analyze phase. In this phase Control-M/Restart analyzes what should be done.

**Corrective Action:** No action is required.

CTR060I EXECUTION PHASE STARTED

**Explanation:** This information message is issued by the CONTROLR step the execution phase starts. In this phase Control-M/Restart executes the special restart or prevent NCT2 adjustment required (for example, delete data sets, perform GDG adjustments).

**Corrective Action:** No action is required.

CTR061I EXECUTION SIMULATION PHASE STARTED

**Explanation:** This information message is issued by the CONTROLR step when starting the execution phase under simulation mode. In this phase Control-M/Restart issues only the messages related to the special restart or prevent NCT2 adjustment required, without actually performing the adjustments.

**Corrective Action:** No action is required.

CTR062I processType OF JOB jobName STARTED

**Explanation:** This information message is issued by the CONTROLR step when starting the simulation (if processType is SIMULATION) or collecting of cross-reference statistics for job - data sets (if processType is REGISTRATION) of a job.

**Corrective Action:** No action is required.

CTR063S CONTROL-M/RESTART IS NOT APF AUTHORIZED

**Explanation:** The CONTROLR step is not APF authorized.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP. The job terminates after the CONTROLR step.

**Corrective Action:** Ensure that the STEPLIB for the CONTROLR step is on the APF authorization list in SYS1.PARMLIB.

CTR064S INVALID FUNCTION CALL func TO MODULE modName

**Explanation:** Internal Control-M/Restart error. This message is followed by other messages detailing the nature of the error.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP. The job terminates after the CONTROLR step.

**Corrective Action:** Notify BMC Software Customer Support.
CTR065S CONTROL-M/RESTART INITIALIZATION FAILED ON PHASE phase

Explanation: Internal Control-M/Restart error. This message is preceded by other messages detailing the nature of the error.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the value set for the ABNDTYP Control-M/Restart installation parameter. The job terminates after the CONTROLR step.

Corrective Action: Examine the preceding messages and take any corrective action associated with those messages. If the problem persists, notify BMC Software Customer Support.

CTR066I OID= orderId NUMBER OF SKIPPED STEPS nnnn WITH A TOTAL ELAPSED TIME hh.mm CPU TIME mmm MIN ss.cc SEC

Explanation: This information message indicates the elapsed and CPU time saved by skipping the indicated number of steps during the restart. This message is issued to the job syslog during Control-M/Restart step termination.

The variables in this message are:
- nnnn - the number of skipped steps
- hh.mm - the elapsed time saved, in hours (hh) and minutes (mm)
- mmm ss.cc - CPU time saved, in minutes (mmm), seconds (ss) and hundredths of seconds (cc)

Corrective Action: No action is required.

CTR067I SIMULATION MODE WAS FORCED BY INSTALLATION PARAMETERS

Explanation: This information message indicates that the CTRSTAT Control-M/Restart installation parameter was set to ONLY. Control-M/Restart has been configured to issue statistics only, not to perform any actions.

Corrective Action: No action is required.

CTR070S DSN dsn SHOULD BE EXCLUDED, BUT IS NOT FOUND IN THE JOB

Explanation: A specific, non-generic, EXCLUDE DSN statement was specified for the dsn data set, but this data set was not referenced in any of the JCL DD statements in the job.

Control-M/Restart assumes that the data set is referenced in the JCL.

Corrective Action: Check the JCL and remove the EXCLUDE DSN statement. Another solution is to change the EXCLUDE DSN statement to a generic statement.

CTR071W MEMBER member DOES NOT EXIST IN CONTROL-M/RESTART PARM LIBRARY

Explanation: The $EXCLUDE or $KEEP member was not found in the Control-M/Restart PARM library. As both members exist in the PARM library as delivered, the member was renamed or deleted.
Corrective Action: Restore the $EXCLUDE or $KEEP member that was renamed or deleted.

CTR072I DSN dsn IN PROCEDURE processName, STEP stepName, DDNAME ddName HAS BEEN EXCLUDED FROM RESTART DECISION.

Explanation: The DD name that is defined in the $EXCLUDE member was excluded from Control-M/Restart restart processing. The $EXCLUDE member contains the definitions of DD names and data set names to be excluded from Control-M/Restart processing.

Corrective Action: No action is required.

CTR073I DSN dsn HAS BEEN EXCLUDED FROM RESTART DECISION.

Explanation: This message informs the user that the data set that was defined in the $EXCLUDE member was excluded from Control-M/Restart restart processing. See message CTR072I.

Corrective Action: No action is necessary.

CTR075S ONLY CONTROLR STEP IS PRESENT IN THE JOB jobName

Explanation: The job contains only the CONTROLR step. This could be the result of the AutoEdit translation or the Control-M submit exit. The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

Corrective Action: Check the job and find out why there are no other steps in the job.

CTR076S processName WAS REQUESTED FROM PGMSTEP stepName PROCSSTEP stepName BUT THE STEP WAS NOT FOUND IN THE JOB

Explanation: Control-M/Restart was requested to process the job from a specific step, but this step was not found in the job.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

Corrective Action: Check the job step names against the restart parameters (against DO IFRERUN in Control-M), or against the manual restart decision. Correct them, and rerun the job.

CTR077S processName WAS REQUESTED TO PGMSTEP stepName PROCSSTEP stepName BUT THE STEP WAS NOT FOUND IN THE JOB

Explanation: Control-M/Restart was requested to restart the job until a specific step, but this step was not found in the job.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

Corrective Action: Check the job step names against the restart parameters (against DO IFRERUN in Control-M), or against the manual restart decision. Correct it, and rerun the job.
CTR078S "TO" STEP APPEARS BEFORE THE "FROM" STEP IN THE JOB

Explanation: Control-M/Restart was requested to restart the job from a specific step until another step, but the TO step appears in the job before the FROM step.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

Corrective Action: Check the job step names against the restart parameters (against DO IFRERUN in the Control-M), or against the manual restart decision. Correct it, and rerun the job.

CTR079S DUPLICATE "FROM/TO" STEP NAMES FOUND IN THE JOB

Explanation: The CONTROLR step found more than one FROM or TO steps in the job, and could not determine the restart step.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

Corrective Action: Change the job step names to avoid duplicate step names in the job.

CTR081I CONDITION CODE code IS RECAPTURED FOR STEP stepName

Explanation: This information message indicates that a condition code was recaptured by Control-M/Restart. Control-M/Restart captures the condition codes of the steps from the previous run or runs of the job. Steps in the restarted job can refer to a recaptured condition code from a step that is not executed in the restarted job. The CONTROLR step can use that condition code to affect the execution of the restarted job.

Corrective Action: No action is required.

CTR082I OID= orderId RESTARTING FROM STEP stepName TO STEP stepName

Explanation: This information message indicates the Control-M/Restart final restart decision. After all the required adjustments, the restarted job will execute in the specified range of steps.

Corrective Action: No action is required.

CTR083S DATASET ADJUSTMENT PROCEDURE FAILED

Explanation: The restarted job required data set adjustments like uncatalog or scratch a data set. For some reason the adjustment operation failed. This could be because the user exit failed the request, or the operation was failed by the operating system, or because of internal errors in Control-M/Restart.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

Corrective Action: If you cannot locate the reason for the failure in previous messages, call BMC Software Customer Support for assistance.
CTR084E SCRATCH OF DATASET $dsn$ FAILED

**Explanation:** The data set must be scratched in order to prevent duplicate data set errors, but the scratch operation failed.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Look in the job log or in the CONTROLR step messages for messages that will clarify the reason for the failure. Correct it, and rerun the job.

CTR085I DATASET $dsn$ SCRATCHED FROM VOL= $volser$

**Explanation:** This information message indicates the data set is scratched from the volume in order to prevent duplicate data set errors when the job is restarted.

The data set is scratched from the volume.

**Corrective Action:** No action is required.

CTR086E "UNCATALG" OF DATASET $dsn$ FAILED

**Explanation:** The data set must be uncataloged in order to prevent NOT CATLGD 2 situations, but the uncatalog operation failed.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Look in the job log or in the CONTROLR step messages for messages that clarify the reason for the failure. Correct it, and rerun the job.

CTR087I DATASET $dsn$ HAS BEEN UNCATALOGED

**Explanation:** This information message indicates that the data set is uncataloged in order to prevent NOT CATLGD 2 situations when the job is restarted.

The data set is uncataloged.

**Corrective Action:** No action is required.

CTR088E "CATALG" OF DATASET $dsn$ FAILED

**Explanation:** The data set must be cataloged in order to prevent DATASET NOT FOUND errors when the job is restarted.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Look in the job log or in the CONTROLR step messages for messages that will clarify the reason for the failure. Correct it, and rerun the job.
CTR089I DATASET $dsn$ HAS BEEN CATALOGED ON VOLUME $volser$

**Explanation:** This information message indicates that the data set is cataloged in order to prevent DATASET NOT FOUND errors when the job is restarted.

The data set is cataloged.

**Corrective Action:** No action is required.

CTR090I CORRECTING REFERENCE OF GDG DATASET TO "$dsn$" FROM:

**Explanation:** This information message is followed by message CTR038I which describes the GDG name before adjustments. The GDG bias numbers must be reversed so that the relative references to them, within the restarted job, will refer to the correct generation of the data set.

The reference to the GDG data set is corrected.

**Corrective Action:** No action is required.

CTR091E REQUESTED VOLUMES $vols$ ARE NOT MOUNTED

**Explanation:** The volumes containing the data set to be scratched were not mounted.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Make sure that the listed volumes are mounted, and rerun the job.

CTR092E "SCRATCH" FAILED. RC="rc"

**Explanation:** An unusual condition was encountered on one or more volumes while scratching a data set.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.

CTR093E INVALID VOLUME LIST $volList$

**Explanation:** An invalid volume list was used to scratch a data set. This is probably due to an internal error in Control-M/Restart, but it may also happen when attempting to run the job in a computer other than the one in which it abended.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Have your system programmer call BMC Software Customer Support for assistance.
CTR094I CHANGING VOLUME(S) FOR DATASET TO - \textit{volser}

\textbf{Explanation:} This information message precedes message CTR038I, which describes the data set name. The data set was cataloged to prevent DATASET NOT FOUND errors, and now resides on another volume. This is done because the data set name in the JCL of the job is not followed by a VOLSER, and the data set was not cataloged in the previous run of the job.

The internal MVS volume reference to the data set is corrected.

\textbf{Corrective Action:} No action is required.

CTR095I \textit{func} FAILED. RC= \textit{rc} REASON= \textit{rsn}

\textbf{Explanation:} This information message indicates that a specified function was not performed for a data set. In the case of a severe error, this message precedes message CTR084E, which indicates the data set name causing the problem.

\textbf{Corrective Action:} No action is required.

CTR096W MODEL DSCB ATTRIBUTES WERE NOT USED FOR \textit{dsn}. REASON \textit{rsn}

\textbf{Explanation:} Control-M/Restart could not find MODEL DSCB attributes. While performing a GDG adjustment for a file (\textit{dsn}), Control-M/Restart checks whether the DD statement for the GDG file refers explicitly to a MODEL DSCB. If so, Control-M/Restart tries to locate this MODEL DSCB. If for some reason the DSCB cannot be located, Control-M/Restart issues this warning message, accompanied by message CTR038I, and continues processing.

Possible values for reason: NOTFOUND or TYPEERR.

\textbf{Corrective Action:} No action is required.

CTR097I NCT2 HAS BEEN PREVENTED FOR DATASET

\textbf{Explanation:} This information message indicates that Control-M/Restart prevented the cataloging of the data set because the data set was already cataloged. This message precedes message CTR038I, which specifies the data set name.

\textbf{Corrective Action:} No action is required.

CTR098S JCL ERROR. DATASET " \textit{dsn} " HAS A NAME OF ALIAS

\textbf{Explanation:} The JCL for the job contains a DD statement that specifies a data set \textit{dsn} whose name is the same as the name of an alias in the catalog. A data set name cannot be the same as the name of an alias in the catalog, because it causes a JCL error when the job is run.

The CONTROLR step terminates with a nonzero condition code or with an abend code, depending on CONTROLR installation parameter ABNDTYP. The job terminates after the CONTROLR step.

\textbf{Corrective Action:} Correct the JCL of the job by specifying a unique data set name, and rerun or restart the job.
CTR099S THE FOLLOWING GDG BASE DOES NOT EXIST IN CATALOG ctlg

**Explanation:** The JCL for the job contains a DD statement that specifies a GDG data set whose GDG base name does not exist in the ctlg catalog. Any GDG data set specified in the job JCL should have a GDG base name defined in the catalog.

The CONTROLR step terminates with a nonzero condition code or with an abend code, depending on CONTROLR installation parameter ABNDTYP. The job terminates after the CONTROLR step.

**Corrective Action:** Define a GDG base name in the catalog by means of the IDCAMS utility, or correct the JCL of the problematic job. Specify the GDG data set with a GDG base name that exists in the catalog.

Messages CTR100 through CTR1xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**CTR100I** ABEND CODE code IS RECAPTURED FOR STEP procStep. pgmStep

**Explanation:** This information message indicates that the CONTROLR step recaptured an abend code from a previous run of the job. This code may affect execution of the restarted job. The steps of the restarted job can refer to (COND=EVEN or COND=ONLY) abends in steps that are not executed in the restart run.

**Corrective Action:** No action is required.

**CTR101I** NONCAT2 FROM STEP procStep. pgmStep TO STEP procStep. pgmStep

**Explanation:** This information message indicates the range of steps which will be executed in a Prevent NCT2 run.

**Corrective Action:** No action is required.

**CTR102I** CLEANUP FROM STEP step.procStep TO STEP step.procStep

**Explanation:** This information message indicates that the Control-M/Restart Data Set Cleanup Facility (CLIST CTRCCLN) was used to perform data set adjustment, without performing the actual restart. Data Set Cleanup Facility is used to restore the steps in the specified step range to their initial state. The CONTROLR step performs data set adjustment, deleting all new cataloged files, adjusting GDG bias numbers, and so on, without executing other steps of the job.

**Corrective Action:** No action is required.

**CTR103I** job [procedure] step - STEP NOT EXECUTED - DUE TO RESTART DECISION

**Explanation:** This information message indicates the step that is being skipped during the restarted run of a job. The job step was not executed because restart was requested by a From Restart Step statement from a later step.

**Corrective Action:** No action is required.
**CTR104S ALL STEPS WILL BE FLUSHED DUE TO PREVIOUS CODES**

**Explanation:** Restart resulted in flushing all remaining steps in the job. A request was made to Control-M/Restart to recapture step completion codes. This request will cause all remaining steps not to be executed, because of condition codes specification.

All the job steps are not executed.

**Corrective Action:** If recapturing of completion codes is required, mark the job as ended OK using the FORCE OK command, or restart the job without the step recapturing option.

**CTR105I 'NCT2' IS RECAPTURED FOR STEP stepName.procStep**

**Explanation:** This message informs the user that Control-M/Restart recaptured the NCT2 codes for a specific step and specific procstep. Control-M will use this information during post-processing analysis of the results of the job.

**Corrective Action:** No action is necessary.

**CTR106I jobName processName stepName - complCode systemAbCode/userAbCode nct2_sign**

**Explanation:** This message appears for every step in the job. It is used by Control-M during the Post-processing analysis of the results of the job.

**Corrective Action:** No action is necessary.

**CTR120E READING OF THE SYSOUT OF PREVIOUS RUN(S) OF ORDERID orderId FAILED**

**Explanation:** Severe errors were encountered during processing of the sysouts from the previous run or runs of the job. The preceding messages explain the problem in detail.

Depending on the Read Sysout Indicator, Control-M/Restart either terminates or continues processing.

If R was specified as a value for READ SYSOUT INDICATOR then the CONTROLR step terminates with a nonzero condition code or with an abend code, depending on the setting of the ABENDTYP Control-M/Restart installation parameter in CTRPARM. The job terminates after the CONTROLR step.

If C was specified as a value for Read Sysout Indicator then Control-M/Restart continues processing.

**Corrective Action:** Check the combination of CONTROLR step parameters MEMNAME and ORDERID. If the combination is valid, try to find out why the compressed data sets containing the sysouts of the previous run for the job were deleted.

**CTR121E IMPORTANT SYSOUT OF JOBID jobId FROM ORDERID orderId IS MISSING. RESTART IMPOSSIBLE**

**Explanation:** Control-M/Restart did not find some or all of the archived SYSDATA for the orderId order ID during the restart run CONTROLR step. The SYSDATA pointers that Control-M/Restart received pointed to archived SYSDATA that was deleted before the restart run was executed. Control-M/Restart cannot perform a restart without this data.
The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the setting of the ABENDTYP Control-M/Restart installation parameter. The job terminates after the CONTROLR step.

**Corrective Action:** Determine the cause of deletion of the needed SYSDATA, and ensure that all SYSDATA needed by Control-M/Restart for restart are available at the time the restart is performed.

**CTR126W PROBLEMS READING ARCHIVED SYSOUT DATA BASE. DSN=dsn**

**Explanation:** Control-M/Restart encountered problems while attempting to read archived SYSDATA from the archived SYSDATA database. This message is accompanied by other messages that define the exact problem.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP. The job terminates after the CONTROLR step.

**Corrective Action:** Notify BMC Software Customer Support.

**CTR128S SYSOUT(S) OF THE PREVIOUS RUN(S) DO NOT CONTAIN USEFUL INFORMATION. NUMBER OF CARDS READ nnnn**

**Explanation:** SYSDATA read by Control-M/Restart did not contain the data necessary to complete processing properly.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP. The job terminates after the CONTROLR step.

**Corrective Action:** Notify BMC Software Customer Support.

**CTR131E INCORRECT DSN SPECIFICATION - dsn**

**Explanation:** The dsn data set specified in the RESTART or PREVENT NCT2 Control-STATEMENT has an invalid syntax.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step. The statement in error is printed before this message.

**Corrective Action:** Correct the RESTART or PREVENT NCT2 Control-statement. Refer to the Control-M/Restart User Guide for the description of the RESTART or PREVENT NCT2 Control-statement.

**CTR132I PARAMETER MISSING IN THE DEBUG LEVEL STATEMENT**

**Explanation:** This information message indicates that parameter DEBUGLEVEL was specified in the CTRPARM member, but no value was supplied.

The program ignores the parameter and continues processing.

**Corrective Action:** Enter the value from 1 to 255 for the DEBUGLEVEL parameter in the CTRPARM member.

**CTR133I INVALID DEBUG LEVEL VALUE**

**Explanation:** This information message indicates that an invalid value was specified in the DEBUGLEVEL parameter in the CTRPARM member.
The program ignores the parameter and continues processing.

**Corrective Action:** Correct the value specified in the DEBUGLEVEL parameter in the CTRPARM member to a number from 1 to 255.

**CTR134E INVALID SPECIFICATION OF NONRESTARTABLE STEP**

*Explanation:* The NONRESTARTABLE_STEP parameter in the CTRPARM member was specified incorrectly.

The program aborts the CONTROLR step with an error code.

**Corrective Action:** Correct the format of the NONRESTARTABLE_STEP parameter to [PROCSTEP. PGMSTEP] and restart the job.

**CTR141S MVS/JES TABLE tableName CANNOT BE LOCATED**

*Explanation:* Control-M/Restart cannot locate the specified operating system table for retrieving necessary information.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Contact BMC Software Customer Support for assistance.

**CTR142S TOKEN TRANSLATION FOR TABLE tableName FAILED. TOKEN= token. RC= rc**

*Explanation:* Failure in request by Control-M/Restart for MVS SWA Manager translation service. Values of table, token, and return-code are provided for problem determination purposes.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP. The job terminates after the CONTROLR step.

**Corrective Action:** Notify BMC Software Customer Support.

**CTR143S UNIT NAME NOT FOUND: unitName**

*Explanation:* Unit name unitname was not recognized by Control-M/Restart. The unit name is either incorrect or missing from the Control-M/Restart Unit Table.

The job terminates with error.

**Corrective Action:** Specify a correct unit name in the Control-M/Restart Unit Table.

**CTR146S "MOD" DISPOSITION IS REQUESTED, BUT THE SPACE PARAMETER IS NOT SPECIFIED IN THE JCL**

*Explanation:* The data set that was specified with a MOD disposition could not be found, and therefore a new one must be allocated. However, the space parameter is missing.
For non-SMS environments, the CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/R M Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step. Under SMS the message is not produced.

**Corrective Action:** Add the SPACE parameter to the data set with the MOD disposition, and rerun the job.

**CTR147f** REFERENCE TO GDG DATASET WILL BE ADJUSTED TO *dsn1*
FROM: *dsn2*

**Explanation:** This information message indicates that the GDG adjustment phase will change the data set name because the generation number was updated by the job during a previous run. Usually the change will be to return to the previous generation data set.

The data set name will be changed. The JCL of the job remains unchanged. Only the real job references the new data set name during execution.

**Corrective Action:** No action is required.

**CTR148f** DATASET NOT FOUND IN CATALOG. STEP ADJUSTMENT IS ATTEMPTED

**Explanation:** A step that should run in the restarted job contains a data set that is not found in the catalog.

Control-M/R M Restart tries to do a step adjustment, find a previous step that creates the required data set, and restart from that step.

**Corrective Action:** No action is required.

**CTR149f** "NEW" DISPOSITION IS REQUESTED FOR A DATASET USED BY A PREVIOUS JOB STEP

**Explanation:** A job step must allocate a data set as if DISP was set to NEW, but Control-M/R M Restart determined that a previous step in the job references the same data set name with a disposition other than DELETE.

Processing continues normally.

**Corrective Action:** No action is required.

**CTR150f** exitName USER EXIT WILL BE INVOKED TO func DATASET

**Explanation:** This information message indicates that the CTRX001 Control-M/R M Restart Exit will replace Control-M/R M Restart data set adjustment processing. This exit is installed during Control-M/R M Restart installation. It overrides CATALOG, UNCATALOG, DELETE (SCRATCH), LOCATE and SCANDS functions originally performed by Control-M/R M Restart.

For more information concerning Control-M/R M Restart user exits, see the INCONTROL for z/OS Administrator Guide.

**Corrective Action:** No action is required.
CTR151W ERRORS OCCURRED WHILE COLLECTING JOBS/DATASETS CROSS-REFERENCE STATISTICS

**Explanation:** Errors occurred during Control-M/Restart PREVENT NCT2 processing while statistics were being collected for the Job Dataset Cross Reference report.

Control-M/Restart continues PREVENT NCT2 processing, and Control-M continues processing of the job, but the Job Dataset Cross Reference report statistics relating to this job are not collected.

**Corrective Action:** Retain the whole sysout of the problematic job execution, and contact BMC Customer Support.

CTR152I JOBS/DATASETS CROSS-REFERENCE STATISTICS COLLECTED SUCCESSFULLY

**Explanation:** During Control-M/Restart PREVENT NCT2 processing, statistics for the Job Dataset Cross Reference report were collected successfully.

**Corrective Action:** No action is required.

CTR160E INVALID "EXEC" CARD FOUND - *stmt*

**Explanation:** An unknown type of EXEC statement was found during sysout processing.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Check the problematic EXEC statement and if appropriate, correct it. If everything appears in order, contact BMC Software Customer Support.

CTR161S "SUBSTITUTION JCL" CARD NOT FOUND FOR JCL LINE " *lineNum*

**Explanation:** Substituting JCL message (IEF653I) had been expected for the JCL line number line-number but it was not found in the sysout. This is probably an internal error in Control-M/Restart. Control-M/Restart tries to analyze the JCL of the previous executions of the job. This message means that Control-M/Restart could not resolve some internal references of the sysout of the job.

The CONTROLR step ends with a non-zero condition code or with an abend code, depending on the Control-M/Restart Installation parameter ABNDTYP in CTRPARM. The job ends after the CONTROLR step.

**Corrective Action:** Check the problematic sysout, and correct the JCL of the job. If everything appears in order, contact BMC Software Customer Support for assistance. Provide a printout of the sysout of the previous execution of the job that failed, and the complete sysout of the job run that produced this message.

CTR162S UNKNOWN SYSOUT STRUCTURE OF JOBID *jobId*

**Explanation:** Severe failure during sysout processing. Control-M/Restart is unable to process the sysout from the previous run of the job (JOBID *jobId*). Control-M/Restart encountered a job SYSJCL or SYSMSG structure with which it is not familiar. It is probably an internal error of Control-M/Restart.
The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart Installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Contact BMC Software Customer Support for assistance. Provide a printout of the sysout of the previous execution of the job that failed, and the complete sysout of the job run that produced this message.

**CTR163I MISPLACED "J CL" STATEMENT - jclStmt**

**Explanation:** This information message indicates that a JCL statement was found in the message area of the job sysout from the previous run.

CONTROLR step continues processing. This JCL statement is ignored.

**Corrective Action:** Check why the specified JCL statement was found in the improper area of the sysout. If everything appears in order, contact BMC Software Customer Support.

**CTR164I MISPLACED SYSOUT STATEMENT - sysout stmt**

**Explanation:** This information message indicates that the specified sysout statement was found in an improper area of the job sysout from the previous run.

CONTROLR step continues processing, and the sysout statement is ignored.

**Corrective Action:** Check why the specified sysout statement was found in the improper area of the sysout of the previous run of the job. If everything appears in order, contact BMC Software Customer Support for assistance.

**CTR165E ERRORS WHILE PROCESSING SYSOUT. SENSE= sense**

**Explanation:** Control-M/Restart encountered an error in the structure of a SYSDATA statement from a previous run. The SYSDATA contained data that was in an invalid format. The value of sense is an internal code that helps in problem analysis. This message is accompanied by message CTR167I, which contains the content of the statement in error.

Control-M/Restart continues the restart process.

**Corrective Action:** Notify BMC Software Customer Support.

**CTR166I CURRENT JOB JCL IS DIFFERENT FROM J CL OF PREVIOUS RUN(S)**

**Explanation:** This information message indicates that differences were found between current job JCL and the JCL or JCLs of the job from previous run or runs of the job.

CONTROLR step continues processing.

**Corrective Action:** No action is required.

**CTR167I UNKNOWN CARD STRUCTURE - sysoutData**

**Explanation:** This information message contains the data that caused the error indicated in the preceding CTR165S message.

**Corrective Action:** No action is required.
CTR168I  ANALYZE {STAGE2 | CHKSTG2} INFORMATION FOR STEP=STEP=
stepName PROCSTEP= procStepName

Explanation: This information message provides additional information for messages CTR164I and/or CTR038I.

The program continues normal error processing.

Corrective Action: Supply BMC Software Customer Support with the sysout of the original run of the job, and the sysout and Control-M/Restart output of all restarted attempts of the job.

CTR169I  {JESJCL | SYSMSG} ddName dsn gdgLevel

Explanation: This information message provides additional information for messages CTR164I and CTR038I.

The program continues normal error processing.

Corrective Action: Supply BMC Software Customer Support with the sysout of the original run of the job, and the sysout and Control-M/Restart output of all restarted attempts of the job.

CTR171S processName FROM CONTROL-M/RESTART STEP IS NOT SUPPORTED

Explanation: Control-M/Restart was requested to perform process starting with the CONTROLR step itself. A RESTART or NONCAT2 run must start processing at some step other than the CONTROLR step itself. The request to begin at the CONTROLR step may have been generated manually, either in the Control-M Restart Window or by manual creation of the JCL, or automatically as the result of a prior run abending in the CONTROLR step.

The CONTROLR step terminates with a non-zero condition code or with an abend code (depending on the Control-M/Restart installation parameter ABNDTYP). The job terminates after the CONTROLR step.

Corrective Action: If the FROM step was manually specified on the Control-M Restart Window, specify a subsequent step in the job as the starting step. If the JCL for the RESTART or NONCAT2 run was created manually, correct the JCL to point to a subsequent step.

If the FROM step was generated automatically, the restart step must be overridden manually in the Control-M Restart Window to point to a later step in the RESTART or NONCAT2 run.

CTR180E DSN dsn IS LOCATED ON MORE THAN ONE VOLUME - CANNOT RESTART

Explanation: During restart of a job that was executing when the system crashed, Control-M/Restart found data set dsn on more than one disk volume. After a system crash, Control-M/Restart must determine where new data sets that did not specify a specific volume were allocated. The system crashed before the data sets were cataloged. At restart, Control-M/Restart found more than one data set with the same name.

This message precedes a series of CTR181E messages that list the volumes on which data set dsn was found.

The CONTROLR step terminates with a non-zero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP. The job terminates after the CONTROLR step.
Corrective Action: If it can be determined from the CTR181E messages which data set was the one created when the system crashed, delete all others with the same data set name and retry the restart.

If it is not possible to determine which data set is the correct one for restart, delete all data sets with data set name dsn, and when restarting, manually ensure that the restart step occurs before the step that created dsn.

An alternative is to modify the JCL for the job so that a specific volume is requested for data set dsn. This permits restart to proceed. In this case, delete dsn from all other volumes on which it appears.

CTR181E DSN dsn IS LOCATED ON VOLUME vol
Explanation: This message accompanies message CTR180E and indicates on which volumes the duplicate data sets reside.
Corrective Action: No action is required.

CTR182I STEP ADJUSTMENT REQUIRED BUT "NOSTEPADJUST" WAS SPECIFIED. RESTART PROCESSING TERMINATED
Explanation: This information message indicates that restart processing terminated because a required step adjustment could not be performed due to a NOSTEPADJUST specification. Control-M/Restart determined that step adjustment was required to perform the restart correctly. However, control statement NOSTEPADJUST, which prevents automatic step adjustment, was specified.

Restart processing is terminated and the job is not executed.
Corrective Action: No action is required.

CTR183I STEP step PROCSTEP procStep NON RESTARTABLE BY REQUEST. STEP ADJUSTMENT ATTEMPTED
Explanation: This information message indicates that, due to specification of the CTRNORST DD statement in the specified JCL step, Control-M/Restart is attempting step adjustment to the previous step in order to restart the job.

By specifying the CTRNORST DD statement for a step, the user indicates to Control-M/Restart that the step is non-restartable. If Control-M/Restart attempts restart from a step, but finds the CTRNORST DD statement specified in the step, Control-M/Restart then attempts restart from the previous step. Control-M/Restart attempts step adjustment.
Corrective Action: No action is required.

CTR184S JOB IS NON RESTARTABLE BY REQUEST
Explanation: Job could not be restarted because Control-M/Restart attempted to perform the restart from the first step, but the user specified the CTRNORST DD statement within that step.

By specifying the CTRNORST DD statement for a step, the user indicates to Control-M/Restart that the step is non-restartable. If Control-M/Restart attempts restart from a step, but finds the CTRNORST DD statement specified in the step, Control-M/Restart then attempts restart from the previous step. Control-M/Restart attempts step adjustment.

When Control-M/Restart attempts restart from the first step, but the CTRNORST DD statement is specified for that step, there is no previous step from which the restart can be attempted, so the restart fails.
Corrective Action: No action is required.

CTR185E ERROR IN PROCESSING OF "IF/THEN/ELSE" JCL CARD FOR STEP
stepName PROCSTEP procStepName

Explanation: An internal error occurred during Control-M/Restart analysis of the ‘IF/THEN/ELSE’ job JCL
statements.

The CONTROLR step terminates with a nonzero condition code or with an abend code, depending on the
Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR
step.

Corrective Action: Report the problem to BMC Software Customer Support.

Messages CTR200 through CTR2xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and
Control-M/Restart products.

CTR220E ENQ OF DATASET dsn FAILED

Explanation: Control-M/Restart attempted to enqueue a data set, but the enqueue failed because the
data set was already enqueued by another MVS task.

Control-M/Restart terminates the job.

Corrective Action: Determine which other tasks in the system are using the data set. Have it relinquish
control of the data set, and restart the job.

CTR230S INVALID "STEP ADJUSTMENT" INDICATOR - val

Explanation: The Step Adjustment indicator specified in the parameters for the CONTROLR step does
not contain a valid value.

The CONTROLR step terminates with a non-zero condition code or with an abend code depending on the
Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR
step has terminated.

Corrective Action: Correct in the JCL the value of the Step Adjustment parameter passed to the
CONTROLR job step.

CTR235I opn REQUEST FROM PROCSTEP procStep PGMSTEP pgmStep TO
PROCSTEP procStep PGMSTEP pgmStep

Explanation: This information message indicates that the input parameters of the job step EXEC
statement were interpreted, and the FROM and TO procedure and program steps were determined by
Control-M/Restart.

The operation identified in the message, could be RESTART, NCT2, or CLEANUP. The FROM pgmstep is
always present while the other steps may be blank. If the TO procstep is present, the TO pgmstep is also
present. If the steps specified by the user were symbolic, for example, $FIRST, in the message the names
of the steps will be the actual JCL steps determined by Control-M/Restart.

Corrective Action: No action is required.
Messages CTR300 through CTR3xx
This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and
Control-M/Restart products.

CTR301I varName

**Explanation:** This information message passes information from the original run of a job to subsequently
restarted runs. It is not intended to provide information to the user. When Control-M/Restart optional
installation feature WR0204 is enabled, one or more of these information messages may appear in the
JES system output or the console hardcopy log. These messages only appear in job runs that were not
restarted. The contents of the message is variable.

**Corrective Action:** No action is required.

CTR302W GETMAIN ERROR IN CTRSTAT

**Explanation:** Insufficient memory to perform enhanced GDG handling. This message can only occur if
optional installation feature WR0204 is enabled. The message does not occur for restarted jobs. If this
message occurs, subsequent reruns of the job may be adversely affected because GDG adjustment could
be incorrect.

The CONTROLR step continues running, but subsequent restarted jobs may perform GDG adjustment
incorrectly.

**Corrective Action:** Increase the REGION size parameter on the JCL JOB or EXEC statement. If the job
must be restarted and if GDG adjustment must be performed, the WR0204 feature should be disabled
until the rerun is complete.

CTR303I POST-SYSTEM CRASH ANALYSIS: SCAN ALL DASD TO SEARCH
FOR UNCATALOGED DATASETS FROM THIS JOB?

**Explanation:** This information message indicates that a system crash occurred during the original run of
this restarted job, and asks if a DASD scan should be performed. Message CTR304I requests a reply
regarding the scan.

**Corrective Action:** Reply to WTOR message CTR304I.

CTR304I REPLY "YES" TO SCAN, "NO" TO BYPASS SCAN, OR "CAN" TO
CANCEL THE JOB

**Explanation:** This information message follows message CTR303I.

The system waits for the user response.

**Corrective Action:** Enter one of the following:
- **YES** - Scan all DASD to search for uncataloged data sets for this job.
- **NO** - Bypass the scan. Control-M/Restart will not search for uncataloged data sets but this may cause problems while running the job.
- **CAN** - Cancel the job.

**CTR305I** NCT2 CONDITION DETECTED - JOB FLUSHED

**Explanation:** This information message indicates that CONTROLR detected an NCT2 problem for a job scheduled with NCT2 option F (FLUSH). If parameter NCT2 is set to F in a job scheduling definition, then the job is not executed when CONTROLR detects an NCT2 condition for the job.

The CONTROLR step terminates with a nonzero condition code or with an abend code, depending on CONTROLR installation parameter ABNDTYP. The job terminates after the CONTROLR step.

**Corrective Action:** Manually DELETE and UNCATALOG data sets that cause the NCT2 condition, or change parameter NCT2 from F to Y so that CONTROLR will DELETE and UNCATALOG such data sets. Then, rerun the job.

**CTR306I** REMOVE VOL=REF REFERENCE FROM THE DD CARD.

**Explanation:** IGNVOLRF = Y is specified in the CTRPARM member. Control-M/Restart does not do step adjustment to resolve the DD card for a tape data set whose volume is specified by a backward reference (VOL=REF in DD card) to a previous step that is not to be executed during Restart. The message is followed by message CTR038I, which describes the data set name.

In the first DD card of a restarted step that allocates a tape volume specified by a backward reference, Control-M/Restart removes the backward reference, that is, the VOL=REF parameter. If a volume name was resolved or extracted (from history or JCL), then Control-M/Restart adds the VOL=SER parameter using the resolved or extracted volume name and issues message CTR094l.

In subsequent DD cards pointing to the same volume (by a VOL=REF backward reference), Control-M/Restart changes the reference so that it points to an executed DD card (that is, a DD card belonging to a restarted step) allocating the same volume. For every such subsequent DD card, Control-M/Restart issues message CTR307I.

If the volume name was not found and the first executed DD that allocates this volume has a label number greater than one, then Control-M/Restart changes the label number to one (it assumes that the restart run uses another volume) and shifts the LABEL numbers of subsequent DD cards points to the same volume, respectively. For every DD card whose LABEL was changed, Control-M/Restart issues message CTR308l.

**Corrective Action:** To make Control-M/Restart always do step adjustment to resolve the DD card for a tape data set whose volume is specified by a backward reference (VOL=REF in DD card) to a previous step that is not to be executed during Restart, keep the parameter IGNVOLRF = N (default) in the CTRPARM member.

**CTR307I** CHANGE VOL=REF REFERENCE TO THE FIRST DD ALLOCATED DURING THE JOB RUN - DD= **ddName**, STEP= **stepName**, procstepName.

**Explanation:** IGNVOLRF = Y is specified in the CTRPARM member. See the description of message CTR306I for more information. The message is followed by message CTR038I, which describes the data set name.
Corrective Action: No action is required.

CTR308I CHANGE LABEL= PARAMETER VALUE FOR TAPE DATASET FROM oldLabelNumber TO newLabelNumber.

Explanation: IGNVOLRF = Y is specified in the CTRPARM member. See the description of message CTR306I for more information. The message is followed by message CTR038I, which describes the data set name.

Corrective Action: No action is required.

CTR309I CHANGE THE DISPOSITION OF THE DATASET TO DISP=OLD

Explanation: The DD card (specifying the NEW data set) fits the definition in the $KEEP member of CTR PARM library. Therefore, Control-M/Restart handles the DD card or data set as a Checkpoint data set. See the Control-M/Restart User Guide for more information regarding the $KEEP member. The message is followed by message CTR038I, which describes the data set name.

The Checkpoint data set is not deleted by Control-M/Restart. To prevent JCL error and NCT2 problems, Control-M/Restart may change the disposition in the DD card specifying a Checkpoint data set.

If the JCL of a job contains a DD statement in which the parameter DISP is set to NEW, and the corresponding Checkpoint data set already exists when Control-M/Restart is invoked, Control-M/Restart automatically changes the value of the DISP parameter to OLD.

Corrective Action: No action is required.

Messages CTR500 through CTR5xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

CTR555S OID= orderId INSUFFICIENT STORAGE. INCREASE THE REGION SIZE

Explanation: There was insufficient memory to perform a task.

The action that could not be performed accompanies this message. It may vary depending on the environment in which the message was issued.

Corrective Action: For jobs, increase the REGION size. For TSO, log on again using a larger SIZE parameter or exit one of the screens.

Messages CTR900 through CTR9xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

CTR913S OPEN OF DDNAME "SYSPRINT" FAILED

Explanation: The opening of a print file failed.

Possible causes are:
The DD statement SYSPRINT is missing.

The data set described by the DD statement SYSPRINT cannot be accessed for sequential write.

The program stops executing.

Corrective Action: Correct the JCL and submit again.

Messages CTRC00 through CTRCxx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

CTRC001 ARCHIVED FILE NOT FOUND

Explanation: The archived file required to perform a Control-M/Restart Simulation or Data Set Cleanup could not be found. To perform a RESTART or NCT2 Simulation (CLIST CTRCSIM) or Data Set Cleanup (CLIST CTRCCLN), Control-M/Restart must locate the archived file corresponding to the member name of the job and unique order ID of the job.

This file could not be located for one of the following reasons:

1. The order ID specified in the main panel of CTRCSIM or CTRCCLN is not the correct order ID for the specified member name.
2. The specified member name does not exist on the AJF.
3. Although the simulated job still exists on the AJF, its corresponding archived file was deleted manually.

Note:

If the relevant entry is deleted from the AJF, the archived file is deleted automatically during the running of the Control-M New Day procedure.

Corrective Action: Identify the cause of the problem, and then correct it, as follows:

4. Check whether or not the specified order ID is the correct one, by issuing command ORDERID (PF12 or PF21) in the Active Environment screen. The order ID for each entry is displayed in the STATUS field.
5. Verify that the specified member name matches the member name of the job to be simulated or cleaned-up.
6. If the relevant job entry still exists on the AJF, and the New Day procedure did not delete the archived file, the file may have been manually deleted by mistake. In this case, simulation or cleanup cannot be performed.

CTRC002 CONTROL-M/RESTART ARCHIVED FILE FOR THIS JOB WAS PROBABLY DELETED

Explanation: The system attempted to access an archived sysout associated with the Active Job file entry being processed, but could not find it. Further processing of the job is impossible.

The job is not processed.

Corrective Action: Manual intervention is required to restart the job.
Messages CTRX00 through CTRXxx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

CTRX01E ERROR OPENING FILE, DDNAME sysprint

**Explanation:** An error opening file occurred in the CTMJDS utility. The CTMJDS utility is invoked when necessary to create data set cross-reference records in statistic file.

The CONTROLR step terminates with a nonzero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Add the SYSPRINT DD statement to the CTMJDS utility, and rerun the job.

CTRX02E SYSTEM INTERFACE ERROR

**Explanation:** An error occurred in the CTMJDS utility. The error occurs when the return codes from the IBM TIME macro are not zero.

The CONTROLR step terminates with a nonzero condition code or with an abend code, depending on the Control-M/Restart installation parameter ABNDTYP in CTRPARM. The job terminates after the CONTROLR step.

**Corrective Action:** Contact BMC Software Customer Support for assistance.

CTT messages

This group includes messages for the Control-M/Tape product.

Messages CTT0 through CTT0xx

This group includes messages for the Control-M/Tape product.

CTT001S INTERNAL ERROR - REASON = rsn. NOTIFY THE IOA ADMINISTRATOR

**Explanation:** Processing failed due to internal error for the specified reason. The program stops executing.

**Corrective Action:** Ask your INCONTROL administrator to notify BMC Software Customer Support.

CTT002S TASK taskName WAS CANCELED BY OPERATOR

**Explanation:** The specified task was canceled by an operator MVS CANCEL command. The job or started task stops executing.

**Corrective Action:** No action is required.
INCONTROL for z/OS Messages Manual

CTT003S CONTROL-M/TAPE REAL-TIME ENVIRONMENT IS NOT ACTIVE

**Explanation:** The Control-M/Tape real-time environment exists but its status is not active, for example, SUSPEND or DORMANT. This message is issued by every component that requires an active environment to perform its function.

The requested Control-M/Tape function is not performed.

**Corrective Action:** Activate Control-M/Tape by starting the CTTINIT procedure with a PARM=RESUME statement before using this function.

CTT004S UNABLE TO LOCATE CONTROL-M/TAPE REAL-TIME ENVIRONMENT TABLE

**Explanation:** Control-M/Tape was not initialized in this CPU. The message is issued by every component that requires an active environment to function.

The requested Control-M/Tape function is not performed.

**Corrective Action:** Initialize Control-M/Tape by starting the CTTINIT procedure before using this function.

CTT005W LOAD OF USER EXIT exitName FAILED. EXIT DISABLED

**Explanation:** Loading of the specified user exit by Control-M/Tape failed.

This could be due to one of the following:

- The installation is not using this user exit and erased the default exit supplied with Control-M/Tape.
- IOA Load library is not in the load modules search list of the job (STEPLIB and Linklist).
- There is insufficient storage to load the exit.
- Another system-oriented reason. Check the MVS system log.
- A security violation was attempted.

No user checking is performed for the rule order.

**Corrective Action:** Notify your INCONTROL administrator.

CTT006E MEMBER memName NOT FOUND IN LIBRARY lib

**Explanation:** The requested member is not found in the requested library. This message may occur when the CTTINIT procedure tries to load the rules according to the rules order list specified by the DARULLST DD statement.

The requested rule is not loaded.

**Corrective Action:** Correct the member or library name in the rules order list, and restart the CTTINIT procedure.

CTT007S INSUFFICIENT STORAGE IN (EXTENDED) CSA

**Explanation:** There is insufficient storage available in the Extended Common Service Area (CSA) to load Control-M/Tape modules or tables.
If the problem occurs during the initialization process, initialization stops. If the problem occurs during a reload function, Control-M/Tape will continue to work with the existing module or table.

**Corrective Action:** Check why there is insufficient CSA. You may need to contact your systems programmer. After correcting the problem, reload the table or restart Control-M/Tape as necessary.

**CTT008W dsn DATASET FREESPAC...**

**Explanation:** The number of free records in the file is below the specified utilization \( nn \% \) threshold that was set at installation. Normal processing continues.

**Corrective Action:** Depending on the specified data set either:
- Enlarge the file for the Media Database (MDB) or Stacking Database.
- Run the MDB backup utility to recycle the space for the Trace file.

**CTT009S TRC DATASET FULL - MDB BACKUP REQUIRED**

**Explanation:** The Trace file is full; therefore, no Media Database (MDB) updates are allowed. The Trace file keeps every update to the MDB, mainly for recovery purposes. When the Trace file becomes full, updates to the MDB are not allowed, since they may cause data to be lost. However, when a backup is made to the MDB, the Trace file data is no longer critical, so new MDB updates can overwrite old records in the Trace file. The currently executing function stops.

**Corrective Action:** Run the MDB backup utility, then rerun the failed job.

**CTT010E MEDIA media DOES NOT EXIST IN CTTPARM**

**Explanation:** The specified media is not defined. All media names must be defined in the CTTPARM installation member. The function that is currently executing stops.

**Corrective Action:** Either specify a media already defined in the CTTPARM member, or add the media name to CTTPARM.

**CTT011I TRACE LEVEL IS TURNED OFF**

**Explanation:** This information message indicates that the debug level of Control-M/Tape was turned off as a result of the TRACELVL=0 parameter. Normal processing continues.

**Corrective Action:** No action is required.

**CTT012S action FAILED FOR MODULE modName**

**Explanation:** The specified action (LOAD, BLDL, FIND) for the \( modName \) module failed. During the Dynamic Interface Process, the \( modName \) module was not found in the STEPLIB library nor in SYS1.LPALIB. The currently executing function stops.
Corrective Action: Ensure that the module exists in the STEPLIB or SYS1.LPALIB library.

CTT013S FUNCTION CATALOG NOT SUPPORTED IN THIS MVS RELEASE

Explanation: An attempt was made to catalog the data sets of an external volume, but the MVS release does not support IEFEB4UV. Cataloging of the data set failed because Control-M/Tape performs online cataloging of a data set of an external volume by means of the look up value of the unit name. IEFEB4UV, which retrieves this information, was not available in early versions of the operating system.

The ENTER command was issued to add an external volume to the Media Database. In addition, Y was entered in the MVS CATALOG field to catalog the data sets of the external volume. The ENTER command triggers both cataloging and adding of the volume to the Media Database, but the cataloging is performed before adding the volume.

The data sets are not cataloged, and the external volume is not added to the Media Database.

Corrective Action: To add the external volume, change the value in the MVS CATALOG field from Y to N.

CTT014W INVALID UNIT NAME unitName FOR MEDIA media

Explanation: The specified unit name is not defined in MVS tables. The specified media is defined in the CTTPARM installation member as unit unitName.

Normal processing continues.

Corrective Action: Check the media definition in the CTTPARM member.

CTT015I TRACE JOB IS SET TO jobName

Explanation: This information message indicates that since CTTINIT was started with the TRACEJOB parameter, the trace job of Control-M/Tape was assigned the name jobName. The trace job sets the job name for which trace messages, printed by some Control-M/Tape components, are issued.

Corrective Action: No action is required.

CTT016E PRINT LABEL ROUTINE FAILED. RC: rc

Explanation: The print label routine failed. This message is issued after control returns from the print label routine. The print label routine calls User Exit 9, which formats the label.

The print label routine issues one of the following return code values:

- 4 - Invalid return code. User Exit 9 returned an rc other than 0 or 4.
- 8 - Invalid label width. User Exit 9 set a label width that does not meet the 1 through 72 byte width restriction.
- 12 - Invalid label size. User Exit 9 set a label width and depth combination that exceeds the maximum print buffer size (2048 bytes).

Processing continues. The label is not printed.

Corrective Action: No action is required.
CTT017W CONTROL-M/TAPE IS NOT ACTIVE IN THE SYSTEM

Explanation: The Control-M/Tape real-time environment was terminated by operator request and is no longer active in the system.
No Control-M/Tape processing takes place.
Corrective Action: Check why Control-M/Tape was brought down, and if appropriate, start the CTTINIT procedure.

CTT018E INVALID REPLY: reply

Explanation: Control-M/Tape received an invalid reply to a WTOR message from the operator.
The WTOR message is issued again.
Corrective Action: Check the possible responses for the issued WTOR message, and respond to this message accordingly.

CTT019E SMS SUBSYSTEM ERROR: RC=rc, REASON= rsn

Explanation: An error was encountered when Control-M/Tape tried to interface with DFSMS.
Message variables are:

- rc -- The DFSMS subsystem return code.
- rsn -- The DFSMS subsystem reason code.
The Control-M/Tape to DFSMS cannot retrieve information from DFSMS.
Corrective Action: Call your INCONTROL administrator for assistance.

CTT020E CTT/SMS INTERFACE NOT ACTIVE

Explanation: Control-M/Tape tried to access DFSMS information as requested by a rule, but the interface to DFSMS is not active.
The requested function is not performed.
Corrective Action: Either remove the DFSMS reference from the Control-M/Tape rules (delete all ON MGMTCLAS rules) and the Control-M/Tape MDB records, or activate the Control-M/Tape SMS interface by setting SMSINTR to Y in the Control-M/Tape TCT table.

CTT021E SMS MANAGEMENT CLASS NOT FOUND

Explanation: The Management Class of a data set was not defined to DFSMS, and was probably deleted after the data set was created. When a data set is created, a Management Class is assigned to it.
Control-M/Tape cannot determine the volume expiration date.
Corrective Action: Define the Management Class in DFSMS, or update the data set record in the Control-M/Tape Media Database (MDB) and assign a Management Class to it.
CTT022E RULE APPLICATION FAILED. RC= rc, REASON= int_diag, ret_rc, vault_rc

Explanation: Control-M/Tape attempted to apply a rule to a data set or volume but the specified retention or vaulting information is not consistent with the relevant records in the Media Database.

The variables in this message are:

- **rc** -- Rule return code. Possible values:
  - 8 -- Insufficient memory.
  - 12 -- Attempt to apply retention or vaulting information failed.

- **int_diag** -- Internal diagnostic flags.

- **ret_rc** -- Retention information application return code. Possible values:
  - 4 -- Expiration date type not supported.
  - 12 -- Internal error.
  - 16 -- Expiration date is non-numeric.

- **vault_rc** -- Vaulting information application return code. Possible values:
  - 4 -- Expiration date type not supported.
  - 8 -- Insufficient memory.
  - 16 -- Expiration date is non-numeric.

If the message was issued by the Dynamic Dataset Stacking facility, the data set is not stacked. Otherwise, the retention and/or the vault pattern of the data set may be different from what was intended, because default retention may have been applied.

Corrective Action: Check the JCL EXPDT values for errors according to return codes, and do one of the following:

- If the message indicates a memory problem, increase the region size for the job which issued the message.
- If an invalid expiration date type was detected, check the values specified for the EXPDT parameter in the JCL DD statement.

If the problem persists, send a complete description of the problem to BMC Software Customer Support. Include the complete message, the job log of the problematic job, and a TI screen printout of the problematic volume and data set records.

CTT023E COULD NOT FIND FIELD fieldName FOR REQUESTED RECORD TYPE

Explanation: The user requested the display of an unrecognized field in the view definition of Media Database information on the z/OS console. Only fields that exist in the requested record type, volume or data set, can be specified. However, the specified field does not exist. The name may be misspelled.

The requested information is not displayed.

Corrective Action: Correct the field name in the view. For more information, refer to the Control-M/Tape chapter in the INCONTROL for z/OS Administrator Guide.
INCONTROL for z/OS Messages Manual

CTT046S BLDL/LOAD FAILED FOR THE MODULE "modName"

Explanation: Loading of the modName module failed.
Possible causes are:

- The IOA Load library is not in the load modules search list (STEPLIB + Linklist).
- There is insufficient memory.
- There is some other system-oriented reason, which may be found in the syslog.
Execution might stop.

Corrective Action: Prepare the Control-M monitor full output and contact BMC Customer Support.

CTT050S UNABLE TO BUILD TCT, RC= rc

Explanation: The Control-M/Tape Control Table could not be built dynamically.
In this message, rc is one of the following:

- 8 - IOAPARM or CTTPARM load failed.
- 12 - GETMAIN failed.

The IOA Functional monitor is terminated.

Corrective Action: Do one of the following, depending on the return code:

- If the return code is 8, check why the CTTPARM member or the IOAPARM member could not be loaded, and restart the Functional monitor.
- If the return code is 12, increase the region size of the IOA Functional monitor, and restart the Functional monitor.

CTT051W STARTING TO READ RECORDS FROM END OF TRACE FILE

Explanation: The IOA Functional monitor failed to identify the check point of the last record it processed from its trace file.
Processing of the IOA Functional monitor continues. Some of the last actions to be recorded in the Trace file before the error may not be performed.
Input records from the Control-M/Tape Trace file will be read starting from the last record in the Trace file.

Corrective Action: No action is required.

CTT070W ROUTINE routineName FAILED. RC= rc

Explanation: This message indicates that an internal error occurred in a certain routine. The significance of this error depends on the utility and the severity of the failure indicated by the return code (rc).
The variables in this message are:
• routine -- Routine in which the error occurred.
• rc -- Type of error.

Refer to the specific utility in the Control-M/Tape User Guide to determine whether processing continues or stops.

**Corrective Action:** Examine the return code of the utility when it stops, and proceed accordingly. If you cannot continue, refer the problem to the INCONTROL administrator.

CTT072I UTILITY util IS RUNNING IN {SIMULATION | R-SIMULATE} MODE

**Explanation:** This information message indicates that the specified Control-M/Tape utility is running in either simulation mode (SIMULATION) or simulation restart mode (R-SIMULATE).

**Corrective Action:** No action is required.

CTT073I *

**Explanation:** The asterisk in this message is positioned directly below the error in the previous CTT700I message to show the location of the error.

The utility stops.

**Corrective Action:** Remove or fix error and try again.

CTT074E SERVICE svc FAILED. RC= rc, REASON= rsn

**Explanation:** The specified external service called by the executing utility has failed. The executing utility returns return code rc and reason code rsn.

Possible values for the service (svc), return code (rc) and reason (rsn) are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCTLOAD</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>Cannot load CTTPARM or IOAPARM</td>
</tr>
<tr>
<td>12</td>
<td>Insufficient region</td>
</tr>
<tr>
<td>INITPARS</td>
<td></td>
</tr>
<tr>
<td>36</td>
<td>Insufficient region</td>
</tr>
<tr>
<td>INITINC</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>Insufficient region</td>
</tr>
<tr>
<td>36</td>
<td>Insufficient region</td>
</tr>
<tr>
<td>BLDINC</td>
<td></td>
</tr>
</tbody>
</table>
### Value | Explanation
--- | ---
8 | Too many INCLUDE statements
16 | Invalid value passed in INCLUDE statement
20 | `<, >` not allowed in this context
24 | Invalid value for a date field
28 | Invalid format in a date field

**CTTRBD**

| Value | Explanation |
--- | ---
4 | RETRY scheduled
8 | DD statement missing or open error
12 | Load failed for one of the following modules: CTTX008, automated tape library interface exit (for example, if you set RBTTYPE to SMST/IBMT in the CTTPARM member, make sure exit CTTOAM has been compiled and exists in the IOA.load library)
16 | Internal. Contact BMC Software Customer Support
20 | Internal. Contact BMC Software Customer Support
14 | Error returned from automated tape library interface exit
28 | Contradicting volume status in the media database
32 | Internal. Contact BMC Software Customer Support
36 | Error when trying to read volume record

Other | Program or system error

The utility stops execution.

**Corrective Action:** Correct the problem according to the reason listed in the table above and rerun the utility. If you cannot correct the problem, contact BMC Software Customer Support.

#### CTT075E DUPLICATE USE OF `{STATEMENT | KEYWORD}` `{ stmt|keywd }`

**Explanation:** A utility encountered duplicate use of a stmt statement or keywd keyword. The statement or keyword listed in the message can only be specified once.

The utility stops execution.

**Corrective Action:** Remove the extraneous statement or keyword.
CTT076E MANDATORY {STATEMENT | KEYWORD} { stmt|keywd } IS MISSING

Explanation: The stmt statement or keywd keyword is mandatory, but was not found in the input to the executing utility. The stmt statement or keywd keyword does not have a default, and must be specified to the utility.

The utility stops execution.

Corrective Action: Specify the required statement or keyword in the input to the utility.

CTT077E NO KEYWORDS FOUND

Explanation: A utility encountered a statement for which no keywords were specified. The statement listed in a previous message must have at least one keyword specified.

The utility stops execution.

Corrective Action: The statement was probably specified incorrectly. Check the syntax and make sure that the appropriate keywords are used for this statement.

CTT078E INVALID VALUE SPECIFIED FOR KEYWORD keywd

Explanation: An invalid value was specified for one of the keywords in the input to a utility.

In this message, keywd is the keyword with the problematic value.

The utility stops execution.

Corrective Action: Fix the value of the specified keyword and rerun the utility.

CTT079E INVALID OR UNKNOWN {STATEMENT | KEYWORD}

Explanation: A utility encountered an invalid statement or keyword. The previous CTT700I message specifies the line in which the error occurs.

The utility stops.

Corrective Action: Check earlier messages for more information. Then, remove or fix the invalid statement or keyword, and try again.

CTT080W VOLUME (volser) EXCLUDED FROM OPERATION TO PREVENT MDB INTEGRITY ERRORS

Explanation: The CTTSPL utility encountered a request to COPY or MOVE a volume (the volser volume) that is part of a chain.

If a volume is removed from a chain, the MDB is corrupted. If the copied volume is MERGED into another MDB, the MDB into which it is merged is also corrupted.

The volser volume is excluded from the COPY or MOVE operation. The utility continues processing.

Corrective Action: BMC Software recommends that you do one of the following:
When ordering a MOVE or COPY operation, ensure that you do not specify any volume that is part of a chain.

If you must perform a MOVE or COPY operation on a volume that is part of a chain, ensure that all the volumes in the chain are specified.

CTT084I NO REPORT STATEMENT SUPPLIED. REPORT NOT GENERATED.

Explanation: There is no REPORT statement for the utility.
The utility continues processing, but no report is displayed.
Corrective Action: No action is required.

CTT085I num RULES GENERATED

Explanation: This information message is displayed when the CTTSCA utility finishes processing. During the search for tape contentions, the CTTSCA utility generated num rules to prevent detected contentions from happening in the future. Rules created by the CTTSCA utility prevent data sets that should be processed simultaneously, from being stacked on the same volume.
For more information about the CTTSCA utility, see the INCONTROL for z/OS Utilities Guide.
Corrective Action: No action is required.

CTT086I num POSSIBLE CONTENTIONS DETECTED

Explanation: This information message is displayed when the CTTSCA utility finishes processing. During the search for tape contentions, the CTTSCA utility detected num possible contentions. Any two data sets processed simultaneously are considered in possible contention, if at least one of them was opened for OUTPUT. This message is accompanied by message CTT085I.
For more information about the CTTSCA utility, see the INCONTROL for z/OS Utilities Guide.
Corrective Action: No action is required.

CTT087I num STACKABLE DATASETS FOUND

Explanation: This information message is displayed when the CTTSTKR utility finishes processing. It indicates that num data sets were identified as stackable by the CTTSTKR utility.
For more information about the CTTSTKR utility, see the INCONTROL for z/OS Utilities Guide.
Corrective Action: No action is required.

CTT088E INVALID OR UNKNOWN {STATEMENT | KEYWORD} ON LINE lineNum, COLUMN col_num OF ABOVE STATEMENT

Explanation: A utility encountered an invalid statement or keyword. This message follows message CTT700I, and specifies the line and column in which the error occurred.
The utility stops.
Corrective Action: Remove or fix the invalid statement or keyword and try again.
CTT096E SCRATCH VOLUME, BUT LAST LABEL NUMBER IS NOT ZERO

**Explanation:** A non-specific (scratch) request was made, but the volume that was mounted is unsuitable for one of the following reasons:

- The volume already contains one or more active data sets.
- The volume status is incorrectly set.
- The last data set number on the scratch volume is greater than zero.

The specified volume is rejected and another volume is requested.

**Corrective Action:** Mount a scratch volume.

CTT098E TAKING LOCK OF ASVT BY FORCE

**Explanation:** An error was encountered while the Control-M/Tape real-time environment was trying to synchronize between subtasks of the same address space.

One of the subtasks of the address space is granted access to one of the Control-M/Tape control blocks without synchronizing this access with the other subtasks.

**Corrective Action:** Call your INCONTROL administrator for assistance.

Messages CTT100 through CTT1xx

This group includes messages for the Control-M/Tape product.

CTT100A msgText

**Explanation:** A tape mount request was detected. This MVS message is displayed when waiting for a tape to be mounted. The tape can be specific or nonspecific (scratch). This message may contain additional information added by means of the MSGFMT parameter defined in the CTTPARM member.

The message ID was changed from the original MVS message ID by means of the CNGMSGID parameter in the CTTPARM member. The original IBM message ID was IEC101A, IEC501A/E, or IEF233A/D. See the appropriate IBM documentation for more information.

**Corrective Action:** Mount the requested tape.

CTT101A msgText

**Explanation:** A request was made to mount a scratch tape from a specific pool. This MVS message is displayed when waiting for a nonspecific (scratch) tape with the volser field containing a specific pool name, instead of SCRTCH or PRIVAT, to be mounted.

The message ID was changed from the original MVS message ID by means of the CNGMSGID parameter in the CTTPARM member. The original IBM message ID was IEC101A, IEC501A/E, or IEF233A/D. See the appropriate IBM documentation for more information.

**Corrective Action:** Mount a tape from the requested pool.
CTT102A msgText

Explanation: A request was made to remove the specified volume from the tape device. This MVS KEEP message is displayed when the tape must be removed. This message may contain additional information added by means of the MSGFMT parameter defined in the CTTPARM member.

The message ID changed from the original MVS message ID by means of the CNGMSGID parameter in the CTTPARM member. The original IBM message ID was IEC111E, IEC502E, or IEF234E. See the appropriate IBM documentation for more information.

Corrective Action: Remove the specified volume from the tape device.

CTT103A msgText

Explanation: A request to mount a tape was detected. This JES3 message is displayed when waiting for a tape to be mounted. The tape can be specific or nonspecific (scratch). This message may contain additional information added by means of the MSGFMT parameter defined in the CTTPARM member.

The message ID was changed from the original JES3 message ID by means of the CNGMSGID parameter in the CTTPARM member. The original message ID was IAT5210.

Corrective Action: Mount the requested tape.

CTT104A msgText

Explanation: A request was made to mount a scratch tape from the specified pool. This JES3 message is displayed when waiting for a nonspecific (scratch) tape with the volser field containing a specific pool name, instead of SCRTCH or PRIVAT, to be mounted.

The message ID was changed from the original JES3 message ID by means of the CNGMSGID parameter in the CTTPARM member. The original message ID was IAT5210.

Corrective Action: Mount a tape from the requested pool.

CTT105A msgText

Explanation: A request was made to remove the specified volume from the tape device. This JES3 KEEP message is displayed when a tape must be removed. This message may contain additional information added by means of the MSGFMT parameter defined in the CTTPARM member.

The message ID was changed from the original JES3 message ID by means of the CNGMSGID parameter in the CTTPARM member. The original message ID was IAT5410.

Corrective Action: Remove the specified tape from the tape device.

CTT106S INTERNAL ERROR IN CONTROL-M/TAPE SVC. CODE: rc

Explanation: An internal error occurred during Control-M/Tape real-time processing.

The job or task is abended.

Corrective Action: Have your INCONTROL administrator notify BMC Software Customer Support.
CTT107E unit, FILES WITH HIGHER SEQUENCE NUMBERS EXIST ON VOLUME volser (ddName, seqNumber)

Explanation: An attempt was made to write a file with sequence number seqNumber on a tape volume while another data set with a higher file sequence number exists on the volume.

The job is abended.

Corrective Action: Correct the JCL and rerun the job.

CTT108E unit, PREVIOUS FILE DOES NOT EXIST ON VOLUME volser (ddName, seqNumber)

Explanation: An attempt was made to write a file with a specified sequence number (seqNumber) on a tape volume but the preceding file sequence number does not exist on the volume.

The job is abended.

Corrective Action: Correct the JCL and rerun the job.

CTT109E unit, CONFLICT WITH MDB DSN: dsn (volser, seqNumber)

Explanation: An attempt was made to read a data set with a different name than the name (dsn) recorded in the Control-M/Tape MDB.

The job abends.

Corrective Action: Correct the JCL and rerun the job.

CTT110E unit, DATASET NOT FOUND IN MDB: dsn (ddName)

Explanation: An attempt was made to read a data set that is not in the Control-M/Tape database, and dynamic data set definition is not allowed (DYNDS is set to N in the CTTPARM member).

The job is abended.

Corrective Action: Correct the JCL, and rerun the job.

CTT111E unit, JOB FAILED BY USER EXIT #3 (ddName)

Explanation: An abend was requested from local exit #3.

The job is abended.

Corrective Action: Notify your system programmer.

CTT112A unit, jobName, VOLUME volser NOT IN MDB. REPLY Y - DEFINE, E - EXTERNAL, I - IGNORE OR N - action

Explanation: A mount request was issued for a volume (VOLSER) that is unknown to Control-M/Tape. The specified volume is probably not on-site. This message is issued only if the DYNVOL parameter is set to P (Prompt) in the CTTPARM member.

The jobName job waits for a reply.

Corrective Action: Reply with one of the following values:
Y - Control-M/Tape dynamically defines the volume in its database.

E - Control-M/Tape dynamically defines the volume in its database. The volume will be marked as External.

I - This volume and its data sets should be ignored, as if EXPDT=98000 was specified in the JCL. This value is not available for the first volume in a chain and for single volumes which are not part of a chain.

N - If this is a specific tape request, the job is abended. If this is a nonspecific tape request, the volume is rejected and a new volume is requested.

CTT113A unit, jobName, VOLUME volser IN VAULT vault. REPLY U - USE OR A - ABEND

Explanation: The database indicates that the volume (volser) requested for mounting is in a remote vault, and the mount request is probably a user error.

Job jobName waits for a reply.

Corrective Action: Reply with one of the following values:

- U - Control-M/Tape should allow the job to continue. Information will be recorded as usual, but the volume status remains vaulted.

- A - The program should abend.

CTT114A unit, ENTER VOLSER FOR {NL | BLP} REQUEST

Explanation: A tape without a label is mounted on the specified unit. This message requires confirmation that the correct volume is mounted, since there is no label information.

Control-M/Tape waits for a reply.

Corrective Action: Specify the VOLSER of the volume mounted on the unit. If this is the same VOLSER as that specified in the user JCL, the job continues normally. Otherwise, after another confirmation, the volume is rejected and the correct volume is requested.

See the section that describes the NL and BLP options for volume processing in the chapter on organization and administration of the Control-M/Tape User Guide.

CTT115S INVALID RETURN CODE (rc) FROM USER EXIT exit_num

Explanation: An invalid return code was returned from the specified exit. The exit in this message can be Exit 3, 4, or 5. The return code (rc) was not in accordance with the documented interface.

If the invalid return code was sent by Exit 4, the job continues. If the invalid return code was sent by either Exit 3 or Exit 5, the job abends.

Corrective Action: Have your system programmer check the specified exit.

CTT116S ABEND IN USER EXIT exit_num

Explanation: The exit_num user exit abended.

The job is abended.
INCONTROL for z/OS Messages Manual

**Corrective Action:** Have your system programmer check the specified exit.

CTT117S ABEND IN MODULE *modName*, E.P: *add* OFFSET: *offset*

**Explanation:** An abend occurred in the Control-M/Tape real-time environment. This message identifies the module, its entry point, and the offset of the error.

The job is abended.

**Corrective Action:** Notify BMC Software Customer Support.

CTT118E unit, FILE ALREADY EXISTS: *dsn (ddName)*

**Explanation:** An attempt was made to overwrite an existing data set with a different name than its current name (*dsn*). A recreate was requested for a DSNAME on a label that has a different DSNAME than the requested DSNAME.

The job is abended.

**Corrective Action:** To recreate, correct the JCL and rerun.

CTT119E unit, RECREATE WITH DISP=NEW: *dsn (ddName)*

**Explanation:** An attempt was made to recreate an existing data set with DISP set to NEW. Recreate is permitted only with DISP set to OLD.

The job is abended.

**Corrective Action:** If recreate is desired, correct the JCL and rerun.

CTT120E unit, RECREATE ON A PERMANENT DATASET: *dsn (ddName)*

**Explanation:** An attempt was made to recreate a data set with Permanent retention. Recreate is permitted only with other types of retention.

The job is abended.

**Corrective Action:** If recreate is desired, change the retention specification of this data set.

CTT121I LAST CHKPT IN SVC: *svc* INTERCEPT: *id* RELEASE: *ver* LEVEL: *lev*

**Explanation:** This information message identifies the last checkpoint in the Control-M/Tape real-time environment module, and may be accompanied by additional messages.

The variables in this message are:

- *svc* -- Last checkpoint reached before the service interruption.
- *id* -- Function internal ID.
- *ver* -- Version number of the currently installed Control-M/Tape.
- *lev* -- Level number of the Control-M/Tape real-time environment module.

**Corrective Action:** Look for previous error or warning messages.
CTT122E unit, NON-POOL REQUEST RECEIVED VOLUME volser FROM POOL: poolName

Explanation: A nonspecific request (scratch request) received a volume from the indicated pool although the request was for a non-pool volume.

The volume is rejected and another volume is requested.

Corrective Action: Mount a scratch volume which is not part of a pool or check the DO POOL statement in the matching rule.

CTT123E unit, NON-POOL VOLUME volser FOR POOL REQUEST: poolName

Explanation: A nonspecific request (scratch request) for the specified pool received a volume that does not belong to any pool.

The volume is rejected and another volume is requested.

Corrective Action: Mount a scratch volume from the specified pool.

CTT124E unit, REQUEST FOR POOL poolName RECEIVED VOLUME volser FROM POOL poolName

Explanation: A nonspecific request (scratch request) for the specified pool received a volume from another pool.

The volume is rejected and another volume is requested.

Corrective Action: Mount a scratch volume from the correct pool.

CTT125E unit, volser NOT A SCRATCH VOLUME

Explanation: A nonspecific (scratch) request on the specified unit received a non-scratch volume.

The specified volume is rejected and another volume is requested.

Corrective Action: Mount a scratch volume.

CTT126E unit, volser MARKED DELETED

Explanation: A nonspecific request (scratch request) on the specified unit received a volume which is marked as deleted (out of service).

The specified volume is rejected and another volume is requested.

Corrective Action: Mount another scratch volume.

CTT127I unit, volser, TEMPORARY DATASET (ddName)

Explanation: This information message indicates that a temporary data set is being written on the specified volume.

Corrective Action: Return the volume to the scratch pool right after its use.
CTT128E  ddName INVALID EXPDT VALUE expdt. RC: rc

**Explanation:** An invalid expiration date (EXPDT) was specified in the JCL. Usually this message is caused by setting EXPDT to 970 xx, which is not supported by Control-M/Tape.

The variables in this message are:
- **ddName** - the DD statement that contains the invalid date
- **expdt** - the invalid expiration date
- **rc** - the return code

Possible values for **rc** are:
- 4 - expiration date type not supported
- 16 - expiration date in an invalid format, such as
  - nonnumeric
  - yy000
  - yyyy/000

The EXPDT value is ignored and the data set is given a default retention.

*Note:* 
The EXPDT value is expressed in internal format.

**Corrective Action:** No action is required.

CTT129I unit, VOLUME volser IN {LOCAL VAULT: vaultName, SLOT: slotNumber| OUT LOCATION: loc }

**Explanation:** This information message indicates that the tape requested for mounting (volser) is located in the specified location.

**Corrective Action:** No action is required.

CTT130E unit, VOLUME volser NOT IN MDB

**Explanation:** The specified volume is not defined in Control-M/Tape's Media database. Possible causes are:
- Dynamic Volume Definition is disabled (DYNVOL is set to N in the CTTPARM member).
- N (Abend) reply to message CTT112A.

**Corrective Action:** Specify EXPDT=98000 in the JCL, or define the volume in the Media database using CTTDLD utility, and rerun the job.

CTT131W unit, VOLUME volser IN USE BY JOB jobName

**Explanation:** The indicated volser is marked in use by the specified job. Possible causes are:
A system or program crash left the 'in use' indicator turned on. This occurs when a data set being written does not go through a complete CLOSE process. In this case, the volume remains 'in use'. For example, in the case of a system abend 837, when a demount has occurred for a multi-volume data set but a new mount is disallowed because the file is on more than the maximum number of volumes, a full CLOSE will not occur, and the volume remains 'in use'. In most cases, a cancel command will cause CLOSE processing to occur, but it depends on exactly when the job was canceled. The IEC205I message in the job log will indicate that the job went through a full CLOSE process.

During online stacking processing, the 'in-use' bit is temporarily set to prevent other jobs from allocating the volume while online stacking is examining the specific volume.

Corrective Action: Do the following:
- To reset this bit, run the CTTIDB utility in repair mode.
- Then run the CTTMUP utility to perform the repair.

CTT132E unit, EDM TRYING TO WRITE ON NON-EDM VOLUME volser

Explanation: An EDM (External Data Manager) is trying to write a data set on a non-scratch volume which is not marked as an EDM Volume. An EDM can only write data on scratch volumes afterwards marked as EDM Volumes, or non-scratch volumes already marked as EDM Volumes.

The job is abended.

Corrective Action: Check the rules regarding EDM. Verify that they have not been changed in a way that caused this problem.

CTT133E unit, NON-EDM TRYING TO WRITE ON EDM VOLUME volser

Explanation: A job that is not an EDM (External Data Manager) is trying to write on a volume that is marked as an EDM Volume. Only an EDM is allowed to write on volumes that are marked as EDM Volumes.

The job is abended.

Corrective Action: Correct the job and rerun.

CTT134A unit, jobName, CONTROL-M/TAPE ENVIRONMENT DOES NOT EXIST. REPLY A - ABEND, R - RETRY OR U - CONTINUE

Explanation: A job is trying to process data on tape, while the Control-M/Tape real-time environment does not exist or is still initializing. Control-M/Tape real-time environment is started by the CTTINIT procedure. No tape processing is allowed while Control-M/Tape is down, unless Control-M/Tape MVS intercepts are disabled.

The job waits for a reply.

Corrective Action: Reply with one of the following values:
A -- Abend this job.
R -- Retry to find Control-M/Tape environment. This option enables you to start CTTINIT and then reply Retry.
U -- Bypass Control-M/Tape for the processing of this data set. In this case, Control-M/Tape does not record or protect any information affected by this job while processing this data set.

CTT135A unit, jobName, 98000 REQUEST FOR MDB VOLUME volume, REPLY ‘U’ - IGNORE, ‘A’ - ABEND OR ‘F’ - FORCE

Explanation: A job specified EXPDT=98000, Control-M/Tape bypass, for a controlled volume. Specifying EXPDT=98000 for a controlled volume is not recommended, because Control-M/Tape cannot enforce data integrity. The job waits for a reply.
Corrective Action: Reply with one of the following:
- U -- Continue. Ignore the bypass request.
- A -- Abend the job.
- F -- Bypass Control-M/Tape for processing of this data set. In this case, Control-M/Tape does not record or protect any information affected by this job while processing this data set.

CTT136E unit, volser MARKED IN AN OUT LOCATION

Explanation: The operator mounted a volume marked “out of the library” in response to a request to mount a scratch tape.
The volume is rejected. The operator is prompted to mount another volume.
Corrective Action: Mount a scratch tape.

CTT137S CSECT IN ERROR csect, EP: add OFFSET: offset

Explanation: An abend occurred in one of the Control-M/Tape real-time environment modules. This message identifies the CSECT in the module, its Entry Point, and the offset of the error. This message follows message CTT117S.
The job abends.
Corrective Action: Notify BMC Software Customer Support.

CTT138W unit, DATASET BYPASSED. REASON: rsn VOLUME: volser

Explanation: Control-M/Tape is bypassing the data set on the specified volume. As a result of this bypass, no information regarding this data set is recorded in the MDB.
Valid values for rsn are:

<table>
<thead>
<tr>
<th>rsn</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>LBL-ERR</td>
<td>An invalid label was used when accessing a SL tape in the Media Database (MDB). For example, a tape, identified as SL in the MDB, was accessed using BLP.</td>
</tr>
<tr>
<td>rsn</td>
<td>Explanation</td>
</tr>
<tr>
<td>------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>READBACK</td>
<td>The data set is read backward (READBACK processing).</td>
</tr>
<tr>
<td>RULE-REQ</td>
<td>A Control-M/Tape rule requested that this data set be bypassed by setting DO BYPASS to Y.</td>
</tr>
<tr>
<td>VOLMISS</td>
<td>The specified volume was not controlled by Control-M/Tape and either:</td>
</tr>
<tr>
<td></td>
<td>▪ the DYNVOL parameter is set to I (ignore) in either the CTTPARM member or a rule.</td>
</tr>
<tr>
<td></td>
<td>or</td>
</tr>
<tr>
<td></td>
<td>▪ the user answered message CTT112A with I (ignore).</td>
</tr>
<tr>
<td></td>
<td>This reason is also given if User Exit CTTX004 was used to temporarily override the setting for the DYNVOL parameter.</td>
</tr>
<tr>
<td>UX03</td>
<td>User Exit CTTX003 requested that this data set be bypassed.</td>
</tr>
<tr>
<td>UX05</td>
<td>User Exit CTTX005 requested that this data set be bypassed.</td>
</tr>
</tbody>
</table>

The job continues without Control-M/Tape involvement.

**Corrective Action:** No action is required.

**CTT139I unit, VOLUME volume DYNAMICALLY DEFINED**

**Explanation:** The specified volume was dynamically defined in the Media Database by Control-M/Tape. This volume was not known to Control-M/Tape before this job. The DYNVOL installation parameter determines whether or not such volumes will be defined dynamically.

The job continues.

**Corrective Action:** No action is required.

**CTT140E unit, SPECIFIC REQUEST FOR SCRATCH VOLUME volume DENIED (ddName)**

**Explanation:** A job attempted to access a scratch volume by specifying the volser of this volume. The SCRPROT installation parameter determines whether a scratch volume is protected from specific access. This message may occur when VOL=REF= value is specified, or when a double open occurs in the same step that acts as a specific request, even though the JCL was for a nonspecific request.

The job is abended.

**Corrective Action:** Change the JCL as required. If a scratch volume is required, remove the parameter VOL=SER= value or VOL=REF= value.
INCONTROL for z/OS Messages Manual

CTT141E unit, RECREATE ON WRONG VOLUME vol

Explanation: A job attempted to recreate a data set that already exists on the vol volume, but the data set does not start on the volume. Data sets can only be recreated on the same volumes they were on before, and in the same order.

The job is abended.

Corrective Action: Change the JCL as required.

CTT142I IА= instruction_addr SVCA= svc_addr COMP CODE= complemented

Explanation: This information message supplies additional details relating to the abend that occurred, and may be accompanied by additional messages.

The variables in this message are:
- instruction_addr - address of the abend
- svc_addr - Control-M/Tape real-time environment module address
- complCode - abend code

Corrective Action: Look for previous error or warning messages.

CTT143E jobName, TASK IS ABENDED BY CONTROL-M/TAPE (rsn)

Explanation: Control-M/Tape abended the jobName task. The cause of the abend is explained in a message that precedes this message, which is indicated by the value of rsn.

The following are the possible values of the reason code (rsn), and the related preceding message for each:

<table>
<thead>
<tr>
<th>rsn</th>

</tr>
<tr>
<td>228</td>
<td>Volume not found during MVS/RESTART.</td>
</tr>
</tbody>
</table>

The task is abended. Control-M/Tape does not record any information on this tape data set.

**Corrective Action:** Do one of the following:

- If $rc = 56$, increase the region size.
- If $rc = 180$, stop the earlier version of Control-M/Tape, and rerun the 6.0.01 or later version of the utility.
- If $rc = 228$, note the contents of the job log and contact BMC Software Customer Support.
- In all other cases check the preceding message to understand why this message was issued, and proceed accordingly.

**CTT144E** unit, CONTROL-M/TAPE WAS NOT ACTIVE WHEN JOB STARTED

**Explanation:** Either Control-M/Tape was not active when the job started to run, or Control-M/Tape was brought down and up while the job was running. If there is any tape activity in the system, Control-M/Tape must be active.

The job is abended, unless Control-M/Tape is in Test mode.

**Corrective Action:** Rerun the job when Control-M/Tape is active.

**CTT145E** unit, ACCESS DENIED TO {VOL: volser/ DS: dsn }

**Explanation:** Permission to access the specified volume or data set was denied by the Control-M/Tape security exit.

The job is abended.

**Corrective Action:** If you think you should have access to this volume or data set, contact your security administrator.

**CTT146I** unit, JOB CONTINUES DUE TO TEST MODE (rsn)

**Explanation:** This information message indicates that a job that probably would have abended in PROD or PHASED mode continues processing because the job is running in TEST mode. The cause of the abend is explained in a message that precedes this message, which is indicated by the value of $rsn$.

<td>Volume not found during MVS/RESTART.</td>
</tr>
</tbody>
</table>

The job continues processing, but Control-M/Tape does not record any more information related to the job.

**Corrective Action:** No action is required.

### CTT147W unit, VOLUME volser MARKED DELETED. JOB CONTINUES

**Explanation:** The specified volume is marked as deleted might be a physically damaged volume. Since the job specifically requested this volume, the job continues.

**Corrective Action:** Check why the volume is marked as deleted, and determine if you want the job to continue processing.

### CTT148E unit, RECREATE DISABLED BY INSTALLATION PARAMETERS (ddName)

**Explanation:** An attempt was made to recreate a data set, and N was specified for the RECREATE installation parameter in the CTTPARM member.

The job is abended.

**Corrective Action:** If you wish to enable recreation of data sets, contact your INCONTROL administrator.
CTT149E unit, jobName, BYPASS ATTEMPT ON MDB VOLUME volser
[ {SCRATCH | ACTIVE}, {R | W}]

Explanation: Job (jobName) tried to access a volume from the Media Database (MDB), while under a
Control-M/Tape bypass. Control-M/Tape bypassed the first volume that the executing task accessed,
because it was not in the MDB. When the executing task tried to access a later volume that was in the
MDB, Control-M/Tape disabled access by the executing task to the volume, and issued this message.

For security reasons Control-M/Tape requires that when DYNVOL is set to I, if the first volume accessed
by the task is not in the MDB, the rest of the volumes accessed by the task must not appear in the MDB
either.

This message is issued when:
- The DYNVOL parameter is set to I in CTTPARM, or User Exit 4 (Dynamic Definition exit) selected
  DYNVOL set to I;
- The first volume accessed by the executing task is not in the MDB, and any volumes that the
  executing task accesses later are in the MDB.

The system action depends on how the volume was requested.
- If the task requested this specific volume, the task is abended.
- If the volume was mounted in response to a nonspecific mount request, it is rejected, and another
  scratch tape is requested instead.

Corrective Action: Do one of the following, depending on how the volume was requested.
- If this is a request for this specific volume, verify that all or none of the volumes to be accessed are
  defined in the MDB.
- If this is a nonspecific tape request, either mount a non-MDB volume, or have the job restarted using
  only MDB volumes.

CTT150A unit, jobName, CONTROL-M/TAPE ENVIRONMENT IS
SUSPENDED. REPLY A-ABEND, R-RETRY OR B-BYPASS

Explanation: A job attempted to process data on a tape, while the Control-M/Tape real-time
environment was suspended. The Control-M/Tape real-time environment was suspended by the
MODE=SUSPEND statement in the CTTINIT procedure. While Control-M/Tape is suspended, no tape
activity is allowed.

The job waits for a reply.

Corrective Action: Specify one of the following operator responses:
A - Abend the job or task.

R - Recheck the status of the real-time environment. This enables you to reset Control-M/Tape to status ACTIVE using statement MODE=RESUME in the CTTINIT procedure, before specifying this operator response. Before resetting the status of Control-M/Tape, determine why SUSPEND mode was requested and whether or not you can reset the mode at this time.

B - Bypass Control-M/Tape for the processing of this data set. In this case, Control-M/Tape does not record or protect any information affected by this job while processing this data set.

CTT151I unit, VOLUMES volser1, volser2 CHAINED ON INPUT

Explanation: This information message indicates that a job successfully read a data set that spans volumes volser1 and volser2, but volume volser2 was a scratch tape. Control-M/Tape automatically changes the status of the scratch tape (volser2) to ACTIVE and updates the necessary pointers in the volume record so that volser2 is joined in a multivolume chain to volser1.

Corrective Action: No action is required.

CTT152W unit, VOLUMES volser1, volser2 ARE NOT FROM THE SAME GROUP

Explanation: A job is reading a data set from volumes volser1 and volser2 as if they belong to the same volume group. However these volumes are recorded in the Media Database as belonging to two different multivolume chains. The information recorded in the Media Database might not reflect the real status of the two volumes.

This error message may also occur while running Control-M/Tape in TEST mode, as a result of differences between Control-M/Tape and the other tape management system.

The job continues processing.

Corrective Action: Check the volumes specified in this message (volser1 and volser2) and their definitions in the Media Database to determine why this message was issued.

CTT153E unit, MOUNT REQUEST FOR VOLUME volser RECEIVED A VOLUME WITH SL-NAME slName1 WHERE slName2 EXPECTED

Explanation: The SL-NAMEs on the mounted tape (slName1) is different from the one listed in the Media Database for this volser (slName2). Probably a different tape from the one requested was mounted.

The tape is rejected.

Corrective Action: Mount the requested tape. The volser specified in this message should appear on the gummed (external) label.

CTT154I unit, RESTART IN PROGRESS FOR VOLUME volser

Explanation: This information message indicates that the job in process was restarted from volume volser by means of the MVS/RESTART feature.

Corrective Action: No action is required.
CTT155E unit, RESTART FAILED, SELECT A-ABEND, B-BYPASS

**Explanation:** During tape processing done under MVS/RESTART, Control-M/Tape encountered errors. Since MVS/RESTART is in process, the current status of the volumes or data sets may be different from the status expected by Control-M/Tape.

The errors encountered are described in the messages that precede this message.

The job waits for a reply.

**Corrective Action:** Reply with one of the following:

- A - Abend the job or task.
- B - Bypass Control-M/Tape for the processing of this data set. In this case, Control-M/Tape does not record or protect any information affected by this job for while processing this data set.

CTT156W unit, {IOA FUNCTIONS | SMS RULES} PROCESSING IS INHIBITED

**Explanation:** Control-M/Tape can no longer process IOA functions or SMS rules, due to a problem described in the messages preceding this message. IOA functions mentioned in the message refer to DO statements that call IOA functions, for example, DO COND, DO RESOURCE and DO SET.

The job continues without using the specified feature, which is IOA functions or SMS rules.

**Corrective Action:** Check preceding messages for the reason for this error and correct the problem accordingly.

CTT157W unit, AUTOMATIC CARTRIDGE LOAD DISABLED (n CONSECUTIVE REJECTS)

**Explanation:** Tapes mounted on the specified unit after a nonspecific mount request, were rejected n consecutive times. Control-M/Tape found that the mounted tape did not satisfy the request requirements. For example, the tape may not be from the requested scratch pool. As a result, it rejected the tape, and issued the mount message again. This process repeated itself n times, after which Control-M/Tape stopped the automatic load process on the specified unit.

Control-M/Tape disables the automatic load process for the specified unit until a tape that satisfies the mount request requirements is mounted manually.

**Corrective Action:** Have the operator mount tapes that satisfy the mount request requirements.

CTT158E unit_addr, DENSITY OF VOLUME volser IS NOT COMPATIBLE WITH THE DEVICE

**Explanation:** Volume volser that was mounted for output on unit_addr has a density that is not compatible with the device. This message is issued only when CNGDENS is set to Y in CTTPARM.

The specified volume is currently recorded with a density lower than the density about to be used by the device (for example, a 3480 volume mounted for output on a 3490E device). When CNGDENS is set to N in CTTPARM, Control-M/Tape allows higher density recording on the volume, making it no longer usable on lower density devices. However, since CNGDENS was set to Y in CTTPARM, Control-M/Tape does not allow higher density recording on the volume.

The volume is rejected from the device and a mount message is issued.
Corrective Action: Mount a scratch volume with a compatible density.

CTT159W jobName, PROCESS STOPPED DUE TO {CANCEL | DETACH | ABEND IN ANOTHER TASK}

Explanation: A task was running under the Control-M/Tape real time environment module, and Control-M/Tape needed to stop execution of the task. The reason is one of the following:

- CANCEL - The job was canceled.
- DETACH - A different task caused the Control-M/Tape task to DETACH.
- ABEND IN ANOTHER TASK - A different task abended, and therefore the Control-M/Tape task abended as well.

Corrective Action: If the reason is CANCEL, ignore the message. Otherwise, use the dump to understand which task abended, since Control-M/Tape is not the reason for the abend.

Messages CTT200 through CTT2xx

This group includes messages for the Control-M/Tape product.

CTT200S operation FAILED FOR logical_ds DATASET. RC= rc, REASON= ic_rsn

Explanation: The specified operation against the logical data set logical_ds failed.

Valid values for logical_ds are shown in the following table:

<table>
<thead>
<tr>
<th>logical_ds</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MDBD</td>

The currently executing function or utility stops.  
**Corrective Action:** Notify your INCONTROL administrator.
CTT202I RECORD: key

Explanation: This information message follows another error message, and identifies the Media Database (MDB) record for which the operation identified in the earlier message failed.

Corrective Action: No action is required.

CTT203E CTTAPI FAILED. FUNCTION= func RC= rc RSN= rsn URC= urc

Explanation: The Control-M/Tape Application Program Interface (CTTAPI) has failed to perform one of its functions.

The variables in this message are:
- \textit{func} - the function that was not performed
- \textit{rc} - the return code
- \textit{rsn} - the reason code
- \textit{urc} - the utility return code, if a utility was run

The following table displays valid values for the return code and reason code, together with the relevant explanations:

<table>

</tbody>
</table>

**Corrective Action:** Use the information in this and any associated message to identify the problem, and take action accordingly.

**CTT204W NUMBER OF FREE RECORDS IN file BELOW THRESHOLD**

**Explanation:** The number of free records in the specified file has fallen below the installation default. The file indicated in this message is either MDB (the Media Database) or STK (the Stacking Database). This message is issued each time a record is added to the specified file while the situation persists.

**Corrective Action:** The size of the specified file should be examined and enlarged according to the current needs of the site. Refer to the INCONTROL for z/OS Administrator Guide.

**CTT205S {MDB | STK} DATA FILE IS FULL**

**Explanation:** An attempt was made to add a new record to the Media Database (MDB) or Stacking Statistic Database (STK), but the MDB/STK Data file has no free space left.

Processing stops.

**Corrective Action:** The MDB/STK Data file should be enlarged. Refer to the INCONTROL for z/OS Administrator Guide.

**CTT206S {MDB | STK} INDEX FILE IS FULL**

**Explanation:** An attempt was made to add a new record to the Media Database (MDB) or Stacking Statistic Database, but the MDB/STK Index file has no free space left.

Processing stops.

**Corrective Action:** The MDB/STK Index file should be enlarged. Refer to the INCONTROL for z/OS Administrator Guide.

**CTT207S DATA FILE FORMATTED INCORRECTLY**

**Explanation:** The format of the Media Database (MDB) Data file is incorrect. This message indicates that the LRECL of the Data file is not correct.

Processing stops.

**Corrective Action:** Refer to the Control-M/Tape chapter in the INCONTROL for z/OS Installation Guide and run the CTTDBF utility to format the MDB correctly.

**CTT208S INDEX FILE FORMATTED INCORRECTLY**

**Explanation:** The format of the Media Database (MDB) Index file is incorrect. This message indicates that the KEYLEN of the Index file is not correct.

Processing stops.
Corrective Action: Refer to Control-M/Tape chapter in the INCONTROL for z/OS Installation Guide and run the CTTDBF utility to format the MDB correctly.

CTT209E RECORD NOT FOUND. KEY= key
Explanation: A record with the indicated key was not found in the Media Database (MDB).
Corrective Action: Contact your INCONTROL administrator for assistance.

CTT210W MEDIA mediaTypeDef OF VOLSER volser NOT FOUND IN CTTPARM
Explanation: The CTTCDB utility cannot locate the media type definition for the volume specified in the CTTPARM member. The CTTCDB utility uses media definitions in the CTTPARM member to convert volume capacity information from feet to megabytes. Since the media assigned to volume volser is not defined in CTTPARM, the default capacity is used.

The variables in this message are:
- mediaTypeDef -- the missing media type definition
- volser -- the volume for which the CTTCDB utility tried to find the media type definition

The utility continues processing. The capacity for volume volser is set to the default for the utility.
Corrective Action: Define med_typ_def in CTTPARM and rerun the utility.

CTT250I TRC IS FORMATTED WITH n1 BLOCKS, n2 RECORDS, n3 AVG RECORD LENGTH
Explanation: This information message is issued by the formatting program at the end of the Trace file format.
- n1 -- Number of blocks
- n2 -- Number of records
- n3 -- Average record length
Corrective Action: No action is required.

CTT251E INDEX FILE IS NOT EMPTY
Explanation: The Index file contains active records.
The Index file must be empty before the issuing utility is started.
Processing of the utility stops.
Corrective Action: Do the following:
1. Use the IOADBF utility to format the Index file.
2. Rerun the utility.
**CTT260E VOLUME vol/ NOT FOUND IN TMC FILE. DATASET dsn**

**Explanation:** No volume record was found for the specified data set record in the database during conversion.

Conversion continues.

**Corrective Action:** No action is required.

**CTT261I num type recd_type CONVERTED FROM REPORT rpt_num**

**Explanation:** This information message indicates that the conversion program has finished converting a number of records of a specific type from the specified CA-TLMS report into Control-M/Tape format.

The variables in this message are:
- **num** - The number of records converted.
- **type** - The status of the specified records (ACTIVE or SCRATCH).
- **recd_type** - The type of records converted (DATASETS or VOLUMES).
- **rpt_num** - The number of the CA-TLMS report that was converted.

**Corrective Action:** No action is required.

**CTT262S UNSUPPORTED TLMS nnn REPORT FORMAT**

**Explanation:** This message indicates that the conversion program encountered a mismatched line in CA TLMS report, where *nnn* indicates the report number and is either 004 or 010.

Execution is terminated.

**Corrective Action:** Produce a corrected CA TLMS report and rerun the utility.

**CTT263E VOLSER volser HAS NO FIRST VOLUME IN REPORT 004**

**Explanation:** Due to an error in the CA TLMS report 004, the conversion program has encountered a volser that is part of a chain of volser, but which does not indicate a first volser.

The volser is assumed to be a single volume.

**Corrective Action:** Produce a corrected CA TLMS report 004 and rerun the utility.

**CTT264W VOLUME volser EXPIRATION DATE IS CHANGED TO PERMANENT**

**Explanation:** The CA1 V4.9 conversion program identified a volume with EXPDT=99366. CA1 V4.9 saves expiration dates that are within keyword range, or whose year is 2000 or more, with EXPDT=99366. The conversion to Control-M/Tape cannot identify the exact expiration date.

The volume expiration date is set to permanent. The conversion program continues processing with the next record.

**Corrective Action:** Contact BMC Software Customer Support.
CTT265W UNKNOWN `fieldName` IN EPIC-RBA: `epic_rba`. VALUE: `unknown_value`

**Explanation:** The EPIC conversion program (CTTCEPC) processed the EPIC record in the specified `epic_rba`, and found an unknown value for the specified field name.

Possible values of `fieldName` are:
- REC-TYPE - EPIC record type
- LBL_TYPE - label type
- DENSITY - density
- UNT_TYPE - unit type

If the `fieldName` is REC-TYPE, the whole record is ignored and is not converted. In all other cases, the record containing the unknown field is converted to the Control-M/Tape Media Database using a default value for the problematic field.

**Corrective Action:** If the field name is known to you, consider modifying the CTTCEPC EPIC conversion program to support the field.

CTT266E UNEXPECTED DSN. RBA: `epic_rba`. DSN: `dsn`

**Explanation:** The EPIC conversion program (CTTCEPC) found that the specified data set name in the EPIC detail record located in the specified `epic_rba` is not the same as the data set name in the associated EPIC master record. This message indicates an integrity error in the EPIC database. The data set name in the EPIC master record must be identical with the data set name in the EPIC detail record.

The variables in this message are:
- `epic_rba` -- the address of the problematic detail record in the EPIC database
- `dsName` -- the data set name in the detail record which was inconsistent with data set name in the EPIC master record.

The conversion program terminates.

**Corrective Action:** Verify the integrity of the EPIC database and restart the conversion process.

CTT267W FIELD NOT NUMERIC: `fieldName` RBA: `epic_rba` VOL: `volser`

**Explanation:** The EPIC conversion program (CTTCEPC) processed the record associated with the specified `volser`, which is located in the listed RBA, and found a non-numeric value where a numeric value was expected in the specified field.

The variables in this message are:
- `fieldName` - the name of the field containing the problematic value

Possible values for `rc` from CTVUPGDB, and their meanings, are:

<table>
<thead>
<tr>
<th>rc</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>OK</td>
<td>OK</td>
</tr>
<tr>
<td>rc</td>
<td>Explanation</td>
</tr>
<tr>
<td>----</td>
<td>-------------</td>
</tr>
<tr>
<td>4</td>
<td>End of file. Key not found.</td>
</tr>
<tr>
<td>8</td>
<td>Error processing the files</td>
</tr>
<tr>
<td>12</td>
<td>Invalid function</td>
</tr>
<tr>
<td>16</td>
<td>An invalid record was read.</td>
</tr>
<tr>
<td>20</td>
<td>Not enough storage</td>
</tr>
<tr>
<td>24</td>
<td>Not enough storage in the GIR file</td>
</tr>
<tr>
<td>28</td>
<td>Not enough storage in the GIRI file</td>
</tr>
<tr>
<td>32</td>
<td>There is no DBO block.</td>
</tr>
<tr>
<td>40</td>
<td>Invalid LRECL or KEYLEN in the data or index file. Invalid logical record in DEFGIT</td>
</tr>
<tr>
<td>48</td>
<td>SETPATH was not issued.</td>
</tr>
<tr>
<td>100 through 199</td>
<td>DBS error codes</td>
</tr>
<tr>
<td>200 through 299</td>
<td>DBI error codes</td>
</tr>
</tbody>
</table>

- Possible fields are:
  - FILE_SEQ - File sequence (label number).
  - BLK_SIZE - Block size (BLKSIZE).
  - REC_SIZE - Logical record length (LRECL).
  - BLK_CNT - Block count.
  - SLOT - Slot number.
  - TUSE_CNT - Tape use count.
  - MCYCLE - Retention cycle limit.
  - RET_DAYS - Retention number of days.

- epic_rba - Address of the EPIC detail record in which bad value was detected.

- volser - Volume whose associated record field contains the problematic value.

The record containing the problematic field is converted to the Media Database but a default value of zero is substituted for the problematic value.

**Corrective Action:** Either fix the problematic field in the EPIC database and repeat the conversion process, or fix that field in the Media Database by means of the CTTMUP utility.
CTT268W NEXT VOLUME NOT FOUND FOR VOLUME: volser, DSN: dsName

**Explanation:** A volume chaining error was detected in the EPIC database. The specified data set name (dsName) resides on the specified volume (volser) and continues on another volume. However, the conversion program was unable to locate the continuation volume.

The conversion program continues. However, the volume chaining error will probably be propagated to the Control-M/Tape Media Database.

**Corrective Action:** Either fix the volume chaining error in the EPIC database and rerun the conversion program, or fix the error directly in the Control-M/Tape Media Database using the CTTMUP utility.

CTT269E CHAIN ERROR IN EPIC DATA. VOLSER: volser CUR_RECD: epic_rba

**Explanation:** A volume group chaining error was found in the EPIC database. The EPIC conversion program (CTTCEPC) could not create a multivolume group chain for volume volser located at record address epic_rba in the EPIC database.

The variables in this message are:

- volser -- Volume ID
- epic_rba -- Address of the volume record in the EPIC database

Conversion continues. However, the group chaining error found in the EPIC database is propagated to the Control-M/Tape database.

**Corrective Action:** Do one of the following:

- Fix the chaining error in the EPIC database, and repeat the conversion process.
- Fix the chaining error directly in the Control-M/Tape database using the CTTMUP utility.

CTT270E REQUEST PATH IS { data_set|volume } BUT stmt PARAMETERS CONTAIN FIELDS FROM { volume|data_set }

**Explanation:** Fields that are used as parameters in the INCLUDE, EXCLUDE or FIELDS statements are not valid with the specified path. Only data set fields can be used with the PATH=DATASET statement. Only volume fields can be used with the PATH=VOLUME statement.

The report is not produced.

**Corrective Action:** Remove the fields used as parameters that conflict with the selected path, or change the path.

CTT271E NEW EXTRACT STATEMENT IS NOT ALLOWED WHILE THE PREVIOUS ONE IS NOT CLOSED

**Explanation:** A new EXTRACT statement was specified before a REPORT statement was specified for the previous EXTRACT statement. A new EXTRACT block cannot be started before closing the previous EXTRACT block with a REPORT statement.

The report is not produced.
Corrective Action: Close the previous EXTRACT statement with a REPORT statement before specifying a new EXTRACT statement.

**CTT275E INCLUDE/EXCLUDE STATEMENTS MUST FOLLOW AFTER stmt STATEMENT**

Explanation: At least one INCLUDE or EXCLUDE statement specified for the CTTRTM or CTTVTM utility did not immediately follow the specified statement.

In the CTTRTM and CTTVTM utility, at least one INCLUDE or EXCLUDE statement must follow the TYPERET and TYPEVLT statements, respectively.

The utility stops execution.

Corrective Action: Place an INCLUDE or EXCLUDE statement immediately after the TYPERET or TYPEVLT statement. Rerun the utility.

**CTT276I VOLUME vol IN USE**

Explanation: This information message indicates that retention processing or vault processing is requested for the volume, but the volume is in use.

If the message is issued during retention processing, the CTTRTM utility skips the volume. If the message is issued during vault processing, the CTTVTM utility skips the volume and, if the volume is part of a multi-volume chain, the whole chain is skipped.

Corrective Action: No action is required.

**CTT277E INVALID EXPDT VALUE. RC: rc**

Explanation: An invalid Expiration Date as defined by the EXPDT parameter was specified in the user JCL.

The EXPDT value is ignored and the data set is given a default retention.

Corrective Action: No action is required.

**CTT278I VAULT vault IN VOLUME vol IS nn IN PATTERN**

Explanation: This information message indicates that the specified vault was found to be the \textit{nn}th vault in the vault pattern for the specified volume.

Corrective Action: No action is required.

**CTT279W CONTROL-M/TAPE IS ACTIVE, RESULTS ARE UNPREDICTABLE**

Explanation: The Control-M/Tape real-time environment remained active while the CTTCDB utility was running. The Media Database records created by CTTCDB might include integrity problems.

The CTTCDB utility continues processing.

Corrective Action: If this message is issued while you are running this utility for test purposes, ignore it. If this is a production execution of the CTTCDB utility, bring Control-M/Tape down and rerun the utility.

See the step that describes conversion of the Control-M/Tape Media Database in the Control-M/Tape chapter of the \textit{INCONTROL for z/OS Installation Guide}. 

1239
CTT280W VOLUME vol DEVICE dev IGNORED. NO CORRESPONDING MEDIA IN MEDIA TABLE

Explanation: The Media Table (the DADEVICE DD statement) did not contain an entry for the device specified in the message.

The current record is ignored.

Corrective Action: If this device should be defined in the Media Table, add an entry for it. Otherwise, consider this message as an information message.

CTT281I num VOLUME/DATASET RECORDS WERE CREATED

Explanation: This information message indicates the number of records written by the Conversion From MVS Catalog utility.

Corrective Action: No action is required.

CTT282W DUPLICATE DATASET dsn (VOL: volser, LABEL: lbl) DISCARDED

Explanation: A duplicate entry was detected for the specified data set during conversion of tape management data from an MVS catalog. While scanning the MVS catalog, the catalog conversion utility detected a more recent entry with the same volume and label number.

The data set with the latest creation date is taken. The referenced data set is dropped.

Corrective Action:
- If the entry is obsolete, then ignore the message and continue.
- Otherwise, resolve the conflict by updating your MVS catalog and rerun the conversion process.

CTT283W OBSOLETE DATASET dsn (VOL: volser LBL: lbl) DISCARDED.

Explanation: An obsolete entry was detected for the specified data set during conversion of tape management data from an MVS Catalog. A data set with a more recent creation date and a lower label number exists on the specified volume making the current entry obsolete.

The variables in this message are:
- dsn -- The data set name of the obsolete catalog entry.
- volser -- Volume serial number of the obsolete catalog entry.
- lbl -- Volume label of the obsolete catalog entry.

The specified catalog entry is ignored. The conversion program continues normally.

Corrective Action: No action is required.

CTT286E SPECIFIED VOLSER volser CANNOT BE {INITIALIZED | ERASED} RSN= rsn

Explanation: The CTTTP utility determined that the specified target volser cannot be initialized or erased.

Possible values of rsn:
- **ACTIVE IN MDB** - The specified volser is in the Media Database and its status is not SCRATCH.
- **ADD=N** - The specified volser is not in the Media Database. The ADD=N and MDBUPDAT=Y statements were specified in the TYPERUN statement.
- **OPER SKIPPED** - The operator responded to a program prompt with a request to skip the initialization or erasure of this volume.
- **OPER CANCELED** - The operator responded to a program prompt with a request to cancel the execution of the CTTTPI utility.

The specified volser is not initialized or erased. Execution terminates unless the reason is OPER SKIPPED, in which case processing continues with next volser or with the next control statement.

**Corrective Action:** If the reason was either OPER SKIPPED or OPER CANCELED, no action is necessary. If the reason was ACTIVE IN MDB or ADD=N examine the status of the volume in the Media Database and the parameters specified in the TYPERUN control statement. Change the settings for these if necessary.

**CTT287E TAPE INITIALIZATION FAILED. PROG= pgm**

**Explanation:** The *pgm* program returned a nonzero return code while trying to write a label on a tape volume. The specified program was called by the CTTTPI utility. This message is also issued if the operator responds ‘S’ (SKIP) to the IBM IEHINITT utility.

The CTTTPI utility is terminated.

**Corrective Action:** Examine the report produced by the *pgm* program, and take appropriate action.

**CTT288E MOUNTED VOLUME volser CANNOT BE USED. RSN= rsn**

**Explanation:** The CTTTPI utility determined that it could not write a new label on the mounted volume (*volser*).

Possible values for *rsn*:
- **ACTIVE IN MDB** - The specified volser is in the Media Database, and its status is not SCRATCH.
- **OPER REJECTED** - The operator responded to a program prompt with a request to not use the mounted volume for the requested initialization.
- **INVALID VOLSER** - The mounted volume is not the requested volume.

The CTTTPI utility unloads the mounted volume, and requests that another volume be mounted for the initialization of the same specified target volser.

**Corrective Action:** Do the following:
1. Remove the unloaded volume from the drive.
2. Either mount a new volume to continue the initialization process, or check the status of the volume in the Media Database and the parameters specified in the TYPERUN control statement, and change the settings if necessary.

**CTT289A MOUNT VOLUME TO BE INITIALIZED AS volser ON unit_num**

**Explanation:** The CTTTPI utility is requesting the mounting of a volume to be initialized on the specified device number (*unit_num*).
The message is scrolled off the screen and is followed by an ordinary MOUNT message (from MVS or from Control-M/Tape) for file CTTTPPI.UTIL.INIT. *volser* on device number *unit_num*.

**Corrective Action:** Do the following:

1. Mount the volume to be initialized as *volser* on the desired tape drive.
2. Verify that the volume is not write-protected. It is recommended that the volume be already externally labeled with the correct serial number.

**CTT290E OPEN FAILED FOR TAPE DD *ddName***

**Explanation:** The CTTTPPI utility was unable to access the designated tape drive using the *ddName* DD statement.

The CTTTPPI utility is terminated.

**Corrective Action:** Examine the JCL printout of the job, input JCL, job console log, and the allocated device. Correct all errors and rerun the CTTTPPI utility.

**CTT291A CONFIRM {ERAS | INIT} unit / *volser1* OLVD= *volser2* (status) D= *dsn* : Y/UNLOAD/SKIP/CANCEL***

**Explanation:** The CTTTPPI utility is requesting operator approval to initialize or erase the volume mounted on unit *unit*. If the user response is Y (Yes) the new label (*volser1*) is written over the old one (*volser2*). The status (*status*) of *volser2* is displayed in parentheses.

If no label previously existed for the volume, *volser2* appears as NO-LBL in this message.

If *volser2* is a standard label volume, the first data set name of the volume is shown in the message (*dsn*). Otherwise, the first data found on the tape (if any) is displayed in its place.

Possible values of *volser2* are:

- **ACTIVE!!** -- *volser2* is ACTIVE in the Media Database.
- **SCRATCH** -- *volser2* is SCRATCH in the Media Database.
- **NON-MDB** -- *volser2* is not found in the Media Database.
- **??????????** -- Status of the mounted volume is unknown.

**Note:**

If the CTTTPPI utility cannot read any data from the volume, the volume may never have been written, or the volume was written by another device.

The utility waits for the user response, after which it continues processing accordingly.

**Corrective Action:** Enter one of the following:

- **Y** -- Confirm the operation.
- **UNLOAD** -- Reject the mounted volume **volser2**. The CTTTPI utility proceeds to request another volume to be initialized as **volser1**.
- **SKIP** -- Reject the mounted volume and the specified target **volser1**. The CTTTPI utility proceeds with the next volser or the next control statement.
- **CANCEL** -- Terminate the CTTTPI utility. If the status of the volser is **ACTIVE!!**, use this option to end the operation, unless it is certain that the volser match between the mounted volume and the other active volume in the Media Database is coincidental.

**Note:**
No abbreviations are allowed for the UNLOAD, SKIP, or CANCEL responses.

**CTT292I INITIALIZED LABEL volser1 ON OLD VOLUME volser2**

**Explanation:** This information message indicates that the CTTTPI utility successfully completed initialization of a volume. Label **volser1** was written on a volume whose previous label was **volser2**. When `PROTECT=NOREAD` is specified, **volser2** appears as **UNKNOWN** in this message.

The CTTTPI utility continues processing with the next volser or with the next control statement.

**Corrective Action:** No action is required.

**Explanation:** This WTOR message is issued by the CTTTPI utility before it adds a volser to the Media Database (MDB).

The utility waits for the user’s response. It then continues processing accordingly.

**Corrective Action:** Enter one of the following:

- **Y** - Add the new volume to the MDB.
- **E** - Add the new volume to the MDB and mark it as External.
- **I** - Ignore the addition, and initialize the tape without adding the volume to the MDB.
- **SKIP** - Reject the specified target volume (**volser**). The CTTTPI utility proceeds with the next volser or the next control statement. **SKIP** cannot be abbreviated.
- **CANCEL** - Terminate the CTTTPI utility. **CANCEL** cannot be abbreviated.

**CTT294E SYNTAX ERROR IN CTTTPIV PARAMETER**

**Explanation:** The CTTTPI utility encountered a syntax error in the value specified for the PARM in the JCL EXEC statement or in the first value passed to it by an invoking program.

The CTTTPI program terminates.

**Corrective Action:** Correct the error and rerun the CTTTPI utility.
CTT295I VOLUME volser1 ERASED. OLD VOLUME volser2

Explanation: This information message indicates that the CTTTPI utility successfully completed erasing information on a volume.

The variables in this message are:
- volser1 - the identity of the volume that was erased
- volser2 - the identity of the volume label that read from the tape

The CTTTPI utility continues processing the next volser or the next control statement.

Corrective Action: No action is required.

CTT296E TAPE I/O ERROR. ECB: ecb_add

Explanation: A tape I/O operation that was issued by the CTTTPI utility failed.

In this message, ecb_add is the Event Control Block of the unsuccessful I/O operation.

If the CTTTPI utility was erasing a tape (TAPERAS) or initializing a tape (INITT), it stops processing.

If the CTTTPI utility was mapping a tape (TAPEMAP), it repeatedly tries to perform the I/O until it reaches the I/O error limit specified in the NUMERR parameter of the TAPEMAP statement.

Corrective Action: If the CTTTPI utility stops, rerun the job or started task using a different tape unit.

Messages CTT300 through CTT3xx

This group includes messages for the Control-M/Tape product.

CTT301I VOLUME vol BECAME SCRATCH

Explanation: This information message indicates that the CTTRTM utility deleted all data sets and changed the status of the volume to SCRATCH.

The utility continues executing.

Corrective Action: No action is required.

CTT302I DATASET dsn (VOLSER=volser) SCRATCHED ON THE MDB

Explanation: This information message indicates that the specified data set was marked SCRATCH by the CTTRTM utility according to the expiration criteria for the data set.

Corrective Action: No action is required.

CTT303I DATASET dsn (VOLSER=volser) HAS ENTERED ITS GRACE PERIOD

Explanation: This information message indicates that although the expiration date of a data set has been reached, the data set has not been expired, because a grace period was defined. However, when the grace period is over, the data set will be expired.

The variables in this message are:
Grace periods are defined by the GRACECAT and GRACECYC parameters in CTTPARM. For more information on these parameters, see the Control-M/Tape chapter in the INCONTROL for z/OS Installation Guide.

The utility continues processing normally.

**Corrective Action:** No action is required.

CTT304E DATASET dsn (VOLSER=volser) IS NOT UNCATALOGED. RC=rc

**Explanation:** The CTTRTM utility could not uncatalog the data set. The data set could not be uncataloged because of one of the following reasons:

- The MVS Catalog is not available.
- The specified data set is not found in the catalog.
- An I/O error occurred in catalog volume.

The CTTRTM utility skips the data set record and continues executing.

**Corrective Action:** Notify your system programmer of the value of rc.

CTT307E INCONSISTENCY BETWEEN REPORT NAME AND UTILITY MODE

**Explanation:** In the input parameters of the CTTRTM utility, there is an inconsistency between the values of the MODE parameter in the TYPERET statement, and the values of the REPORT NAME parameter. For example, MODE is set to REGULAR in the TYPERET statement for the RECALC report.

The utility stops executing.

**Corrective Action:** Correct the values of the TYPERET MODE parameter and the REPORT NAME, and rerun the utility.

CTT308E THERE ARE NO DATASETS ON VOLUME vol

**Explanation:** Volume vol is an active volume, but no data sets from the Media Database were found on the volume. This message indicates a logical error in the Media Database.

The CTTRTM utility continues processing.

**Corrective Action:** Notify your database administrator.

CTT309E NUMBER OF {VOLUMES | DATASETS} TO BE SCRATCHED (num) EXCEEDED THE LIMIT. CHANGES WERE NOT PERFORMED IN MDB

**Explanation:** More than the maximum number of volumes or data sets specified by the MAXVOLNO parameter or the MAXDSNO parameter, respectively, were marked for expiration during a run of the CTTRTM utility. Before scratching data sets or volumes, the CTTRTM utility checks how many volumes or data sets will be scratched in the current run of the utility.

In this message, num is the number of volumes or data sets that would have been marked for expiration by this run of the utility.
No volumes or data sets are scratched. The CTTRTM utility produces a Scratch report that describes the volumes and data sets that would have been scratched if the specified maximum were not exceeded.

**Corrective Action:** Determine why so many data sets were marked as expired and, if necessary, increase the limit for the maximum number of volumes or data sets that can be marked for expiration in the MAXVOLNO parameter or the MAXDSNO parameter.

**CTT320I** \texttt{rba : fileType OF recordType entity action}

**Explanation:** This information message indicates that a record was processed by the CTTMER or CTTSPL utilities.

The variables in this message are:
- \texttt{rba} -- RBA of the record in the MDB.
- \texttt{fileType} -- Either DATA or INDEX.
- \texttt{recordType} -- Type of MDB record processed (for example D for data set, V for volume).
- \texttt{entity} -- Identifier, data set name for a data set record, volser for a volume record.
- \texttt{action} -- Any of the following:
  - NOT-DELETED (RESTART)
  - DELETED
  - ADDED
  - RESTART-DELETED

**Corrective Action:** No action is required.

**CTT321E** VOLSER OF RECORD TO BE MERGED EXISTS IN MDB. RBA: \texttt{rba} VOLSER: \texttt{volser}

**Explanation:** The CTTMER utility tried to merge a record that already exists in the Media Database. The records that CTTMER was merging into a target Media Database were split off from another Media Database by the CTTSPL utility. These records can only be merged into the target Media Database if they, that is, their volser, do not already exist there. However, the volser of the record identified in the message already exists in the target Media Database.

CTTMER ignores this record, and does not merge it to the Media Database. The original record in the source Media Database remains unchanged. CTTMER continues to process the rest of the records.

**Corrective Action:** Check why the record to be merged already exists in the target Media Database.

**CTT330E** INVALID SILO TYPE - \texttt{type}

**Explanation:** An invalid silo type was specified in the CTT Parm member.

Valid values of \texttt{type} are:
NONE -- No silo installed.

3495 -- IBM 3495 Automated Tape library.

STK -- StorageTek Silo.

**Corrective Action:** Specify a valid silo type (if desired).

CTT331E INVALID SILO FUNCTION - *func*

**Explanation:** The CTTRBM utility was invoked with an invalid silo function input parameter.

The following silo functions (*func*) are valid when invoking the CTTRBM utility:

- CUASCR -- Set a volume use attribute to SCRATCH.
- EJECT -- Eject a volume from the Automated Tape library.

**Corrective Action:** Correct the procedure used to invoke the CTTRBM utility.

CTT332I REPORT FILE DOES NOT CONTAIN RELEVANT DATA

**Explanation:** This information message indicates that the report file passed to the CTTRBM utility does not match the requested silo function.

**Corrective Action:** If desired, either request the CUASCR silo function for the SCRATCH or FULLSCR report of the Retention Management Utility (CTTRTM), or request the EJECT silo function for the DISTRIB report of the Vault Management Utility (CTTVTM).

CTT333I VOLUME *volser* NOT IN AUTOMATED LIBRARY. (INTERFACE MODULE IS *modName*)

**Explanation:** This information message indicates that a robot function requested for the specified volume failed because the volume cannot be found in the Automated Tape library.

In this message, *mod_name* is one of the following Automated Tape library Interface module names:

- CTTSTK -- Interface to a StorageTek silo.
- CTTSTK -- Interface to a StorageTek silo.
- CTOAM -- Control-M/Tape interface to an automated tape library controlled by an OAM such as IBM ATL or IBM VTS.
- CTTMMRX -- Interface to a SUTMYN robotic tape library.
- CTTMMRX -- Interface to a SUTMYN robotic tape library.
- CTTMMRX -- Interface to a SUTMYN robotic tape library.
- CTTMMRX -- Interface to a SUTMYN robotic tape library.
- CTTMMRX -- Interface to a SUTMYN robotic tape library.
- CTTMMRX -- Interface to a SUTMYN robotic tape library.

Possible system actions:

- If *modName* specifies the last library to be searched, CTTRBM continues processing with the next volume.
- If *modName* specifies a library other than the last library to be searched, CTTRBM searches for the same volume (*volser*) in the next tape library.

**Corrective Action:** To suppress this message, see the description of user exit CTTX008 in the *Control-M/Tape Implementation Guide.*
CTT334E FUNCTION func FAILED. VOLSER=volser, OPCODE=opc, RC=rc, REASON=rsn, INTERFACE=modName

**Explanation:** The silo function requested for a volume failed. The software of the robotic tape library returns the operation code opc, the return code rc in decimal format, and the reason rsn in hexadecimal format.

In this message, modName is one of the following Automated Tape library Interface module names:

- CTTRSTK -- Control-M/Tape interface to a StorageTek silo.
- CTTOAM -- Control-M/Tape interface to an automated tape library controlled by an OAM such as IBM ATL or IBM VTS.
- CTTMMRX -- Control-M/Tape interface to a Memorex Telex robotic tape library.
- CTTTHACC -- Control-M/Tape interface to an ADIC robotic tape library.
- CTTFUJI -- Control-M/Tape interface to a Fujitsu robotic tape library.

Possible system actions:

- If modName indicates the last library to be searched, the CTTRBM utility continues processing with the next volume.
- If modName indicates a library other than the last library to be searched, the CTTRBM utility searches for the same volume (volser) in the next tape library.

**Corrective Action:** Refer to the messages and codes documentation for your tape robot or silo for a description of the codes returned in this message.

CTT335E REPORT TYPE type IS IRRELEVANT FOR AUTOMATED TAPE LIBRARY

**Explanation:** The report file passed to the CTTRBM utility is inappropriate for the requested silo function. The report passed to the CTTRBM utility was neither a SCRATCH report nor a DISTRIB report.

The CTTRBM utility is terminated.

**Corrective Action:** Do one of the following:

- Pass a CTTRTM SCRATCH report to the CTTRBM utility, while specifying the CUASCR silo function.
- Pass a CTTVTM DISTRIB report to the CTTRBM utility, while specifying the EJECT silo function.

CTT336E SILO INTERFACE modName LOAD FAILED

**Explanation:** The CTTRBM utility was unable to load the specified interface module.

In this message, modName is one of the following Automated Tape library Interface module names:
- CTTSTK - Control-M/Tape interface to a StorageTek silo.
- CTTOAM -- Control-M/Tape interface to an automated tape library controlled by an OAM such as IBM ATL or IBM VTS.
- CTTMMRX - Control-M/Tape interface to a Memorex Telex robotic tape library.
- CTTEMAS - Control-M/Tape interface to an EMAS robotic tape library.
- CTTFUJI - Control-M/Tape interface to a Fujitsu robotic tape library.

The specified interface is not used. The CTTRBM utility continues processing with the other interfaces (if any are loaded). If no other interfaces are loaded, the CTTRBM utility is terminated.

**Corrective Action:** If the specified interface is not needed, remove it from the specification for the RBTTYPE parameter in the CTTPARM member. If the specified interface is needed, add the appropriate module to one of the STEPLIB or LINKLIST libraries.

**CTT337E {SCRATCH | ACTIVATE} FOR VOLUME volser FAILED DUE TO CONTRADICTING STATUS IN THE MDB**

**Explanation:** Control-M/Tape initiated a SCRATCH or ACTIVATE operation on the specified volume (volser) in the database of the robot. However, the current status of this volume in the Media Database is incompatible with the attempted operation. The status of each volume in the Media Database and the robot database must be the same.

There was probably a delay between the issuance and execution of the robot request. During which the status of the specified volume was changed in the Media Database.

In this message, volser is the volume whose status update attempt is not compatible with its status in the Media Database.

The status of the volume is not changed in the robot database.

**Corrective Action:** Do one of the following:

- If the volser was directly accessed as a scratch volume (SCRPROT set to N in CTTPARM) before Control-M/Tape was able to access the robot, ignore this message.
- In all other cases, determine why the status update attempt for the volume in the robotic library contradicts its status in the Media Database. If necessary, correct the volume status in the Media Database using the Inquire Update Screen, the CTTMUP utility, or the robotic library using the standard robotic library update utility.

**CTT338I RETRY retry ctr (OUT OF max_retry) FOR VOLUME volser INITIATED**

**Explanation:** This information message indicates the current retry number for an action requested of a robotic tape library. This message is generated each time the action is retried.

Control-M/Tape requested an action from a robotic tape library. The action failed and is being retried. Each time the action is attempted, the retry number is incremented. The action is not retried if the action is successfully performed, or if the specified maximum number of retries is exceeded.

Message variables are:
retry_ctr -- Retry number of the current attempt.
max_retry -- Maximum number of retries allowed for a robot operation on the specified volume.
volser -- Volser of the volume on which the requested action is to be performed.

Processing continues normally.

**Corrective Action:** Verify that the retry was completed successfully.

**Explanation:** The robotic library function `func` that was requested by means of the robot_int robotic interface module was successfully performed for the volser volume.

See message CTT333I for a list of interface modules and the robotic libraries with which they are associated.

**Corrective Action:** No action is required.

**Explanation:** This information message indicates that the CTTVEXP utility successfully issued the EXPORT command to the Virtual Tape Server (VTS) and the export list volume is `volser`. The EXPORT command ejects physical tapes from the VTS so that logical VTS volumes can be put into external vaults. CTTVVM created `volser` earlier.

CTTVEXP waits for messages from OAM indicating that export processing is finished.

**Corrective Action:** No action is required.

**Explanation:** The CTTVEXP utility could not export tapes from the Virtual Tape Server (VTS).

Possible reasons are:

- The EXPORT command of the CBRXLCS service failed.
- The EXPORT command did not fail, but OAM issued error messages.

CTTVEXP stops.

**Corrective Action:** Do one of the following:
- The CTT074E message that precedes CTT341E shows the return code and the reason code of the CBRXLCS EXPORT command. Check these codes in IBM documentation for details and fix the error.

- Search the system log for IBM messages CBR3857I, CBR3858I and CBR3863I, or for similar messages. Then, check IBM documentation for explanations and fix the error.

CTT342I UTIL IS RUNNING IN SIMULATION MODE

**Explanation:** This information message indicates that the CTTVVM or CTTVEXP utility is running in simulation mode. When CTTVTM runs in simulation mode (TYPERUN MODE is set to SIMULATION), CTTVTM notifies CTTVVM and CTTVEXP, so that they also run in simulation mode.

In simulation mode, CTTVVM does not create the Export List volume or the Import List volume and CTTVEXP does not perform any EXPORT command.

**Corrective Action:** To export tapes from the VTS, run CTTVTM with TYPERUN MODE set to NORMAL.

CTT343I VOLSER volser SKIPPED BECAUSE OF TEST MODE

**Explanation:** This information message indicates that a volume with serial number volser was not exported because Control-M/Tape processed it in test mode. Test mode is set with the expression MODE=TEST in CTTPARM, or by a rule specifying MODE TEST. Control-M/Tape does not export a volume from the VTS (Virtual Tape Server) that it processed in test mode.

CTTVVM does not include the volser in the Export List File.

**Corrective Action:** If you intend to export a volume, make sure Control-M/Tape is not in test mode when it processes the volume.

CTT344E VOLSER volser NOT EXPORTED BECAUSE OF PREVIOUS ERROR

**Explanation:** Volume with serial number volser was not exported because of an earlier error. Control-M/Tape does not export a volume serial number if an error occurred while Control-M/Tape was processing it.

CTTVVM does not include the volser in the Export List File.

**Corrective Action:** Check the error message before CTT344E, fix the problem and try again.

CTT345E MAINTENANCE FOR VENDOR TAPE MANAGEMENT SYSTEM SUPPORT HAS NOT BEEN APPLIED TO EXLM

**Explanation:** The StorageTek ExLM level does not support vendor tape management systems. Control-M/Tape uses the StorageTek ExLM vendor tape management systems support to interface with ExLM.

ExLM processing terminates.

**Corrective Action:** See the section that describes the Robotic Tape Library Interface in the Control-M/Tape Implementation Guide for the minimum ExLM level required for the interface.

CTT346E LOCATION CANNOT EXCEED THE TENTH VAULT

**Explanation:** The CTTVVM utility was invoked with the expression MODE=ALLVLT to export a volume with a vaulting pattern that has more than ten vaults, and the next requested vault is beyond the tenth.
When the CTTVVM utility exports volumes from the Virtual Tape Server (VTS) based on the complete vaulting pattern (MODE=ALLVLT), it supports a maximum of ten vaults in each vaulting pattern. Since the next vault of the volume specified in the CTT344E message that accompanies this message is beyond the tenth vault, CTTVVM cannot export this volume.

CTTVVM issues message CTT344E, which specifies the volser for the volume that caused this error. This volume is not included in the Export List file created by this run.

**Corrective Action:** Use the CTTVVM utility with MODE set to FIRSTVLT to export the volume based on the first vault only.

**CTT347I func LIST VOLUME CREATED ON VOLSER volser**

**Explanation:** This information message indicates that the CTTVVM utility successfully created an Import or Export List volume.

Message variables are:

- **func** -- Whether an Import or an Export List volume was created.
- **volser** -- Volume serial number of the new volume.

If CTTVVM created an Export List volume, CTTVVM passes its volser to CTTVEXP by means of DD card VVMVOL and CTTVEXP issues the EXPORT command.

**Corrective Action:** If CTTVVM created an Import List volume, check that the physical volumes that contain the logical volumes to be imported are in the library. Then, issue the IMPORT command.

**CTT348E INVALID EXPORT STATUS FILE IDENTIFIER**

**Explanation:** The CTTVEXP utility could not read the Export Status File to produce a status report, because Control-M/Tape does not support the Export Status file identifier. CTTVEXP stops without issuing a report.

**Corrective Action:** Check that Export processing finished successfully, and that OAM messages indicate that an Export Status file was created. If necessary, notify your INCONTROL administrator.

**CTT349I EXPORT FOR LOGICAL VOLSER log_volser, STATUS CODE=stat_code {PHYSICAL VOLSER IS phys_volser, DESTINATION IS dest| REASON IS rsn}**

**Explanation:** This information message indicates the results of the CTTVEXP export operation. The information is based on the Export Status File records, where **log_volser** is the serial number of the logical volume, and **stat_code** is the export status code.

If the export operation succeeded, **phys_volser** specifies the serial number of the physical volume to which the logical volume was exported and **dest** specifies the destination.

If the export operation ended with an error, **rsn** describes the nature of the error.

**Corrective Action:** Refer to IBM documentation to resolve errors during processing of logical volumes.
**CTT350I** DYNAMIC STACKING ON VOLUME vol PERFORMED FOR:

**Explanation:** This information indicates that dynamic stacking was successfully performed on the specified volume. This message is followed by message CTT351I, which contains details about the stacked data set.

**Corrective Action:** No action is required.

**CTT351I** JOBNAME=jobName DDNAME=ddName DSN=dsn

**Explanation:** This information message follows message CTT350I. It provides details about the data set that will be added to the volume specified in CTT350I.

**Corrective Action:** No action is required.

**CTT352S** STACKING PROCESSING STOPPED FOR JOB jobName - REASON:

**Explanation:** An error was encountered during the stacking process for job jobName. This message is followed by another message that has details about the error.

Stacking stops for this job.

**Corrective Action:** Check the accompanying error message for details about the error.

**CTT353S** INSUFFICIENT STORAGE FOR STACKING PROCESSING

**Explanation:** This message follows message CTT352S when there is insufficient storage for stacking processing.

Stacking processing stops for this job.

**Corrective Action:** Notify your INCONTROL administrator.

**CTT354S** INTERNAL ERROR IN STACKING PROCESSING - CODE=code

**Explanation:** This message follows message CTT352S when an internal error in encountered during stacking processing.

Stacking processing stops for this job.

**Corrective Action:** Notify your INCONTROL administrator.

**CTT355S** ABEND Sxxx IN MODULE modName OFFSET=X'offset' (LOAD - POINT=load_point)

**Explanation:** This message follows message CTT352S when an internal abend occurs in stacking processing.

The message contains details about the abend: abending module name, abending load module load point, and offset of the abending instruction in the module.

Stacking processing stops for this job and a system dump is produced.

**Corrective Action:** Format and save the dump, and notify your INCONTROL administrator.
CTT356W STACKING STOPPED FOR DATASET dsn

**Explanation:** Control-M/Tape could not satisfy the stacking requirements for the dsn data set.

This message is followed by a message describing why the data set could not be stacked and why the stacking requirements could not be satisfied.

Stacking stops for the specified data set. The job continues without stacking for the dsn data set. The data set is written to a scratch volume.

**Corrective Action:** See later messages for details about the error and correct the problem.

CTT357W REACHED SEARCH LIMIT FOR STACKABLE VOLUME, LIMIT=limit

**Explanation:** The search limit for a stackable volume has been reached. This message follows message CTT356W, which specifies the data set for which stacking has stopped.

Stacking stops for the data set. The job continues without stacking for this dsn. The search for the next stackable volume begins from the volume reached in this search.

**Corrective Action:** Check and, if necessary, adjust the search limit for stackable volumes, defined in the STKSRCHL parameter in the CTTPARM member.

CTT358W MATCHING RULE SPECIFIED ‘DO RETENTION=EDM’

**Explanation:** DO RETENTION=EDM is specified in the matching rule. Stacking cannot be performed for EDM-controlled data sets.

This message follows message CTT356W, which specifies the data set for which stacking stopped.

Stacking stops for the data set. The job continues without stacking for this dsn.

**Corrective Action:** Use the Rule Simulation Facility to find matching rules for the data set. Check matching rules for conflicts between stacking definitions and other definitions (for example, retention definitions).

CTT359W MATCHING RULE SPECIFIED ‘TEST’ MODE

**Explanation:** TEST mode is specified in the matching rule. Stacking is not performed for data sets matched by rules with mode TEST.

This message follows message CTT356W which specifies the data set for which stacking has stopped.

Stacking stops for the data set. The job continues without stacking for this dsn.

**Corrective Action:** Use the Rule Simulation Facility to find matching rules for the data set. Check matching rules for conflicts between stacking definitions and other definitions (for example, mode definitions).

CTT360W MATCHING RULE CONTAINS VAULT ENTRIES

**Explanation:** The matching rule contains vault entries, and the stacking algorithm specified by the STKMODE parameter in the CTTPARM member does not allow vault matching.

This message follows message CTT356W, which specifies the data set for which stacking stopped.

Stacking stops for the data set. The job continues without stacking for this DSN.

**Corrective Action:** Do the following:
1. Use the Rule Simulation Facility to find the matching rules for the data set.
2. Verify that the matching rule does not conflict with the stacking algorithm defined by means of the STKMODE parameter in the CTTPARM member.

To use vault matching in the stacking algorithm set STKMODE to R or A.

**CTT361W NO STACK RECORD FOR DATASET**

**Explanation:** The data set to be stacked is not in the Stacking Database, and a default size value is not specified. The search process must locate the data set record in the Stacking Database to determine its average size.

This message follows the CTT356W message, which specifies the data set for which stacking stopped.

Stacking stops for the data set. The job continues without stacking for this data set.

**Corrective Action:** Do one or more of the following:
- Run the CTTSTK utility to collect statistical information for the Stacking Database.
- Use the STKDEFSZ parameter in the CTTPARM member to specify a default size for data sets not defined in the Stacking Database.
- Use the DO STKDEFSZ option in a Control-M/Tape rule to specify a default size for data sets not defined in the Stacking Database.

**CTT362W DATASET IS NOT STACKABLE**

**Explanation:** The specified data set record is marked NOT STACKABLE in the Stacking Database. Stacking cannot be performed for NOT STACKABLE data sets.

This message follows message CTT356W which specifies the data set for which stacking stopped.

The data set record was marked NOT STACKABLE for one of the following reasons:
- The data set was opened with DIPS=MOD specified in the JCL.
- The data set was recreated on the volume.
- The data set was opened by a job step that specified //NOSTACK DD.

Stacking stops for the data set. The job continues without stacking for this dsn.

**Corrective Action:** No action is required.

**CTT363W POOL pool IS NOT DEFINED**

**Explanation:** The matching rule specifies a pool not defined to Control-M/Tape.

This message follows message CTT356W, which specifies the data set for which stacking stopped.

Stacking stops for the data set. The job continues without stacking for this dsn.

**Corrective Action:** Do the following:
1. Use the Rule Simulation Facility to find the matching rules for the data set.
2. Either define the pool name by means of screen TP, or replace the pool name in the rule with the name of a previously defined pool.
CTT364W INVALID POOL FOUND IN MEMORY

**Explanation:** The pool name in the matching rule has an invalid pointer in memory. It points to an area in memory that cannot be identified as a pool block.

This message follows message CTT356W, which specifies the data set for which stacking stopped. Stacking stops for the data set. The job continues without stacking for this dsn.

**Corrective Action:** Reload the pool table into memory with the following operator command:  
```s
CTTINIT,PARM='RELOAD,TBLT=POOL'
```

CTT365W NO ELIGIBLE VOLUME FOR STACKING IN POOL *pool*

**Explanation:** All volumes in all ranges of the specified pool were searched, and none satisfied the search process requirements. The search process searches all volumes in the specified pool for a stackable volume. The search starts at the last found volser, and checks volsers one at a time until the first searched volser is encountered (that is, until a loop is detected).

This problem is probably due to one of the following reasons:

- Incorrectly defined pool ranges.
- The wrong pool was requested by the job.
- Invalid stacking criteria were defined.

This message follows message CTT356W which specifies the data set for which stacking stopped. Stacking stops for the data set. The job continues without stacking for this dsn.

**Corrective Action:** Determine the reason for this error and correct the problem.

CTT366W NO MEDIA ENTRIES WERE DEFINED IN CTTPARM

**Explanation:** The search process found that no Media entries were defined in CTTPARM. The search process uses the values specified for the Media parameters in CTTPARM to calculate the remaining size on a volume.

This message follows message CTT356W which specifies the data set for which stacking stopped. Stacking stops for the data set. The job continues without stacking for this dsn. No data set stacking can be performed until this problem is corrected.

**Corrective Action:** Define Media parameters in CTTPARM, as explained in the Control-M/Tape chapter of the *INCONTROL for z/OS Installation Guide*. Definition of these parameters only takes effect after Control-M/Tape is brought down and restarted.

CTT367I DDNAME *ddName* OF JOB *jobName* CHANGED TO DEFERRED MOUNT

**Explanation:** This information message indicates that the specified immediate request for a scratch tape was changed to a deferred request by Control-M/Tape.

Under JES3, dynamic data set stacking is performed only in deferred mode. When a job is interpreted by JES3, Control-M/Tape searches the job for created data sets that are candidates for stacking. If any of the scratch requests for tapes for these candidate data sets are in immediate mode, Control-M/Tape changes them to deferred mode so that stacking can be performed.
The variables in this message are:

- **ddName** -- A data set DD name that is a candidate for stacking.
- **jobName** -- The name of the job interpreted by JES3 that created the data set referenced by **ddName**.

The job continues. The DD allocation is deferred so that stacking can be performed.

**Corrective Action:** No action is required.

**CTT368W SEARCH STOPPED BY EXIT 10**

**Explanation:** User Exit CTTX010 requested that stacking search processing be stopped for the data set. The exit request causes a halt in the stacking process for the data set specified in message CTT356W which follows this message.

Stacking stops for the data set. The job continues and a scratch volume is requested for the data set.

**Corrective Action:** No action is required.

**CTT369W FUNCTION **func** FAILED. VOLSER=volser, OPCODE=opc, RC=rc, REASON=rsn, INTERFACE=modName**

**Explanation:** The silo function requested for a volume ended with a warning.

The software of the robotic tape library returns the operation code **opc**, the return code **rc** in decimal format, and the reason **rsn** in hexadecimal format.

In this message, **modName** is one of the following Automated Tape library Interface module names:

- **CTTRSTK** - Control-M/Tape interface to a StorageTek silo.
- **CTTOAM** - Control-M/Tape interface to an automated tape library controlled by an OAM such as IBM ATL or IBM VTS.
- **CTTMMRX** - Control-M/Tape interface to a Memorex Telex robotic tape library.
- **CTTHACC** - Control-M/Tape interface to an ADIC robotic tape library.
- **CTTFUJI** - Control-M/Tape interface to a Fujitsu robotic tape library.

If **modName** indicates the last library to be searched, the CTTRBM utility continues processing with the next volume. If **modName** indicates a library other than the last library to be searched, the CTTRBM utility searches for the same volume (**volser**) in the next tape library.

**Corrective Action:** Refer to the messages and codes documentation for your tape robot or silo for a description of the codes returned in this message.

**CTT370E VOLSER volser HAS NO VAULTING PATTERN**

**Explanation:** CTTVVM cannot process the volume whose serial number is **volser**, because it has no vaulting pattern. The CTTVVM utility groups logical volumes by their vaulting patterns. No vaulting pattern is an integrity error in the Media Database (MDB).

The CTTVEXP utility issues error message CTT344E and does not include the volser volume serial number in the Export List file.
Corrective Action: Use the CTTIDB utility to check the integrity of the MDB. Then, fix the errors.

CTT371I LOGICAL VOLSER log_volser, IS TO BE IMPORTED FROM PHYSICAL VOLSER phys_volser

Explanation: This information message specifies the serial numbers for a logical volume (log_volser) that should be imported, and the physical volume (phys_volser) from which it should be imported. The CTTWVM utility determines when a logical volume should be imported back to the Virtual Tape Server (VTS).

The CTTWVM utility produces an Import List File for the volume with the specified serial number.

Corrective Action: Issue an IMPORT command. Refer to the previous CTT347I message for the serial number of the Import List volume.

CTT372E util CAN NOT RUN WHEN CONTROL-M/TAPE IS NOT ACTIVE

Explanation: The CTTWVM or CTTVEXP utility could not run because Control-M/Tape is not active. Control-M/Tape intercepts OAM messages about completion of the export operation in a real-time environment. For this reason, Control-M/Tape must be active when the CTTWVM and CTTVEXP utilities run.

The specified utility stops.

Corrective Action: Start Control-M/Tape and rerun CTTWVM and CTTVEXP.

CTT373W FUNCTION func FOR VOLUME volser FAILED - VOLUME IS IN USE

Explanation: Control-M/Tape tried to perform the func function on the volser volume in the robotic tape library, but the robotic tape library returned an error because the tape is currently being used by the robotic tape library.

The utility continues processing. The IOA Functional Monitor will later automatically retry the func function on the volser volume.

Corrective Action: No action is required.

CTT374W CLEANUP FOR {VOLUME vol| LABEL vol label} COMPLETED WITH AN ERROR. REASON=rsn

Explanation: An error occurred during "volume cleanup" or "label cleanup."

Volume cleanup is the deletion from the Media database of all data set records of a volume.
Label cleanup is the deletion from the Media database of a database record.

Cleanup occurs when
- A scratch volume is used for a mount request. Control-M/Tape must delete all the old data set records of the volume from the Media database before the new data sets are tracked into the Media database.
- A volume is deleted from the Media database. Control-M/Tape must delete all the data set records of the volume before deleting the volume record.

The variables in this message are:
- vol - the identity of the volume
- label - the identity of the database record
- rsn - a 4-digit reason code

Possible values of rsn, and their explanations, are shown in the following table:

<table>
<thead>
<tr>
<th>rsn</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0001</td>
<td>No data set record for L-Index</td>
</tr>
<tr>
<td>0002</td>
<td>Attempt to remove an active data set</td>
</tr>
<tr>
<td>0003</td>
<td>Active data set on a non-active volume</td>
</tr>
<tr>
<td>0004</td>
<td>Record of the first volume of the data set not found</td>
</tr>
<tr>
<td>0005</td>
<td>The first volume of the multi-volume chain differs from the first volume of the data set</td>
</tr>
<tr>
<td>0006</td>
<td>Non-active volume in an active multi-volume chain</td>
</tr>
<tr>
<td>0007</td>
<td>The volume update function failed for a volume</td>
</tr>
<tr>
<td>0008</td>
<td>The update function failed for a volume</td>
</tr>
<tr>
<td>0009</td>
<td>A data set that had already been found could not be read at deletion time</td>
</tr>
<tr>
<td>0010</td>
<td>Data set deletion failed</td>
</tr>
<tr>
<td>0011</td>
<td>Next volume expected but not found</td>
</tr>
<tr>
<td>0012</td>
<td>A volume other than the first in a multi-volume chain could not be read</td>
</tr>
<tr>
<td>0013</td>
<td>A volume other than the first in an active multi-volume chain is not active</td>
</tr>
<tr>
<td>0014</td>
<td>The volume update function failed for a volume other than the first in a multi-volume chain</td>
</tr>
<tr>
<td>0015</td>
<td>The first volume in a multi-volume chain differs from the first volume of a data set (other than the first)</td>
</tr>
</tbody>
</table>
The cleanup process is performed only for the current volume in the multi-volume chain of which it is part. Processing continues normally.

**Corrective Action:** Use the CTT1DB utility to check the logical integrity of the Media database, and correct all errors that are reported by the utility. For more information, see the description of verifying Media database integrity in the Control-M/Tape Implementation Guide.

<table>
<thead>
<tr>
<th>rsn</th>
<th>Explanation</th>
</tr>

</tr>
</tbody>
</table>

**CTT381I**

**Explanation:** This information message contains summary information on each data set for which statistical calculations regarding average data set size have been performed.

This message follows the CTT380I message, which provides column headers for the information in this CTT381I message.

The variables in this message are:
INCONTROL for z/OS Messages Manual

- **jobName** - the name or user ID of the job which created the data set
- **dsn** - the name of the data set
- **c_obs** - the number of observations used for statistical calculations before the present run
- **c_size** - the data set average size, calculated on the basis of \( c_{\text{obs}} \)
- **n_obs** - the number of observations used for statistical calculations (including the present run) This number differs from \( c_{\text{obs}} \) by the number of valid runs of \( \text{jobName} \) and \( \text{dsn} \) since the previous run of the CTTSTK utility
- **n_size** - the data set average size, calculated on the basis of \( n_{\text{obs}} \)
- **max_size** - the data set maximum size encountered in the present run This value is meaningful only if more than one new observation has been encountered for the \( \text{jobName} \) and \( \text{dsn} \) statistics
- **min_size** - the data set minimum size encountered in the present run This value is meaningful only if more than one new observation has been encountered for the \( \text{jobName} \) and \( \text{dsn} \) statistics
- **s_dev** - the standard deviation for the average size of the data set, calculated on the basis of \( n_{\text{obs}} \)

**Corrective Action:** No action is required.

**CTT390S FAILED TO OPEN DDNAME \( ddName \).**

**Explanation:** Open of the \( ddName \) DD statement failed.

Possible causes are:
- The \( ddName \) DD statement is missing.
- The data set described by the \( ddName \) DD statement does not exist.

Execution stops.

**Corrective Action:** Correct the JCL of the job and rerun.

**CTT394S INVALID PARAMETER - \( parm \)**

**Explanation:** An invalid parameter was specified.

If this message was issued during execution of the CTMBLT utility, it is followed by message BLT895I and/or BLT896I, which identify the problematic job, keyword, and value. This message may also be issued by the CTMBUPD utility.

The report or utility stops executing with a condition code of 08 or 12.

**Corrective Action:** For the syntax of the parameter for the report or utility, see either the INCONTROL for z/OS Administrator Guide or the INCONTROL for z/OS Utilities Guide, as appropriate.

**Messages CTT400 through CTT4xx**

This group includes messages for the Control-M/Tape product.
CTT400S INVALID RETURN CODE FROM SORT = rc. CHECK THE SORT MANUAL

Explanation: A sort program that has been activated internally ended with an unexpected return code (rc).

The program stops executing with a condition code higher than 08.

Corrective Action: Refer to documentation for the sort program and to the sort messages of the job to clarify the reason.

CTT401S INTERNAL ERROR, REASON: rsn

Explanation: Control-M/Tape failed during the dynamic installation process for MVS Tape Label Processing Exits.

The started task of Control-M/Tape real-time environment is stopped.

Corrective Action: Contact BMC Software technical support.

CTT402S INCONSISTENCIES FOUND IN MODULE mod: {LENGTH | V-CONSTANT} MISMATCH

Explanation: Control-M/Tape failed during the dynamic installation process for MVS Tape Label Processing Exits. Control-M/Tape found an inconsistency between the modules in the LPA and in the SYS1.LPALIB library.

The started task in the Control-M/Tape real-time environment is stopped.

Corrective Action: Make sure the module in error is match between the LPA and SYS1.LPALIB. If you have recently applied the IBM PTF to the SYS1.LPALIB library, then perform an IPL or add the LPALIB DD statement to the CTTINIT procedure that points to the SYS1.LPALIB library before applying the IBM PTF.

CTT420I MODULE: modName CSECT: csect

Explanation: This information message follows other messages concerning the dynamic intercept process and identifies the module and CSECT in error.

Corrective Action: No action is required.

CTT421S VERIFY REJECTED. INTERCEPT: i_id VER-ID: v_id

Explanation: One of the dynamic intercepts failed verification. Verification of an MVS module failed. The verification is done against the module in memory (LPA). The module or CSECT names are identified by CTT420I.

The dynamic intercept process is terminated. The failing CSECT is dumped into the data set pointed to by the DADUMP DD statement.

Corrective Action: Make sure that the intercepts are not already applied. Keep the dump of the failing CSECT. Contact BMC Software Customer Support.
CTT422S MODULE *modName* NOT FOUND IN LPA/MLPA/FLPA

**Explanation:** One of the dynamic intercept modules was not found in the Active LPA Queue (FLPA or MLPA) or in PLPA. The module is searched in the LPA, MLPA, or FLPA of the current active system. The dynamic intercept process is terminated.

**Corrective Action:** Contact BMC Software Customer Support.

CTT423S CSECT *csect* NOT FOUND IN MODULE *modName*

**Explanation:** One of the dynamic intercept CSECTs was not found in the *modName* module. The CSECT is searched in the specified module that resides in your STEPLIB libraries or in the cataloged SYS1.LPALIB library.

The dynamic intercept process is terminated.

**Corrective Action:** Contact BMC Software Customer Support.

CTT424S CTTIDYN INTERNAL ERROR. CODE: *rc* REASON: *rsn*

**Explanation:** An internal error occurred in the dynamic intercept process. The dynamic intercept process is terminated. All the intercepts already processed are rejected. The module or CSECT names are identified by CTT420I.

**Corrective Action:** Contact BMC Software Customer Support.

CTT425S {ALLOC | UNALLOC} FAILED FOR DDNAME *ddName*

**Explanation:** The specified action failed for the specified DD statement. The dynamic intercept process is terminated.

**Corrective Action:** Contact BMC Software Customer Support.

CTT426W LENGTH MISMATCH. MODULE: *modName* CSECT: *csect*

**Explanation:** There is a difference in length between the memory copy (in LPA) and the disk copy (in SYS1.LPALIB) of a specified module. This situation indicates a problem in the environment.

The dynamic intercept process continues.

**Corrective Action:** No action is required.

CTT427S SVC UPDATE FAILED FOR *modName*. RC: *rc*

**Explanation:** The SVCUPDTE function failed with the specified return code. The Control-M/Tape SVC could not be installed.

The dynamic intercept process is terminated.

**Corrective Action:** Contact BMC Software Customer Support.

CTT428I REMOVE PROCESSING STARTED

**Explanation:** This information message indicates that the dynamic intercept process is reversed and the MVS intercepts are being removed.
This message is the result of one of the following:

- Starting the CTTINIT utility with the MODE parameter set to REMOVE.
- A failure during the dynamic intercept process.

If the reason for this message is failure of the dynamic intercept process, after the intercepts are removed, the currently executing utility (CTTINIT or CTTHSMP) terminates.

**Corrective Action:** No action is required.

**CTT429S** ZAP: zap REP: rep_num NOT IN PLACE. ADDR: add  
**Explanation:** Removal of Control-M/Tape intercepts failed. The expected intercept code was not found. The Dynamic Intercepts Removal Process stops.  
**Corrective Action:** Notify BMC Software Customer Support.

**CTT430S** INCONSISTENT FMID FOUND. MOD=mod  
**Explanation:** The input to the CTTHSMP utility contains information on MVS MOD entries that belong to more than one FMID. The CTTHSMP utility cannot operate on input that contains several FMIDs. The program terminates with a return code of 12.  
**Corrective Action:** Provide input to the CTTHSMP utility in a single FMID MOD group.

**CTT431S** UMI D/RMI D BUFFER OVERFLOW  
**Explanation:** Too many UMI D or RMI D entries were added to the work area in the CTTHSMP utility. The utility cannot process more than 20,000 entries. The program terminates with a return code of 16.  
**Corrective Action:** Call BMC Software Customer Support.

**CTT432W** WARNING: MOD=mod HAS UMI D=umid  
**Explanation:** The CTTHSMP utility detected a UMI D in an IBM MOD entry. IBM MODs do not normally have UMI Ds. The detected UMI D can indicate the existence of an IBM APAR fix or a hook applied for another product. The program continues processing but ends with a return code of 4.  
**Corrective Action:** Check which modifications apply to the relevant module and change accordingly.

**CTT433W** OPTIONAL COMPONENT opt_cpnt CANNOT BE INSTALLED, COMPONENT DISABLED  
**Explanation:** Control-M/Tape could not locate the elements necessary to install optional component opt_cpnt. Possible causes are:
The component requirements are incompatible with the release of MVS installed at this site.
Another product uses the same resources that are needed for installation of this component.
An internal error.

Control-M/Tape continues operation without optional component opt-cpnt.

**Corrective Action:** Contact BMC Software Customer Support.

**CTT440S** INTERNAL ERROR IN CTTI WTO. CODE: int_code REASON: rsn

**Explanation:** An error occurred while trying to install or remove the Control-M/Tape WTO Intercept. The dynamic intercept process is terminated.

**Corrective Action:** Call BMC Software Customer Support.

**CTT441S** SVC svcNumber INTERCEPT LEVEL ERROR

**Explanation:** The CTTWTOI module in the Control-M/Tape Load library does not contain the expected header.

The dynamic intercept process is terminated.

**Corrective Action:** Call BMC Software Customer Support.

**CTT442S** SVC svc_num INTERCEPT NOT FOUND. REMOVE NOT PERFORMED

**Explanation:** As part of the Control-M/Tape termination process, when trying to remove the Control-M/Tape WTO Intercept, the current WTO module (SVC 35) was not identified as the Control-M/Tape Intercept.

The dynamic intercept process is terminated. A snap of the current WTO SVC is provided under the DADUMP DD name.

**Corrective Action:** Check if some other program product at your site is interfering with MVS WTO and installing its own WTO Intercept. If not, call BMC Software Customer Support.

**CTT450W** VOLUME vol NOT MOVED. VOLUME STATUS WAS CHANGED.

**Explanation:** The CTTVTM utility initiated the movement of the vol volume to a new location, but the status of the volume was changed by another job before the volume record was updated in the Media database.

The volume is not moved to a new location, although the movement appears in the utility output report.

**Corrective Action:** Do not move the volume. Ignore the vol entry in the CTTVTM utility output report.

**CTT451E** LOCATION loc FOR VOLUME vol NOT FOUND IN RULE. VOLUME MARKED MANUALLY VAULTED

**Explanation:** During a run of the CTTVTM utility with MODE set to CONVERT, the specified volume was marked vaulted but its current location was not found in the vault pattern of the matching rule of the volume data set.
The CTTVTM utility moves the volume to MAINLIB in the Distribution Report and marks it as a potential vault.

**Corrective Action:** Check the vault pattern of the rule that matches the volume’s data set and change it to include the current location name. Then rerun the CTTVTM utility.

**CTT452E RULE NOT FOUND FOR DATASET ON VOLUME volser. VOLUME MARKED MANUALLY VAULTED**

**Explanation:** No rule was found for the data set used to determine the vaulting pattern for volume `volser`. Possible causes are:

- **MODE** was set to CONVERT for the CTTVTM utility, no rule exists for the data set, and the data set resides on a volume marked as VAULTED.
- **MODE** was set to RECALC for the CTTVTM utility, and no rule exists for a volume which is already marked as MANUALLY VAULTED.

This message is accompanied by message CTT202, which supplies the name of the data set used to determine the vaulting pattern for this volume. If **MODE** was set to CONVERT, the volume is marked as MANUALLY VAULTED.

In both CONVERT and RECALC modes, the volume is assigned the current location, and the expiration date of the data set that is used to determine the vaulting pattern of the volume.

**Corrective Action:** If a rule should have existed for the data set, define this rule and rerun CTTVTM with **MODE** set to RECALC.

**CTT453E RESLOT=YES IS INVALID WITH MODE={SLOTBLD | BOXBLD}**

**Explanation:** The RESLOT parameter and SLOTBLD or BOXBLD mode were specified for the CTTVTM utility. The RESLOT=YES and MODE=SLOTBLD or MODE=BOXBLD expressions cannot be both specified for the same run of the CTTVTM utility.

CTTVTM stops execution.

**Corrective Action:** If you want to run the CTTVTM utility with RESLOT=YES, change the mode of the utility to REGULAR or RECALC; otherwise, remove the RESLOT=YES option.

**CTT454E BOX boxName (boxRecordNum) NOT FOUND IN MDB**

**Explanation:** The CTTVTM utility detected a logical error while processing the Media Database (MDB). CTTVTM accesses the volumes in a box by locating all its associated records. In this case, the box record number identified in the message cannot be located in the MDB. As a result, the data accessed for this box might be incomplete.

CTTVTM continues processing.

**Corrective Action:** If it is important to obtain precise data for the box in question, run CTTVTM in the BOXBLD mode.
CTT455E BOX COUNT boxId (count) INCONSISTENT WITH NUMBER OF VOLUMES (num)

Explanation: The CTTVTM utility detected that the number of volumes in the box found in the box record differs from the number of volumes actually in the box (count), based on information from the volume records (num). The two values should match.

The utility continues processing.

Corrective Action: Contact your IOA database administrator.

CTT456E BOX boxId VOLUME LIST IS INCONSISTENT WITH VOLUMES BELONGING TO THIS BOX

Explanation: The CTTVTM utility detected that the list of volumes in the box detailed in the box record, does not match the volumes that are actually found in the box, based on the information in the volume records. The two lists should match.

The utility continues processing.

Corrective Action: Contact your IOA database administrator.

CTT457E LOCATION vol_loc OF VOLUME volser DIFFERS FROM LOCATION box_loc IN BOX boxId

Explanation: The CTTVTM utility detected that the location of the volume (vol_loc) is different than the location of the box in which the volume is contained. The two locations should match.

The utility continues processing.

Corrective Action: Contact your IOA database administrator.

CTT458E NO BOX DEFINITION RECORDS IN MDB

Explanation: The CTTVTM utility did not find any box definition records in the Media Database (MDB), but found volumes that should be vaulted by box. Box records must be defined so vaulting by boxes can take place. To build box records, first the box must be defined and then the CTTVTM utility must be executed with the BOXBLD parameter.

The utility continues processing.

Corrective Action: If vault by boxes is required, define the box records and rerun CTTVTM. If the volumes need not be vaulted by box, change the Vault By Box parameter in the Rule Definition screen (screen TR) to ‘N.’

CTT459E BOX boxId IS NOT DEFINED IN MDB

Explanation: The CTTVTM utility found that the record of box (boxId), does not exist in the Media Database (MDB), although at least one volume in the MDB is marked as being in the box.

The utility continues processing.

Corrective Action: Contact your IOA database administrator.
CTT460E EMPTY BOXES ARE NOT AVAILABLE FOR MEDIA media

**Explanation:** The CTTVTM utility cannot find an empty box for the media specified to be used for vaulting by boxes. Volumes in the media specified in the message are marked to be vaulted by boxes. This cannot be carried out, since no more empty boxes are available for this media.

The utility continues processing.

**Corrective Action:** Check that all the boxes that are supposed to be available for this media are in fact available. If no problem can be found in the availability of the boxes, then define more boxes for this media.

CTT461I THE FOLLOWING VOLUMES FROM BOX boxId IN LOCATION location NOT MOVED:

**Explanation:** The CTTVTM utility was unable to move all volumes belonging to the box. The volumes that cannot be moved are listed in CTT202I messages that follow this message.

The utility continues processing without updating the new location of the volumes listed in CTT202I. Therefore, these volumes should be ignored even though they are listed in the CTTVTM report.

**Corrective Action:** See the previous error message.

CTT462E BOX PREFIX box_prfx (MEDIA media_type) IS DEFINING DUPLICATE BOX ID/IDS

**Explanation:** The CTTVTM utility was invoked with the BOXBLD parameter, but the box ranges defined in the MAINLIB library with prefix box_prfx and media media_type overlap each other, causing duplicate box IDs. Each box ID must be unique.

The utility terminates with no action taken. No box is defined.

**Corrective Action:** Check and correct the box definitions. Rerun the CTTVTM utility with the BOXBLD parameter.

CTT463E MODE=BOXBLD IS INVALID WITH SIMULATION RUN

**Explanation:** MODE was set to BOXBLD in a simulation run of the CTTVTM utility. MODE cannot be set to BOXBLD in a simulation run of the CTTVTM utility.

The utility does not start processing.

**Corrective Action:** If you would like to define new boxes or to change existing box definitions, remove the SIMULATION option and rerun CTTVTM.

CTT464E BOX boxId IS IN USE BUT HAS NO DEFINITION

**Explanation:** The CTTVTM utility was invoked with the BOXBLD parameter, but the specified box ID is in use and was not defined. All boxes presently in use must be included in the box definitions in the MAINLIB library.

The utility terminates with no action taken (no box is defined).

**Corrective Action:** Check the box definitions. Verify that all boxes in use have correct definitions. Rerun the CTTVTM utility with the BOXBLD parameter.
CTT465E BOX $boxId$ IS IN USE BUT DEFINED WITH A NEW MEDIA TYPE

Explanation: The CTTVTM utility was invoked with the BOXBLD parameter, but a box already in use was defined with a media type different from the one specified in its previous definition. Attributes of a used box cannot be changed.

CTTVTM terminates with no action taken. No box is defined.

Corrective Action: Specify the correct media type for this box, or range of boxes. Rerun the CTTVTM utility with the BOXBLD parameter.

CTT466E BOX $boxId$ IS IN USE BUT DEFINED WITH A NEW BOX SIZE

Explanation: The CTTVTM utility was invoked with the BOXBLD parameter, but a box already in use was defined with a new box size. Attributes of a box in use cannot be changed.

The utility terminates with no action (no box is defined).

Corrective Action: Specify the correct size for this box or range of boxes. Rerun the CTTVTM utility with the BOXBLD parameter.

CTT467W VOLUME $volser$ HAS MAINLIB IN ITS VAULT PATTERN AND CANNOT BE VAULTED BY BOX

Explanation: The volume ($volser$) has been marked for vault by box, but MAINLIB is one of the locations specified in its vault pattern. A volume cannot be vaulted by a box if it has MAINLIB as one of the locations in its vault pattern.

The utility continues processing.

Corrective Action: Remove the mark from the volume so that it is not vaulted by box, or remove MAINLIB from the volume vault pattern.

CTT468W UPDATE FOR VOLUME $volser$ REJECTED BY CTTX006. INTEGRITY PROBLEMS MIGHT OCCUR

Explanation: Exit CTTX006 rejected a Media Database (MDB) update of the specified volser that was requested by the utility. The utility tried to update the specified volume information in the MDB. Database. However, the update operation was rejected by Exit CTTX006. This may cause an integrity error in the MDB.

The utility continues. The specified volume information is not updated.

Corrective Action: Make sure an integrity error was not created due to the rejected update. Consider modifying Exit CTTX006 in case of unexpected rejections. Ignore this message if the rejection is expected.

CTT469E INCLUDE/EXCLUDE CANNOT BE SPECIFIED WITH MODE={SLOTBLD | BOXBLD}

Explanation: An attempt has been made to run the CTTVTM utility in SLOTBLD or BOXBLD mode, but with at least one INCLUDE or EXCLUDE statement in the input statements of the utility.

The utility stops processing.
Corrective Action: Remove all INCLUDE and EXCLUDE statements from the input statements of the utility and rerun the utility.

CTT470I STATUS OF VOLUME volser HAS BEEN SET TO {IN ATL | NOT IN ATL}

Explanation: The automated tape library residence status of the specified volume was set by the CTTSYNC utility in the Media Database (MDB). The CTTSYNC utility synchronizes the automated tape library residence status of MDB volumes according to the actual residence in the automated tape library. The status of the volume in the MDB was changed to represent its actual status. The utility continues processing.

Corrective Action: No action is required.

CTT471I VOLUME volser HAS BEEN MARKED AS IN ATL LIBRARY newLib (oldLib)

Explanation: The automated tape library name of the specified volume was set by the CTTSYNC utility in the Media Database (MDB). The CTTSYNC utility synchronizes the automated tape library name of the MDB volumes from the name that was previously recorded in the MDB (oldLib) to the library name where the volumes actually reside (newLib).

The status of the volume in the MDB was changed to represent its actual status. The utility continues processing.

Corrective Action: No action is required.

CTT472I ATL NOTIFIED OF STATUS {SCRATCH | ACTIVE} FOR VOLUME volser

Explanation: The status of the indicated volume in the automated tape library was set by the CTTSYNC utility according to its status in the Media Database (MDB). The CTTSYNC utility synchronizes the status of volumes in the automated tape library with the equivalent status in the MDB.

The status of the volume in the automated tape library was changed to agree with its status in the MDB. The utility continues processing.

Corrective Action: No action is required.

CTT473I VOLUME volser HAS BEEN MARKED AS IN ATL INTERFACE atl_intfce

Explanation: This information message indicates that the CTTSYNC utility synchronized the automated tape library with the Media Database (MDB) and found that the volume resides in the automated tape library. The CTTSYNC utility then updated the MDB.

The utility continues processing.

Corrective Action: No action is required.
CTT474I  TYPE OF VOLUME  volser  HAS BEEN MARKED AS  {LOGICAL | PHYSICAL}

**Explanation:** This information message indicates that the CTTSYNC utility synchronized the automated tape library type with the Media Database (MDB), determined the volume type, and updated the MDB accordingly.

The utility continues processing.

**Corrective Action:** No action is required.

CTT475I  SMS STORAGE GROUP OF VOLUME  volser  HAS BEEN SET TO  storage-group-name

**Explanation:** This information message indicates that the CTTSYNC utility retrieved the DFSMS Storage Group of the volume from the automated tape library database, and updated the Media database accordingly.

The utility continues processing.

**Corrective Action:** No action is required.

CTT476E  VOLUME  volser  NOT DEFINED IN MEDIA DATABASE

**Explanation:** The volser is controlled by DFSMSHsm or Control-V, but it is not defined in the Control-M/Tape Media database.

Normal processing continues.

**Corrective Action:** Check why the volume is not defined in the Media database. If the volume should be defined in Control-M/Tape Media database, then use the CTTMUP utility to add the volume and its datasets to the Media database.

CTT477E  VOLUME  volser  STATUS SHOULD BE  {ACTIVE | EDM-CONT}  IN MEDIA DATABASE

**Explanation:** The volser is controlled by DFSMSHsm or Control-V, but its status in the Media database is not active or not it is not under EDM control.

Normal processing continues.

**Corrective Action:** Use the CTTMUP utility to update the volume record in the Media database to its correct status.

CTT478E  VOLUME  volser  NOT CONTROLLED BY  {DFSMShsm | CONTROL-V}

**Explanation:** The volser is not controlled by DFSMSHsm or Control-V, but it is marked as active and under EDM control in Control-M/Tape Media database.

Normal processing continues.

**Corrective Action:** Verify that the volume is really not controlled by any of the External Data Managers (for example DFSMSHsm, CA-Disk, or ExHPDM) used at your site, and scratch the volume in the Media database using the CTTMUP utility.
CTT479W NO ROBOTIC TAPE LIBRARIES DEFINED IN THE CTTPARM

Explanation: The RBTTYPE parameter is set to NONE in the CTTPARM. The CTTSYNC utility cannot perform synchronization with any automated tape library.

The Utility ends.

Corrective Action: Specify the necessary ATL in the RBTTYPE parameter and rerun the utility.

CTT481E stmt STATEMENT WAS NOT SUPPLIED OR IS NOT FIRST

Explanation: Control-M/Tape did not detect a valid statement at the beginning of the SYSIN file. The SYSIN file for the utility must begin with a valid statement. The SYSIN file is empty or the first control statement is invalid.

The utility stops executing.

Corrective Action: Correct the statements in the SYSIN file, and rerun the utility.

CTT486E RESTART OF UTILITY util IS REQUIRED. RUN TIME dd/mm/yyyy hh:mm:ss

Explanation: The CTTIDB utility detected that the previous run of the specified Control-M/Tape utility abended.

In this message, dd/mm/yyyy is the date of the abending execution of the utility, and hh:mm:ss is the abending execution time.

The CTTIDB utility continues processing.

Corrective Action: Locate and correct the cause of the error. Rerun the utility.

CTT487I Phase n/m of utility util {ENDED | STARTED}

Explanation: This information message indicates that phase n out of m phases of the specified utility started or ended. This message can help in estimating the execution time of the specified utility.

If this message does not indicate the end of the last phase of the utility, the specified utility continues processing.

Corrective Action: No action is required.

CTT488I n PERCENT OF rcrd_type RECORDS WERE PROCESSED

Explanation: This information message indicates that a Control-M/Tape utility has processed n percent of the records of the specified record type. This message can help in estimating the execution time of the utility.

The utility continues processing.

Corrective Action: No action is required.

CTT489I n rcrd_type RECORDS WERE PROCESSED

Explanation: This information message indicates that a Control-M/Tape utility has processed n records of the specified record type. This message can help in estimating the execution time of the utility.
The utility continues processing.

**Corrective Action:** No action is required.

**CTT490E INVALID MULTI-VOLUME GROUP.** REASON=rc, VOLSER=volser, FIRST=first_vol

**Explanation:** Control-M/Tape discovered that the volser belongs to an invalid multivolume group in the Media Database (MDB). The first_vol variable indicates the first volume in the volume group.

Possible values of rc are:
- 01 - Invalid first volume in the group.
- 02 - The group does not contain the selected volume.
- 03 - Invalid PREV and/or NEXT pointers in the volume record.
- 04 - Volser in DATA differs from INDEX.
- 05 - Volume number is out of sequence.
- 06 - Invalid Scratch Timestamp in the volume record.
- 07 - Invalid volume status.
- 08 - Loop is detected within the group.
- 09 - I/O error.
- 10 - Volume record is not found.

Control-M/Tape stops processing the invalid multivolume group.

**Corrective Action:** Use the CTTMUP utility to correct invalid fields in volume records within the multivolume group.

**CTT492I RECORD CHANGED.** REC=record

**Explanation:** This information message indicates that a Control-M/Tape task was about to update a Media Database (MDB) record but discovered that the record was changed by another task. The record is not updated in the current task.

**Corrective Action:** If the update was requested from the Online Facility, check the record, and if the update is still required, repeat the request.

**CTT493I RETENTION INFORMATION UPDATED SUCCESSFULLY**

**Explanation:** This information message indicates that the CTTRTM utility updated retention information in volume and data set records when running in either CONVERT or RECALC mode.

This message is followed by message CTT202I, which shows the Media Database (MDB) record being handled.

**Corrective Action:** No action is required.
CTT494I RECORD ELIGIBLE FOR SELECTION

**Explanation:** This information message indicates that the user was running the CTTRTM utility, and specified INCLUDE or EXCLUDE statements to select Media Database (MDB) records.

This message is followed by message CTT202I which shows the Media Database (MDB) record being handled.

**Corrective Action:** No action is required.

CTT495I RESTART CANCELLED DUE TO USER REQUEST

**Explanation:** A previous run of the CTTRTM utility or the CTTVTM utility abended. The current utility run includes the Automatic Restart mode. However, the user set RESTART to NO in the TYPERUN statement to prevent restarting the utility.

The utility continues running without restarting.

**Corrective Action:** No action is required.

CTT496E TOO MANY RETENTION FACTORS. EXTRANEOUS FACTORS DISCARDED

**Explanation:** When applying retention criteria to a Media Database (MDB) data set record, Control-M/Tape discovered that more than three retention factors were specified for a data set. Data set retention information is stored in data set records by either the real-time environment when creating a data set, or by the CTTRTM utility in either RECALC or CONVERT mode.

Extraneous retention factors are ignored. Message CTT202I showing the Media Database (MDB) record being handled, is issued after this message.

**Corrective Action:** Check the matching Control-M/Tape rule, using the Rule Definition screen (Screen TR), and the JCL EXPDT parameter for the data set, and remove any extra retention factors.

CTT497I TASK IS NOT APF AUTHORIZED. CHANGES WERE NOT PERFORMED IN ATL

**Explanation:** After modifying the Media Database (MDB) records, Control-M/Tape tried to make the equivalent changes in databases of the robot systems (automated tape libraries). To be able to update databases of the robot systems such as StorageTek or IBM 3495, the Control-M/Tape task must be APF-authorized, since this is required by interfaces to the robot systems.

The robot system databases are not updated.

**Corrective Action:** Contact your system programmer to make the Control-M/Tape task APF-authorized.

CTT498W JCL EXPDT WAS NOT SUPPLIED. INSTALLATION DEFAULT RETENTION USED (ddName)

**Explanation:** According to the matching rule, Control-M/Tape requires that retention criteria for a data set be provided by the JCL EXPDT parameter when creating the data set. However, the JCL EXPDT parameter was not supplied in the JCL. The message is issued by one of the following:
By the real-time environment when creating a data set.

By the CTTRTM utility running in either the RECALC or CONVERT mode.

By the CTTMUP utility when adding new dataset record.

If the message is issued by the Control-M/Tape real-time environment, the ddName parameter will be displayed. In other cases, the message will be followed by message CTT202I, which shows the Media Database (MDB) record being handled.

Installation default retention criteria are applied to the data set record.

**Corrective Action:** Supply the JCL EXPDT parameter in the DD statement when creating a data set. To change the retention criteria of the data set record that was created using the default retention criteria, use the CTTMUP utility.

CTT499E SLOT CAPACITY RECORD NOT FOUND. VAULT=vault, MEDIA=media

**Explanation:** Control-M/Tape has updated a vaulted volume, and has unsuccessfully tried to update the appropriate Slot Definition record, to synchronize its data with the newly updated Volume record.

The Slot Definition records are created by the CTTVTM utility, according to the vault definitions that the user specifies in the Control-M/Tape Vault Definition screen (Screen TV).

The Slot Definition record is not updated.

**Corrective Action:** Check vault definitions using the Vault Definition screen (Screen TV), and then run the CTTVTM utility in mode SLOTBLD to synchronize the Slot Definition records with the Volume records.

**Messages CTT500 through CTT5xx**

This group includes messages for the Control-M/Tape product.

CTT501E PLEASE FILL IN TABLE NAME OR OMIT RULE

**Explanation:** A rule name was specified without a table name. A rule name cannot be specified without a table name.

**Corrective Action:** Either specify the table name, or omit the rule name, in order to receive a list of tables in the library.

CTT510E INVALID "ON". USE A, D, J, ME, MG, P, UC, US OR V

**Explanation:** An invalid option was specified in the ON field.

The ON field is used to specify criteria which must be met before Control-M/Tape performs actions. The option specified identifies certain criteria from the active environment.

Valid options in the ON field are:
CTT511E VOLSER RANGE IS INVALID

Explanation: An invalid volser range was specified in ON VOLSER fields. The ON VOLSER field enables specifying a range of volsers. For a volser range to be valid, the first value in the specified range must be less than or equal to the second value.

Corrective Action: Correct the entry by specifying a valid range.

CTT512E VALID RETENTION TYPES ARE CA,CY,DAT,DAY,ED,J,L,P,R,M

Explanation: An invalid retention type was specified in a DO RETENTION statement. The DO RETENTION statement is used to specify a duration for which a data set or volser is kept. The retention type specified identifies how the duration is calculated. There may be a single retention type specified, or a combination of up to three different retention types using the AND/OR field.

Valid retention types are:
- CA (MVS Catalog)
- CY (Cycles)
- DAT (Date)
- DAY (Days)
- ED (EDM)
- J (JCL EXPDT)
- L (Last access)
- P (Permanent)
- R (Return from vault)

Corrective Action: Correct the entry by specifying a valid retention type.
CTT513E THERE MAY BE ONLY ONE RETENTION PERIOD PER "ON" BLOCK

**Explanation:** An attempt was made to open a DO RETENTION statement in a rule that already contains a DO RETENTION statement. The DO RETENTION statement specifies a duration for which a data set or volser is kept.

To avoid conflicting duration periods for the criteria defined in the ON block, there may be only one DO RETENTION statement per ON block.

**Corrective Action:** Instead of opening a second DO RETENTION statement, specify a combination of retention periods in one DO RETENTION statement using the AND/OR parameter.

CTT514E INVALID RETENTION COMBINATION

**Explanation:** An attempt was made to specify a retention period that does not correspond to previous retention periods in the DO RETENTION statement. The DO RETENTION statement has up to three different retention periods to specify a duration for which a data set or volser is kept.

To avoid conflicting duration periods, the combination of retention periods specified in one DO RETENTION statement must be logical. For example, a retention period of PERMANENT may not be combined with any other retention periods.

**Corrective Action:** Specify a valid retention combination.

CTT515E PERMANENT RETENTION IN VAULT. ADDITIONAL VAULTS CANNOT BE SPECIFIED

**Explanation:** An attempt was made to specify an additional vault or an additional retention period in a DO VAULT statement that already contains a retention period of PERMANENT. If a volume is to be kept permanently, it cannot be transferred to an additional vault, and no more retention periods can be specified.

**Corrective Action:** Clear the additional VAULT parameter or AND/OR parameter, if the volume is to be kept permanently, or change the retention period from PERMANENT to another retention period.

CTT516E RETENTION TYPE MUST BE FILLED IN

**Explanation:** A retention line was opened, but no retention type was specified. The retention period in a DO RETENTION, ABENDRET, or VAULT statement specifies a duration for which a data set or volser is kept. The retention type determines how the duration is calculated. There may be a single retention type, or a combination of up to three different retention types using the AND/OR field.

Valid retention types are: CA (MVS Catalog), CY (Cycles), DAT (Date), DAY (Days), ED (EDM), EX (EXPIRE), J (JCL EXPDT), L (Last access), P (Permanent), R (Return from vault), and V (VAULT DAYS). Some retention types are not valid for all retention periods in the different statements.

**Corrective Action:** Specify a valid retention type, or clear the preceding AND/OR field (or DO field in the case of a single retention) if no further retention criteria are required.

CTT517E VALID WHEN TYPES ARE A,CH,CL,K,M,O

**Explanation:** The WHEN type was specified in the WHEN field of a DO statement was invalid or absent. The WHEN parameter determines when the DO statement that contains the WHEN parameter is performed.
Valid WHEN types are:

- A (Close after abend)
- CH (Check in volumes)
- CL (Close)
- K (Keep)
- M (Mount)
- O (Open)

**Corrective Action:** Correct the entry by specifying a valid WHEN type.

**CTT518E ONLY ONE POOL NAME PER "ON" BLOCK MAY BE SPECIFIED**

**Explanation:** An attempt was made to open a DO POOL statement in an ON block that already contains a DO POOL statement. The DO POOL statement specifies the pool from which a scratch volume is taken.

To avoid conflicting data when mounting a scratch tape, there may be only one DO POOL statement per ON block.

**Corrective Action:** Delete the second DO POOL statement by clearing the DO field.

**CTT519E ONLY ONE PRINT LABEL OPTION PER "ON" BLOCK MAY BE SPECIFIED**

**Explanation:** An attempt was made to open a DO LABEL statement in an ON block that already contains a DO LABEL statement. The DO LABEL statement specifies whether or not a label is to be printed when a data set is written on a volume.

To avoid conflicting data when deciding whether or not to print a label, there may be only one DO LABEL statement per ON block.

**Corrective Action:** Delete the second DO LABEL statement by clearing the DO field.

**CTT520E ONLY ONE STACK OPTION PER "ON" BLOCK MAY BE SPECIFIED**

**Explanation:** An attempt was made to open a DO STACK statement in an ON block that already contains a DO STACK statement. The DO STACK statement specifies whether or not stacking of data sets is performed on a certain volume.

To avoid conflicting data when deciding whether or not to stack data sets on a volume, there may be only one DO STACK statement per ON block.

**Corrective Action:** Delete the second DO STACK statement by clearing the DO field.

**CTT521E ONLY ONE VAULT CYCLE PER "ON" BLOCK MAY BE SPECIFIED**

**Explanation:** An attempt was made to open a DO VAULT statement in a rule that already contains a DO VAULT statement. The DO VAULT statement determines in which vaults, if any, a volume is to be kept.

To ensure that a volume is specified in the correct sequence of vaults, there may be only one DO VAULT statement per ON block. However, a sequence of vaults may be specified in a DO VAULT statement. An empty VAULT entry is opened whenever a new vault is specified in a DO VAULT statement.
Corrective Action: Instead of opening a second DO VAULT statement, specify a sequence of vaults in the DO VAULT statement using the empty VAULT entry at the end of the statement.

CTT522E A BLOCK WITH FILLED "DO" STATEMENTS AND NO "ON" STATEMENTS IS INVALID

Explanation: The rule does not contain any ON statements. Every rule must have at least one ON statement that identifies under what conditions to perform the DO statements.

The rule is not saved.

Corrective Action: Add an ON statement to the rule.

CTT523E AT LEAST ONE CYCLE MUST BE SPECIFIED

Explanation: In a DO RETENTION, ABENDRET, or VAULT statement, a value of zero was specified in the CYCLES field of a retention period. The CYCLES retention type determines the number of cycles that a volume or data set is to be kept. A cycle of a data set relates to the creation of a copy of the specified data set. A retention period of zero is invalid since it means there is no duration.

Corrective Action: Add an ON statement to the rule.

CTT524E ONLY ONE OWNER PER "ON" BLOCK MAY BE SPECIFIED

Explanation: An attempt was made to open a DO OWNER statement in an ON block that already contains a DO OWNER statement. The DO OWNER statement determines the owner of a volume data set. There may be only one owner for a volume or data set. Therefore, there may be only one DO OWNER statement per ON block.

Corrective Action: Delete the second DO OWNER statement by clearing the DO field.

CTT525E DATE ALREADY IN PREVIOUS VAULT RANGE

Explanation: A retention type of DATE was specified for a vault. However, the date specified overlaps the duration of the same volume in a previous vault.

The DO VAULT statement enables a volume to be kept in a sequence of vaults. Each vault may have its own retention period. A volume is transferred from one vault to the next vault in the sequence at the end of its duration field. Overlapping of dates is invalid. The calculated duration for the retention of a volume or data set in a vault must only begin at the end of the retention period of the previous vault.

Corrective Action: Modify the retention date to a date after the retention period of the previous vault.

CTT526E ONLY ONE "ON DATASET" STATEMENT PER RULE MAY BE SPECIFIED

Explanation: An attempt was made to add an ON DATASET statement in a rule that already contains an ON DATASET statement. The ON DATASET statement specifies the data set or data set prefix that must be matched for Control-M/Tape to perform actions defined in the rule. This is the basic search criterion. Therefore, only one ON DATASET statement is allowed.

Corrective Action: Delete one of the ON DATASET statements. A mask containing * and ? may be used instead of a data set name.
CTT527E  VALID RETENTION TYPES ARE CA, CY, DAT, DAY, EX, J, L, P, V, M

Explanation: An invalid retention type was specified in a retention period of a DO VAULT statement. The DO VAULT retention period specifies a duration for which a data set or volser is kept in a vault. The retention type specified identifies how the duration is calculated. There may be a single retention type, or a combination of up to three types using the AND/OR field.

Valid retention types are:
- CA - MVS Catalog
- CY - Cycles
- DAT - Date
- DAY - Days
- EX - EXPIRE
- J - JCL EXPDT
- L - Last access
- P - Permanent
- V - VAULT DAYS
- M - MVS Catalog

Corrective Action: Correct the entry by specifying a valid retention type.

CTT528E  VALID RETENTION TYPES ARE CA, CY, DAT, DAY, ED, J, L, P, M

Explanation: An invalid retention type was specified in a retention period of a DO ABENDRET statement. The DO ABENDRET retention period specifies a duration for which a data set or volser is kept in case of an abend. The retention type specified identifies how the duration is calculated. There may be a single retention type, or a combination of up to three types using the AND/OR field.

Valid retention types are:
- CA -- MVS Catalog
- CY -- Cycles
- DAT -- Date
- DAY -- Days
- ED -- EDM
- J -- JCL EXPDT
- L -- Last access
- P -- Permanent
- M -- MVS Catalog

Corrective Action: Correct the entry by specifying a valid retention type.
CTT529E INVALID DO STATEMENT WAS SPECIFIED

**Explanation:** An invalid DO statement was specified in a Control-M/Tape rule (screen TR). DO statements specify actions to be performed by Control-M/Tape when scheduling and selection criteria for a rule are satisfied. For more information about DO statements, see the description of ON and DO statements in the rule parameters chapter of the Control-M/Tape User Guide.

The rule definition cannot be saved.

**Corrective Action:** Either delete the invalid DO statement or replace it with a valid DO statement.

CTT530E POOL ASSIGNMENT IS INVALID AFTER "ON VOLUME" OR "ON MEDIA" ARE SPECIFIED

**Explanation:** A POOL assignment was requested by means of a DO field in a rule that previously contains ON VOLUME or ON MEDIA statements. The POOL assignment is only meaningful when scratch tapes may be requested. If a volume or media appears as criteria for executing the rule, scratch tapes cannot be requested.

**Corrective Action:** Correct the entry by deleting the POOL assignment.

CTT531E THE PREFIX FIELD ON CYCLE RETENTIONS MUST BE THE SAME

**Explanation:** An attempt was made to define a cycle retention type with a prefix that does not match the prefix of another cycle retention type. The prefix of the cycle retention types for the DO RETENTION and DO ABENDRET statements must be the same. The prefix of the cycle retention types within the DO VAULT statement must also be the same.

**Corrective Action:** Correct the entry.

CTT532E STACK=Y IS INVALID AFTER "ON {VOLUME | MEDIA | UCB}" IS SPECIFIED

**Explanation:** A STACK=Y statement was specified in a rule that previously contained an ON VOLUME, ON MEDIA, or ON UCB statement. STACK=Y processing takes place before media, volume or UCB information is available. Therefore, rules that are triggered by volume, media or UCB information cannot request dynamic stacking.

Correct the rule by deleting the STACK=Y statement or use a different ON statement.

**Corrective Action:** No action is required.

CTT533E UCB RANGE IS INVALID

**Explanation:** The UCB range specified in the TR screen is invalid. The FROM or TO value is not a valid UCB address (hexadecimal value) or the FROM value is larger than the TO value.

The rule cannot be saved until the range is specified correctly.

**Corrective Action:** Specify a valid UCB range and save the rule.

CTT534E ONLY ONE do_stmt STATEMENT PER RULE CAN BE SPECIFIED

**Explanation:** The specified DO statement (do_stmt) was included more than once in a Control-M/Tape rule. Only one DO statement of the specified type can be included in each Control-M/Tape rule.
The rule definition cannot be saved.

**Corrective Action:** Delete the duplicate DO statement, leaving only one DO statement of the specified type. See the section on ON and DO blocks in the chapter on rule parameters of the *Control-M/Tape User Guide* for more information about the specified DO statement.

**CTT535E VALID SCOPES ARE DSN OR VOL**

**Explanation:** An invalid value was specified for the SCOPE subparameter in a DO STACK statement in the Rule Definition screen (screen TR).

Valid SCOPE values:

- **DSN** -- Do not stack the current copy of the data set.
- **VOL** -- Do not stack the current copy of the data set. Mark the volume on which it is created as non-stackable.

The rule definition cannot be saved.

**Corrective Action:** Specify a valid SCOPE value.

**CTT536E "DO STKRULE" IS VALID ONLY IF "DO STACK=Y"**

**Explanation:** A DO STKRULE statement was specified in a Control-M/Tape rule that does not include a DO STACK=Y statement. A DO STKRULE statement can only be specified if a STACK=Y statement is specified earlier in the rule.

The rule definition cannot be saved.

**Corrective Action:** Either specify a DO STACK=Y statement earlier in the rule or remove the DO STKRULE statement.

**CTT537E SPECIFY A JOBNAME, DSN, OR BOTH**

**Explanation:** No value was specified for subparameters JOB and DSN in a DO STKRULE statement of a Control-M/Tape rule. The DO STKRULE statement describes data sets or jobs that create data sets, which should not be stacked with the data set whose access triggered the rule. Therefore, a value must be specified for at least one of these subparameters.

The rule definition is not saved.

**Corrective Action:** Specify the required jobname, data set name, or both, in DO STKRULE and save the rule.

**CTT538E VALID OPTIONS FOR THIS FIELD ARE YES OR NO**

**Explanation:** An invalid value was specified for the current field in a Control-M/Tape rule. This field must have a value of either YES or NO.

The rule definition cannot be saved.

**Corrective Action:** Specify either YES or NO and save the rule.

**CTT539E VALID DYNVOL OPTIONS ARE I, E, N, P, OR Y**

**Explanation:** An invalid value was specified in a DO DYNVOL statement of a Control-M/Tape rule.
Valid values for a DO DYNVOL statement are:

- I - Ignore the volume.
- E - Define the volume dynamically in the Media Database as an external tape.
- N - Do not define the volume in the Media Database. Specific request cases abend the job. Nonspecific (scratch) requests are rejected.
- P - Prompt the operator to determine whether or not to dynamically define the volume.
- Y - Define the volume dynamically in the Media Database.

The rule definition cannot be saved.

**Corrective Action:** Either specify a valid value for the DO DYNVOL statement, or delete the statement.

CTT540E VALID RECREATE OPTIONS ARE YES, NO, OR PERMANENT

**Explanation:** An invalid value was specified in a DO RECREATE statement of a Control-M/Tape rule.

Valid values for a DO RECREATE statement are:

- YES - Data sets (except permanent data sets) can be recreated.
- NO - Data sets cannot be recreated.
- PERMANENT - Data sets (including permanent data sets) can be recreated.

The rule definition cannot be saved.

**Corrective Action:** Either specify a valid value for the DO RECREATE statement or delete the statement.

CTT541E VALID STKMODE OPTIONS ARE SIMPLE, VAULT, RETENTION, OR ALL

**Explanation:** An invalid value was specified in a DO STKMODE statement of a Control-M/Tape rule. A DO STKMODE statement determines the algorithm used to search for a volume on which to stack the current data set. These searches are performed on the same pool as the eligible candidate volumes for stacking.

Valid values for a DO STKMODE statement are:

- SIMPLE - Searches for volumes regardless of retention date and vaulting pattern.
- VAULT - Searches for volumes that have a vaulting pattern similar to the stacked data set.
- RETENTION - Searches for volumes which have a similar or later retention date.
- ALL - Satisfies the requirements of both the Vault and Retention search criteria.

The rule definition cannot be saved.

**Corrective Action:** Specify a valid value for the DO STKMODE statement, or delete the statement.

CTT542E KEEP EVENT IS INVALID AFTER "ON PGM" IS SPECIFIED

**Explanation:** A DO statement at KEEP event was specified in a rule that previously contained an ON PGM statement. KEEP processing takes place when the PGM name is no longer available. Therefore, rules that are triggered by a PGM name cannot request an IOA service at a KEEP event.

Control-M/Tape does not save the rule definition.
**Corrective Action:** Correct the entry by deleting the KEEP event, or use a different ON statement.

**CTT543E VALID FASTPOS OPTIONS ARE YES, NO, OVERRIDE, OR TEST**

**Explanation:** An invalid fast positioning option was specified in a DO FASTPOS rule statement. The DO FASTPOS statement specifies the mode of operation for fast positioning.

Valid fast positioning options are:
- Y - Yes
- N - No
- O - Override
- T - Test

Control-M/Tape does not save the rule definition.

**Corrective Action:** Correct the entry by specifying a valid fast positioning option.

**CTT544E REDUNDANT RETENTION AFTER AN EMPTY AND/OR OPTION**

**Explanation:** A value was specified in a RETENTION field but the AND/OR relationship to the value in a previous RETENTION field was left blank.

If values are specified in more than one RETENTION field, a value must be inserted into the AND/OR field relating to each of the RETENTION fields, except the last, to avoid inconsistency.

The definition is rejected.

**Corrective Action:** Correct the definition, either by deleting the current RETENTION value, or by inserting an AND/OR relationship between the current RETENTION and the previous RETENTION.

**CTT545E STACK=Y ALONG WITH NONSPECIFIC VAULT RETENTION IS INVALID**

**Explanation:** A Control-M/Tape rule definition is invalid. The definition included both of the following:
- the statement DO STACK=Y
- a DO VAULT statement with UNTIL set to "MVS CATALOG" or "CYCLES" or "LAST ACCESS"

Dynamic stacking cannot be performed for data sets with an unpredictable return date from the vault. All stacked data sets on the volume must have the same return date from the vault.

The rule definition cannot be saved.

**Corrective Action:** Do one of the following:
- Remove the statement DO STACK=Y.
- Change the DO VAULT return criteria.

**CTT548E SEVERE ERROR IN CALENDAR OR YEAR NOT FOUND IN CALENDAR**

**Explanation:** Either the year is not defined in the calendar, or the calendar was incorrectly modified.
The rule is not ordered.

**Corrective Action:** Check the contents of the rule order and the calendar. Correct accordingly, and reorder the rule.

**CTT551E VALID CAPACITY TYPES ARE "S" (SLOT) OR "B" (BOX)**

**Explanation:** An invalid capacity type was specified. Valid capacity types are slots and boxes.

**Corrective Action:** Specify a valid capacity type.

**CTT552E PLEASE FILL IN TABLE NAME OR OMIT VAULT NAME**

**Explanation:** A vault name was specified without a table name. A vault name cannot be specified without a table name.

**Corrective Action:** Either specify the table name or omit the vault name.

**CTT553E THIS FIELD MUST BE NUMERIC AND GREATER THAN ZERO**

**Explanation:** The field contains the value 0. It must hold a numeric value greater than 0.

**Corrective Action:** Correct the value in the field.

**CTT554E A VALID CALCULATED BOX ID IS 2 - 6 CHARS LONG**

**Explanation:** The combination of the box ID and Capacity parameters creates a calculated box ID that exceeds six characters.

**Corrective Action:** Change either the box ID or Capacity parameters, or both, so that their combination does not exceed six characters.

**CTT555S INSUFFICIENT STORAGE. INCREASE THE REGION SIZE**

**Explanation:** There was insufficient memory to perform a task.

The action that could not be performed accompanies this message. It may vary depending on the environment in which the message was issued.

**Corrective Action:** For jobs, increase the REGION size. For TSO, log on again using a larger SIZE parameter or exit one of the screens.

**CTT556I CHANGE OF VAULT MAY CAUSE CHANGES IN CAPACITY TYPE BOX**

**Explanation:** The vault name has been changed by the user from MAINLIB to a different name, and therefore all box definitions are automatically changed to box capacity definitions. Be aware that box definitions are allowed only under the definition of vault name MAINLIB.

**Corrective Action:** No action is required.

**CTT557E DUPLICATE DEFINITION**

**Explanation:** The same media capacity is already defined under the same vault, or the same box ID with the same media is already defined under the vault name MAINLIB.
Corrective Action: Do one of the following:

- Use a different media name.
- Use a different box ID.
- Delete the line.

CTT567E USER NOT AUTHORIZED

Explanation: The function requested is not authorized for the user. The message is issued by the IOA security mechanism.

Corrective Action: Check with your system security administrator.

CTT567I COND cond ODATE odate {ADDED | DELETED | FOUND} BY USER userId / jobName (jobId)

Explanation: This information message indicates that the ADD, DELETE, or CHECK option completed successfully and the cond condition with the odate original scheduling date was added to or deleted from, or found in the IOA Conditions file.

In this message, odate is the date on which the message is issued. If the ADD, DELETE, or CHECK option is run by the IOACND utility in batch mode, the user ID (userId), job name (jobName), and job ID (jobId) of the batch file are also displayed.

Corrective Action: No action is required.

CTT570E VOLUME RANGE MUST BE DEFINED

Explanation: No volume range is defined.

Corrective Action: Specify the volume range.

CTT571E VOLUME RANGE IS INVALID

Explanation: Volume range is invalid. The first value in a valid volume range must be less than or equal to the second.

Corrective Action: Specify a valid range.

CTT572E PLEASE FILL IN TABLE NAME OR OMIT POOL NAME

Explanation: A pool name was specified without a table name. A pool name must have a table name.

Corrective Action: Either specify the table name or omit the pool name.

CTT585W A DSN=** STATEMENT IGNORED. RULE MUST BE DEFINED MANUALLY

Explanation: During the conversion of EPIC vaulting rules into Control-M/Tape rules, an EDM rule was found. EDM rules cannot be converted automatically. They must be defined manually.

The rule is not converted.

Corrective Action: Define the EDM rule manually by means of screen TR.
 Messages CTT600 through CTT6xx
This group includes messages for the Control-M/Tape product.

CTT601E SPECIFY DSNAME OR REMOVE CREATION DATE
Explanation: A creation date is specified on the Inquire/Update Entry Panel without a data set name. A creation date may be specified only when a data set is defined.
Corrective Action: Specify a data set name or mask on the Inquire/Update Entry Panel or remove the creation date.

CTT602E INVALID RECORD TYPE. USE "V","D","VD" OR "DV"
Explanation: The specified record type on the Inquire/Update Entry Panel is invalid.
Valid record types on the Inquire/Update Entry Panel are:
- V -- Volume
- D -- Data set record
- VD -- Volume followed by Data set
- DV -- Data set followed by Volume
Corrective Action: Specify a valid record type value.

CTT604E OPTION VALID FOR VOLUMES ONLY
Explanation: An option was requested for a data set that is valid only for volumes.
Corrective Action: Refer to the Control-M/Tape User Guide for a list of valid line options for volumes.

CTT605E OPTION INVALID FOR THE CURRENT STATUS OF dsn /vol
Explanation: An option that is not valid for the current status of the data set or volume is specified. For more information about status field values, see the description of the Inquire/Update facility in the Control-M/Tape User Guide.
Corrective Action: Specify an option that is valid for the current status of the data set or volume.

CTT606E RECORD IN USE BY ANOTHER USER
Explanation: Option specified for a data set or volume is in use by another user or job.
Corrective Action: Try the option again later.

CTT607E NO INFORMATION FOUND IN MEDIA DATABASE
Explanation: The requested information was not found in the Media database.
Corrective Action: No action is required.
CTT608E YOU ARE NOT AUTHORIZED TO USE THIS OPTION

**Explanation:** An option was requested for which there is no authorization. The INCONTROL administrator can authorize or deny use of certain options for certain users.

**Corrective Action:** To get authorization to use the option specified, contact your INCONTROL administrator.

CTT609E EXTEND INVALID FOR THE EXPIRATION TYPE OF *vol/dsName*

**Explanation:** The Extend option is requested for a volume or data set entry that cannot be extended. Extend is valid only for an entry with expiration type D (actual Date). Expiration types that are not specific, like MVS CATALOG, cannot be extended.

The Extend option fails.

**Corrective Action:** Use the Extend option only for a volume or data set entry with expiration type D.

CTT610I VOLUME *vol* WAS SENT TO *loc*

**Explanation:** This information message indicates that the requested CHECKOUT, VAULT, or RECALL operation, to transfer a volume to a different location, was executed successfully.

**Corrective Action:** No action is required.

CTT611I VOLUME *vol* WAS RETURNED FROM *loc*

**Explanation:** This information message indicates that line option BACK-IN-LIB was executed successfully. When option BACK-IN-LIB is specified for a volume, the volume location is immediately set to MAINLIB.

**Corrective Action:** No action is required.

CTT612I VOLUME *vol* WAS operation

**Explanation:** This information message indicates that the requested line option (CLEAN, DELETE, UPDATE, or EXPIRE) was successfully executed on the volume.

**Corrective Action:** No action is required.

CTT613I DATASET *dsn* WAS operation

**Explanation:** This information message indicates that the requested line option (UPDATE, EXPIRE, or EXTEND) was successfully executed on the data set.

**Corrective Action:** No action is required.

CTT615E {GROUP | SUBLINES} NOT ALLOWED ON THIS LEVEL

**Explanation:** Either line option G (GROUP) or S (SUBLINES) to open a third level of sublines is specified for the current line. Only two levels of sublines are allowed for each line in screen TI.

**Corrective Action:** Do not specify option G or S for the current line.
CTT616E THERE ARE NO SUBLINES FOR THIS ENTRY

Explanation: Either line option G (GROUP) or S (SUBLINES) is specified to open sublines for a line on screen TI, but the line does not contain sublines.

Corrective Action: Do not specify option G or S for the current line.

CTT617E RECORD CHANGED. TRY AGAIN

Explanation: A line option was requested for a record whose displayed data was no longer current. An option was requested for a line on screen TI, but between the time the screen was displayed and the time the request was made, the corresponding record on the Media Database changed. The request may have been based on outdated data.

The requested line option is not executed.

Corrective Action: Press the Enter key to refresh the screen with current data, and repeat the request again if desired.

CTT618E OPTION NOT SUPPORTED FOR MULTI-VOLUME GROUP

Explanation: Line option E (EXPIRE) was requested for a volume that is a part of a multivolume group. The EXPIRE option is supported for a single volume only.

Corrective Action: Do not specify option E for the current line.

CTT619E OPTION SUPPORTED FOR DATASETS ONLY

Explanation: Line option X (EXTEND) was requested for a volume. The EXTEND option is supported for a data set only.

Corrective Action: Do not specify option X for the current line.

CTT620E UNABLE TO UNCATALOG DATASETS

Explanation: In response to a request for option E (immediate expiration) for a volume, all data sets on the volume were deleted, but the Online Facility cannot uncatalog the data sets from the MVS Catalog. The probable cause of the problem is that the MVS Catalog is not available.

Corrective Action: Call your system programmer for assistance.

CTT621E SILO REQUEST FAILED

Explanation: In response to a request for option E (immediate expiration) for a volume, the volume was scratched in the Media Database and the corresponding SCRATCH request was sent to a Silo Interface. However, the Silo request failed. Error message CTT334E, containing return and reason codes, in the MVS SYSLOG accompanies this message.

Corrective Action: Check the MVS SYSLOG for the return and reason codes in message CTT334E. Proceed accordingly.
INCONTROL for z/OS Messages Manual

CTT623E SLOT slot WAS NOT RELEASED. RC=rc, VAULT=Vault, MEDIA=media

Explanation: A volume expiration request was issued for a vaulted volume. Control-M/Tape cannot release the slot that was assigned to the volume.

Possible values for rc (causes for the failure) are:

- 04 -- Slot Definition Records not in Media Database (MDB) for specified vault.
- 08 -- Internal program error.
- 12 -- Not enough memory.
- 16 -- I/O error.
- 20 -- The specified media was not defined for the specified vault.
- 32 -- The CTTVTM utility is currently running, and updating the Slot Definition Records.

The currently executing function continues. The requested volume becomes scratch in the MDB.

Corrective Action: For a return code of 12 or 16, do one of the following:

- If rc is 12, increase the region size for the executing job's online procedure.
- If rc is 16, notify your INCONTROL administrator.

In all other cases, check the vault definition using the Vault Definition screen (screen TV), and then run the CTTVTM utility in mode SLOTBLD to synchronize the Slot Definition records with the Volume records.

CTT624E BOX CANNOT BE VAULTED MANUALLY

Explanation: Option VAULT was requested in the Inquiry/Update Media DB screen (screen TI) for a volume that is located in a box. This is not permitted since the volume was not previously recalled from a vault. Option VAULT is valid for a volume from a box only if the box was previously recalled from a vault to the MAINLIB.

Corrective Action: No action is required.

CTT625E INVALID DATASET GENERATION QUERY

Explanation: An invalid format was used for data set generation in the DSNAME field in Screen TI, the Control-M/Tape Inquire/Update entry panel. To request data set generation, specify zero or a negative number in parentheses appended to the data set name in the DSNAME field, for example, data set (-1).

No data is displayed until data set generation is specified correctly.

Corrective Action: Correctly specify the data set generation value. For more information, see the DSNAME field in the section that describes entry panel fields in the chapter on online facilities of the Control-M/Tape User Guide.

CTT626E INVALID SORT COMMAND SYNTAX. USE ‘SORT FIELD-NAME A/D’

Explanation: The syntax for the SORT command on the TI screen, the Control-M/Tape Inquire/Update screen, is invalid.

The valid syntax for the SORT command is `SORT field [{A|D}]` where:
• A means sort in ascending order
• D means sort in descending order

For more information about this command, see the section that describes the commands of the Inquire/Update screen in the chapter on online facilities of the Control-M/Tape User Guide. The SORT command is ignored.

**Corrective Action:** Specify the command with valid syntax.

**CTT627E** SORT FIELD UNKNOWN, OR INVALID WITH {VOLUME | DATASET} RECORDS

**Explanation:** The SORT command contains an invalid sort field. Either the specified sort field is unknown or it is not in the current display. This command is used in the Inquire/Update screen (Screen TI).

If data set records are currently displayed, only data set fields can be used to sort displayed records. If volume records are currently displayed, only volume fields can be used to sort displayed records.

The SORT command is ignored.

**Corrective Action:** Specify a valid sort field. Valid field names are listed under the heading External names in tables in the appendix that describes logical field names for the Control-M/Tape repository in the INCONTROL for z/OS Administrator Guide, or the column headers on the TI screen.

**CTT630E** LOCATION NOT FOUND IN THE VAULT PATTERN

**Explanation:** During update of a vaulted volume record using the Volume Update screen, the value specified in the LOCATION field did not match any of the VAULT NAME fields.

**Corrective Action:** Synchronize LOCATION and VAULT NAME fields.

**CTT631E** DATE CANNOT BE LESS THAN PREVIOUS VAULT ENTRY DATE

**Explanation:** During an attempt to update a vaulted volume record using the Volume Update screen, one of the Entry Date fields was specified for a date earlier than the previous entry date.

**Corrective Action:** Correct the erroneous Entry Date field.

**CTT632E** INVALID TYPE retention. VALID RETENTION TYPES ARE CA, CY, DAT, EX, L, P, VA, VO, M

**Explanation:** An invalid UNTIL type specifies the retention period in a DO VAULT statement. The UNTIL type specifies the retention period for which a volser is kept in a vault, and how the period is calculated. A single UNTIL type, or a combination of up to three types, can be specified using the AND/OR field.

See the UNTIL subparameter of DO VAULT in the chapter on rule parameters of the Control-M/Tape User Guide for a description of valid UNTIL types.

**Corrective Action:** Correct the entry by specifying a valid retention type.
**CTT633E INVALID TYPE** retention. **VALID RETENTION TYPES ARE CA, CY, DAT, ED, L, P, R, S, M**

**Explanation:** An invalid RETENTION type was specified in a DO RETENTION statement. The DO RETENTION statement specifies a duration for which a data set is kept. The retention type specified identifies how the duration is calculated. A single retention type, or a combination of up to three different retention types may be specified using the AND/OR field.

For a description of valid RETENTION types, see the RETENTION subparameter of DO VAULT in the rule parameters chapter in the *Control-M/Tape User Guide*.

**Corrective Action:** Correct the entry by specifying a valid retention type.

**CTT634W VAULT PATTERN HAS MORE THAN THREE ENTRIES**

**Explanation:** The user was attempting to update a vaulted volume record using the Volume Update screen, but the volume record contains more than three vault entries in the vault pattern. It is impossible to update such a vault pattern.

All vaulting related fields, such as LOCATION and MOVE DATE, are displayed but cannot be edited.

**Corrective Action:** No action is required.

**CTT635E INVALID DATE** date

**Explanation:** An invalid date was specified in the Volume/Dataset Update screen. The date format is set according to installation parameters and may be either ddmmyy, mmddyy, or yymmdd. Other date fields may be four digits (omit the yy year values) or eight digits (include a four digit year: ddmmyyyy, mmddyyyy or yyyymmdd).

**Corrective Action:** Specify a valid date.

**CTT636E INVALID VALUE** value. **FIELD SHOULD BE NUMERIC**

**Explanation:** A nonnumeric value was specified in a numeric field.

**Corrective Action:** Fill in a numeric value.

**CTT637E INVALID VALUE** value

**Explanation:** An invalid value was specified in a field in the Volume/Dataset Update screen.

**Corrective Action:** Correct the invalid value according to the field contents.

**CTT638E fld VALUE EXCEEDED MAXIMUM**

**Explanation:** The specified field value exceeded the maximum value.

Valid values for fld are:

<table>
<thead>
<tr>
<th>fld</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVE-DS#</td>
<td>Active data set number. The maximum value is 65535.</td>
</tr>
</tbody>
</table>
### fld | Explanation
---|---
LAST-LABEL | Last label on volume. The maximum value is 65535.
V-DATASET | Vaulting data set number. The maximum value is 65535.
RET-DATASET | Retention data set number. The maximum value is 65535.

Corrective Action: Specify a valid value below the maximum.

CTT639E INVALID VALUE `value`. VALID UNITS ARE KB, MB, GB, TB

**Explanation:** An invalid value was specified in the capacity type units fields in the Volume/Dataset Update screen. KB, MB, GB, and TB stand for kilobytes, megabytes, gigabytes, and terabytes.

Corrective Action: Correct the invalid value according to the field contents.

CTT63AE MAXIMUM VALUE IS 2047 TB

**Explanation:** A value greater than the maximum was specified in the capacity value fields in the Volume/Dataset Update screen.

Corrective Action: Correct the invalid value.

CTT645I utility IS RUNNING IN RESTART MODE

**Explanation:** This information message indicates that the previous run of the specified utility abended and the utility is now running in RESTART mode. The utility is either RTM (for CTTRTM) or VTM (for CTTVTM).

Corrective Action: No action is required.

CTT646I INVALID `fileName`. RESTART CANCELED

**Explanation:** The specified file is invalid. RESTART mode cannot continue. Restart is based on information in the specified file. Because the file is invalid, the utility cannot run in RESTART mode. RESTART mode is canceled. The utility continues in NORMAL mode.

Corrective Action: No action is required.

CTT647I RESTART OF `{rtm | vtm}` ENDED SUCCESSFULLY

**Explanation:** This information message indicates that the CTTRTM utility (or the CTTVTM utility) finished processing successfully in Automatic Restart mode.

Corrective Action: No action is required.

CTT648E BOX `boxId` IS IN ERROR

**Explanation:** An error occurred when the CTTVTM utility was handling a Box Definition record while running in Automatic Restart Mode.
This message follows one of the following messages, which detail the error that occurred: CTT200E, CTT209E, CTT459E, or CTM555S.

Control-M/Tape stops handling the Volume records of the problematic Box Definition record. The utility continues processing.

**Corrective Action:** Correct errors that are detailed in the preceding messages.

**Messages CTT700 through CTT7xx**

This group includes messages for the Control-M/Tape product.

**CTT700I** text

**Explanation:** This information message displays one of the following:

- a control statement read from SYSIN
- a parameter specified in a JCL EXEC statement
- information to accompany another message

**Corrective Action:** No action is required.

**CTT701S INCLUDE/EXCLUDE STATEMENT ERROR. FUNCTION=func, RC=rc. EXECUTION WILL TERMINATE**

**Explanation:** A syntax error occurred in an INCLUDE/EXCLUDE statement.

The variables in this message are:

- `func` - the name of the function in which the error occurred
- `rc` - the return code that indicates the type of error for that function

Valid values for `func` and `rc`, and their explanations, are displayed in the following table:

<table>
<thead>
<tr>
<th>Function</th>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>INIT</td>
<td>08</td>
<td>Insufficient memory</td>
</tr>
<tr>
<td></td>
<td>36</td>
<td>Internal error</td>
</tr>
<tr>
<td>BUILD</td>
<td>08</td>
<td>Too many INCLUDE/EXCLUDE statements</td>
</tr>
<tr>
<td></td>
<td>12</td>
<td>The statement is not of the INCLUDE/EXCLUDE type.</td>
</tr>
<tr>
<td>Function</td>
<td>Return Code</td>
<td>Explanation</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
|          | 16          | One of the following problems occurred:  
|          |             | - The parameter specified exceeds 44 characters.  
|          |             | - No parameter was specified.  
|          |             | - The keyword in invalid. It is not in the dictionary.  
|          |             | - The parameter specified is not allowed (not in the dictionary).  
|          | 20          | The > (greater than) or < (less than) relation is not allowed in the specified format.  
|          | 24          | The date value is not numeric.  
|          | 28          | The date value is neither 6 nor 8 digits.  
|          | 32          | Internal error  
|          | 36          | The value is neither numeric nor hexadecimal.  
| SELECT   | 8           | An INCLUDE/EXCLUDE block is empty.  
|          | 32          | Internal error  
|          | 40          | The field being used for comparison contains an invalid numeric value.  

Execution stops.

**Corrective Action:** Correct the statement and rerun the utility.

**CTT702S STATEMENT PARSING ERROR. REASON=rsn. EXECUTION WILL TERMINATE**

**Explanation:** A parsing error occurred in one or more control statements. The reason code (rsn) in the message text indicates the type of error that occurred, as shown in the following table:

<table>
<thead>
<tr>
<th>Utility</th>
<th>rsn</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>All Utilities</td>
<td>4</td>
<td>No keywords were found</td>
</tr>
<tr>
<td></td>
<td>8</td>
<td>Continuation statement is missing</td>
</tr>
<tr>
<td></td>
<td>12</td>
<td>Operation code not found. No keywords parsed.</td>
</tr>
<tr>
<td>Utility</td>
<td>rsn</td>
<td>Explanation</td>
</tr>
<tr>
<td>---------</td>
<td>-----</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>16</td>
<td>No keywords found in the parsed record, or a mandatory keyword was not found.</td>
</tr>
<tr>
<td></td>
<td>20</td>
<td>Redundant data in a parsed record.</td>
</tr>
<tr>
<td></td>
<td>24</td>
<td>Internal error. Missing parameter name in command definition.</td>
</tr>
<tr>
<td></td>
<td>28</td>
<td>More than 255 characters to parse.</td>
</tr>
<tr>
<td></td>
<td>48</td>
<td>More than 31 input parameter lines.</td>
</tr>
<tr>
<td>CTTDLD</td>

<td>74</td>
<td>SPLIT statement is missing.</td>
</tr>
</tbody>
</table>
Utility | rsn | Explanation
---|---|---
| 78 | Invalid MODE parameter. |
| 82 | Invalid FUNCTION parameter. |

Execution is terminated.

**Corrective Action:** Correct the control statement and rerun the utility.

**CTT703I recd_type RECORDS action = num**

**Explanation:** This message is generated to provide additional information from a Control-M/Tape utility.

Message variables are:
- `rec_type` -- The type of records that have been processed.
- `action` -- The action that was performed on the records, for example, read, written, updated, or dropped.
- `num` -- The number of records processed.

**Corrective Action:** No action is required.

**CTT704I CONTROL-M/TAPE UTILITY utility STARTED**

**Explanation:** This information message indicates that a Control-M/Tape utility has started execution.

**Corrective Action:** No action is required.

**CTT705I CONTROL-M/TAPE UTILITY utility ENDED RC=rc**

**Explanation:** This information message indicates that a Control-M/Tape utility has ended with return code `rc`.

**Corrective Action:** No action is required.

**CTT707S PARAMETERS parm1 AND parm2 ARE MUTUALLY EXCLUSIVE**

**Explanation:** The specified parameters passed to the utility are mutually exclusive and therefore cannot be specified together.

The utility does not start processing.

**Corrective Action:** Specify either one of the parameters, but not both.

**CTT708S UNRECOGNIZED POSITIONAL PARAMETER parm**

**Explanation:** The specified positional parameter passed to the utility is unrecognized.

The utility does not start processing.

**Corrective Action:** Refer to the utility description in the *INCONTROL for z/OS Utilities Guide* for information regarding parameters which can be passed to the utility.
CTT709S POSITIONAL PARAMETER parm APPEARED MORE THAN ONCE

**Explanation:** The positional parameter was specified more than once as input to the utility.
The utility does not start processing.

**Corrective Action:** Specify this parameter only once. Refer to the utility description in the *INCONTROL for z/OS Utilities Guide* for more information regarding parameters that can be passed to the utility.

CTT710S STATEMENT VALIDATION ERROR IN KEYWORD keyName, EXECUTION WILL TERMINATE

**Explanation:** Validation error in scanning parameters of the specified keyword.
Execution is terminated.

**Corrective Action:** Correct the keyword parameters and rerun the utility.

CTT711I num RECORDS COPIED

**Explanation:** This information message indicates that the CTTACP utility copied the specified number of records.

**Corrective Action:** No action is required.

CTT712I num STATEMENTS READ FROM SYSIN

**Explanation:** This information message specifies how many control statements SYSIN has read.

**Corrective Action:** No action is required.

CTT713I format TYPE RECORDS - PROCESSED = n1, SELECTED = n2

**Explanation:** This information message indicates that the Stacking Database was built as shown.
The variables in this message are:

- **format** - the track recording format
- **n1** - the number of records read from input
- **n2** - the number of records selected due to INCLUDE/EXCLUDE statements

**Corrective Action:** No action is required.

CTT714I TOTAL OF n1 RECORDS READ n2 DUPLICATE RECORDS WERE DROPPED

**Explanation:** This information message indicates that the Stacking Database was built as shown.
The variables in this message are:

- **n1** - the total number of records read from input
- **n2** - the total number of records ignored because they appeared in a previous execution of the utility

**Corrective Action:** No action is required.
CTT715S ROUTINE routineName FAILED. RC=rc

Explanation: A severe internal error occurred in the specified routine.
The variables in this message are:
- routine - the routine in which the error occurred
- rc - the return code of the routine
Execution is terminated.
Corrective Action: Check accompanying messages.

CTT716S {RETENTION | VAULTING} PROCEDURE ENDED WITH ERRORS

Explanation: Due to logical errors on the Media Database (MDB), a retention or a vaulting procedure ended with errors. This message follows other messages that indicate the exact nature of the problem.
The procedure terminates with errors.
Corrective Action: Check the accompanying error messages, and proceed accordingly.

CTT717E INVALID EXPIRATION DATA. RECORD KEY=key

Explanation: The data set or volume record contains invalid expiration information.
The CTTRTM (CTTVTM) utility skips the bad record and continues executing.
Corrective Action: Contact your database administrator.

CTT718I ANOTHER CTT UTILITY IS USING THE MDB. TRY AGAIN LATER

Explanation: This information message indicates that the requested utility requires, but cannot access, the Media Database, which is in use by another utility. Simultaneous access to the Media Database by these utilities might corrupt the data. Therefore, only one of the utilities at a time can access the database.
Corrective Action: Run the requested Control-M/Tape utility after the previous utility has ended.

CTT719E {POOL | RULE | VAULT} DEFINITION LOAD FAILED

Explanation: Control-M/Tape cannot load the Pool, Rule, or Vault definition into memory, for one of the following reasons:
- The member is not in the Control-M/Tape PARM or RULE library.
- There was an invalid allocation of the Control-M/Tape PARM or RULE library.
- There is some other definition problem.
Execution stops.
Corrective Action: Examine the job log and the IOA log for messages relating to this error, and take appropriate corrective action.

CTT720E VAULT vault NOT FOUND. VOLUME=vol

Explanation: Control-M/Tape did not find the vault name vault in the vault definition.
Control-M/Tape moves the volume to the vault, and continues processing.

**Corrective Action:** Add the vault to the vault definition using the Vault Definition screen.

**CTT721E INVALID LOCATION loc FOR VOLUME vol**

**Explanation:** Volume was marked as vaulted, but the current vault name (location) is not in the volume vault list.

The CTTVTM utility skips the volume, and continues executing.

**Corrective Action:** Contact your INCONTROL administrator.

**CTT722E INTERNAL ERROR IN DATA. RECORD=key**

**Explanation:** Control-M/Tape detected one of the following errors in the indicated record:

- The creation date on a data set record is either invalid or not specified (DDSCDT).
- An invalid last access operation on a data set record (DDSLACS).
- The last read or write date is not defined (DDSRDT or DDSWDT).
- The last data set label number is not specified on a volume record (DVLLBLNM).
- No data set found for an active volume.

This message is issued by the Online Facility, by the CTTRTM utility, or by the CTTVTM utility. Execution continues with another record from the Media Database.

**Corrective Action:** Notify your database administrator.

**CTT723E CHAIN ERROR ON VOLUME vol**

**Explanation:** A Control-M/Tape utility detected a multivolume chain error. Possible causes are:

- A volume record was found that has a first, next or previous VOLSER specification, but the related VOLSER was not found in the Media Database.
- A multivolume chain with no data sets was found. The specified volume is a member of this multivolume chain.

This message is accompanied by other messages that provide additional information about the problematic record.

**Corrective Action:** No action is required.

**CTT724I VOLSER=volser ; RBA=rba ; \{FIRST | NEXT | PREV\} = volser ; \{LABEL = lbl\| DSN = dsn \}**

**Explanation:** This information message provides information about a volser that caused an error. It accompanies error messages issued by other utilities.

**Corrective Action:** No action is required.
CTT725W CHAIN INCOMPLETE BECAUSE OF INCLUDE/EXCLUDE SELECTION OR CHAIN ERROR

**Explanation:** The CTTVTM utility detected an incomplete multivolume chain. Possible causes are:

- The INCLUDE/EXCLUDE specification does not contain all the volser of the chain.
- A volume record was found that has a first, next or previous VOLSER specification, but the related VOLSER was not found in the Media Database.

This message is accompanied by message CTT724I, which provides additional information (VOLSER and RBA) about the problematic/missing record.

**Corrective Action:** No action is required.

CTT726E VOLUME vol NOT IN SEQUENCE (seqNumber)

**Explanation:** A Control-M/Tape utility detected that the seq_no sequence number in the vol volume is out of sequence in the volume chain. This problem generally relates to the conversion process.

**Corrective Action:** No action is required.

CTT727E CTTRPT FAILED. RC=rc, STATEMENT={FIELDS | SORTBY | BREAK}, PARM=parmName, ROW=row_id

**Explanation:** The CTTRPT utility, invoked directly or called internally by another utility, failed due to an invalid value in the parmName parameter.

In this message, row_id is the ROWID specified in a BREAK or SORTBY statement. The type of error is indicated by the return code (rc), as follows:

<table>
<thead>
<tr>
<th>rc</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>08</td>
<td>Missing DD statements or open error occurred.</td>
</tr>
<tr>
<td>12</td>
<td>Control card error.</td>
</tr>
<tr>
<td>16</td>
<td>Operation code not found.</td>
</tr>
<tr>
<td>20</td>
<td>Invalid operation code.</td>
</tr>
<tr>
<td>24</td>
<td>Syntax error in REPORT, FIELDS or SORTBY statement.</td>
</tr>
<tr>
<td>28</td>
<td>Field name specified in FIELDS or SORTBY list is undefined.</td>
</tr>
<tr>
<td>32</td>
<td>Same parameter specified more than once.</td>
</tr>
<tr>
<td>36</td>
<td>Field name exceeds maximum length.</td>
</tr>
<tr>
<td>40</td>
<td>Invalid relation specified (must always be an equal sign).</td>
</tr>
<tr>
<td>44</td>
<td>Report NAME is undefined.</td>
</tr>
<tr>
<td>rc</td>
<td>Explanation</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>48</td>
<td>BRK not specified for the preceding field in the SORTBY list.</td>
</tr>
<tr>
<td>52</td>
<td>FIELDS statement not specified.</td>
</tr>
<tr>
<td>56</td>
<td>Total of all field lengths requested in the FIELDS statement exceeds the line size.</td>
</tr>
<tr>
<td>60</td>
<td>Continuation card expected but not received.</td>
</tr>
<tr>
<td>64</td>
<td>Invalid numeric value.</td>
</tr>
<tr>
<td>68</td>
<td>Option in the FIELDS or SORTBY statement already specified.</td>
</tr>
<tr>
<td>72</td>
<td>ROWID specified in the BREAK or SORTBY statement.</td>
</tr>
<tr>
<td>76</td>
<td>EDIT parameter in the ATTR statement is invalid for the specified FIELDS.</td>
</tr>
<tr>
<td>80</td>
<td>EDIT mask is not valid.</td>
</tr>
</tbody>
</table>
| 84 | Specified number not in permitted range.  
For example, the end column of a MARGIN statement exceeds the LINESIZE, or a column in a FIELDS statement is outside the margins of the report. |
| 88 | Column option (/C) not specified in the preceding field. |
| 92 | One of the following has occurred:  
- No column is specified in the current FIELDS statement.  
- The specified column in a FIELDS statement is inconsistent with the column specified in another FIELDS statement |
| 108 | Insufficient memory. |
| 112 | All fields specified for the primary and secondary line have the BRK attribute |
| 200 | Fields in the FIELDS or SORTBY statements do not fit the PATH parameter of the EXTRACT statement. |

The utility is stopped.

**Corrective Action:** Depending on the return code, check and correct the appropriate parameters or DD statements.

CTT728I CONTROL-M/TAPE UTILITY *util* IS RUNNING. MDB UPDATES DELAYED

**Explanation:** This information message is issued upon the start of an IDB utility, which checks and analyzes Media Database integrity.
The message is highlighted and unrollable until the utility has finished accessing the Media Database.

**Corrective Action:** No action is required.

**CTT729E CONTINUATION RECORD NOT FOUND FOR VOLUME volser**

**Explanation:** Control-M/Tape tried to expire a volume that has continuation records (DTR records) that are not in the Media Database. This message is issued by either the Online Facility or by the CTTRTM utility.

**Corrective Action:** Notify your database administrator.

**CTT730E MAXIMUM CAPACITY EXCEEDED FOR MEDIA type**

**Explanation:** The value specified in the CAPACITY USD field exceeded the maximum capacity value defined in CTTPARM for the type media type. An attempt was made to update the CAPACITY USD field on a volume record through screen TI.

**Corrective Action:** Decrease the value in the CAPACITY USD field.

**CTT731E LAST LABEL NUMBER CANNOT BE BELOW NUMBER OF ACTIVE DATASETS**

**Explanation:** The value in the LAST LABEL field is invalid.

This message is issued in one of the following circumstances:

- Using Screen TI, an attempt was made to update either the ACTIVE DS# field or the LAST LABEL field on a volume record in a manner that would result in the LAST LABEL field value being less than the ACTIVE DS# field value.
- There is an active data set with a label number that is higher than the value in the LAST LABEL field.

In the Control-M/Tape database:

- the ACTIVE DS# field is called ACTIVEDS
- the LAST LABEL field is called LBLNUM

**Corrective Action:** Adjust the value in the LAST LABEL field to a number equal to the highest label number of all the active data sets on the volume.

**CTT732E VOLUME vol IS ACTIVE AND HAS NO DATASETS**

**Explanation:** A utility detected a volume data record which is marked as active, but the volume has no associated data set.

The utility continues processing.

**Corrective Action:** Contact your database administrator for assistance.
CTT733E NUMBER OF ACTIVE DATASETS CANNOT BE BELOW NUMBER OF EXISTING DATASETS

**Explanation:** The value in the FILES field cannot be less than the actual number of data sets which reside on the selected volume. An attempt was made to update the FILES field on a volume record through Screen TI.

**Corrective Action:** Increase the value in the FILES field so that it is not less than the actual number of data sets on the volume.

CTT734E DATASET *num* DOES NOT EXIST ON THE VOLUME

**Explanation:** The user tried to update the DATASET NUM field within Vaulting Information on a volume record, but a data set with label number *num* was not found on the selected volume.

**Corrective Action:** Correct the value in the DATASET NUM field.

CTT735E MAXIMUM PREFIX NAME LENGTH EXCEEDED

**Explanation:** An attempt was made to update the DSNAME PREF LTH field in Vaulting Information on a volume record with a value greater than 44. The maximum value for the DSNAME PREF LTH field is 44.

**Corrective Action:** Decrease the value in the DSNAME PREF LTH field to a value not greater than 44.

CTT736E DUPLICATE {VOLUME | DATASET}: *rkey*

**Explanation:** The CTTIDB utility detected two or more data records with the same key (*rkey*).

The utility continues processing.

**Corrective Action:** Contact your database administrator for assistance.

CTT737E MAXIMUM NUMBER OF MEDIA BLOCKS EXCEEDED. VAULT *vault*

**Explanation:** The CTTVTM utility detected more than 10 different media types defined for the specified vault. No more than 10 media types can be defined for a vault.

Only the first 10 media types are considered by the CTTVTM utility. The utility continues processing.

**Corrective Action:** Decrease the number of media types in the vault definition through screen TV.

CTT738E VAULT *vault* NOT DEFINED

**Explanation:** The Media Database contains information about slot assignment in the specified vault, but that vault is not defined through screen TV.

The CTTVTM utility continues processing.

**Corrective Action:** If the vault should be defined, define it through screen TV. Otherwise, ignore the message.

CTT739E MEDIA *mediaName* NOT DEFINED FOR VAULT *vault*

**Explanation:** The *mediaName* media type is not defined for the vault through screen TV.

The CTTVTM utility continues processing.
Corrective Action: Define the media type for the vault from screen TV.

CTT740W VOLUME *vol* SKIPPED. RANGE INVALID

Explanation: The CTTDLD utility, with TYPERUN set to CONVERT, detected a volume with VOLSER set to *vol* that was not defined in a RANGE statement.

The specified volume is not converted.

Corrective Action: Correct the definition of the RANGE statement.

CTT742W DUPLICATE DATASETS ON SAME VOLUME - VOL=SER=*volser* LABEL=*lbl*. DATASET NOT ADDED

Explanation: The CTTDLD utility, with TYPERUN set to CONVERT, detected a volume (*volser*) with multiple data sets residing on the same label.

Only one data set is added to the Media Database (MDB).

Corrective Action: List the data sets of the volume and define the data sets on it manually.

CTT743W VOLUME *vol* IS NOT A SCRATCH VOLUME. VOLUME NOT DELETED

Explanation: The CTTDLD utility, with TYPERUN set to DELETE, detected a non-scratch volume to be deleted from the Media Database (MDB).

The volume is not deleted.

Corrective Action: Check the status of the volume and verify why it is not scratch.

CTT744S RETENTION TYPE NOT RECOGNIZED. TYPE=*type* RMFKEY=*key*

Explanation: During conversion from CA-TLMS RMF (Retention Master File), an invalid retention type was detected in the input.

The volumes that will contain the data set indicated in the RMFKEY are assigned a permanent retention type.

Corrective Action: Check and correct the data set retention type in the Control-M/Tape rule definition.

CTT745S CONDITIONS IN VAULT PATTERN CONTROL STATEMENT EXCEEDED. DSN=*dsName*

Explanation: The conversion program encountered too many vault control statements in the definition file being converted.

The extra conditions are ignored.

Corrective Action: Check your CA-1 vault management definition for valid conditions.

CTT746W control NOT SUPPORTED. DSN=*dsName*

Explanation: The control value specified for the data set name is not relevant for Control-M/Tape.

The control statement is ignored. Conversion continues.
**Corrective Action:** No action is required.

**CTT747S INSTALLATION NOT IN UCC-1**

**Explanation:** The conversion routine that converts CA-1 VMS or VPDS to Control-M/Tape rules discovered that the input parameters were set for a non UCC-1 installation. The CTTCVMS program checks the EXPDTYPE parameter in the CTTPARM, and issues this message if the parameter is not set to CA1.

Rule conversion is stopped.

**Corrective Action:** Change the EXPDTYPE in the CTTPARM to CA1, if you are converting from CA-1 to Control-M/Tape.

**CTT748W EXPIRATION DATE: date NOT SUPPORTED. VOL=vol**

**Explanation:** The CTTDLD utility, with TYPERUN set to CONVERT, detected an unrecognizable expiration date.

The specified volume with this expiration date is assigned a permanent expiration date.

**Corrective Action:** Check volume retention type and date. Redefine it in the Control-M/Tape Inquire/Update Entry Panel if permanent status is incorrect.

**CTT749E INVALID COMBINATION OF FIRST,LAST AND RENAME FIELDS**

**Explanation:** An invalid combination of FIRST, LAST and RENAME values was used in a RANGE statement. The length of the string specified for RENAME must not exceed the length of the corresponding part of the FIRST and LAST prefixes. The FIRST and LAST prefixes must be identical.

The CTTDLD utility is terminated.

**Corrective Action:** Correct the RANGE statement and rerun the CTTDLD utility.

**Messages CTT800 through CTT8xx**

This group includes messages for the Control-M/Tape product.

**CTT801I CONTROL-M/TAPE rel REAL-TIME ENVIRONMENT IS ACTIVE**

**Explanation:** This information message indicates that the real-time environment was successfully established.

In this message, rel is the specific release of Control-M/Tape.

**Corrective Action:** No action is required.

**CTT802E CONTROL-M/TAPE INITIALIZATION FAILED. RC rc IN PHASE phase_num**

**Explanation:** The initialization of Control-M/Tape activated by the CTTINIT procedure failed due to an error. This message is preceded by a message that identifies the error that caused the initialization failure.

Initialization terminates and the already-created environment is removed from the system.
Corrective Action: Notify your INCONTROL administrator.

CTT803E STARTSTK IS NOT ALLOWED. CONTROL-M/TAPE WAS INITIALIZED WITH DYNSTK=N

Explanation: Dynamic stacking cannot be activated if Control-M/Tape was initialized without dynamic stacking, meaning that the DYNSTK parameter was set to N in CTTPARM.

STARTSTK is not performed. Control-M/Tape continues to work in NOSTACK mode.

Corrective Action: If you want to utilize dynamic stacking, do the following:
1. Change the value of the DYNSTK parameter in CTTPARM to Y.
2. Stop and restart the Control-M/Tape real time environment.

If you later want to stop dynamic stacking temporarily, use the CTTINIT setting MODE=STOPSTK. To stop it for a longer period, set DYNSTK to N.

CTT804I Control-M/TAPE rel REAL-TIME ENVIRONMENT DELETED

Explanation: This information message indicates that the real-time environment was successfully removed from the system. The CTTINIT procedure was activated with MODE set to TERM to delete the previously established environment.

In this message, rel is the specific release of Control-M/Tape.

The system operates now without Control-M/Tape.

Corrective Action: No action is required.

CTT805E func FAILED WITH RC rc REASON rsn FOR DATASET dsn

Explanation: The specified MVS function (LOCATE or OBTAIN) failed for a Control-M/Tape file. All the Control-M/Tape files are accessed by the CTTINIT procedure, and should exist on the CPU where each is activated. The LOCATE function could fail if the data set is not cataloged. The OBTAIN function could fail if it is cataloged on a wrong volume.

The return code in the message is a SVC99 MVS return code.

Initialization terminates.

Corrective Action: Check that the data set in the message matches the name specified in installation the DBPREF parameter in the CTTPARM member. Make sure that the data set exists and is cataloged on the correct volume.

CTT806E UCBSCAN FAILED WITH RC rc FOR VOL vol

Explanation: The specified volume could not be located in the system.

Initialization terminates.

Corrective Action: Check that the volume is accessible from the CPU where the CTTINIT procedure was activated.
CTT807E CONTROL-M/TAPE REAL-TIME ENVIRONMENT IS ALREADY ACTIVE

**Explanation:** The CTTINIT procedure was started with MODE set to either

- INIT - to initialize Control-M/tape environment
- VERIFY - to verify Control-M/tape interfaces could be applied

while the INIT/VERIFY process reveals that the Control-M/Tape real-time environment was already active in this CPU.

The INIT/VERIFY process is not started.

**Corrective Action:** Either use the existing Control-M/Tape environment or delete the existing one before trying to INIT/VERIFY a new one.

CTT808W CONTROL-M/TAPE OPERATES IN *op_mode* MODE

**Explanation:** The Control-M/Tape operation mode is set to one of the following modes: TEST, ACTIVE, SUSPEND, DORMANT, STACKING, or NO-STACK.

Control-M/Tape operates according to the mode, as follows:

- TEST - Information is recorded in the Media Database (MDB); however, there is no intervention in the running of jobs (shadow mode).
- ACTIVE - All functions are under Control-M/Tape control.
- SUSPEND - All media access is suspended.
- DORMANT - All media access is performed without Control-M/Tape control. No information is recorded in the MDB.
- STACKING - Dynamic stacking is performed.
- NO-STACK - Dynamic stacking is not performed.

**Corrective Action:** No action is required.

CTT809I CONTROL-M/TAPE *func* STARTED

**Explanation:** This information message indicates that the Control-M/Tape initialization or termination process was started by the CTTINIT procedure.

**Corrective Action:** No action is required.

CTT810I CONTROL-M/TAPE RELOAD *modName*/*tbl_typ* ENDED. RC=rc

**Explanation:** This information message indicates that the reload function for a module (for example, user exit) or tables (rules, pools or vaults) was performed. When Control-M/Tape is activated in the system, certain components can be reloaded (refreshed with a new copy). Reload can be performed for the following:
- Modules - Mainly user exits but also Control-M/Tape internal modules.
- Rules - All the rules (as specified in the RULLIST member) are reloaded.
- Pools - All the defined rules (as specified in the DAPOOLS member) are reloaded.
- Vaults - All the defined vaults (as specified in the DAVLTS member) are reloaded.

Upon successful completion, the system operates with the new modules or tables.

Corrective Action: No action is required.

CTT811I CONTROL-M/TAPE DYNAMIC component func SUCCESSFULLY

Explanation: This information message indicates that the specified dynamic installation component function was successfully performed (for example, applied, removed).

The dynamic installation function can be optionally performed according to installation parameters for each of the following components:
- SVC - Control-M/Tape SVC; controlled by the DYNSVC parameter.
- WTO Interface - WTO intercept; controlled by the DYNWTO parameter.
- VOLSTAT INTR - VOLSTAT interface; no available parameter.
- O/C/E Exits - MVS Tape Label Processing Exits; controlled by the DYNINTR parameter.
- FAST-POSITION - fast position feature; no available parameter.
- IEFDB401 Exit - MVS IEFDB401 Exit; controlled by the STKALCD parameter.

Corrective Action: No action is required.

CTT812E CONTROL-M/TAPE DYNAMIC INSTALLATION FAILED. RC=rc

Explanation: The dynamic installation function (for example, APPLY, REMOVE) failed with the specified return code (rc). This function can also be performed according to installation parameters on operating system interfaces, the SVC, and the WTO intercept. This message follows a message about a failure to a component.

Processing terminates immediately.

Corrective Action: Check preceding error messages for details about the error and notify your INCONTROL administrator.

CTT813E CONTROL-M/TAPE SVC NUMBER (svc_num) IS BEING USED BY ANOTHER PRODUCT

Explanation: SVC number svc_num is already defined for another purpose not related to Control-M/Tape. The SVC number that was specified for Control-M/Tape during installation time in the CTTPARM member is already defined in the system. Control-M/Tape does not replace it with its own SVC.

Dynamic installation of the SVC fails, and the currently executing function is terminated.

Corrective Action: Either change the SVC number in the CTTPARM member to an unused number, or remove the older definition from the system.
INCONTROL for z/OS Messages Manual

CTT814W CONTROL-M/TAPE SVC (svc_num) IS NOT INSTALLED

**Explanation:** SVC svc_num is not installed in the system. The SVC is used by all Control-M/Tape real-time functions. Therefore, as part of the initialization process, the existence of the SVC is checked. This message indicates that although the dynamic SVC installation was not required (DYNSVC was set to N in the CTTPARM member), the SVC is not properly defined.

The currently executing function continues without defining the SVC since dynamic definition was not requested.

**Corrective Action:** Check why the SVC was not properly defined, or change the installation parameters to perform dynamic SVC installation (set DYNSVC to Y).

CTT815E CONTROL-M/TAPE SVC (svc_num) IS ALREADY INSTALLED

**Explanation:** The APPLY option of Control-M/Tape could not install SVC svc_num, because it was already in the system. Before installing the specified SVC, the CTTINIT procedure of Control-M/Tape checks to see if it already exists in the system.

The SVC may be already in the system for one of the following reasons:
- This SVC was already installed by some method other than Control-M/Tape.
- Another Control-M/Tape installed this SVC and did not remove it, either because the other Control-M/Tape is still running, or because a severe error occurred and it did not shut down properly.

The attempt to install the SVC stops, and the initialization process stops.

**Corrective Action:** Check earlier errors, or do one of the following:
- If no other release of Control-M/Tape is running, check that the DYNSVC installation parameter in the CTTPARM member is specified correctly.
- If another release of Control-M/Tape is already running, use the PARALLEL installation parameter.

For more information, refer to the INCONTROL for z/OS Upgrade Guide.

CTT816E CONTROL-M/TAPE SVC (svc_num) func FAILED. RC=rc

**Explanation:** SVC svc_num could not be dynamically installed or removed from the system.

The SVC is not installed or removed. The currently executing function stops.

**Corrective Action:** Check preceding error messages for details. Notify your INCONTROL administrator.

CTT817W CONTROL-M/TAPE interceptName INTERCEPT IS NOT INSTALLED

**Explanation:** Although dynamic installation was not required, the specified intercept is not installed or properly defined in the system. As part of the initialization process, the existence of the intercept is checked.

Valid values for interceptName are WTO or VOLSTAT.

The currently executing function continues without installing the intercept.

**Corrective Action:** Check why the intercept was not properly installed, or change the installation parameters to perform dynamic installation.
CTT818E CONTROL-M/TAPE interceptName INTERCEPT IS ALREADY INSTALLED

Explanation: The APPLY option of Control-M/Tape could not install the specified intercept because it was already in the system. Before installing the specified intercept, the CTTINIT procedure of Control-M/Tape checks to see if it already exists in the system.

The intercept may be already in the system for one of the following reasons:

- This intercept was already installed by some method other than Control-M/Tape.
- Another Control-M/Tape installed this intercept and did not remove it, either because the other Control-M/Tape is still running or because a severe error occurred and it did not shut down properly.

Valid values for interceptName are WTO or VOLSTAT.

The attempt to install the intercept stops.

Corrective Action: Check earlier errors or do one of the following:

- If no other release of Control-M/Tape is running and interceptName is WTO, check that the DYNWTO installation parameter in the CTTPARM member is specified correctly.
- If another release of Control-M/Tape is already running, use the PARALLEL installation parameter.

Consult the INCONTROL for z/OS Upgrade Guide.

CTT819E CONTROL-M/TAPE interceptName INTERCEPT func FAILED. RC=rc

Explanation: The specified intercept could not be dynamically installed or removed from the system.

Possible values of interceptName are WTO or VOLSTAT.

The specified intercept is not reinstalled or removed. The currently executing function is terminated.

Corrective Action: Check preceding error messages for details about the error. Notify your INCONTROL administrator.

CTT81AW THE PARAMETER CTVINTR HAS BEEN FORCED TO 'NONE'

Explanation: The real-time value of the parameter CTVINTR has been changed to 'NONE'. Control-M/Tape changes the real-time value of CTVINTR to 'NONE' and continues to run.

Corrective Action: No response required.

CTT81BW CONTROL-M/TAPE OPERATES WITH ACTIVATED CONTROL-V INTERFACE

Explanation: The real-time value of the parameter CTVINTR is other than 'NONE'. Control-M/Tape continues to use the current value of the CTVINTR parameter.

Corrective Action: Change the Control-M/Tape CTVINTR parameter in the member CTTPARM to 'NONE'. Then issue the following command, which updates the system with the new value:

S CTTINIT,PARM='MODE=RELOAD,TBLT=PARM'
CTT820W CONTROL-M/TAPE component NOT APPLIED

**Explanation:** One of the following situations occurs:

- If the component is FAST-POSITION, then Control-M/Tape finds that the fast position intercept is already applied and therefore bypasses its installation.

- If the component is O/C/E EXITS and the DYNINTR parameter is set to N, then the MVS Tape Label Processing Exits are not applied in the system, since their installation is not required. The MVS Tape Label Processing Exits are used by all Control-M/Tape real-time functions. Therefore, as part of the initialization process, the existence of these interfaces is checked.

- If the component is O/C/E EXITS and the DYNINTR parameter is set to Y, then the MVS Tape Label Processing Exits were already applied in the system, since their installation was required. The MVS Tape Label Processing Exits are used by all Control-M/Tape real-time functions. Therefore, as part of the initialization process, the existence of these interfaces is checked.

The currently executing function continues without installation of the specified component

**Corrective Action:** No action is required.

CTT821E CONTROL-M/TAPE component ALREADY APPLIED

**Explanation:** The APPLY option of Control-M/Tape could not install the specified component because it is already in the system. Before installing the specified component, the CTTINIT procedure of Control-M/Tape checks to see if it already exists in the correct place in the system.

The component may be already in the system for one of the following reasons:

- It was already installed statically using ICE via SMP/E user mode.

- Another Control-M/Tape installed it and did not remove it, either because the other Control-M/Tape is still running or because a severe error occurred and it did not shut down properly.

The attempt to install the interfaces stops, and the initialization process stops.

**Corrective Action:** Check earlier errors or do one of the following:

- If no other release of Control-M/Tape is running, check that the DYNINTR installation parameter in the CTTPARM member is specified correctly.

- If another release of Control-M/Tape is already running, use the PARALLEL installation parameter.

Consult the *INCONTROL for z/OS Upgrade Guide*.

CTT822E CONTROL-M/TAPE componentfunc FAILED. RC=rc

**Explanation:** The component could not be dynamically installed or removed from the system. The component is not installed or removed. The currently executing function is terminated.

**Corrective Action:** Check preceding error messages for details about the error.

CTT823S INITIALIZATION OF SUBSYSTEM subsys FAILED. RC=rc

**Explanation:** Due to internal error, activation of a Control-M/Tape subsystem failed. The initialization process stops and the already created environment is removed from the system.

**Corrective Action:** Notify your INCONTROL administrator.
CTT824E CONTROL-M/TAPE TERMINATION HALTED. THE FOLLOWING JOBS ARE ACTIVE:

**Explanation:** Termination of Control-M/Tape cannot continue because Control-M/Tape detected active jobs that use removable media in the system. When active jobs that use removable media are still active, Control-M/Tape cannot stop. This message is followed by one or more CTT825I messages that identify the active jobs.

Control-M/Tape does not terminate.

**Corrective Action:** No action is required.

CTT825I JOBNAME: jobName JOBID: jobId

**Explanation:** This information message identifies the name and ID of an active job in the system that uses removable media.

This message accompanies message CTT824E. There is one CTT825I message for each active job that uses removable media. The last CTT825I message is followed by message CTT826A.

**Corrective Action:** No action is required.

CTT826A TO CONTINUE CONTROL-M/TAPE TERMINATION, REPLY ‘R’-RETRY, ‘A’-ABORT, OR ‘F’-FORCE

**Explanation:** There was an attempt to terminate Control-M/Tape while there are still active jobs in the system that use removable media.

This message asks what to do next, as follows.

- **R** (Retry) -- Check again for active jobs.
- **A** (Abort) -- Fail the termination request and continue processing.
- **F** (Force) -- Continue the termination request regardless of the active jobs status.

This message follows message CTT825I.

The CTTINIT procedure waits for the operator reply.

**Corrective Action:** Reply to the message.

Note:

Using the FORCE option is not recommended. If you use this option, the removable media used by the active jobs will not be updated in the Control-M/Tape repository, and jobs might abend. Also, other unpredictable situations could occur, that sometimes might be resolved only by IPL.

CTT827S UNABLE TO REMOVE component. ENTERING DORMANT MODE

**Explanation:** Termination of Control-M/Tape failed because Control-M/Tape was unable to remove the specified component. Since termination cannot continue, Control-M/Tape enters DORMANT mode.

This message follows a specific error message, which identifies the error.

Termination of Control-M/Tape stops. Control-M/Tape enters DORMANT mode.

**Corrective Action:** Look for previous Control-M/Tape messages and check why Control-M/Tape failed to remove the specified component. Then proceed accordingly.
CTT828I TERMINATION ABORTED BY OPERATOR. PROCESSING CONTINUES

Explanation: This information message indicates that the operator instructed Control-M/Tape to abort termination, probably because termination of Control-M/Tape was in progress when Control-M/Tape informed the operator about active jobs in the system.

This message follows message CTT826A.

Normal processing continues.

Corrective Action: No action is required.

CTT829E CTTINIT CANNOT PROCEED BECAUSE ANOTHER CTTINIT IS ALREADY ACTIVE

Explanation: A CTTINIT operation was attempted while another was already operating. The current run of the CTTINIT utility cannot proceed until the old one ends.

The new CTTINIT is ended.

Corrective Action: Restart the CTTINIT utility after the conclusion of the current run of the CTTINIT utility.

CTT830S PASSWORD CHECK FAILED

Explanation: The CTTINIT utility discovered an error in the Control-M/Tape password.

This message follows other messages that detail the error and password.

The CTTINIT procedure stops.

Corrective Action: Check the job log of CTTINIT for previous messages that refer to this failure, and proceed accordingly.

CTT831W CONTROL-M/TAPE TRACE FILE AND MDB BOTH RESIDE ON THE SAME VOLUME (vol)

Explanation: The Media Database (MDB) and the Trace (TRC) file are on the specified volume. Control-M/Tape initialization continues.

Corrective Action: As soon as possible, move the TRC file to a different volume from the one holding the MDB. Control-M/Tape must be inactive when the file is moved.

CTT832E CONTROL-M/TAPE SUBSYSTEM IS NOT DEFINED

Explanation: A Control-M/Tape subsystem was not statically defined. Because the TSSALLOC parameter in the CTTPARM member was set to N, Control-M/Tape does not dynamically define its subsystem during initialization.
The Control-M/Tape real time environment is not initialized.

**Corrective Action:** Either change the value of the TSSALLOC parameter in the CTTPARM member to Y, or define the Control-M/Tape subsystem statically.

For more information, see the description of the TSSALLOC parameter in the Control-M/Tape chapter of the *INCONTROL for z/OS Installation Guide*.

**CTT833I** CONTROL-M/TAPE IS UNABLE TO RELEASE THE RULES BECAUSE THEY ARE IN USE BY ANOTHER PROCESS

**Explanation:** When Control-M/Tape reloads rules following operator request `RELOAD, TBLT=RULE`, it first loads the new set of rules into memory and makes them active. Then, after several seconds, it releases the old set of rules, unless there are active processes using these old rules. This message indicates that there is at least one active process still using the old set of rules.

This message is followed by message CTT834A.

**Corrective Action:** Implement one of the options specified in message CTT834A.

**CTT834A** TO CONTINUE, REPLY 'R' - RETRY OR 'F' - FORCE

**Explanation:** In the situation described by message CTT833I, the user has the following response options:

- **F**—Control-M/Tape retries releasing the old set of rules immediately.
- **R**—Control-M/Tape retries releasing the old set of rules after a short delay.

**Corrective Action:** Implement the appropriate option.

**CTT835S** DYNAMIC INSTALLATION FOR EXIT `exitName` FAILED. RC=`rc` REASON=`rsn`

**Explanation:** During Control-M/Tape real time environment initialization, the dynamic installation for the `exitName` exit failed.

Control-M/Tape real-time environment initialization is terminated.

**Corrective Action:** Refer to IBM documentation along with the return code and reason code displayed in the message to understand why Control-M/Tape could not dynamically install the exit.

**CTT840E** KEY CHANGED. UPDATE FAILED FOR RECORD `rcrd_type`

**Explanation:** When updating a record using function RECUPD, an attempt was made to change the record key, (for example, the VOLSER in the volume record).

Execution of the RECUPD function is terminated, and the record is not updated.

**Corrective Action:** The record key cannot be updated directly. Instead, first delete the record, and then add a new one with the required key. If you inadvertently try to change the key by specifying an invalid offset in the REP statement, correct the control REP statement accordingly.
CTT841E VOLSER volser DOES NOT MATCH POOL poolName

**Explanation:** When trying to add a data set to the Media Database (MDB) using the DSNADD function, the selected pool specified in the corresponding Control-M/Tape rule did not contain the volser in which the data set resides.

The variables in this message are:

- **poolName** - the pool specified in the corresponding Control-M/Tape rule
- **volser** - the volser in which the data set resides

Execution of the DSNADD function is terminated. The data set is not added.

**Corrective Action:** Synchronize the DSVOLSER parameter with the pool definition.

CTT842W CTTVTM SHOULD RUN IN MODE={SLOTBLD | BOXBLD} AFTER UPDATING THE VOLUME

**Explanation:** The CTTMUP utility issues this message when volume record fields that are related to vaulting are modified. When vaulting related fields are modified in a volume record, the corresponding vault, slot and box records need to be modified to reflect the changes made in the volume record. The CTTVTM utility performs the necessary synchronization in the indicated mode.

The CTTMUP utility continues.

**Corrective Action:** Run the CTTVTM utility in SLOTBLD or BOXBLD mode as indicated by the message.

CTT850S RULE ORDER LIST IS EMPTY. DDNAME="DARULLST"

**Explanation:** Open of a rule list data set failed (the DARULLST DD statement).

Possible causes are:

- The DARULLST DD statement is missing.
- The data set described by the DARULLST DD statement cannot be opened for sequential read or the record length is not 80.

The CTTINIT procedure stops.

**Corrective Action:** Correct the JCL and restart the CTTINIT procedure.

CTT851S INVALID DATA IN RULE ORDER LIST CARDS

**Explanation:** Invalid data has been found in the rule order list.

The CTTINIT procedure stops.

**Corrective Action:** Check the format of the rule order list in the PARM library; correct and restart the CTTINIT procedure.

CTT852S ORDER OF TABLE tableName RULE ruleName FAILED

**Explanation:** The order of rule ruleName from table tableName failed. This message is preceded by messages which explain why the rule table could not be ordered.

The rule is not ordered.
Corrective Action: Check earlier messages for reasons the rule order failed. Correct as necessary and reorder the rule table.

CTT853S ERROR IN RULE DATA. MANDATORY stmt_type STATEMENT IS EITHER MISSING OR NOT IN THE CORRECT ORDER

Explanation: A stmt_type statement is either missing or in the wrong order in a rule definition member. The rule definition data may have manually been changed incorrectly. The data does not conform to a valid Control-M/Tape format.

The rule is not ordered.

Corrective Action: Restore the table to its original state (from a backup copy) and reorder the rule table.

CTT854S INVALID SCHEDULING DATE - date

Explanation: An invalid scheduling date format was used in the rule list or in an order or force request.

Valid date formats are:
- ddmmyy -- Day, month, and year
- mmddyy -- Month, day, and year
- * -- Current Control-M/Tape working date

The requested table order fails.

Corrective Action: Correct the date; reorder the rule table.

CTT855S **** ERROR IN RULE STATEMENTS. CHECK THE FOLLOWING STATEMENTS ***

Explanation: The rule definition has been corrupted and the data does not conform to a valid Control-M/Tape format.

This message is followed by one or more CTT856S messages describing all statements belonging to the damaged rule. An asterisk (*) appears in the line under the erroneous data.

The rule is not ordered.

Corrective Action: Restore the table to its original state by means of the Online Viewing Facility, or by editing the member, then reorder the rule table.

CTT856S STATEMENT = stmt

Explanation: The rule definition is corrupt.

This message follows message CTT855S, and displays each statement in the damaged rule. An asterisk * appears in the line under a damaged statement.

The CTTMRLL program terminates with a condition code of 08.

Corrective Action: Restore the table to its original state.
**CTT857I** RULE *ruleName* TABLE *tableName* LIBRARY *lib* ODATE *odate* LOADED

**Explanation:** This is the normal message when a rule order is successfully loaded by the CTTINIT procedure. The rule is now active and will be used by the Control-M/Tape real-time process.

**Corrective Action:** No action is required.

**CTT858S** SEVERE ERROR IN RULE DATA STATEMENTS

**Explanation:** A severe error was found in the rule definition data statements. This message is followed by additional messages regarding the error.

The rule table is not ordered.

**Corrective Action:** Check for additional messages concerning the errors. Correct the error and reorder the table.

CTT859W ORDER CANCELED BY USER EXIT: RULE *ruleName* TABLE *tableName* LIBRARY *lib*

**Explanation:** The specified rule order failed as a result of a user exit check.

The rule order is not ordered or loaded.

**Corrective Action:** Check for prior messages concerning the reason for failure and the Control-M/Tape EXIT 1.

**CTT862E** OPERATION CANCELED BY USER EXIT CTTSE01

**Explanation:** The operation was canceled because Control-M/Tape User Exit CTTSE01 ended with a return code higher than 0.

The operation is canceled.

**Corrective Action:** Check why the exit ended with a return code higher than 0, and proceed accordingly.

**CTT863E** RULE MEMORY BLOCK GETMAINED BELOW 16MB LINE (IN CSA)

**Explanation:** The rule loading program of the CTTINIT utility tried to allocate a block for rules in ECSA. Due to lack of memory, it received an area in CSA. Control-M/Tape does not allocate CSA areas for rule blocks when working in TEST mode.

Rule loading is stopped. The CTTINIT procedure terminates after freeing all memory blocks allocated thus far.

**Corrective Action:** Either increase the ECSA size defined in your system, or reduce the number of rules defined to Control-M/Tape. Restart the CTTINIT utility.

**CTT864E** UNABLE TO FREE RULE BLOCKS FROM MEMORY

**Explanation:** Control-M/Tape was unable to free rule blocks from memory. The rule loading program ended unsuccessfully. An error occurred during the process of freeing all rule blocks allocated thus far.
If the allocated blocks are in ECSA or CSA, they are not freed by Control-M/Tape. If the allocated blocks are in a private region, they will be freed at job end.

**Corrective Action:** If allocated blocks remained in ECSA or CSA, use a tool (for example, OMEGAMON, RESOLVE) to free these blocks. Blocks not freed by a tool will be freed automatically by the next IPL.

**Note:**
Use extreme caution when freeing blocks from ECSA or CSA manually.

**CTT865S NO RULES WERE LOADED BECAUSE NONE MATCH SCHEDULING CRITERIA**

**Explanation:** Control-M/Tape was unable to load any rules because no rules were scheduled for today. Control-M/Tape does not load any rule, and execution stops.

**Corrective Action:** Use the TR screen to check your rule definitions and update the rule scheduling criteria so as to ensure that at least one rule will be scheduled for today.

**CTT870E INSUFFICIENT CAPACITY FOR MEDIA media, VAULT vault**

**Explanation:** The Slot Management Facility could not find an empty slot for a volume being moved to the vault specified in the message. If a capacity is defined for a vault, Control-M/Tape tries to assign a slot to each volume that comes to the vault.

The appropriate Slot Definition record is not updated.

**Corrective Action:** Increase the capacity of the vault using the Vault Definition screen (screen TV), or define the vault with no capacity. Then run the CTTVTM utility in SLOTBLD mode.

**CTT871E SLOT slot ALREADY IN USE. MEDIA=media, VAULT=vault**

**Explanation:** The Slot Management Facility tried to assign a slot to a volume according to the slot number specified in the volume record, but the slot is already occupied by another volume.

Control-M/Tape does not reassign the slot number, but continues with the next volume.

**Corrective Action:** Correct the slot number in the volume record using the Volume Update screen.

**CTT872E CONTROL-M/TAPE IS STILL ACTIVE, UTILITY util CANNOT CONTINUE**

**Explanation:** The util utility cannot run in the mode requested if Control-M/Tape is active. Some Control-M/Tape utilities cannot be run while the Control-M/Tape real-time environment is active.

The utility terminates.

**Corrective Action:** See the description of this utility in the *INCONTROL for z/OS Utilities Guide.*

**CTT873E EXPECTED CONTINUATION NOT RECEIVED**

**Explanation:** An input statement was continued to the next line, but no continuation line was supplied. A comma at the end of a line indicates a continuation line, but the input was exhausted before the continuation line was received.

The program stops executing.
**Corrective Action:** Either remove the comma or supply the missing line.

**CTT874E INVALID CONTROL STATEMENT: err**

**Explanation:** The current control statement is in error.

Possible values for `err` are:

<table>
<thead>
<tr>
<th><code>err</code></th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID DATE - <code>date</code></td>
<td>The date specified (<code>date</code>) is in an invalid date format or contains invalid values. Valid formats for the date are <code>yyyymmdd</code> or <code>yymmdd</code>.</td>
</tr>
<tr>
<td>INVALID EQUATE SPECIFIED - <code>equ</code></td>
<td>The equate <code>equ</code> was used incorrectly. For the correct usage of equate, see the appendix that describes logical field names for the Control-M/Tape repository in the <em>INCONTROL for z/OS Administrator Guide</em>.</td>
</tr>
<tr>
<td>INVALID FUNCTION ISSUED</td>
<td>An invalid function was used. For a list of supported functions, see the documentation for the CTTMUP utility.</td>
</tr>
<tr>
<td>INVALID HEX VALUE SPECIFIED - <code>hex</code></td>
<td><code>hex</code> is an invalid hexadecimal value.</td>
</tr>
<tr>
<td>INVALID KEYWORD SPECIFIED - <code>kwd</code></td>
<td>The keyword <code>kwd</code> was used incorrectly, perhaps on the wrong side of the relation symbol. For the correct keyword format, see the appendix that describes logical field names for the Control-M/Tape repository in the <em>INCONTROL for z/OS Administrator Guide</em>.</td>
</tr>
<tr>
<td>INVALID NUMERIC VALUE SPECIFIED</td>
<td>A non-numeric value was specified.</td>
</tr>
<tr>
<td>INVALID PARAMETER VALUE - <code>parm= val</code></td>
<td>The value assigned to parameter <code>parm</code> is invalid. For a list of correct values, see the appendix that describes logical field names for the Control-M/Tape repository in the <em>INCONTROL for z/OS Administrator Guide</em>.</td>
</tr>
<tr>
<td>INVALID <code>parm=</code> SPECIFICATION</td>
<td>The value specified for the <code>parm</code> parameter is invalid.</td>
</tr>
<tr>
<td>INVALID RBA PARAMETER</td>
<td>An invalid value was given to an RBA field. The RBA format is <code>X hhhhhhhh</code>, where <code>X</code> is a constant and <code>hhhhhhhh</code> is a valid RBA found in the MDB.</td>
</tr>
<tr>
<td>INVALID RELATION IN KEYWORD - <code>keywd</code></td>
<td>An invalid relation symbol was used. Only the “=” symbol can be specified.</td>
</tr>
<tr>
<td>err</td>
<td>Explanation</td>
</tr>
<tr>
<td>-----</td>
<td>-------------</td>
</tr>
<tr>
<td>INVALID RETENTION DATA - rtn</td>
<td>Incorrect retention data was specified. For the correct format of retention data, see the documentation for the CTTMUP utility.</td>
</tr>
<tr>
<td>INVALID STATEMENT CODE</td>
<td>The statement contained an invalid code, or was not correctly placed.</td>
</tr>
<tr>
<td>INVALID ZERO VALUE SPECIFIED</td>
<td>The value of zero is invalid.</td>
</tr>
<tr>
<td>KEYWORD NOT FOUND IN DICTIONARY - keywd</td>
<td>The keyword keywd is invalid. Check the spelling.</td>
</tr>
<tr>
<td>MANDATORY FIELDS NOT FOUND</td>
<td>At least one mandatory field is missing. For mandatory fields, see the documentation for the CTTMUP utility.</td>
</tr>
<tr>
<td>TYPERUN STATEMENT MISSING</td>
<td>The TYPERUN statement is mandatory. It was not specified.</td>
</tr>
<tr>
<td>VOLSER TOO LONG - volser</td>
<td>VOLSER should contain one through six characters only.</td>
</tr>
<tr>
<td>VALUE EXCEED MAXIMUM parm= val</td>
<td>The parm parameter has been set to a value (val) that exceeds the maximum.</td>
</tr>
</tbody>
</table>

**Corrective Action:** Correct the error and rerun the utility.

**CTT875W RULE SEARCH IS NOT PERFORMED FOR DATASET dsn**

**Explanation:** Rule search is not performed for the dsn data set that is being added. The CTTMUP utility was activated with RULEINFO set to YES (the default). The DSNADD function was requested, but the volume specified as dsvolser was not in the Media Database. A rule search cannot be performed without valid volume information.

The dsn record is added without application of rule information for this data set.

**Corrective Action:** Ensure that the correct volume keyword dsvolser was specified in command DSNADD. When adding a data set (DSNADD) and a volume (VOLADD) to contain the data set, it is recommended that commands be issued in the following order: VOLADD, DSNADD.

**CTT876I FUNCTION func PERFORMED SUCCESSFULLY. RECORD=key**

**Explanation:** This information message indicates that the specified function was performed successfully. The record key or the record type is indicated.

The CTTMUP utility continues to the next function.

**Corrective Action:** No action is required.
CTT877W VOLUME vol IS NOT EXPIRED. USE GROUP EXPIRATION FUNCTION

Explanation: The scratch action requested for the vol volume could not be performed because vol is a member of a multivolume chain, and expiration of a single volume of a multivolume chain is not allowed.

The CTTMUP utility continues to next function.

Corrective Action: Use function GRPSCR if you wish to expire the entire multivolume chain.

CTT878W MISMATCH BETWEEN DATASET LABEL AND HIGHEST LABEL OF VOLUME volser

Explanation: The data set label number does not match the number of the highest label specified on one of its volumes. All the volumes connected by a multivolume data set must have the same label number as the data set itself, except for the last volume, which can have a higher label number.

In this message, volser is the identity of the problematic volume.

The execution of the current function continues.

Corrective Action: Correct the data set label number using the DSNUPD function, or the highest label number of the volume using the VOLUPD function.

CTT879E VERIFY REJECT

Explanation: The RECUPD function discovered that the data specified in the VER statement does not correspond to the data in the selected record.

Execution of the RECUPD function is terminated.

Corrective Action: Correct the data in the VER statement according to that in the selected record.

CTT880S {POOL | VAULT} LOAD FAILED. NAME: {poolName|vaultName }

Explanation: The load of the pool or vault failed. This message is preceded by messages that explain why the pool or vault could not be loaded.

The pool or vault is not loaded.

Corrective Action: Check earlier messages for reasons the pool or vault load failed. Correct as necessary.

CTT881W {POOL | VAULT} FILE IS EMPTY. DDNAME: {DAPOOLS | DAVLTS}

Explanation: Open of the pool or vault data sets failed (the DAPOOLS or DAVLTS DD statement).

Possible causes are:

- The DAPOOLS or DAVLTS DD statement is missing.
- The data set described by the DAPOOLS or DAVLTS DD statement cannot be opened for sequential read, or the record length is not 80.

Processing continues. Control-M/Tape will not have a pool or vault defined to it.
Corrective Action: No action is required.

CTT882S ERROR IN {POOL | VAULT} DATA. MANDATORY type STATEMENT IS EITHER MISSING OR NOT IN THE CORRECT ORDER

Explanation: A statement of the type type is either missing or in the wrong order in a pool or vault definition member. The pool or vault definition data may have been manually changed incorrectly. The data does not conform to a valid Control-M/Tape format.

The pool or vault is not ordered.

Corrective Action: Restore the table to its original state from a backup copy. Reorder the pool or vault table.

CTT883I {POOL | VAULT} LOADED SUCCESSFULLY. NAME: name

Explanation: This information message indicates a pool or vault order was successfully loaded by the Control-M/Tape monitor.

The pool or vault is now in a Control-M/Tape WAIT SCHEDULE state.

Corrective Action: No action is required.

CTT884S **** ERROR IN {POOL | VAULT} STATEMENTS. CHECK THE FOLLOWING STATEMENTS ***

Explanation: The pool or vault definition is corrupt, and the data does not conform to a valid Control-M/Tape format.

This message is followed by one or more CTT885S messages describing all statements belonging to the corrupted pool or vault order. An asterisk (*) appears in the line under the erroneous data.

The pool or vault is not ordered.

Corrective Action: Restore the table to its original state by means of the Online Viewing facility; then reorder the pool or vault table.

CTT885S STATEMENT = stmt

Explanation: The pool or vault definition is corrupt.

This message follows message CTT884S. It appears once for each statement in the corrupted pool or vault in the scheduling table, each occurrence displaying a different statement. An asterisk * appears in the line under an erroneous statement.

The CTTMPVL program terminates with a condition code of 08.

Corrective Action: Try to restore the table to its original state.

CTT886S SEVERE ERROR IN {POOL | VAULT} DATA STATEMENTS

Explanation: A severe error was found in the pool or vault definition data statements. It is followed by additional messages regarding the error.

The pool or vault table is not ordered.
Corrective Action: Check for additional messages concerning the errors in the systems and IOA Log. Correct the error and reorder the table.

CTT887S POOL RANGES OVERLAP: pool1 AND pool2

Explanation: Two pools (pool1 and pool2) were defined with a range overlap. Therefore, some volumes may belong to both pools. Control-M/Tape requires that volume ranges be unique for all pools. The initialization process terminates.

Corrective Action: Correct the pool definitions so that no volume is defined in more than one pool.

Messages CTT900 through CTT9xx

This group includes messages for the Control-M/Tape product.

CTT900E VALID LABELS ARE SL/NL/NSL/AL

Explanation: An invalid label type was specified in the LABEL TYPE field. The LABEL TYPE field is used to specify the label type of the external volume to be added (or modified) to the Control-M/Tape Media Database (MDB).

Valid label types are:
- SL - Standard label
- NL - No label
- NSL - Nonstandard label
- AL - ANSI label

Corrective Action: Correct the entry by specifying a valid label type.

CTT901E VALID RETENTION TYPES ARE DAY/DAT/P/C/R/M

Explanation: An invalid retention type was specified in the RETENTION field. The RETENTION field specifies a period for which an external volume should be kept. Different retention types specify different ways to calculate the duration to retain an external volume before it may be used as a scratch volume.

Valid retention types are:
- DAT - Date
- DAY - Days
- P - Permanent
- C - MVS catalog
- R - according to specified rules
- M - MVS Catalog

Corrective Action: Correct the entry by specifying a valid retention type.
CTT902E INVALID DATA ON RETENTION LINE

**Explanation:** Either data were specified for a retention type that does not allow additional data, or a retention type was changed to a retention type for which additional data are not allowed. The RETENTION field is used to specify a period for which an external volume should be kept. Additional data are not valid for the PERMANENT and MVS CATALOG retention types.

**Corrective Action:** Correct the entry by clearing out the additional data after the RETENTION field.

CTT903E VOLSER volser ALREADY EXISTS IN MDB

**Explanation:** An attempt was made to add a volume (volser) to the Control-M/Tape Media Database (MDB), and the volume name already exists in the MDB. The MDB contains information about all the volumes known to Control-M/Tape. The SL-NAME field must contain a unique volume identification for Control-M/Tape.

The entry is not added to the MDB, nor is the existing record in the MDB modified by any of the fields in the Check-In Volume screen.

**Corrective Action:** If the existing entry in the MDB refers to the external volume specified, then exit the Check-In Volume screen, or add a different external volume.

If the existing entry does not refer to the external volume specified, and they happen to share the same identification, then do the following:

1. Specify a new unique identification in the SL-NAME field. This may be a brand new ID and is used by Control-M/Tape internally. This name is not physically written on the volume.

2. Specify in the VOLSER field the value that was previously specified in the SL-NAME field (the physical volser).

The SL-NAME and VOLSER fields should contain the same value, except in cases described above in which the SL-NAME is an ID given to Control-M/Tape for internal purposes and VOLSER is the physical ID of the volume. All references to this volume using Control-M/Tape should be done using the ID in the SL-NAME field.

CTT904I VOLSER volser ADDED TO MDB

**Explanation:** This information message indicates that external volume volser was successfully added to the Control-M/Tape Media Database (MDB).

**Corrective Action:** No action is required.

CTT905E PREVIOUS DATASET FIELD MUST BE SPECIFIED

**Explanation:** A data set name was specified in a DATASET # field, but no value was specified in the previous DATASET # field.

DATASET # fields specify a list of data set names that appear on the external volume. The list may not contain entries separated by an empty field. This information is automatically recorded in the Media Database (MDB) whenever the external volume is read under Control-M/Tape, but only after the external volume is added to the MDB.

**Corrective Action:** Correct the list of data set entries by filling in the blank field or by clearing all the entries following the empty data set entry.
CTT906E AT LEAST ONE DATASET SHOULD BE SPECIFIED TO ENABLE CATALOGING

**Explanation:** A request was made to catalog the data sets of an external volume but no data set names were specified in the DATASET # fields. A value of Y (yes) specified in the MVS CATALOG is a request to catalog all of the volume data sets specified. If no data set names are listed, cataloging cannot be performed.

**Corrective Action:** Specify at least one DATASET # value or change the value of the MVS CATALOG field to N (no).

CTT907E AT LEAST ONE DATASET SHOULD BE SPECIFIED TO ENABLE CATALOG RETENTION

**Explanation:** The retention period of the external volume was set to MVS CATALOG, but there were no data sets specified in the DATASET # fields.

Specifying a retention type of MVS CATALOG in the RETENTION field means keep the external volume as long as the data sets on the external volume are cataloged. If no data set names are listed, no data sets are cataloged and this retention period cannot be supported.

**Corrective Action:** Either specify at least one DATASET # value, or change the retention type of the external volume to a type other than MVS CATALOG.

CTT908S CATALOG OF dsn FAILED. RC=rc

**Explanation:** A request to add an external volume to the MDB using the ENTER command and a request to catalog the data sets of the external volume by specifying Y in the MVS CATALOG field both failed. The ENTER command triggers both requests. Cataloging is performed first.

The variables in this message are:

- `dsn` - the name of the data set
- `rc` - the return code

Possible values of `rc`, and their explanations are shown in the following table:

<table>
<thead>
<tr>
<th>rc</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>The required catalog does not exist or is not open.</td>
</tr>
<tr>
<td>8</td>
<td>The user is not authorized to perform the operation.</td>
</tr>
<tr>
<td>20</td>
<td>There is insufficient space on the catalog data set.</td>
</tr>
<tr>
<td>24</td>
<td>Either an attempt was made to catalog an improperly named generation data set, or the generation index is full and the named data set is older than any in the index.</td>
</tr>
<tr>
<td>28</td>
<td>An I/O error occurred.</td>
</tr>
</tbody>
</table>

The data sets are not cataloged. The external volume is not added to the MDB.
Corrective Action: Check the return code to see why the catalog attempt was unsuccessful. After the cataloging problem is resolved, try again.

CTT909E LABEL OF DATASET MUST BE HIGHER THAN lbl_num

Explanation: The label number specified in a DATASET# field is lower or equal to the previous label number. The label number of a data set must be higher than the label number of the preceding data set. The first data set in the list must have label number of 1 or higher.

Corrective Action: Correct the label number of the data set by entering a valid sequence of label numbers in the data set list.

CTT910E PREVIOUS MULTI-VOLUME SL-NAME MUST BE SPECIFIED

Explanation: An SL-NAME was specified in one of the multivolume SL-NAME fields but the previous SL-NAME field in the list was empty.

Multivolume SL-NAME fields specify a list of volumes that are spanned by the last specified data set. For example, the last data set in the list spans the SL-NAME that appears at the top of the screen as well as all the multivolume SL-NAMEs filled in at the bottom of the screen. The multivolume list may not contain two completed entries separated by a blank entry.

Corrective Action: Correct the list of multivolume SL-NAMEs either by filling in the blank entry or by clearing all the other SL-NAME fields following the blank entry.

CTT911E SL-NAME CANNOT BE SPECIFIED WITHOUT VOLSER

Explanation: An SL-NAME was specified in one of the multivolume SL-NAME fields but the corresponding VOLSER field in the list was not specified. If the SL-NAME field is specified, then the VOLSER field must also be specified. For more information, see the description of the SL-NAME concept in the section on volume processing in the Control-M/Tape User Guide.

Corrective Action: Correct the list of multivolume volsers by filling in the VOLSER field or removing the SL-NAME field.

CTT912E ADDITIONAL VOLSER volser ALREADY EXISTS IN MDB

Explanation: A volser was entered in one of the multivolume SL-NAME fields but this volser already exists in the Media Database.

Multivolume SL-NAME fields specify a list of volumes which are spanned by the last specified data set. For example, the last data set in the list spans the SL-NAME that appears at the top of the screen as well as all the multivolume SL-NAMEs filled in at the bottom of the screen. A unique value must be specified in the SL-NAME field; the volume cannot be identified with a non-unique identifier.

Corrective Action: Correct the list of multivolume SL-NAMEs by identifying the volume with a unique identifier (a new SL-NAME) which should be entered in the SL-NAME field. (In such a case, the VOLSER field should be used to hold the actual volume serial number which is not unique.)

CTT913I MULTI VOLUMES ADDED TO MDB STARTING WITH VOLSER volser

Explanation: This information message indicates that external multi volumes (volsers) were successfully added to the Control-M/Tape Media Database.
The Media Database contains information about all volumes known to Control-M/Tape. An attempt to add using command ENTER external multi volumes to the Media Database was successful. For example, the external multi volumes were entered as known volumes to the Media Database.

**Corrective Action:** No action is required.

**CTT913S OPEN OF DDNAME "SYSPRINT" FAILED**

**Explanation:** The opening of a print file failed.
Possible causes are:
- The DD statement SYSPRINT is missing.
- The data set described by the DD statement SYSPRINT cannot be accessed for sequential write.

The program stops executing.

**Corrective Action:** Correct the JCL and submit again.

**CTT914E ADDITIONAL VOLSER volser HAS BEEN PREVIOUSLY SPECIFIED IN LIST**

**Explanation:** A volser was entered in one of the multivolume SL-NAME fields but this volser already exists in one of the multivolume SL-NAME fields or in the first SL-NAME field.

Multivolume SL-NAME fields specify a list of volumes which are spanned by the last specified data set. For example, the last data set in the list spans the SL-NAME that appears at the top of the screen, as well as all the multivolume SL-NAMEs filled in at the bottom of the screen. A unique value must be specified in the SL-NAME field; the same value cannot appear twice in the same list.

**Corrective Action:** Correct the list of multivolume SL-NAMEs by eliminating SL-NAMEs that appear more than once in the list.

**CTT915S DSN dsn ALREADY CATALOGED**

**Explanation:** A request to add an external volume to the Media Database using the ENTER command and a request to catalog the data sets of the external volume by specifying Y in the MVS CATALOG field both failed. The ENTER command triggers both, but performs cataloging first. Cataloging of the data set failed, because one of the data sets (dsn) is already cataloged.

The data sets are not cataloged and the external volume is not added to the Media Database.

**Corrective Action:** Notify your system programmer. To add the external volume, change the value in the MVS CATALOG field from Y to N.

**CTT916I CONTROL-M/TAPE IS NOT ACTIVE. IOA DO COMMANDS WILL HAVE NO EFFECT**

**Explanation:** An attempt was made to process IOA DO commands with a WHEN CHECKIN statement or the RETENTION by RULES option while Control-M/Tape was not active.

IOA DO commands in matching rules are ignored. If RETENTION BY RULES is requested, no retention or vaulting pattern is set for any data set in the checked in volume.
**Corrective Action:** To perform IOA DO commands in matching rules, or to implement the retention and vaulting pattern defined in Control-M/Tape rules for the checked-in data sets, start Control-M/Tape by means of CTTINIT.

**CTT917I** RANGE OF EXTERNAL VOLUME REFERENCES BY PREFIX IS FULL

**Explanation:** The range of volume names using the external prefix is full. The External Volume Reference Prefix is defined in CTTPARM by the EXTRNVOL parameter. All volume names defined by this prefix are already defined in the Media Database (MDB).

The name of the volser will no longer be assigned automatically by Control-M/Tape.

**Corrective Action:** Fill in an alternate volser name.

**CTT918I** PRESS ENTER TO CONFIRM THE ADDITIONAL VOLSER LIST

**Explanation:** When the CTTPARM EXTRNVOL parameter is set, when entering a multi-volume data set on the TC screen (EXTERNAL VOLUME CHECK-IN SCREEN), this message requests that the user confirm each additional volume name as the volume is added.

**Corrective Action:** Press Enter to confirm each additional volume name.

**CTT919E** CONTROL-M/TAPE IS NOT ACTIVE. RETENTION BY RULES CANNOT BE REQUESTED.

**Explanation:** RETENTION BY RULES was specified when checking-in an external volume in screen TC while Control-M/Tape was inactive.

The retention for the checked-in volume cannot be determined. Therefore, the check-in is rejected. Control-M/Tape rules can only be applied when Control-M/Tape is active. Only manually specified retention types can be used in the TC screen when Control-M/Tape is inactive.

The online screen waits for a retention type to be manually specified for the volume.

**Corrective Action:** Do one of the following:

- Start Control-M/Tape using the CTTINIT procedure, and then check-in the volume.
- Manually specify a retention type for the volume in screen TC.

**CTT920E** INVALID UNIT NAME unitname

**Explanation:** The unitname unit name is not defined in the system.

The requested action fails. If issued by the CTTUGNM utility, the utility continues to process the next volume record.

**Corrective Action:** Perform one of the following actions:
If issued when trying to add a tape in a TC screen, correct the unit name specified in the ON UNIT field to the correct unit name for the volume being added.

If issued in the output of the CTTUGNM utility, the message is followed by message CTT202I, which contains the details of the failing volume. Use CTTMUP to change the unit name for this volume to be a valid unit name that is defined in the system, and rerun the CTTUGNM utility.

CTT921E UNIT NAME IS REQUIRED WHEN CATALOG=Y IS SPECIFIED

Explanation: A unit name should be specified when datasets are cataloged.
Corrective Action: Specify a valid unit name in the ON UNIT field.

CTT922E service req FAILED. UNIT=unitName RC=rc REASON=rsn

Explanation: The specified service and request for the unitName unit failed with the specified return and reason codes.

This message is followed by message CTT202I, which contains the details of the failing volume.

The CTTUGNM utility continues to process the next volume record.

Corrective Action: For the EDTINFO service, a request of RTNDEVN, a return code of 8, and a reason code of 00000001, change the unit name for this volume to be a valid unit name that is defined in the system using CTTMUP, and rerun the CTTUGNM utility.

For any other information, verify that the unit name is defined in the system and that there are devices attached to it. If not, change the unit name of the volume record to be a valid unit name and rerun the CTTUGNM utility.

CTT930I opc (type) RBA=x'rba' DT=date /time V=vol /dsn

Explanation: This information message indicates the physical recovery of a Media Database (MDB) record from the Trace file. The message is issued for every physically recovered MDB record.

The variables in this message are:

- opc - Operation code for the operation performed on the MDB.

Valid values are:

<table>
<thead>
<tr>
<th>opc</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEL</td>
<td>The record is deleted from the MDB.</td>
</tr>
<tr>
<td>ADD</td>
<td>The record is added to the MDB.</td>
</tr>
<tr>
<td>UPD</td>
<td>The record is updated in the MDB.</td>
</tr>
</tbody>
</table>
- **type** - Record type in the MDB.

  Valid values are:

<table>
<thead>
<tr>
<th>type</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>DS</td>
<td>Data set record</td>
</tr>
<tr>
<td>VL</td>
<td>Volume record</td>
</tr>
<tr>
<td>CT</td>
<td>Vault control</td>
</tr>
<tr>
<td>CA</td>
<td>Vault capacity</td>
</tr>
<tr>
<td>CN</td>
<td>Vault continuation</td>
</tr>
</tbody>
</table>

- **rba** - RBA of the record being updated, added, or deleted.

- **date** - Date portion of the record timestamp.

- **time** - Time portion of the record timestamp.

- **vol** - For DSN record, the first volume of the data set. For other record types, this field is blank.

- **dsn** - For DSN record, data set name. For other record types, this field is blank.

**Corrective Action:** No action is required.

CTT931I  opc (type)  U=userId /jobId DT=date /time V=vol /lbl /dsName

**Explanation:** This information message indicates the logical recovery of a Media Database (MDB) record from the Trace file. The message is issued for every logically recovered MDB record.

The variables in this message are:

- **opc** - Operation code for the operation performed on the MDB.

  Valid values are:

<table>
<thead>
<tr>
<th>opc</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEL</td>
<td>The record is deleted from the MDB.</td>
</tr>
<tr>
<td>ADD</td>
<td>The record is added to the MDB.</td>
</tr>
<tr>
<td>UPD</td>
<td>The record is updated in the MDB.</td>
</tr>
<tr>
<td>CAT</td>
<td>The data set is cataloged.</td>
</tr>
<tr>
<td>MAT</td>
<td>The MDB record does not match its data in the Trace file.</td>
</tr>
</tbody>
</table>
- type - Record type in the MDB.
  Valid values are:

<table>
<thead>
<tr>
<th>type</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>DS</td>
<td>Data set record</td>
</tr>
<tr>
<td>VL</td>
<td>Volume record</td>
</tr>
<tr>
<td>CT</td>
<td>Control record</td>
</tr>
<tr>
<td>CA</td>
<td>Vault capacity</td>
</tr>
<tr>
<td>CN</td>
<td>Vault continuation</td>
</tr>
</tbody>
</table>

- userId - Job name or user ID of the job that caused the record to be written.
- jobId - Jobid of the above job name or user ID.
- date - Date portion of the record timestamp.
- time - Time portion of the record timestamp.
- vol - For a data set name or cat record, the first volume of the data set. For other record types, this field is blank.
- lbl - For a data set name or cat record, label number of the data set on the volume. For other record types, this field is blank.
- dsn - For a data set name or cat record, data set name. For other record types, this field is blank.

Processing continues unless an error occurs. A later message indicates if the process is prematurely terminated. If terminated, recovery is complete up to the point of termination. All MDB records created prior to that point reflect the unrecovered situation.

Corrective Action: No action is required.

CTT932E opcode REQUIRED FOR THE FOLLOWING RECORD BUT IT WAS [NOT] FOUND IN MDB:

Explanation: The opcode action requested for the record cannot proceed. Possible causes are:

- If opcode is ADD and the record already exists in the Media Database.
- If opcode is DEL or UPD and the record does not exist in the Media Database.
- In simulation mode, this message may be issued if previous records were not added to the Media Database.

Note:

In normal mode, recovery can be successful without issuing the message.

This message precedes message CTT931I.

Processing of records continues.
**Corrective Action:** No action is required.

**CTT934I**  
*num* RECORDS WERE {DELETED | UPDATED | ADDED}

**Explanation:** This information message is issued at the end of a logical or physical recovery.  
**Corrective Action:** No action is required.

**CTT935E** CATALOG FAILED. **RC:** rc **DSN:** dsn  

**Explanation:** The catalog operation for the specified data set failed with the specified rc. Whenever the CTTRTM utility expires a data set, it uncatalogs the data set. When the actions of the CTTRTM run are reversed using Logical Recovery, the CTTRCV utility tries to recatalog the data set.  
**Corrective Action:** Determine why the catalog operation failed and proceed accordingly. If the return code is 8, probably the data set is already cataloged. The meaning of other return codes is in IBM documentation for LOCATE return codes. The CTTRCV utility must run in the same catalog environment in which the CTTRTM utility ran.

**CTT936E** THE FOLLOWING RECORD WAS FOUND WITH DIFFERENT FIELDS IN THE TRACE FILE AND THE MDB  

**Explanation:** A trace record to be recovered has incompatible data in the Media Database (MDB). The record was updated at least one time after its current appearance in the Trace file. The record cannot be recovered because its trace file afterimage does not match its current data in the MDB. Recovering the data will cause loss of integrity.  
This message precedes message CTT931.  
Recovery is not performed for all records. However, the recovery job continues running until all records to be recovered are found, and appropriate messages issued.  
**Corrective Action:** To omit processing of the record, use INCLUDE and/or EXCLUDE statements. If you set the FORCE parameter to YES, this message is issued but recovery is performed anyway. Setting FORCE to YES may cause loss of integrity in the MDB. For more information, refer to documentation for the CTTRCV utility in the *INCONTROL for z/OS Utilities Guide*.

**CTT937I**  
*num* RECORDS ARE NOT MATCHED WITH DATA IN THE MDB  

**Explanation:** This statistical information message issued at the end of a logical or physical recovery of the Media Database (MDB) indicates the number of records (*num*) that were found with different fields in the Trace file and the MDB.  
**Corrective Action:** No action is required.

**CTT950E** COULD NOT ACCESS lib (mem)  

**Explanation:** Dynamic allocation of the mem member in the specified library failed. The indicated library member should contain the rule list. It is usually found in the Control-M/Tape parameter library.  
**Corrective Action:** Check that the DARLLIB DD statement points to a library containing the RULLIST member. If it does, check for possible I/O errors on that library.
CTT951E FILE DARSR COULD NOT BE BROWSED

Explanation: Dynamic allocation of the output file created by simulation the CTTCRSS utility failed. The probable cause of failure is that the output file could not be created by the CTTCRSS utility due to an SPF problem in the profile.

Corrective Action: Reactivate the CTTCRSS utility using CLIST CTTCRSS, and using the DEBUG parameter to get detailed information. If the failure is due to an SPF problem, correct accordingly. Otherwise, notify BMC Software Customer Support.

CTT952I NO RULE WAS ACTIVATED BY THESE CONDITIONS

Explanation: This information message indicates that the specified combination of conditions caused no rule to be activated.

Since no rules were activated, the simulation showed no results. However, in an identical situation, the Control-M/Tape Real Time environment would use either the JCL EXPIRATION DATE, if supplied, or the retention defaults defined in the installation parameters.

Corrective Action: No action is required.

CTT953S ONE OF THE RULES SPECIFIED BY THE RULE LIST IS INVALID

Explanation: An invalid rule definition was encountered during new RULLIST processing.

Corrective Action: Correct the invalid rule definition and rerun the CTTCRSS simulation utility. To find which rule is invalid, activate CLIST CTTCRSS using the DEBUG parameter. This parameter enables debug listings.

CTT954S INTERNAL ERROR IN "CTTCRSS"

Explanation: An unrecognized return code was issued during the processing of the CTTCRSS simulation utility.

Corrective Action: Reactivate CTTCRSS using CLIST CTTCRSS, and using the DEBUG parameter to get detailed information. Notify BMC Software Customer Support of the results.

CTT955S UNABLE TO LOAD NEW RULE LIST. CORRECT RULLIST FILE

Explanation: The new rules could not be loaded, probably because invalid data was found in the rule order list file specified in the RULLIST file.

The simulation terminates.

Corrective Action: Correct the RULLIST file and rerun the CTTCRSS simulation utility.

CTT961E {DATA | INDEX} RECORD DOES NOT HAVE MATCHING {INDEX | DATA} RECORD RECTYPE=type

Explanation: The CTTIDB utility detected a data or index record in the Media Database (MDB) with no corresponding index or data record. Each data record should have a corresponding index record pointing to it, and each index record should point to a data record.

This message is issued with message CTT724I, which provides additional information about the problem record (volser, rba, and optionally, label, and data set).
The utility continues processing.

**Corrective Action:** If this problem occurs many times, rebuild the index using the CTTBIX utility.

**CTT963E INDEX RECORD DIFFERS FROM DATA**

**Explanation:** The CTTIDB utility detected a data record whose index fields do not match the key of the index record which is pointing to the data record.

This message is issued with messages CTT202I and CTT724I. Message CTT202I indicates the differences between the data record index fields and the key fields of the index record. Message CTT724I provides additional information about the problem record (volser, rba, and optionally, label and data set).

The utility continues processing.

**Corrective Action:** If this problem occurs many times, rebuild the index using the CTTBIX utility.

**CTT964E SPECIFIED VOLUME NUMBER (DDSVOLS#=%num1%) DIFFERS FROM NUMBER OF L INDEX (%num2%)**

**Explanation:** The CTTIDB utility detected that the number of volumes (%num1%) specified in DDSVOLS# does not equal the L index count (%num2%). These two values should be equal. DDSVOLS# is the data set data record field that contains the number of volsers on which the data set resides. Each of these volsers should have an L index record in the Index file.

This message is issued with message CTT724I, which provides additional information about the problematic record (volser, rba, and (optionally) label and data set).

The utility continues processing.

**Corrective Action:** If this problem occurs many times, rebuild the index using the CTTBIX utility.

**CTT967E SPECIFIED LAST DATASET VOLUME RECORD (%num1%) DIFFERS FROM LABEL OF LAST DATASET (%num2%)**

**Explanation:** The CTTIDB utility detected a volume record whose specified number of data sets (%num1%) is not equal to its highest data set sequence number (%num2%). These values should be the same.

This message is issued with message CTT724I, which provides additional information about the problematic record (volser, rba, and (optionally) its label).

The utility continues processing.

**Corrective Action:** Correct the problem manually using the CTTMUP utility. If the problem persists, see the INCONTROL for z/OS Utilities Guide.

**CTT968E SPECIFIED NUMBER OF ACTIVE DATASETS (%num1%) IN VOLUME RECORD DIFFERS FROM DATASET COUNT (%num2%)**

**Explanation:** The CTTIDB utility detected a volume record whose specified number of active data sets (%num1%) is not equal to the actual number of data sets counted (%num2%). These values should be the same.

This message is issued with message CTT724I, which provides additional information about the problematic record (volser, rba, and optionally, its label).

The utility continues processing.
Corrective Action: Correct the problem manually using the CTTMUP utility. If the problem persists, see the *INCONTROL for z/OS Utilities Guide*.

**CTT969E RECORD REFERS TO A WRONG VOLUME. TYPE=*/type*

**Explanation:** A Control-M/Tape utility received a record other than the specific volume record that was expected. The record received either belonged to a different volume or was not a volume record.

The utility continues processing.

**Corrective Action:** Do the following:

1. Use the CTTIDB utility to list all errors in the Media database.
2. Use the CTTMUP utility to correct all errors found by the CTTIDB utility.

**CTT972E VOLUME vol NOT FIRST BUT HAS AN ADDITIONAL VAULT RECORD**

**Explanation:** The CTTIDB utility detected a volume data record that is not the first volume in a multivolume data set, but has an additional vault record associated with it. Only the first volume in a multivolume chain should have an additional vault record associated with it.

This message is issued with message CTT724I, which provides additional information about the problematic record (volser, rba, and optionally its label).

The utility continues processing.

**Corrective Action:** Contact your database administrator for assistance.

**CTT973E SPECIFIED NUMBER OF DATASET VOLUMES (num1) DIFFERS FROM VOLUME COUNT (num2)**

**Explanation:** The CTTIDB utility detected a data set data record whose specified number of volumes (num1) does not equal its actual number of associated volumes (num2). These values should be the same.

This message is issued with message CTT724I, which provides additional information about the problematic record (volser, rba, and optionally, its label).

The utility continues processing.

**Corrective Action:** Contact your database administrator for assistance.

**CTT975E VOLUME vol IS NOT SCRATCHED AND NOT ACTIVE**

**Explanation:** The CTTIDB utility detected a volume data record which is not scratched, deleted, or active. A volume status should be ACTIVE, SCRATCH, or DELETED.

The utility continues processing.

**Corrective Action:** Contact your database administrator for assistance.
CTT976E VOLUME volser IS SCRATCH BUT DATASET ON LABEL num IS ACTIVE

Explanation: A Control-M/Tape utility detected a SCRATCH volume (volser) that contains an ACTIVE data set. All the data sets on a SCRATCH volume should be SCRATCH. This situation is probably a result of a job abend or a system crash.

The utility continues processing.

Corrective Action: Determine whether the data set and the volume should be SCRATCH or ACTIVE, and change status accordingly using the CTTMUP utility.

CTT977E status1 VOLUME volser IS INCONSISTENT WITH status2 FIRST VOLUME first_vol

Explanation: A Control-M/Tape utility detected a chained volume (volser) with a status different from the status of the first volume for this multivolume chain. This situation is probably a result of a job abend or a system crash. All data sets and volumes of a multivolume chain must have the same status.

The variables in this message are:

- status1 -- Status of the detected volume in error.
- volser -- Volume serial number of the volume in error.
- status2 -- Status of the first volume in the multi volume chain.
- first_vol -- Volume serial number of the first volume in the multivolume chain.

The utility continues processing.

Corrective Action: Determine the correct status for the volumes in this multivolume chain, and update the volumes and data sets of the group accordingly, using the CTTMUP utility.

CTT980E RBA rba: INVALID RECORD TYPE: rcrd_type

Explanation: A Control-M/Tape utility detected a Media Database record with an invalid record type.

The variables in this message are:

- rba - the record RBA
- rcrd_type - the invalid type

The utility continues processing.

Corrective Action: Contact your database administrator for assistance.

CTT982E RBA rba: ACTIVEDS(num) IS HIGHER THAN LBLNUM (lbl_num) OF VOLUME

Explanation: A Control-M/Tape utility detected a logical error in a volume record. The value in the ACTIVEDS field cannot be greater than the value in the LBLNUM field.

The variables in this message are:
**CTT997E RBA rba : I/O ERROR WHILE TRYING TO READ VOLUME: vol**

**Explanation:** A Control-M/Tape utility encountered an I/O error while trying to read the volume record of the specified volume. In this message, rba is the RBA of the volume record of the specified volume.

This message is accompanied by message CTT200S, which provides information on the nature of the I/O error.

The utility continues processing.

**Corrective Action:** Contact your database administrator for assistance.

**CTT998E RBA rba : DSN num IS ACTIVE, BUT VOLUME vol IS SCRATCH**

**Explanation:** A Control-M/Tape utility detected a SCRATCH volume with an ACTIVE data set. n is the data set label. In this message rba is the RBA of the data set record. A SCRATCH volume cannot contain ACTIVE data sets.

Information message CTT999I, which describes the record in error, accompanies this message.

The utility continues processing.

**Corrective Action:** Determine if the data set and the volume should be SCRATCH or ACTIVE. Then depending on the results, do one of the following:

- Change volume status (VOLSTAT) to ACTIVE using the VOLUPD function of the CTTMUP utility.
- Change the data set status (DSSTAT) to SCRATCH using the DSNUPD function of the CTTMUP utility.

**CTT999I rcd_desc**

**Explanation:** This information message describes a DATA or INDEX record in error. The nature of the error is described in the previous message.
Possible values for `rcrd_desc` are set out in the following table:

<table>
<thead>
<tr>
<th>rcrd_desc value</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>In the case of a data record:</strong></td>
<td></td>
</tr>
</tbody>
</table>
| D `dsn volser lbl` | All fields are taken from the data set record, where:  
  - `dsn` is the data set name  
  - `volser` is the volser on which the data set starts  
  - `lbl` is the data set label |
| V `volser SEQ: num [FIRST: first_vol ] [PREV: prev_vol ] [NEXT: next_vol]` | All fields are taken from the volume record, where:  
  - `volser` is the volser of the volume  
  - `num` is the volume sequence number in its multivolume chain  
  - `first_vol` is the volser of the first volume in the multivolume chain  
  - `prev_vol` is the previous volume in the multivolume chain  
  - `next_vol` is the next volume in the multivolume chain |
| **Note:** | Fields (first_vol, prev_vol, and next_vol) that are empty in the volume record do not appear in text of this message. |
| T `volser` | A volume continuation record, where `volser` is the volser of this volume continuation record. |
| B `boxId media num` | A box record, where:  
  - `boxId` is the name of the box  
  - `media` is the media of the box.  
  - `num` is the box record count in the Media Database |
| **In the case of an index record:** | |
| K D `dsn` | Index to a data set record, where `dsn` is the data set name. |
| K V `volser` | Index to a volume record, where `volser` is volser of the volume. |
### **rcrd_desc value** | **Explanation**
---|---
K L `{volser} {lbl}` | L-type index, where:
  - `{volser}` is the volser of the data set
  - `{lbl}` is the data set label (file sequence number)

K T `{volser}` | Index to a volume continuation record, where `{volser}` is the volser of the volume.

K A `{vault}` | Vault index, where `{vault}` is the vault name.

K C `{hex_contents}` | Index to a control record, where `{hex_contents}` are the contents of the key in hexadecimal format.

K B `{boxId} {media} {num}` | Index to a box record, where:
  - `{boxId}` is the box name
  - `{media}` is the media of the box
  - `{num}` is the box record count in the Media Database

Possible values for `DATA rcrd_desc` are:

- **D `{dsn} {volser} {lbl}`** All fields are taken from the data set record, where:
  - `{dsn}` is the data set name
  - `{volser}` is the volser on which the data set starts
  - `{lbl}` is the data set label

- **V `{volser} SEQ: {num} [FIRST: {first_vol}] [PREV: {prev_vol}] [NEXT: {next_vol}]`** All fields are taken from the volume record, where:
  - `{volser}` is the volser of the volume
  - `{num}` is the volume sequence number in its multivolume chain
  - `{first_vol}` is the volser of the first volume in the multivolume chain
  - `{prev_vol}` is the previous volume in the multivolume chain
  - `{next_vol}` is the next volume in the multivolume chain

Note:

Fields (FIRSTVOL, NEXTVOL, and PREVVOL) that are empty in the volume record do not appear in text of this message.
- **T volser**: A volume continuation record, where `volser` is the volser of this volume continuation record.
- **B boxId media num**: A box record, where:
  - `boxId` is the name of the box.
  - `media` is the media of the box.
  - `num` is the box record count in the Media Database.

Possible values for `INDEX rcrd_desc` are:
- **K D dsn**: Index to a data set record, where `dsn` is the data set name.
- **K V volser**: Index to a volume record, where `volser` is volser of the volume.
- **K L volser lbl**: L-type index, where:
  - `volser` is the volser of the data set.
  - `lbl` is the data set label (file sequence number).
- **K T volser**: Index to a volume continuation record, where `volser` is the volser of the volume.
- **K A vault**: Vault index, where `vault` is the vault name.
- **K C hex_contents**: Index to a control record, where `hex_contents` are the contents of the key in hexadecimal format.
- **K B boxId media num**: Index to a box record, where:
  - `boxId` is the box name.
  - `media` is the media of the box.
  - `num` is the box record count in the Media Database.

**Corrective Action**: No action is required.

### Messages CTTA00 through CTTAxx

This group includes messages for the Control-M/Tape product.

**CTTA55E TASK IS NOT APF AUTHORIZED**

**Explanation**: A started task (STC) requiring APF authorization was not APF authorized. Certain STCs (for example, CTMVMON) must be run from APF authorized libraries.

The task stops after issuing the error message.

**Corrective Action**: Change the JCL or authorize the library so that the STC will be run from an authorized library.

### Messages CTTB00 through CTTBxx

This group includes messages for the Control-M/Tape product.
CTTB00I  CTTSBD PROCESSING COMPLETED|STOPPED, MODE=NORMAL|SIMULATION, REASON=rsn

**Explanation:** This information message indicates that the current run of the CTTSBD utility was either completed or stopped. The reason for stopping the current run of the utility is one of the following:

- **PROCESSED ALL SELECTED VOLUMES** - The utility finished processing the selected volumes and ended normally.
- **OPERATOR REQUEST** - The utility was ended in response to an operator command issued by the user.
- **EXCEEDED ALLOWED NUMBER OF FAILURES (MAXERR=)** - More than a specified maximum number of recoverable errors were detected.
- **FREED REQUESTED NUMBER OF VOLUMES (NUMVOL=)** - The utility freed a specified a maximum number of volumes.
- **REACHED THE ALLOTTED AMOUNT OF TIME** - A specified time limit was reached.
- **INTERNAL ERROR** - The utility ended due to an internal error.

The utility stops execution.

**Corrective Action:** The action depends on the value of rsn, as follows:

- If rsn is **EXCEEDED ALLOWED NUMBER OF FAILURES (MAXERR)**, search for other messages that describe the specific errors detected, and make all necessary corrections.
- If rsn is **INTERNAL ERROR**, contact BMC Software Customer Support.
- All other reasons do not require any action.

CTTB02E  INPUT VERB INVALID OR OUT OF ORDER

**Explanation:** The CTTSBD utility encountered an invalid input statement or an input statement that was not in the expected order.

The utility stops execution.

**Corrective Action:** Check the input to the utility, correct the statement in error, and rerun the utility.

CTTB03E  UNRECOGNIZED KEYWORD: parm

**Explanation:** An invalid parameter was specified in the input for the CTTSBD utility.

The utility stops execution.

**Corrective Action:** Check the input to the utility, correct or replace the invalid parameter, and rerun the utility.

CTTB04E  ERROR IN KEYWORD: parm

**Explanation:** An inappropriate value was specified for the parm parameter in the input for the CTTSBD utility.

The utility stops execution.

**Corrective Action:** Check the input to the utility, correct the parameter in error, and rerun the utility.
CTTB05E OPEN FAILED FOR DDNAME: ddName

Explanation: The CTTSBD utility was unable to open the ddName file during this run. The utility stops execution.

Corrective Action: Check the JCL used to execute the CTTSBD utility and verify that all files used by the CTTSBD utility are allocated properly.

CTTB06E ATTACH/LOAD OF SUBTASK/MODULE: modName FAILED

Explanation: The modName module or subtask of the CTTSBD utility could not be activated. The utility stops execution.

Corrective Action: Verify that the appropriate LINKLIST and STEPLIB libraries are available to the CTTSBD utility, and that a sufficient region size is allocated for the utility.

CTTB07E MISSING CONTINUATION RECORD

Explanation: A syntax error was found in a multiline statement in the input for the CTTSBD utility. A continuation record was not found where expected. The utility stops execution.

Corrective Action: Check the input to the CTTSBD utility, correct the statement in error, and rerun the utility.

CTTB08E UNABLE TO OBTAIN VIRTUAL STORAGE

Explanation: The CTTSBD utility could not run due to insufficient storage (memory). The utility stops execution.

Corrective Action: Ensure that sufficient virtual storage is available for CTTSBD execution.

CTTB09E STATEMENT OUT OF ORDER

Explanation: A syntax error was found in the member containing data set group definitions for the CTTSBD utility. This message is issued when a member containing data set group definitions does not start with a GROUP statement. The utility stops execution.

Corrective Action: Check and correct the data set group definition member referenced by the CTTSBGRP DD statement, and rerun the CTTSBD utility.

CTTB10E CTTSBD INTERNAL ERROR: mod-func

Explanation: An internal error was detected in the mod module and func function of the CTTSBD utility. The utility stops execution.

Corrective Action: Contact BMC Software Customer Support. Supply the text of this message, and prepare a copy of the JCL used to execute the CTTSBD utility and any output (including the dump) that were produced by this run of the utility.
CTTB11E LOAD OF CONTROL-M/TAPE CONTROL TABLE (TCT) FAILED

Explanation: The CTTSBD utility was unable to locate the Control-M/Tape Control Table. Control-M/Tape is not active. The CTTSBD utility can run only when Control-M/Tape is active.

The utility stops execution.

Corrective Action: Start Control-M/Tape and rerun the utility.

CTTB13I CTTSBD REACHED SPECIFIED TIME LIMIT - PROCEEDING TO COMPLETE CURRENT INPUT VOLUME CHAIN

Explanation: This information message indicates that the CTTSBD utility has been running for the maximum amount of time specified in the TIMELIM parameter.

The utility finishes processing the INPUT volume chain of the current data set and then shuts down.

Corrective Action: No action is required.

CTTB14I CTTSBD SHUTDOWN REQUESTED BY OPERATOR - PROCEEDING TO COMPLETE CURRENT INPUT VOLUME CHAIN

Explanation: This information message indicates that an operator command requested shut down of the CTTSBD utility.

The utility finishes processing the current volume chain and then shuts down.

Corrective Action: No action is required.

CTTB15E CANNOT EXECUTE WITH MODE=NORMAL WHEN CONTROL-M/TAPE IS NOT ACTIVE

Explanation: An attempt to run the CTTSBD utility in NORMAL mode when Control-M/Tape was not active failed. The CTTSBD utility can run in NORMAL mode only when Control-M/Tape is active. If Control-M/Tape is not active, the utility can only be run in SIMULATION mode.

The CTTSBD utility is not run.

Corrective Action: Either run the utility in SIMULATION mode, or activate Control-M/Tape before attempting to rerun the CTTSBD utility.

CTTB16E VOLUME volser: MDB VOLUME|DATASET RECORD(S) NOT FOUND. CHAIN PROCESSING STOPPED

Explanation: The CTTSBD utility was unable to locate volume and/or data set records for the specified volser. This volume cannot be processed by the CTTSBD utility.

The CTTSBD utility stops processing the current volume chain and continues with the first data set in the next volume chain.

Corrective Action: No action is required.
CTTB19W CHAIN STOPPED: VOL=volser DSN=dsName REASON=rsn

Explanation: The CTTSBD utility was unable to process the specified input data set. The possible values for rsn and the appropriate action to take for each are listed in the User Response section of this message.

The CTTSBD utility stops processing the current volume chain and continues with the first data set in the next volume chain.

Corrective Action: The action to be taken depends on the reason specified in the message, as follows:

<table>
<thead>
<tr>
<th>REASON rsn and Explanation</th>
<th>User Response</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>FAILURE IN DATASET PROCESSING</strong></td>
<td></td>
</tr>
<tr>
<td>The utility was unable to copy the specified data set.</td>
<td></td>
</tr>
<tr>
<td><strong>VOLUME RECORD CHANGED</strong></td>
<td>To stack the data sets on this input volume chain, rerun the utility. Ensure that the volume or volume record is not accessed by another application during the execution of the CTTSBD utility.</td>
</tr>
<tr>
<td>The Media Database record for the first volume of an input volume chain was modified between the time it was selected and the time the first data set residing on this chain was copied.</td>
<td></td>
</tr>
<tr>
<td><strong>CYCLE RETENTION</strong></td>
<td>The specified data set cannot be processed by the CTTSBD utility. If necessary, copy this data set using other means.</td>
</tr>
<tr>
<td>The specified data set has a CYCLE retention type. To minimize interference with retention of other data sets, the CTTSBD utility does not process data sets with CYCLE type retention.</td>
<td></td>
</tr>
<tr>
<td><strong>INVALID DATA IN MDB</strong></td>
<td>Correct the records in error through the Control-M/Tape Inquire/Update screen (TI) or the CTTMUP utility. After the Media Database records have been corrected, rerun the CTTSBD utility on the abandoned volume chain.</td>
</tr>
<tr>
<td>The CTTSBD utility encountered invalid information in Media Database records for the specified volume and/or data set. (This type of problem is most often a result of conversion from another tape management system.)</td>
<td></td>
</tr>
</tbody>
</table>
CTTB20E UNABLE TO ALLOCATE D=dsname V=volser U=unitName DD=ddName RC=rc RSN=rsn

Explanation: The CTTSBD utility could not dynamically allocate the specified data set. This error may be due to a mismatch between the selected volume and the unit names specified by the INUNIT and OUTUNIT CTTSBD parameters, or to the unavailability of drives of the requested type.

See the appropriate IBM manual containing reason codes for dynamic allocation (SVC 99).

The CTTSBD utility stops processing the current volume chain and continues with the first data set in the next volume chain.

Corrective Action: Either modify the values for the INUNIT and OUTUNIT parameters, or ensure that more drives are available during the subsequent runs of the CTTSBD utility.

CTTB21I UNABLE TO COMPLETE RECOVERY, PROCESSING STOPPED

Explanation: This information message indicates that automatic recovery attempted by the CTTSBD utility abended. During automatic recovery, the CTTSBD utility attempts to recatalog the last data set that was uncataloged. This cataloging operation failed.

This message is preceded by message CTTB29E, which contains the name of the data set that could not be cataloged.

The CTTSBD utility stops execution.

Corrective Action: Recatalog the data set specified in message CTTB29E, and rerun the CTTSBD utility.

CTTB22E UTILITY {IEBGENER | ADRDSSU} ENDED WITH RC=rsn

Explanation: The specified IBM utility detected an error.

In this message, rsn is an IBM code that indicates the reason for the error.

The utility terminates.

Corrective Action: Consult IBM documentation for the specified utility to determine the reason for the IBM code rsn and the recommended action, if any.

CTTB23A REQUESTED {INPUT | OUTPUT} VOLUME=volser NOT AVAILABLE. PLEASE REPLY C(ANCEL) OR W(AIT)

Explanation: This information message indicates that the CTTSBD utility could not allocate an input or output volume that was already in use or not available. In this message volser is the volume serial number of the unavailable volume.

The utility waits for a reply.

Corrective Action: Enter C for Cancel or W for Wait, as follows:
CTTB25E NO INCLUDE STATEMENT FOUND ON SYSIN

Explanation: No INCLUDE statement was specified for the current run of the CTTSBD utility. At least one INCLUDE statement must be specified. The CTTSBD utility stops execution.

Corrective Action: Specify one or more INCLUDE statements for the CTTSBD utility and rerun the utility.

CTTB26E INVALID INFORMATION RECEIVED FROM CTTX011 = rc

Explanation: Control-M/Tape Exit 11 returned an invalid return code to the CTTSBD utility. Exit 11 is expected to return a 1-character code to the utility, which affects the choice of output volume for the current data set. The code returned for the current data set is not recognized by the utility. The utility stops execution.

Corrective Action: Check and correct the source code in Exit 11 and rerun the CTTSBD utility.

CTTB27E CHAIN PROCESSING STOPPED. OUT DSN EXCEEDS 44 CHARSD=dsn

Explanation: The specified output data set has a name that is more than 44 characters in length. A prefix and/or a suffix can be specified for output data set name by means of the OUTPREF and OUTSUFF parameters of the CTTSBD utility. When the prefix and or the suffix was added to the name of the specified data set, the new data set name exceeded the 44-character limit.

In this message, dsn is the output data set name that exceeds the 44-character limit.

The CTTSBD utility stops processing the current volume chain and continues with the first data set in the next selected volume chain.

Corrective Action: Change the settings for the OUTPREF or OUTSUFF parameters and rerun the CTTSBD utility to stack data sets on the volume chain that was abandoned due to this error.

CTTB28E UNABLE TO UNCATALOG DATASET DSNAME=dsn

Explanation: The CTTSBD utility was unable to uncatalog the specified input data set. The CTTSBD utility must uncatalog the input data set before cataloging an output data set with the same name. Common causes of this error include

- insufficient authorization for the user who ran the utility
- an I/O error

The CTTSBD utility stops processing the current volume chain and continues with the first data set in the next selected volume chain.

Corrective Action: Check the catalog entry for the problem data set, consider any related issues (for example, security), and if necessary correct the problem. It is also recommended that you search the console log for other messages that may be related to this problem.
CTTB29E UNABLE TO CATALOG DATASET DSNAME=dsn

**Explanation:** The CTTSBD utility was unable to catalog the specified output data set.

Common causes of this error include
- insufficient authorization for the user who ran the utility
- an I/O error

The utility stops execution.

**Corrective Action:** Check the catalog entry for the problem data set and correct it if necessary. It is also recommended that you search the console log for other messages that may be related to this problem.

CTTB30A DEVICE FOR {INPUT | OUTPUT} VOLUME=volser NOT AVAILABLE, PLEASE REPLY C(ANCEL) OR W(AIT)

**Explanation:** The device required to access volume *volser* is not available. The CTTSBD utility must access the specified volume for input or output, as specified. However, no device is available on which to mount the specified volume.

The system waits for a response.

**Corrective Action:** Do one of the following:
- Enter C to cancel device allocation and to end the run of the CTTSBD utility.
- Enter W to make the utility wait three minutes before trying again to allocate the required device.

**Messages CTTC00 through CTTCxx**

This group includes messages for the Control-M/Tape product.

CTTC01E CURRENT TMS IS INVALID

**Explanation:** An invalid or unsupported tape management system name was specified in the Automated Conversion Step Entry panel, the first screen of the Control-M/Tape automated conversion steps. Automatic conversion is a series of steps, which converts tape management data from another system into Control-M/Tape data format. Valid tape management system names are: CA1, TLMS, RMM, EPIC and CATALOG.

The conversion program waits for a correction to the specified value.

**Corrective Action:** Specify a valid tape management system name and retry.

CTTC02E INVALID LEVEL. VALID LEVELS FOR CA1 ARE: 4.9, 5.0, 5.1 AND 5.2

**Explanation:** An invalid or unsupported level was specified for CA-1 in the automatic conversion screen. Valid level values for the CA-1 tape management system: 4.9, 5.0, 5.1, and 5.2.

The conversion program waits for a correction to the specified value.

**Corrective Action:** Specify a valid level for the CA-1 tape management system and retry.
CTTC03E INVALID LEVEL. VALID LEVELS FOR CA-TLMS ARE: 5.3 AND 5.4

Explanation: An invalid or unsupported level was specified for CA-TLMS in the automatic conversion screen. Valid values for the CA-TLMS tape management system: 5.3 and 5.4.
The conversion program waits for a correction to the specified value.
Corrective Action: Specify a valid level for the CA-TLMS tape management system and retry.

CTTC04E INVALID LEVEL. VALID LEVELS FOR EPIC ARE: 3.1, 3.2 AND 3.3

Explanation: An invalid or unsupported level was specified for CA-EPIC/MVS in the automatic conversion screen. Valid values for the CA-EPIC/MVS tape management system: 3.1, 3.2, and 3.3.
The conversion program waits for a correction to the specified value.
Corrective Action: Specify a valid level for the CA-EPIC/MVS tape management system and retry.

CTTC05E LIBRARY/DATASET NOT FOUND

Explanation: A library or data set name that is not found in the MVS CATALOG was specified. The library or the data set name is either misspelled or not cataloged.
The conversion program waits for a correction to the specified data set or library name.
Corrective Action: Specify the cataloged library or data set name correctly and retry.

CTTC06E MEMBER NOT FOUND

Explanation: The member name specified cannot be found in the specified library. The library name or the member name, or both, are incorrect.
The conversion program waits for a correction to the specified library or member name.
Corrective Action: Correct the library name and the member name, and retry.

CTTC07E UNDEFINED OPTION CODE

Explanation: An option that is not supported in the current screen of the Control-M/Tape automatic conversion program was specified. The current screen lists the valid options.
The conversion program waits for specification of a valid option.
Corrective Action: Specify a valid option and retry.

CTTC08E AT LEAST ONE VOLUME RANGE MUST BE DEFINED

Explanation: There was an attempt to delete the last remaining range in the volume range table. The volume range table lists ranges of volumes that should be handled during conversion of tape management data to Control-M/Tape format. At least one volume range must be defined.
The volume range is not deleted.
Corrective Action: Define the correct volume range and then delete the existing volume range.
CTTC09E FROM VOLUME CANNOT BE HIGHER THAN TO VOLUME

**Explanation:** The current volume range definition contains a FROM value that is higher than its TO value. The TO volser (volume serial number) must not be less than the FROM volser.

The conversion program waits for a correction to the invalid range specification.

**Corrective Action:** Specify a valid volume range and retry.

CTTC10E REPORT CANNOT BE PROCESSED. MAKE SURE IT WAS SUCCESSFULLY PRODUCED

**Explanation:** The report that was produced as input to the automated conversion cannot be processed, because it was either empty or in an invalid format. To convert from a different tape management system to Control-M/Tape, a report is produced in the previous tape management environment. After the user confirms that it was successfully produced, the report is used as input to the conversion program.

The conversion program waits for the user to confirm that a report is successfully produced.

**Corrective Action:** Either produce a new report or wait for the report job to complete and confirm that it was successfully produced.

CTTCBR0 ACCDB FUNC: `func` FOR VOL: `volser` FAILED. RC=`rc`

**Explanation:** The high level API of Control-M/Tape (macro CTTACCDB) failed to perform function `func` for volume `volser`. The return code is `rc`.

The specified volume is not processed.

**Corrective Action:** See the CTTACCDB macro in the Control-M/Tape chapter of the INCONTROL for z/OS Administrator Guide for more information.

CTTCBR0 LAST IOS FUNC: `func`, IOS RC=`rc`, IOS RSN=`rsn`

**Explanation:** The specified function for the MDB failed. This message follows message CTTCBR01, if the problem is in an operation that modifies the MDB.

The variables in this message are:
- `func` - the function that failed
- `rc` - the return code of the error
- `rsn` - the reason code of the error

**Corrective Action:** Refer to the CTT200S message for a description of the return code (rc) and reason code (rsn).

CTTCBR0 VOLUME: `volser` NOT FOUND IN MDB. VOL IS MARKED PRIVATE

**Explanation:** This message is issued by exit CBRUXENT when a volume that is not known to Control-M/Tape enters the automated tape library. The volume serial number of the unknown volume is `volser`.

Processing continues. The volume is marked PRIVATE in the robotic library database.

**Corrective Action:** No action is required.
CTTCBR0 VOLUME: volser NOT FOUND IN MDB. UPDATE NOT PERFORMED

**Explanation:** This message is issued by exit CBRUXEJC when a volume that is not known to Control-M/Tape is ejected from the robotic library. The volume serial number of the unknown volume is volser.

Processing continues. The MDB is not updated.

**Corrective Action:** No action is required.

CTTCBR0 VOLUME: volser NOT FOUND IN MDB. CHANGE IS ALLOWED

**Explanation:** This message is issued by Exit CBRUXCUA when an attempt is made to change the status of a volume that is not known to Control-M/Tape. The volume serial number of the unknown volume is volser.

Processing continues. The status of the volume is changed in the robotic library.

**Corrective Action:** No action is required.

CTTCBR0 VOLUME: volser STATUS CHANGE DENIED BY CONTROL-M/TAPE EXIT

**Explanation:** This message is issued by Exit CBRUXCUA when an attempt is made to change the status of a volume and the new status contradicts with the status in the Control-M/Tape MDB.

The status of the volume is not changed.

**Corrective Action:** Check the volume status in the MDB. If appropriate, change the volume status in the MDB using the Control-M/Tape interface. The robotic library will be automatically notified of the change.

CTTCBR0 LINK OF EXIT exitName SUCCESSFUL

**Explanation:** A Control-M/Tape exit successfully linked a similar exit of another tape management system that runs parallel to Control-M/Tape.

**Corrective Action:** No action is required.

CTTCBR0 LINK OF EXIT exitName FAILED

**Explanation:** A Control-M/Tape exit failed to link a similar exit of another tape management system (TMS) that runs parallel to Control-M/Tape. When Control-M/Tape runs in TEST mode parallel to another TMS, Control-M/Tape interface exits attempt to pass control to similar exits of the other TMS.

**Corrective Action:** Verify that the STEPLIB or LINKLIST library of the job contains the specified exit. If the exit is in one of these libraries, refer to the messages guide for that exit.

CTTCBR0 VOLUME: volser NOT FOUND IN MDB. CANNOT LOCATE IT. PLEASE RESPOND TO CTTCBR12 MESSAGE

**Explanation:** This message is issued by exit CBRUXVNL when a mount message is issued for a volume that is not in the robotic library and is also unknown to Control-M/Tape.

Waits for one of the replies listed in message CTTCBR12.

**Corrective Action:** Reply to message CTTCBR12.
CTTCBR1 VOLUME: volser NOT IN LIBRARY. LOCATION: loc PLEASE RESPOND TO CTTCBR12 MESSAGE

Explanation: This message is issued by exit CBRUXVNL when a mount message is issued for a volume which is not in the robotic library. The message specifies the location of the volume as recorded in the Control-M/Tape database.

Waits for one of the replies listed in message CTTCBR12.

Corrective Action: Reply to message CTTCBR12.

CTTCBR1 VOLUME: volser NOT IN LIBRARY ALTHOUGH MARKED AS IN LIBRARY: lib. PLEASE RESPOND TO CTTCBR12 MESSAGE

Explanation: This message is issued by exit CBRUXVNL when a mount message is issued for a volume that should be in the robotic library based on data recorded in the Control-M/Tape MDB, but actually is not in the robotic library.

Waits for one of the replies listed in message CTTCBR12.

Corrective Action: Reply to message CTTCBR12.

CTTCBR1 VOLUME: volser. REPLY R-RETRY, I-IGNORE, C-CANCEL

Explanation: This message is issued by exit CBRUXVNL when a mount message is issued for a volume that is not in the robotic library. This message follows message CTTCBR09, CTTCBT10, or CTTCBR11.

Waits for user reply.

Corrective Action: Reply with one of the following options:
- R -- The volume was manually inserted in the robotic library. The system will again to find the volume in the robotic library.
- I -- The system will issue the mount message on a unit other than the robotic library.
- C -- The system will cancel the mount volume request and the job will abend.

CTTCBR1 VOLUME: volser NOT FOUND IN MDB. VOLUME IS IGNORED

Explanation: This message is issued by exit CBRUXENT when volume volser, which is unknown to Control-M/Tape, is inserted in the robotic library.

The volume status in the robotic library is not initialized by the exit.

Corrective Action: No action is required.

CTTCBR1 VOLUME: volser IS CURRENTLY IN EJECT PROCESS. PLEASE RESPOND TO CTTCBR12 MESSAGE

Explanation: This message is issued by exit CBRUXVNL when a mount message is issued for a volume that is currently in eject process from the automated tape library.

Waits for one of the replies listed in message CTTCBR12.

Corrective Action: Reply to message CTTCBR12.
Messages CTTE00 through CTTExx

This group includes messages for the Control-M/Tape product.

CTTE15S  INSUFFICIENT STORAGE. INCREASE SIZE

**Explanation:** Insufficient memory to perform the task.

**Corrective Action:** For jobs, increase the REGION size. For TSO, log on again using a larger SIZE parameter, or exit one of the screens using an END command.

CTTE29S  UNABLE TO LOAD MODULE *modName*

**Explanation:** Loading of the *modName* module failed. Possible causes are:

- The IOA Load library is not in the load modules search list.
- There is insufficient storage available to load the module.
- The *modName* module does not exist in the IOA Load library.
- The IOA Load library was updated while you were working and the position of the *modName* module has changed.

The function requested is terminated.

**Corrective Action:** Look on the system log for additional messages that clarify the problem. Suggested actions:

- If the IOA Load library is not in the search list, add a STEPLIB DD statement to the library.
- If the loading failed due to lack of storage then for batch jobs, increase the REGION size, and for TSO, try to log on again using a larger SIZE parameter. If you are using many IOA screens concurrently, try to exit a few using the END command. This can release storage that is used by the screens.
- Add the *modName* module to the Load library.
- If the IOA Load library was modified and you are working under TSO, try to log on again. If you are working under ROSCOE, you may have to shut down ROSCOE and bring it up again. If the IOA Load library is in the Linklist, a refresh to the LLA is needed.

CTTEDM0  *volser* FUNC=func RC=rc RSN=rsn URC=ursn FROM CTTAPI

**Explanation:** The Control-M/Tape interface to the EDM software used CTTAPI to scratch the *volser* in the Media Database, but CTTAPI ended with an error.

The specified volume is not expired.

**Corrective Action:** Refer to message CTT203E to understand the explanation for the return codes from CTTAPI.

Check the specified volume status in the Media Database, and if required, expire it online or by means of the CTTMUP utility.
CTTEDM0 {ATTACH | LINK} OF EXIT exitName SUCCESSFUL

Explanation: This information message indicates that the exitName exit was successfully activated. The Control-M/Tape interface to EDM software can call another exit after completion of the expiration process, probably an interface to another tape management system or a second Control-M/Tape version.

Corrective Action: No action is required.

CTTEDM0 {ATTACH | LINK} OF EXIT exitName FAILED

Explanation: Activation of the exitName exit failed. The Control-M/Tape interface to EDM software can call another exit after completion of the expiration process, probably an interface to another tape management system or a second Control-M/Tape version.

The specified exitName exit is not activated.

Corrective Action: When running two Control-M/Tape versions, verify that the exitName exit exists in the load library that is referenced by the parallel DD as described in Appendix D of the IOA Upgrade Guide. When not running two Control-M/Tape versions, verify that the STEPLIB or LINKLIST libraries contain the specified exitName exit. In addition, look for additional MVS errors messages in the job.

CTTEDM0 OPTION opt NOT SUPPORTED

Explanation: CA-Disk exit TMSCTLEX received an unrecognized option.

The Control-M/Tape interface to CA-Disk supports only the Volume Expire option, supplied as option number 1, of this exit. CA-Disk supplies a different option.

No operation is performed. The volume is not expired.

Corrective Action: No action is required.

Messages CTTF00 through CTTFx

This group includes messages for the Control-M/Tape product.

CTTF40I UTILITY CTTDBIB STARTED

Explanation: Normal start message of the Index file rebuilding the CTTDBIB utility.

Corrective Action: No action is required.

CTTF41E ERROR err AT LINE line. CURRENT STATEMENT: stmt

Explanation: The CTTDBIB utility failed during reading of the indicated input statement, from the data set pointed to by DD statement SYSIN.

The utility stops executing with a condition code of 08.

Corrective Action: Notify your INCONTROL administrator.

CTTF42I PROGRAM ENDED: num KEYS BUILT

Explanation: Normal termination message of the Index file rebuilding the CTTDBIB utility.

Corrective Action: No action is required.
CTTF43S ERROR OPENING SYSPRINT

Explanation: The CTTDBIB utility failed to open the print file pointed to by DD statement SYSPRINT. Possible causes are:

- DD statement SYSPRINT is missing.
- The data set pointed to by DD statement SYSPRINT cannot be accessed for sequential write.

The utility stops executing with a condition code of 08.

Corrective Action: Correct the JCL and rerun the job.

CTTF44E NO INPUT PARAMETERS. PROGRAM STOPPED

Explanation: The input file for the CTTDBIB utility is empty (DD statement SYSIN). The utility stops executing with a condition code of 04.

Corrective Action: Fill in the input statements and rerun the job.

CTTF45S INTERNAL ERROR WHILE PROCESSING DDNAME ddName

Explanation: The CTTDBIB utility failed during processing of the data set pointed to by the specified DD name. This message is followed by message CTTF47S, which contains additional details about the error. The utility stops executing with a non-zero condition code.

Corrective Action: Contact your INCONTROL administrator with the details displayed in this and the following message.

CTTF46S RETURN CODE rc FROM routineName ROUTINE, FUNCTION func

Explanation: The CTTDBIB utility failed while processing the data set pointed to by the DD name indicated in message CTTF46S, which precedes this message. The utility stops executing with the indicated return code.

Corrective Action: Notify your INCONTROL administrator.

CTTF47S INSUFFICIENT STORAGE TO RUN UTILITY CTTDBIB

Explanation: The CTTDBIB utility requires more storage to rebuild an Index file. The utility stops executing with a condition code of 12.

Corrective Action: Increase the REGION size and rerun the job.

CTTF48E INVALID BUILD KEY PARAMETER

Explanation: Invalid build key instructions were specified. Build key instructions are specified by means of the SYSIN DD statement. The key length parameter does not match the total length of the key fields. The utility stops processing.

Corrective Action: Notify your INCONTROL administrator.
INCONTROL for z/OS Messages Manual

CTTF90S OPEN OF DDCARD *ddName* FAILED

**Explanation:** Open for the specified DD name pointing to the password member failed.

Possible causes are:

- The DD statement is missing.
- The file allocated to the DD statement is not a sequential file nor a member in a PDS.

Authorization to access the product is denied.

**Corrective Action:** Correct the JCL statement for the procedure or the allocations for the CLIST.

CTTF91S PASSWORD MEMBER TOO LARGE (DD *ddName*)

**Explanation:** The password member (or sequential data set) has too many lines.

The DD statement points to the password member.

Authorization to access the product is denied.

**Corrective Action:** Remove unnecessary lines from the member.

CTTF92S SYNTAX ERROR IN PASSWORD MEMBER (DD *ddName*)

**Explanation:** A syntax error was found in the password member. When this message is issued by the monitor, it is generally followed by message CTTF9DS, which describes the erroneous line in the member.

In this message, *ddName* is the identity of the DD statement that points to the password member.

Authorization to access the product is denied.

**Corrective Action:** Correct the text in the password member.

CTTF93S VALUE ERROR IN PASSWORD MEMBER (DD *ddName*)

**Explanation:** A field in the password member contains invalid data. When this message is issued by the monitor, it is generally followed by message CTTF9DS, which describes the erroneous line in the member.

The *ddName* DD statement points to the password member.

Authorization to access the product is denied.

**Corrective Action:** Correct the text in the password member.

CTTF94S PASSWORD INVALID, PLEASE RECHECK PASSWORD MEMBER (DD *ddName*)

**Explanation:** Data in the password member was not consistent with the specified password.

The DD statement points to the password member.

Authorization to access the product is denied.

**Corrective Action:** Check the contents of the password member against the text received from BMC Software Customer Support. If it checks, contact the representative.
CTTF95S PASSWORD FOR CONTROL-T IS ABOUT TO EXPIRE IN num DAYS

**Explanation:** Highlighted, unrollable message.

Password expiration period is about to end.

An expiration date is specified in the password member for the product.

**Corrective Action:** Contact BMC Software Customer Support for a new password.

CTTF96S PASSWORD FOR CONTROL-T HAS EXPIRED

**Explanation:** Highlighted, unrollable message.

Password expiration period has ended.

An expiration date is specified in the password member for the product.

Authorization to access the product is denied.

**Corrective Action:** Contact BMC Software Customer Support for a new password.

CTTF97S INTERNAL ERROR OCCURRED ON DD ddName. PLEASE NOTIFY THE IOA ADMINISTRATOR

**Explanation:** An internal error has occurred while analyzing the password member pointed to by the DD statement.

Authorization to access the product is denied.

**Corrective Action:** Notify the IOA administrator.

CTTF98S OBLIGATORY FIELD MISSING FROM PASSWORD MEMBER (DD ddName)

**Explanation:** An obligatory field is missing from a password member.

The DD statement points to the password member. The PROD, START, CPUID, PASS, and TYPE fields should appear at least once in a password member.

Authorization to access the product is denied.

**Corrective Action:** Check the contents of the password member against the text received from your INCONTROL administrator.

CTTF9AS PASSWORD FOR CONTROL-T NOT DEFINED IN MEMBER (DD ddName)

**Explanation:** The member pointed to by the DD statement does not contain the password for the appropriate product.

The DD statement should point to the password member.

Authorization to access the product is denied.

**Corrective Action:** Check that the specified password member is the correct member for this product.
CTTF9BS AUTHORIZATION PERIOD HAS NOT STARTED YET (DD ddName)

**Explanation:** The start date of the password has not yet arrived.

The DD statement points to the password member. The START field contains the starting date of the password.

Authorization to access the product is denied.

**Corrective Action:** Check that the specified password member is the correct member for this period.

CTTF9CS CPUID/MODEL NOT FOUND IN AUTHORIZED CPU LIST (DD ddName)

**Explanation:** The current CPU is not defined in the CPU list.

The DD statement points to the password member. Each entry in the CPU list in the password member contains the CPUID of the CPU and its model.

Authorization to access the product is denied.

**Corrective Action:** Check that the specified password member is the correct member for this CPU.

CTTF9DS CARD = text

**Explanation:** This message supplies additional information for a previous error message.

This message may appear after message CTTF92S or CTTF93S which indicates an error has occurred in one of the lines of the password member. Message CTTF9DS displays the erroneous line.

**Corrective Action:** See messages CTTF92S or CTTF93S.

CTTF9ES PASSWORD DDCARD ddName POINTS TO A NON EXISTING MEMBER (ABEND S013-18)

**Explanation:** The DD statement is allocated to a nonexisting member in a PDS file.

The DD statement should point to the password member.

Authorization to access the product is denied.

**Corrective Action:** Correct the name of the member in the DD statement or create a member with the specified name.

CTTF9FS PASSWORD FOR CONTROL-x EXPIRED, TEMPORARY AUTHORIZATION GRANTED

**Explanation:** The password for Control-x has expired. Nonetheless, Control-x can be run on the current date.

Despite password expiration, Control-x can be run on the 28th, 29th, 30th, 31st, 1st, 2nd, and 3rd days of each month for special purposes.

Control-x processing continues.

**Corrective Action:** Contact BMC Software Customer Support to obtain password renewal.
Messages CTTH00 through CTTHxx

This group includes messages for the Control-M/Tape product.

CTTHAC0 ACCDB FUNC: func FOR VOL: volser FAILED. RC= rc

Explanation: The high level API of Control-M/Tape (macro CTTACCDB) failed to perform function func for volume volser. The return code is rc.

The specified volume is not processed.

Corrective Action: For more information, see the CTTACCDB macro in the Control-M/Tape chapter of the INCONTROL for z/OS Administrator Guide.

CTTHAC0 LAST IOS FUNC: func, IOS RC=rc, IOS RSN=rsn

Explanation: The specified function for the MDB failed. This message follows message CTTHAC01, if the problem is in an operation that modifies the MDB.

The variables in this message are:
- func - the function that failed
- rc - the return code of the error
- rsn - the reason code of the error

Corrective Action: See the CTT200S message for a description of the return code (rc) and reason code (rsn).

CTTHSC0 ACCDB FUNC: func FOR VOL: volser FAILED. RC= rc

Explanation: The high level API of Control-M/Tape (macro CTTACCDB) failed to perform function func for volume volser. The return code is rc.

The specified volume is not processed.

Corrective Action: For more information, see the CTTACCDB macro in the Control-M/Tape chapter of the INCONTROL for z/OS Administrator Guide.

CTTHSC0 LAST IOS FUNC: func, IOS RC=rc, IOS RSN=rsn

Explanation: The specified function for the MDB failed. This message follows message CTTHSC01, if the problem is in an operation that modifies the MDB.

The variables in this message are:
- func - the function that failed
- rc - the return code of the error
- rsn - the reason code of the error

Corrective Action: See the CTT200S message for a description of the return code (rc) and reason code (rsn).
CTTHSC0 VOLUME: volser NOT FOUND IN MDB. UPDATE NOT PERFORMED

Explanation: This message is issued by exit SLSUX06 when the volume ejected from the robotic library is unknown to Control-M/Tape.
Processing continues. The MDB is not updated.
Corrective Action: No action is required.

CTTHSC0 LINK OF EXIT exitName SUCCESSFUL

Explanation: A Control-M/Tape exit successfully linked a similar exit of another tape management system that runs parallel to Control-M/Tape.
Corrective Action: No action is required.

CTTHSC0 LINK OF EXIT exitName FAILED

Explanation: A Control-M/Tape exit failed to link a similar exit of another tape management system (TMS) that runs parallel to Control-M/Tape. When Control-M/Tape runs in TEST mode parallel to another TMS, Control-M/Tape interface exits attempt to pass control to similar exits of the other TMS.
Corrective Action: Verify that the STEPLIB or LINKLIST library of the job contains the specified exit exitName. If the exit is in one of these libraries, refer to the messages guide for the exit.

Messages CTTI00 through CTTIxx

This group includes messages for the Control-M/Tape product.

CTTI00E RBA rba1, rba2: DUPLICATE {VOLUME | DATASET}

Explanation: The CTTIDB utility detected one of the following:
- data records with the same volser in two volumes
- data records with the same label number located on the same volume in two data sets
- data records with the same label number located on the same multi-volume group in two data sets
In this message, rba1 and rba2 are the RBAs of these two records. This message is followed by two CTT999I information messages, which give the details about these duplicate data records.
Corrective Action: Delete one of the duplicate records by using the RECDEL statement of the CTTMUP utility, and then rebuild the equivalent index entries using the GRPBIX statement of the CTTMUP utility.

CTTI01E RBA rba: DUPLICATE {MDB | STK} x-INDEX FOUND

Explanation: The CTTIDB utility found a duplicate key in the index component of the Media database (MDB) or the Stacking database (STK). The record type and rba are reported in this message.
Corrective Action: Rebuild the relevant index file using the CTTBIX utility for the Media database or the CTTDBIX utility for Stacking database.
CTTI02E RBA rba. CHAIN ERROR: err_desc

Explanation: The CTTIDB utility detected an error in a multi-volume group. Information message CTT999I, which describes the record in error, is issued after this message. Many of the errors described by this message refer to the following fields in the volume record that hold information used to link a multi-volume group:

- FIRSTVOL - the first volume of the multi-volume group
- PREVVOL - the previous volser in the multi-volume group
- NEXTVOL - the next volser in the multi-volume group
- VOLSEQ - the volume sequence number

The variables in this message are:

- rba - the RBA of a record of this multi-volume group
- err_desc - text describing the type of group error

Corrective Action: The following table lists and explains the possible texts for the err_desc variable. Perform the corrective action as indicated.

<table>
<thead>
<tr>
<th>Error Description and Explanation</th>
<th>Corrective Action</th>
</tr>
</thead>
</table>
| FIRST VOL IS NOT THE SAME IN ALL VOLS | 1. Determine whether the problem is the value of the FIRSTVOL field of this volume, or the NEXTVOL field of the previous volume in the chain.  
2. Use the VOLUPD function of the CTTMUP utility to update the volume record of the volume in error.  
3. Correct the indexes of the group using the GRPBIX function of the CTTMUP utility. |
| VOLUME IN BROKEN GROUP | 4. Determine whether the volume belongs to a broken multi-volume chain.  
5. Use the VOLUPD function of the CTTMUP utility to update the volume record of the volume in error.  
6. Correct the indexes of the group using the GRPBIX function of the CTTMUP utility. |
<p>| INVALID PREV/NEXT POINTER |</p>
<table>
<thead>
<tr>
<th>Error Description and Explanation</th>

</tr>
</thead>
</table>
| The next or previous volume does not belong to this multi-volume group. The group is probably broken. | 7. Determine whether the problem is the value of the NEXTVOL or PREVVOL fields.  
8. Use the VOLUPD function of the CTTMUP utility to update the volume record of the volume in error.  
9. Correct the indexes of the group using the GRPBI X function of the CTTMUP utility. |
| VOLUME OUT OF SEQUENCE | 10. Determine whether the problem is the value of the VOLSEQ field.  
11. Use the VOLUPD function of the CTTMUP utility to update the volume record of the volume in error. |
| SCRATCH VOLUME IN THE ACTIVE CHAIN
ACTIVE VOLUME IN THE SCRATCH CHAIN | 12. Determine whether all volumes from the same multi-volume group have the same status.  
13. Use the SCRATCH or EXTEND functions of the TI screen to correct this problem or the VOLSCR function of the CTTMUP utility. |
| INVALID NEXT POINTER IN THE LAST VOLUME | 14. Determine whether this volume is really the last volume in the group.  
15. Use the VOLUPD function of the CTTMUP utility to reset the VOLNEXT field for the last volume record. |
| INVALID PREV POINTER IN THE FIRST VOLUME | 16. Determine whether this volume is really the first volume in the group.  
17. Use the VOLUPD function of the CTTMUP utility to reset the VOLPREV field for the first volume record. |
### Error Description and Explanation

#### SINGLE VOLUME WITH WRONG SEQUENCE NUMBER

The sequence number of a single volume (not multi-volume) should be equal to one.

<table>
<thead>
<tr>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>18. Determine whether this volume is really single volume and does not belong to any multi-volume group.</td>
</tr>
<tr>
<td>19. Use the VOLUPD function of the CTTMUP utility to set the VOLSEQ field for this volume to 1.</td>
</tr>
</tbody>
</table>

#### INVALID VOLFIRST FOR 1ST VOLUME IN GROUP

The first volume field (VOLFIRST) of the volume record that is the first of a multi-volume group (according to the VOLSEQ field) must be equal to the value of the VOLSER field.

<table>
<thead>
<tr>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>20. Determine whether this volume is the first volume of the multi-volume group, or a single volume.</td>
</tr>
<tr>
<td>21. Use the VOLUPD function of the CTTMUP utility to set the VOLFIRST field to the VOLSER value.</td>
</tr>
</tbody>
</table>

#### DATASET OUT OF SEQUENCE

The label number of a data set is out of sequence with the other labels of its multi-volume group.

<table>
<thead>
<tr>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>22. Determine whether the problem is that the dataset record is redundant.</td>
</tr>
<tr>
<td>23. Use the RECDEL function of the CTTMUP utility to delete the redundant dataset record.</td>
</tr>
</tbody>
</table>

---

**CTTI03E RBA rba: UNIDENTIFIED {MDB | STK} {DATA | INDEX} RECORD**  
**TYPE=x**

**Explanation:** The CTTIDB utility detected a data record or index entry with an invalid type.

**Corrective Action:** For an invalid type of data record, use the CTTMUP utility to delete the record. For an invalid type of index entry, you need to rebuild the entire index file.

---

**CTTI04E RBA rba: VOLUME volser OF THIS DATASET RECORD IS NOT FOUND**

**Explanation:** The CTTIDB utility detected a volume specified in a dataset record (the DSVOLSER field) but the corresponding volume data record was not found. In this message, `rba` is the RBA of the dataset record whose volume was not found. Information message CTT999I, which describes the record in error, accompanies this message.

**Corrective Action:** See message CTT999I for the volser of the volume in error. Use the VOLADD function of the CTTMUP utility to add the missing volume record, or the RECDEL function to delete the redundant dataset record. The user also may decide to correct the volume name in the dataset record.
CTTI05E RBA rba. {VOL-CONT | L-INDEX} [NOT] {EXPECTED | FOUND} BUT [NOT] {FOUND | EXPECTED}

**Explanation:** The CTTIDB utility either detected an unexpected volume continuation record (T type) or L-index, or did not find one that was expected.

Volume continuation records are expected for single volumes or for the first volume of a multi-volume group that has more than three vaults in its vault pattern. Volume continuation records are not expected for single volumes with up to three vaults in their vault pattern, or for a chained volume that is not the first volume in its multi-volume group.

The L-index is expected for each dataset record and volume combination. For example, if a dataset spans on two volumes, then it will have two L-indexes, one for each volume.

In this message, rba is the RBA of volume record, volume continuation record, or dataset record according to the error detected. Information message CTT999I, which describes the record in error, accompanies this message.

**Corrective Action:** For an unexpected or expected L-index, use the GRPBI5 function of the CTTMUP utility. If the error is not corrected, then rebuild the index file using the CTTBIX utility. For volume continuation record, determine the cause of the problem and correct it by deleting the unexpected volume continuation record, or update the number of vault entries in the VLTENTNM field in the volume record.

---

CTTI06E VOLUME volser IN USE FOR num DAYS

**Explanation:** The CTTIDB utility detected a volume record that is marked as being in use for num days. If a volume record is marked IN-USE for several days, it usually indicates a problem such as a system crash or a job abend.

**Corrective Action:** Check the USEDAYS parameter of the CTTIDB utility, and adjust it if necessary. Use the VOLUPD function of the CTTMUP utility to reset the IN-USE indicator from the volume record.

---

CTTI07E RBA rba. ACTIVE VOLUME WITH NO [ACTIVE] DATASETS

**Explanation:** The CTTIDB utility detected an active volume with no data set records or with no active data set records. In this message, rba is the RBA of the volume record. Information message CTT999I, which describes the volume record, follows this message.

**Corrective Action:** Request information on the volume by using the TI screen.

- For a single volume: If its status should be SCRATCH, change it using the VOLSCR function of the CTTMUP utility. Otherwise, you can add new active dataset record using the DSNADD function of the CTTMUP utility, or activate one of the existing dataset records using DSNEXT function of CTTMUP utility.
- For a volume that is part of a multi-volume group: Use the GRPBI5 function of the CTTMUP utility to rebuild the indexes for the multi-volume group. If the error is not fixed, you will probably need to update the VOLSNUM field of a dataset record that is part of the multi-volume group.

---

CTTI08E RBA rba. DSN IS ACTIVE, BUT VOLUME volser IS SCRATCH

**Explanation:** The CTTIDB utility detected a SCRATCH volume with an ACTIVE data set. In this message, rba is the RBA of the data set record. A SCRATCH volume cannot contain ACTIVE data sets. Information message CTT999I, which describes the dataset record in error, accompanies this message.
Corrective Action: Determine if the data set and the volume should be SCRATCH or ACTIVE. Then depending on the results, do one of the following:

- Change the volume status (VOLSTAT) to ACTIVE using the VOLUPD function of the CTTMUP utility.
- Scratch the volume using the VOLSCR function of the CTTMUP utility.

CTT109E RBA rba. VOLUME IS {NEITHER | BOTH} ACTIVE {NOR | AND} SCRATCH

Explanation: The CTTIDB utility detected a volume record that is either marked as both ACTIVE and SCRATCH, or is marked as neither ACTIVE nor SCRATCH. The volume must be either ACTIVE or SCRATCH, not both. In this message, rba is the record RBA of the volume record. Information message CTT999I, which describes the bad volume record, accompanies this message.

Corrective Action: Determine whether this volume should be ACTIVE or SCRATCH. Then, depending on the results, use the VOLUPD function of the CTTMUP utility to change the status (VOLSTAT) of the volume to either ACTIVE or SCRATCH.

CTT110E RBA rba. LBLNUM num1 DIFFERS FROM HIGHEST DSN LABEL FOUND num2

Explanation: The CTTIDB utility detected a volume record for which the LBLNUM field is not equal to the highest active label number on volume. Information message CTT999I, which describes the volume record in error, accompanies this message.

The variables in this message are:

- rba - the RBA of the volume record
- num1 - the current value of LBLNUM field from the volume record
- num2 - the label number of the highest active data set on the volume

Corrective Action: Use the VOLUPD function of the CTTMUP utility to update the LBLNUM field of the volume record to the correct value, which is num2, instead of num1. This error can also be corrected by means of the update function by using the TI screen.

CTT111E RBA rba. ACTIVEDS num1 DIFFERS FROM # OF DSN RECORDS FOUND num2

Explanation: The CTTIDB utility detected a logical error in a volume record. Information message CTT999I, which describes the error volume record, accompanies this message.

The variables in this message are:

- rba - the RBA of the volume record for which the error was detected
- num1 - the volume record field ACTIVEDS, containing the number of active data sets on the volume
- num2 - the number of active data set records that the utility detected on this volume

Corrective Action: Use the VOLUPD function of the CTTMUP utility to update the ACTIVEDS field of the volume record to the correct value, which is num2, instead of num1. This error can also be corrected by means of the update function by using the TI screen.
INCONTROL for z/OS Messages Manual

CTTI12E RBA rba. VOLSNUM num1 DIFFERS FROM # OF VOLUME RECORDS FOUND num2

Explanation: The CTTIDB utility detected a data set record in which the field value that holds the number of volumes that the data set resides on (VOLSNUM) is not correct. Information message CTT999I, which describes the dataset record in error, accompanies this message.

The variables in this message are:
- rba - the RBA of the data set record
- num1 - the current value of the VOLSNUM field from the data set record, holding the number of volumes occupied by the data set
- num2 - the number of volume records counted by the utility for the data set

Corrective Action: Use the DSNUPD function of the CTTMUP utility to update the VOLSNUM field of the dataset record to the correct value, which is num2, instead of num1. Then use the GRPBIX function of the CTTMUP utility to rebuild the corresponding index entries.

CTTI13E RBA rba. MISSING VAULT PATTERN INFORMATION

Explanation: The CTTIDB utility detected a vaulted volume record with missing vaulting information. A vaulted volume means that one of the following flags is set on the volume record: VAULTED, PVLT, PENDVLT. Missing vault information means that the number of vault entries field (VLTENTNM) is zero.

Corrective Action: Use the VOLUPD function of the CTTMUP utility to update all vaulting information fields in the volume records (VLTENTNM, VAULT, VLTEXTYP, and VLTEXPDT), or run the CTTVTM utility with RECALC mode and INCLUDE statement on the problematic volume only.

CTTI14E RBA rba. SPECIFIED # OF VAULTS num1 DIFFERS FROM VAULT COUNT num2

Explanation: The CTTIDB utility detected a volume record whose specified number of vaults (num1) does not equal its actual vault count (num2). A volume record contains a field that specifies the number of vaults in the vault pattern of the volume (VLTENTNM). Information message CTT999I, which describes the erroneous volume record, accompanies this message.

Corrective Action: Use the VOLUPD function of the CTTMUP utility to update the VLTENTNM field of the volume record to the correct value, which is num2, instead of num1.

CTTI15E RBA rba. VAULT INFO NOT EQUAL TO VAULT INFO OF FIRST VOLUME

Explanation: The CTTIDB utility detected a chained volume record with vaulting information different from vaulting information in the volume record of the first volume of the multi-volume group. Vaulting information in the chained volume record must be identical to the vaulting information for the first volume. The following vaulting information fields of the volume records are compared: VLTENTNM, VAULT, VLTENTDT, VLTEXTYP, and VLTEXPDT. In this message, rba is the RBA of the volume record of the chained volume in error. Information message CTT999I, which describes the erroneous volume record, accompanies this message.
Corrective Action: Use the VOLUPD function of the CTTMUP utility to update the VLTENTNM, VAULT, VLTENDDT, VLETEXTYP and VLTEXPDT fields of the volume record to have the same value as in the first volume in this multi-volume group. You can also run the CTTVTM utility with RECALC mode and INCLUDE statement on all volumes belonging to that multi-volume group.

CTTI16E VLTVEXP IS INCONSISTENT WITH VAULTING INFORMATION (vault_seq)

Explanation: The CTTIDB utility detected a volume data record with incorrect information in the VLTVEXP field. This field identifies the vaulting pattern sequence number that holds the expiration type, which is VOL EXPIRE. In this message, vault_seq is the information that should be in the VLTVEXP field. Information message CTT999I, which describes the erroneous volume record and the current value of the VLTVEXP field, accompanies this message.

Corrective Action: Use the VOLUPD function of the CTTMUP utility to update the VLTVEXP field of the volume record to the correct value, which is vault_seq.

CTTI17E RBA rba: {MDB | STK} KEY NOT FOUND. RECTYPE: rec_typ, MISSING KEY: key_typ

Explanation: The CTTIDB utility detected a data record for which there is no index record (key). Information message CTT999I, which describes the record in error, accompanies this message.

The variables in this message are:
- rba - the RBA of the data record
- rec_typ - the data record type
- key_typ - the type of the missing index

Corrective Action: If the missing index is a V-type index, use the VOLBIX function of the CTTMUP utility to rebuild this index (key). If the missing index is a L or D-type index, use the GRPBIX function of the CTTMUP utility to rebuild all multi-volume group indexes. For others index types, or if you did not succeed in fixing the error with the CTTMUP utility, rebuild the entire index file using the CTTBIX utility for the Media database or the CTTDBID utility for the Stacking database.

CTTI18E RBA rba: {MDB | STK} KEY BUILT FROM DATA REC IS NOT EQUAL TO REAL INDEX KEY

Explanation: The CTTIDB utility detected a mismatch between a data record and index entry. The index (key) generated from the data record does not match the index pointing to this record. These two indexes should be the same. In this message, rba is the RBA of the data record. Information message CTT999I, which describes the record in error, accompanies this message.

Corrective Action: For V, D, and L index types use the GRPBIX function of the CTTMUP utility to rebuild all multi-volume group indexes. For others index types, or if you did not succeed in fixing the error with the CTTMUP utility, rebuild the entire index file using the CTTBIX utility for the Media database or the CTTDBID utility for the Stacking database.
CTTI19E RBA rba: {MDB | STK} INDEX POINTS TO NOT EXISTING OR FREE DATA RECORD

Explanation: The CTTIDB utility detected an index record that points to a free data record or to one that does not exist. In this message, rba is the RBA of the data record. Information message CTT999I, which describes the record in error, accompanies this message.

Corrective Action: Rebuild the entire index file using the CTTBIX utility for the Media database or the CTTDBID utility for the Stacking database.

CTTI20E RBA rba: WRONG OR REDUNDANT L-INDEX

Explanation: The CTTIDB utility detected an L-type index pointing to an inappropriate data set record. In this message, rba is the RBA of the data record. Information message CTT999I, which describes the record in error, accompanies this message.

Corrective Action: Use the GRPBIX function of the CTTMUP utility to rebuild all indexes of this multi-volume group. If the error is not fixed, rebuild the entire Media database index file using the CTTBIX utility.

CTTI21E RBA rba1: INVALID RBA (rba2) POINTER IN THE {MDB | STK} HI-LEVEL INDEX

Explanation: The CTTIDB utility detected an invalid pointer from the HI-level index record to an inappropriate LOW-level index record.

The variables in this message are:
- rba1 - the RBA of the HI-level index record
- rba2 - the invalid RBA pointer found in the HI-level index record

Corrective Action: Rebuild the entire index file using the CTTBIX utility for the Media database or the CTTDBID utility for the Stacking database.

CTTI22E RBA rba1: HI-LEVEL {MDB | STK} INDEX POINTER rba2 HAS NO TARGET

Explanation: The CTTIDB utility detected an HI-level index record, which has no target LOW-level index record.

The variables in this message are:
- rba1 - the RBA of the problematic HI-level index record
- rba2 - the invalid RBA pointer from the HI-level index record

Corrective Action: Rebuild the entire index file using the CTTBIX utility for the Media database or the CTTDBID utility for the Stacking database.
CTTI23E RBA rba: {MDB | STK} LOW LEVEL INDEX IS NOT A TARGET OF ANY HI-LEVEL INDEX

**Explanation:** The CTTIDB utility detected a LOW-level index record, which is not a target of any HI-level index record. In this message, rba is the RBA of the problematic LOW-level index record.

**Corrective Action:** Rebuild the entire index file using the CTTBIX utility for the Media database or the CTTDBID utility for the Stacking database.

CTTI24E RBA rba: DIFFERENT SL-NAME slName FOUND FOR SCRATCH VOLUME volser

**Explanation:** The CTTIDB utility detected a scratch volume record with different values in the VOLSER and SLNAME fields.

The variables in this message are:
- rba - the RBA of the problematic volume record
- slName - the value of the SLNAME field
- volser - the value of the VOLSER field

**Corrective Action:** Delete the volume record from the media database using the CTTDLD utility, and then initialize the physical volume with a new unique volser using the CTTTPI utility. Make sure the new volser will be added to the Media database.

CTTI25E RBA rba: INVALID DATASET LABEL NUMBER EQUAL TO ZERO

**Explanation:** The CTTIDB utility detected a dataset record with the label number equal to zero. In this message, rba is the RBA of the problematic dataset record.

**Corrective Action:** Delete the invalid dataset record by using the RECDEL statement of CTTMUP utility.

CTTI26E RBA rba: INVALID {DATA | INDEX} RECORD STATUS z(X'xx') in {MDB | STK}

**Explanation:** The CTTIDB utility detected a record with invalid status. Valid status can be only A (active) or F (free).

The variables in this message are:
- z - incorrect status value
- rba - the RBA of the problematic record

**Corrective Action:** Manually update the record by entering either A or F as appropriate.

CTTI27E RBA rba: THE {MDB | STK} INDEX FILE IS CORRUPT

**Explanation:** The internal structure of the index file has been corrupted.

In this message, rba is the RBA of the problematic index record.

**Corrective Action:** Reformat the INDEX file and rebuild the index using the CTTBIX utility.
CTTI28E RBA rba1, rba2: SLOT IS OCCUPIED BY TWO VOLUMES: volser1, volser2

**Explanation:** The CTTIDB utility detected two different volumes, which occupy the same slot in the same vault.

In this message, rba1 and rba2 are RBAs of problematic volume records. This message is followed by message CTT999I, which contains information about the vault and the problematic slot number.

**Corrective Action:** Manually update one or both volume records by entering a correct slot number. Then run the CTIVTM utility in SLOTBLD mode.

CTTI29E RBA rba: VOLUME volser ASSIGNED TO NON-EXISTENT VAULT

**Explanation:** The CTTIDB utility detected the volumes, which are assigned to the vault, but the vault record does not exist.

In this message, rba is the RBA of the problematic volume record. This message is followed by message CTT999I, which contains information about the problematic vault record.

**Corrective Action:** Create the vault definition, using screen TV. Then run the CTIVTM utility in SLOTBLD mode.

CTTI30E RBA rba: VOLUME volser IS IN SLOT, BUT SLOT IS MARKED "VACANT"

**Explanation:** The CTTIDB utility detected the volume that occupied the slot, but the slot is marked as vacant.

In this message, rba is the RBA of the problematic volume record. This message is followed by message CTT999I, which contains information about the vault and the problematic slot number.

**Corrective Action:** Run the CTIVTM utility in SLOTBLD mode.

CTTI31E RBA rba: SLOT IS MARKED "OCCUPIED", BUT NO VOLUME IS ASSIGNED TO IT

**Explanation:** The CTTIDB utility detected the slot in the vault, which marked as "occupied", but there is no volume, assigned to it.

In this message, rba is the RBA of the problematic vault record. This message is followed by message CTT999I, which contains information about the vault and the problematic slot number.

**Corrective Action:** Run the CTIVTM utility in SLOTBLD mode.

CTTI32E RBA rba: RECVLNUM num1S INCONSISTENT WITH VAULTING INFORMATION

**Explanation:** The CTTIDB utility detected the volume, in which the value of the RECVLNUM field (number of the vaulting pattern "recalled from"), is inconsistent with the value of the VLTENTNM field (total number of vaulting patterns).

This message is followed by message CTT999I, which contains information about the problematic volume.

**Corrective Action:** Correct the problematic field using the CTMUP utility.
CTTI33I {TOTAL | NUMBER OF \textit{errmsg}} ERRORS FOUND: \textit{nn}

\textbf{Explanation:} This information message shows statistical information about the number of appropriated errors detected by CTTIDB utility or total number of errors.

In this message, \textit{errmsg} refers to the corresponding CTTIDB error message, such as CTTI00E or CTTI01E.

\textbf{Corrective Action:} No action is required.

CTTI34W NO VAULT RECORDS FOUND. ALL VAULTING ERROR MESSAGES BLOCKED.

\textbf{Explanation:} When attempting to cross-validate volume records and vault records, the CTTIDB utility found that no vault records exist in the MDB. No further vault-related error or warning messages are displayed.

\textbf{Corrective Action:} Run the CTTVTM utility in SLOTBLD mode to build vault records.

CTTI35E RBA \textit{rba}. VOLUME \textit{volser} CONTAINS INVALID SLOT NUMBER \textit{number}

\textbf{Explanation:} The CTTIDB utility detected an invalid volume record. The slot number in the volume record is not in the range of the slots defined in the vault record.

The variables in this message are:
- \textit{rba} - the RBA of the problematic volume record
- \textit{volser} - the volser of the problematic volume record
- \textit{number} - the problematic slot number in the volume record

\textbf{Corrective Action:} Run the CTTMUP utility to change the problematic slot number to the correct one.

CTTI36E RBA \textit{rba}. VOLUME \textit{volser} CONTAINS MUTUALLY EXCLUSIVE STATUS FLAGS \textit{flags}

\textbf{Explanation:} The CTTIDB utility detected status flags with mutually exclusive meanings. For example, the volume record status flags indicate that the volume is a SCRATCH volume and an ACTIVE volume.

The variables in this message are:
- \textit{rba} - the RBA of the problematic volume record
- \textit{volser} - the volser of the problematic volume record
- \textit{flags} - the volume record status flags (in hexadecimal format)

\textbf{Corrective Action:} Run the CTTMUP utility to change the problematic status flag to the correct one.

CTTI37E RBA \textit{rba}. DATASET OUT OF SEQUENCE

\textbf{Explanation:} The CTTIDB utility detected an incorrect data set sequence among the data set records. For example, the utility found the following data set sequence: DS1, DS3, and DS2 (the data sets are not in the proper sequence) or DS1 and DS3 (data set DS2 is missing).
In this message, \textit{rba} is the RBA of the first data set record out of sequence

\textbf{Corrective Action:} Run the CTTMUP utility to correct the incorrect data set sequence or to add the missing data set record.

\textbf{CTTI38E} RBA \textit{rba}: VOLUME \textit{volser}: INCORRECT DVLUSED VALUE \textit{value}

\textbf{Explanation:} A negative value of DVLUSED was received by Control-M/Tape from the device. (The DVLUSED parameter is required for stacking processing.)

The variables in this message are:
- \textit{rba} - the RBA of the problematic volume record
- \textit{volser} - the volser of the problematic volume record
- \textit{value} - the DVLUSED value

The utility CTTIDB continues to run. The error is automatically fixed when the problematic tape is returned to the scratch pool.

\textbf{Corrective Action:} If stacking is used, you can also resolve the error by running the CTTMUP utility. If stacking is not used, consider this message as an information message.

Messages \textbf{CTTS00} through \textbf{CTTSxx}

This group includes messages for the Control-M/Tape product.

\textbf{CTTS01W} THE CTVINTR=NONE SPECIFIED IN THE CTTPARM

\textbf{Explanation:} The CTVINTR parameter is set to NONE in the CTTPARM member. The CTTSYNC utility cannot perform synchronization with Control-V.

The CTTSYNC utility ends.

\textbf{Corrective Action:} Set the CTVINTR parameter to EDM or DSN in the CTTPARM member and rerun the CTTSYNC utility.

\textbf{CTTS02E} THE EDMID OF VOLUME \textit{volser} IS NOT EQUAL \textit{edmid}

\textbf{Explanation:} The volser is controlled by EDM, but the EDMID field in the Media database reflects an incorrect EDM type.

The variables in this message are:
- \textit{volser} - the volser of the problematic volume record
- \textit{edmid} - type of EDM controlled the volume

Normal processing continues.

\textbf{Corrective Action:} Use the CTTMUP utility to update the volume record in the Media database to its correct status.
CTTS03E DATASET  volser/label STATUS SHOULD BE  \{ACTIVE | PERM\} IN MEDIA DATABASE

**Explanation:** The dataset is controlled by Control-V, but its status is not active or its retention type is not permanent in the Media database.

Normal processing continues.

**Corrective Action:** Use the CTTMUP utility to update the dataset record in the Media database to its correct status.

CTTS04E THE CREPGM OF THE DATASET  volser/label IS NOT  "CTVMIG"

**Explanation:** The dataset is controlled by Control-V, but its create program (CREPGM) field is not equal to CTVMIG in the Media database.

Normal processing continues.

**Corrective Action:** Use the CTTMUP utility to update the dataset record in the Media database to its correct status.

CTTS05E CONFLICT BETWEEN DSNAMES  volser/label

**Explanation:** The dataset is controlled by Control-V, but the dataset name in the Media database is different from dataset name specified in Control-V Migrated User file.

Normal processing continues.

**Corrective Action:** Decide which is the correct dataset name and make necessary updates in the relevant database.

CTTS06E DATASET  volser/label IS NOT DEFINED IN MEDIA DATABASE

**Explanation:** The dataset is controlled by Control-V, but it is not defined in Control-M/Tape Media database.

Normal processing continues.

**Corrective Action:** Check why the dataset is not defined in the Media database. If the dataset should be defined in Control-M/Tape Media database, then use CTTMUP utility to add the dataset to the Media database.

CTTS07E DATASET  volser/label IS NOT CONTROLLED BY CONTROL-V

**Explanation:** The dataset is not controlled by Control-V, but it is marked in the Media database as ACTIVE, its retention type is PERMANENT and its create program (CREPGM) field is CTVMIG.

Normal processing continues.

**Corrective Action:** Verify that the dataset is really not controlled by Control-V, and scratch the dataset in the Media database using the CTTMUP utility.
CTV - CVI

This group includes messages for the Control-D, Control-M for z/OS and Control-V products.

CTV messages

This group includes messages for the Control-D includes: Control-D/Image Control-D/Page on Demand product.

Messages CTV500 through CTV5xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

CTV5F0E INVALID MEDIA = mediaName WAS SPECIFIED FOR FILE fileName

Explanation: The media name specified for the specified file to be deleted is invalid. The CTVCLMIG utility calls the CTVDEL program to delete specified files and the media on which they reside. Some of the input for CTVDEL was invalid.

The system skips the problematic file, and continues processing.

Corrective Action: Check the media name in IOASPRM, correct the problem, and try again.

CTV5F1E media DEVICE device SM-CMD-INTF FAILED. COMMAND cmd

Explanation: The SM-CMD-INTF command, which is used to delete FileTek files, failed for the specified media and device.

In this message, cmd is the command that caused the error.

The system skips the problematic file, and continues processing.

Corrective Action: Use FileTek interfaces to determine the cause of the failure, and the status of the file to be deleted. Fix the problem and try again.

CTV5F2E DELETE FAILED. fileName RC : rc

The system skips the problematic file, and continues processing.

Corrective Action: Check FileTek messages to determine the significance of the reason code. Then, use FileTek interfaces to determine the cause of the failure, and the status of the file to be deleted. Fix the problem and try again.
CTV5F3I DELETED *fileName*

**Explanation:** This information message indicates that the specified FileTek file was successfully deleted.

**Corrective Action:** No action is required.

CTV5F4E COLLECTION *collect-name* NOT DELETED FROM DB2 RC = rc

**Explanation:** The attempt to delete collection *collect-name* from a DB2 database failed.

**Corrective Action:** No action is required.

Messages CTV700 through CTV7xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

CTV700E "INDEX" MUST BE FILLED IN

**Explanation:** The index name was not specified in a decollating mission DO INDEX statement. Each index must be identified by a unique name which may later be used to access part of a report according to a specific index. A DO INDEX statement without a name is invalid.

**Corrective Action:** Specify an index name or mask.

CTV702E ONLY 3 INDEX LINES CAN BE SET TO R=Y

**Explanation:** An attempt was made to designate more than three indexes as disk-resident. A maximum of three indexes can be defined as disk-resident.

The index is not designated disk-resident. It will be deleted from DASD when the corresponding report is deleted, and will only be available on migrated media, if report is migrated.

**Corrective Action:** Redefine the Report Decollation Mission so that no more than three indexes are specified disk-resident.

CTV703E FROM/UNTIL COL ARE OBLIGATORY

**Explanation:** The FROM COL parameter or the UNTIL COL parameter (or both) of the index value or the value mask was not specified in the Decollation Mission DO INDEX statement.

**Corrective Action:** Specify FROM COL and UNTIL COL parameters to locate the index value. Either omit the value mask or specify FROM COL and UNTIL COL parameters to locate the mask.

CTV704E FIELD SHOULD BE BLANK WHEN " *fieldname* " IS BLANK

**Explanation:** Either

- The report line and column location of an index mask were specified without specifying the mask itself.
- The TYPE or STORED parameters of an index print mission were specified without specifying the print mission itself.

**Corrective Action:** Depending on the problem, either
Specify an index mask, or do not specify the mask location, for the index.
Specify an index print mission, or do not specify the TYPE and STORED subparameters.

CTV705E "MIGRATE" MUST BE FILLED IN
Explanation: The Migration Mission name was not specified in a DO MIGRATE statement.
Corrective Action: Specify a Migration Mission name or omit the DO MIGRATE statement.

CTV706E SUBINDEX LEVEL MUST BE IN THE RANGE OF 02-10
Explanation: There was an attempt to specify a subindex level below 02 or above 10. The LVL parameter indicates the hierarchical index level of the subindex. The default value is one level below the previously specified (sub)index. The specified value must be between 02 and 10.
The invalid value is not accepted and the cursor remains in the LVL field.
Corrective Action: Set a valid value for the LVL parameter, or blank out the Level field to activate the default value.

CTV707E NEXT SUBINDEX LEVEL MUST BE AT ANY EXISTING LEVEL OR THE NEXT ADJACENT LEVEL
Explanation: The value specified for the LVL parameter is not at the level of any existing subindex, and is more than one level of the previously specified index or subindex.
The LVL parameter indicates the hierarchical index level of the subindex. The default value is one below the previously specified level. The level of the subindex currently being specified must be either:
  - one below the previously specified index level
  - the same as a previously specified subindex level
The invalid value is not accepted and the cursor remains in the LVL field.
Corrective Action: Specify a subindex level that is one below the previously specified index level, or the same level as a previously specified subindex.

CTV708E FIELD SHOULD BE BLANK WHEN "SUBINDEX" IS BLANK
Explanation: A LINE, COL range or MASK was specified for a subindex whose name was not specified.
The LINE, COL range and MASK parameters cannot be specified for a subindex unless the subindex name has been specified.
The specified value is not accepted and the cursor remains in the LINE, CO or MASK field.
Corrective Action: Specify the name of the subindex name before specifying its LINE, CO range or MASK values, or blank out all fields for the subindex whose name is not specified.

CTV709E ONLY 9 SUBINDEXES ARE ALLOWED
Explanation: There was an attempt to define more than 9 subindexes for one main index. Each main index can have up to 9 subindexes.
Corrective Action: Blank out the extra subindex fields.
CTV70AE INVALID SUBINDEX DEFINITION IN THE BRANCH OF MULTI-VALUE INDEX

Explanation: A subindex that is defined in additional value branch of a multi-value index is absent in the base branch at the same level.

Corrective Action: Define a subindex according to the base branch of a multi-value index structure.

CTV70BE INVALID OPTION. TRY "M", "A", "T" OR BLANK

Explanation: An invalid option was specified in the M parameter of a DO INDEX statement.

Valid values are:
- M - creates a multi-value index from one range, according to a mask
- A - defines a multi-value index from additional ranges
- T - defines a multi-value index with separate subindex values
- Blank - defines a regular index

Corrective Action: Specify M, A, T, or blank.

CTV70CE INVALID OPTION. TRY "M", "A" OR BLANK

Explanation: An invalid option was specified in the M parameter of an AND statement.

Valid values are:
- M - creates a multi-value index from one range, according to a mask
- A - defines a multi-value index from additional ranges
- Blank - defines a regular index

Corrective Action: Specify M, A, or blank.

CTV70DE VALID OPTIONS IS "T" ONLY

Explanation: An invalid option was specified in the M parameter of an INDEX for an additional value branch of a multi-value index.

T is the only valid option.

Corrective Action: No action is required.

CTV70EE MASK SHOULD BE IN ASTERISKS.

Explanation: The MASK parameter is not enclosed in asterisks. MASK should be enclosed in asterisks if M=M is specified in the INDEX statement.

Corrective Action: Endose the MASK parameter in asterisks.

CTV70FE INDEX COL MUST BE RELATIVE (+/-)

Explanation: The INDEX COL is not relative. INDEX COL must be relative if M=M is specified in the INDEX statement.
Corrective Action: Define the relative INDEX COL parameter.

CTV70GE ONLY ONE "DO APPROV" STATEMENT PER "WHEN" STATEMENT MAY BE SPECIFIED

Explanation: An attempt was made to open a DO APPROV statement in a WHEN criteria statement that already contains a DO APPROV statement.

Corrective Action: Delete the second DO APPROV statement by clearing the DO field.

Messages CTVG00 through CTVGxx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

CTVG31E THIS OPTION IS INVALID WHEN THE INDEX NAME IS BLANK

Explanation: A line command (option) was entered in an Index Window on a line that does not contain an index name. The Index Window displays a list of indexes whose values can be used to retrieve a report or section of a report. Options S (Select) and Q (Quick Index) can only be used to select an existing index.

Corrective Action: Use the S or Q line command to select a filled-in index name, or exit the Index Window using the PF04 or PF16 key.

CTVG32E NO INDEX EXISTS FOR THIS REPORT

Explanation: Option X to list a report indexes in the Index Window was specified in the Active Report List screen but the selected report has no index.

Corrective Action: Define one or more indexes with DO INDEX statements in the Report Decollation Mission if this report should be indexed.

CTVG33I ONLY NINE INDEXES MAY BE DISPLAYED

Explanation: This information message indicates that an attempt was made to display more than nine indexes. The screen on which indexes are displayed has room for nine indexes. Only the first nine indexes are displayed.

Corrective Action: Redefine the Report Decollation Mission to specify no more than nine indexes for this report.

CTVG34E ONLY "S", "Q" OR " " ARE ALLOWED IN THIS FIELD

Explanation: A character other than S, Q or blank was entered in an Index Window Option field. S selects an index and displays its Values of Index Panel. Q displays the Quick Access Panel for the specified index.

The specified character is ignored. The system waits for a valid option or command.

Corrective Action: Specify option S or Q, or press PF03 or PF04 to redisplay the Active User Report List.
CTVG36E NO VALUES IN INDEX

**Explanation:** The specified index has no values in the specified user report. An error probably occurred in:

- Specifying or dynamically retrieving a user name.
- Specifying an index.

**Corrective Action:** Check the Decollation Mission Definition for this report. Be sure the user-recipient and index are properly specified.

CTVG39E IF A VALUE STARTS WITH A QUOTE, IT MUST END WITH THE SAME TYPE OF QUOTE

**Explanation:** The VALUE field in the User Reports Entry Panel began with a single (') or double (") quote but did not end with the same type of quote.

The specified value is ignored.

**Corrective Action:** Specify a valid index value in the VALUE field or leave the field empty.

CTVG3AE DYNAMIC ALLOCATION OF INDEX FILE FAILED, REASON CODE=rsn

**Explanation:** Control-D or V failed to dynamically allocate an index file.

The index file is not allocated.

**Corrective Action:** See the IBM manual *MVS Programming: Authorized Assembler Services Guide* for a description of the reason code received. If you cannot resolve the problem, record the rsn and contact BMC Software Customer Support.

CTVG3BE OPTION MUST BE BLANK OR ONE OF 1, 2 OR 3

**Explanation:** An invalid option was specified in the OPTION field of the User Reports Entry Panel.

The only valid options are:

- 1 - Display a Permanent Report List
- blank or 2 - Display an Active Report List
- 3 - Display a History Report List

**Corrective Action:** Specify a valid option.

CTVG3CE ONLY "Y", "N" OR "O" ARE ALLOWED IN THIS FIELD

**Explanation:** An invalid option was specified in the SHOW MIGRATED field of the User Reports Entry Panel.

The only valid options are:
Y - Display both active and migrated reports.
N - Display active reports only.
O - Display migrated reports only.

**Corrective Action:** Specify a valid option. Blank is not valid.

**CTVG3DE OPEN OF INDEX FILE FAILED**

**Explanation:** An index file could not be opened. It was probably deleted or uncataloged.

**Corrective Action:** Check the IOA Log file for a message indicating the report name and the name of the index file that could not be opened. Recreate the index which could not be opened by decollating the report again.

**CTVG3EI INDEX/VALUE NON-UNIQUE. VIEW FULL REPORT**

**Explanation:** This information message indicates that more than one index satisfies the specified index mask or more than one value satisfies the specified value prefix.

The entire report will be viewed or printed unless the User Action described below is taken.

**Corrective Action:** Use the Index Window to specify a unique index or use the Values of Index Panel to specify a unique value before viewing or printing the report.

**CTVG3FI INDEX VALUE NOT FOUND. VIEW FULL REPORT**

**Explanation:** This information message indicates that the specified value does not exist in the specified index.

The entire report is viewed or printed unless a unique existing value is specified before viewing or printing.

**Corrective Action:** Specify the desired index and value in the User Reports Entry Panel. Use the Index Window to determine if the desired index exists. Use the Values of Index Panel to determine if the desired value exists.

**CTVG40S "E" IS NOT SUPPORTED FOR MIGRATED REPORTS. USE VIEW AND PF4 TO EDIT RULER**

**Explanation:** Option E is not supported for migrated reports.

**Corrective Action:** Use option V to view the migrated report and PF04 to edit its ruler.

**CTVG41E THE DISPLAY TYPE CANNOT BE CHANGED WHEN BYPASS PANEL=Q**

**Explanation:** There was an attempt to change the Display Type by means of the DISPLAY command. However, while the BYPASS PANEL parameter is set to Q, only Display Type Q (Quick Access) is valid and no other Display Type is available.

Setting the BYPASS PANEL parameter in the User Reports Entry Panel to Q enables users to work directly with the Quick Access Panel. If more than one report matches selection criteria while the BYPASS PANEL parameter is set to Q, the matching reports are listed so users can specify which report to display in the Quick Access Panels. While this list is displayed, only Display Type Q and option Q are valid.

1380
**Corrective Action:** To change the Display Type, use the RETURN command to access the User Reports Entry Panel. Change the value of the BYPASS PANEL parameter to Y or N. Specify the desired Display Type in the DISPLAY TYPE parameter in the User Reports Entry Panel or, after pressing Enter to display the User Reports List, use the DISPLAY command.

**CTVG42E FROM DATE="LAST" TO DATE MUST BE BLANK**

**Explanation:** An invalid date parameter was specified in the User Report List Entry Panel. The TO DATE field must be blank when specifying FROM DATE=LAST.

**Corrective Action:** Correct the date parameter.

**CTVG43E DATE="LAST". USER MUST BE SPECIFIED**

**Explanation:** An invalid combination of values was specified in the User Report List Entry Panel. The USER field must not be blank when specifying FROM DATE=LAST.

**Corrective Action:** Specify a valid user name in the USER field or do not specify LAST in the FROM DATE field.

**CTVG44E THERE IS NO PREVIOUS INDEX**

**Explanation:** The PREV command was entered, or the PF10 or PF22 key was pressed in the Quick Access Panel to display a previous index for a report, but no previous index exists.

The current index-report combination remains displayed in the Quick Access Panel.

**Corrective Action:** Use the NEXT command or PF11 or PF23 key to display the next index, if any exists, for the report.

**CTVG45E THERE IS NO NEXT INDEX**

**Explanation:** The NEXT command was entered, or the PF11 or PF23 key was pressed in the Quick Access Panel to display the next index for a report, but no next index exists.

The current index-report combination remains displayed in the Quick Access Panel.

**Corrective Action:** Use the PREV command, or press the PF10 or PF22 key to display the previous index, if any exists, for the report.

**CTVG46E NO INDEX FOUND FOR THIS REPORT**

**Explanation:** Display of Quick Access Panels was requested for a report that has no indexes. Quick Access Panels cannot be displayed for a report that has no indexes.

Quick Access Panels are not displayed.

**Corrective Action:** Determine why the report has no index. If necessary, modify and rerun the Decollation Mission to create one or more indexes for the report.

**CTVG47E REQUIRED VALUE DOES NOT EXIST IN THIS INDEX**

**Explanation:** The index value entered in the Quick Access Panel does not exist in the current index. The user attempted to print a report, or section of a report, based on an index value specified in the Quick Access Panel. The specified value does not exist in the current index for the report.
The report is not printed.

**Corrective Action:** Display the Values of Index Panel for the specified report and index to list existing index values.

CTVG48E DISPLAY TYPE Q IS VALID ONLY WHEN BYPASS PANEL=Q

**Explanation:** DISPLAY Q was entered on the command line of an Active User Reports List. Display Type Q facilitates the display of data about a report in the Quick Access Panels. Display Type Q is only available when the BYPASS PANEL parameter in the User Reports Entry Panel is set to Q. Display Type Q cannot be implemented by means of the DISPLAY command.

**Corrective Action:** Use option Q in any display type of the Active User Reports List to access the Quick Access Facility. The display type does not need to be changed to Q in order to use option Q.

CTVG49E ERROR IN routineName CACHE ROUTINE - RC= rc

**Explanation:** Due to an internal error in routine routineName, a cache request could not be satisfied. The return code from routine routineName was rc. The View option (V) was specified. Routine routineName was called by the View function.

Possible causes and return codes by routine name:

- IOASCRQ - Possible return codes:
  - 4 - OSE (open session entry) was not active.
  - 8 - Another request was issued with this OSE.
  - 24 - PC-call (cross memory addressing) error.

- IOASAOS - Possible return codes:
  - 4 - ENQ query for user existence failed.
  - 16 - There is no free OSE (open session entry).

- IOAXCP5 - Return code is 8, REQ (request queue element) error.

- IOAXPC7 - Return 8, requested media not defined in the IOASPRM member.

- IOASCAW - Return code 4, cannot copy the OSE (open session entry).

The report is not displayed or only partially displayed.

**Corrective Action:** Use the information above to determine what is wrong with the cache request mechanism. If the error cannot be resolved, record the error message and contact BMC Software Customer Support.

CTVG4AE IOASMON ARCHIVE SERVER NOT ACTIVE - RC= rc

**Explanation:** The IOA Archive Server was either terminated or not started.

The cache request is not performed.

**Corrective Action:** Ask the operator to start the IOA Archive Server.
CTVG4BE REQUESTED MEDIA NOT ACTIVE

**Explanation:** The media to which the requested report migrated is not active in the IOA Archive Server. The required media was terminated or not started.

The cache request is not performed.

**Corrective Action:** Ask the operator to activate the required media in the IOA Archive Server.

CTVG4CE ERROR LOCATING MIGRATED REPORT

**Explanation:** The requested report was not found in the catalog. The IOA Archive Server searched the catalog for the requested migrated report but did not find it.

The cache request is not performed.

**Corrective Action:** Contact your INCONTROL administrator to find out what happened to the required data set.

CTVG4DE REQUESTED VOLUME NOT FOUND IN OSS DATABASE

**Explanation:** The requested report migrated to a volume that has been manually deleted from the OSS database.

The cache request is not performed.

**Corrective Action:** Contact your OSS operator to find out what happened to the required volume.

CTVG4EE REQUESTED PLATTER NOT FOUND IN OSS DATABASE

**Explanation:** The requested report migrated to a volume that resides on a platter that has been exported or manually deleted from the OSS database.

The cache request is not performed.

**Corrective Action:** Contact your OSS operator to find out what happened to the required platter.

CTVG4FE NO DEVICES ARE ACTIVE FOR THIS MEDIA

**Explanation:** The media to which the requested report migrated has no currently active device in the IOA Archive Server. The devices of the required media were terminated or not started.

The cache request is not performed.

**Corrective Action:** Ask the operator to activate at least one device of the required media in the IOA Archive Server.

CTVG4GE CTVX001 COULD NOT ACCESS INDEXES

**Explanation:** The CTVX001 exit, could not retrieve an index value from a non-Control-V index file.

The system stops.

**Corrective Action:** Contact BMC Software Customer Support.

CTVG4HS x IS NOT SUPPORTED FOR ACTIVE REPORTS

**Explanation:** Options R and C are not supported for migrated reports.
Corrective Action: Specify a valid option.

CTVGB0E ERROR ALLOCATING DEVICE

Explanation: The IOA Archive Server could not allocate a device to retrieve a migrated report. See messages DVT191E or IOA191E and DVT192E or IOA192E in the IOA Log file for the error code and information about the failed allocation.

The cache request is not performed.

Corrective Action: Correct the problem that caused the allocation to fail, and retry.

CTVGB1E OPERATOR COULD NOT MOUNT REQUESTED TAPE

Explanation: The operator did not mount a volume requested by the IOA Archive Server. The requested volume could not be found or the operator did not mount the volume for some other reason.

The cache request is not performed.

Corrective Action: Contact the operator to determine why the requested volume was not mounted.

CTVGB2E CACHE REQUEST FAILED - SERVER CODE = rc

Explanation: Due to an internal error in the cache mechanism, a cache request was not performed. Return code rc was produced as a result, as shown below.

<table>
<thead>
<tr>
<th>rc</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>20</td>
<td>Media error in adding request to chain.</td>

</tr>
</tbody>
</table>

The cache request is not performed.

**Corrective Action:** See the IOA Log file for messages regarding the event. Use the return code to determine what caused the IOA Archive server cache mechanism to fail. If the error cannot be resolved, contact BMC Software Customer Support.

**CTVGB3E INDEX/VALUE NON-UNIQUE. PRINT REQUEST DENIED**

**Explanation:** This message indicates that more than one index satisfies the specified index mask, or more than one value satisfies the specified prefix value.

The report is not printed.

**Corrective Action:** To print a specific portion of the report use the Index window to specify a unique index, or use the Values of Index panel to specify a unique value.

**CTVGB4E INDEX VALUE NOT FOUND - PRINT REQUEST DENIED**

**Explanation:** This message indicates that the specified value does not exist in the specified index.

The report is not printed.
Corrective Action: Use the Index window to determine whether or not the required index exists. Use the Values of Index panel to determine whether or not the required value exists. Specify the required index and value for the print request.

CTVGB5I NO MORE SUBINDEXES FOR THIS BRANCH
Explanation: This information message indicates that there are no lower level indexes for this index.
Corrective Action: No action is required.

CTVGB6I NO VALUES EXIST FOR THIS INDEX
Explanation: This information message indicates that no values of the specified index appear in the user’s report.
Corrective Action: No action is required.

CTVGB7E INVALID MEDIA SPECIFIED FOR REPORT
Explanation: A migrated report could not be accessed because the media to which it was migrated was not found. The $SYSDATA entry that corresponds to this migrated report specifies a migrated media which does not appear in IOASPRM.

The migrated report is not accessed.
Corrective Action: Have your INCONTROL administrator correct IOASPRM to reference the migrated media that appears in the $SYSDATA entry.

CTVGC5S INTERNAL ERROR - FREEMAIN ERROR. RC = rc
Explanation: An internal error occurred during the execution of a FREEMAIN macro. This error occurred during the execution of the database conversion utility. See CVIGC5S.

The database conversion utility terminates with an error. The conversion of the VSAM file to an IOA Access Method file is not completed.
Corrective Action: Contact BMC Software Customer Support.

Messages CTVP00 through CTVPxx
This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

CTVP40E UNABLE TO ACCESS INDEXES - RC = rc
Explanation: An internal error occurred when accessing the Index facility of Control-D/WebAccess Server Page On Demand or Control-D PRINT monitor.

The requested action is not performed.
Corrective Action: Report this problem and any relevant error messages from the IOA Log and the Control-D Application Server to BMC Software Customer Support.
CTVP41E NOT ENOUGH SPACE FOR INDEXES - SOME INDEXES ARE MISSING

Explanation: There are too many index paths for this report. Some index paths cannot be accessed using Page On Demand.

Only the displayed index paths are accessible using Page On Demand.

Corrective Action: You can access the rest of the index paths by means of the Control-D Index facility.

CTVP42E INTERNAL ERROR - INVALID REQUEST SUB-TYPE - MUST BE BETWEEN 1 AND n

Explanation: An internal error occurred when the user attempted to access an Index facility of Control-D/WebAccess Server Page On Demand.

The function is not performed.

Corrective Action: Check the IOA Log and the system log for additional error messages. Report the problem and any additional error messages to BMC Software Customer Support.

CTVP43E INTERNAL ERROR FREEING STORAGE - RC = rc

Explanation: An internal error occurred when the user attempted to exit from the Index facility of Control-D/WebAccess Server Page On Demand.

The server on the host cannot close the index used. Other problems may occur because of this error.

Corrective Action: Check the IOA Log and the system log for additional error messages. Report the problem and any additional error messages to BMC Software Customer Support.

CTVP44S INSUFFICIENT STORAGE - INCREASE REGION SIZE

Explanation: Insufficient memory in the host server to perform the index request.

The indexes cannot be accessed.

Corrective Action: Increase the REGION size of the server task on the host, and restart the server.

CTVP45E REPORT ENTRY DELETED - CANNOT ACCESS INDEXES

Explanation: The report entry corresponding to the index being processed does not exist. The report entry was probably deleted by another user or by CTDDELRP utility.

The report is not displayed.

Corrective Action: Refresh the User Report list to get a current list of existing report entries.

CTVP46S ERROR IN INPUT MESSAGE LENGTH - MESSAGE IS TOO SHORT

Explanation: An internal communication error occurred between Control-D/WebAccess Server and the Control-D Application Server.

The requested action is not performed.

Corrective Action: Report this problem and any relevant error messages from the IOA Log and the Control-D Application Server to BMC Software Customer Support.
CTVP47S EOR IN INPUT MESSAGE - INDEX PATH IS INCORRECT

**Explanation:** Internal error in communication between Control-D/WebAccess Server and the Control-D Application Server. The report section is not retrieved.

**Corrective Action:** Report this problem and any relevant error messages from the IOA Log and the Control-D Application Server to BMC Software Customer Support.

CTVP48S INTERNAL ERROR - LOAD OF MODULE *modName* FAILED

**Explanation:** The Control-D Application Server failed to load a load module. The requested function is not performed. Other problems may follow.

**Corrective Action:** Consult your INCONTROL administrator. If necessary, report this problem to BMC Software Customer Support.

CTVP49S INTERNAL ERROR - MISMATCH BETWEEN INDEX RECORD AND USER RECORD

**Explanation:** Internal error in the Control-D Application Server or Control-D PRINT monitor. The requested action is not performed.

**Corrective Action:** Report this problem, the report entry for which it occurred, and any relevant error messages from the IOA Log and the Control-D Application Server to BMC Software Customer Support.

CTVP4AS INTERNAL ERROR IN INPUT PARAMETERS

**Explanation:** An internal error occurred when accessing the Index facility of Control-D/WebAccess Server Page On Demand. The requested action is not performed.

**Corrective Action:** Record this problem and any relevant error messages from the IOA Log and the Control-D Application Server to BMC Software Customer Support.

CTVP4BS INTERNAL ERROR - CANNOT LOCATE THE PREVIOUS VALUE FROM WHICH TO START

**Explanation:** An internal error occurred when accessing the Index facility of Control-D/WebAccess Server Page On Demand. The requested action is not performed.

**Corrective Action:** Record this problem and any relevant error messages from the IOA Log and the Control-D Application Server to BMC Software Customer Support.

CTVP4CE CANNOT VIEW REPORT SECTION - INDEX PATH VALUES ARE NOT UNIQUE

**Explanation:** The index values in the selected path are not unique. The report cannot be viewed. The report section is not viewed.
Corrective Action: Choose index values from the List of Index Values, and then attempt to View the report.

CTW messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages CTW0 through CTW0xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

CTW001W taskName : COMMUNICATION IS NOT ACTIVE

Explanation: Communication with the Enterprise Manager gateway was disconnected. IOAGATE reported the disconnection to the Application Server of Control-M. The task-name task of the Application Server issues this message.

The Application Server waits until communication is connected again.

Corrective Action: Check IOAGATE messages to identify and fix the communication problem.

CTW002W taskName : NO RESPONSE RECEIVED WITHIN EXPECTED TIME INTERVAL

Explanation: The Enterprise Manager gateway did not respond to an IOAGATE transmission within the time allowed.

The Control-M Application Server waits for a message from the Enterprise Manager gateway.

Corrective Action: Check the Enterprise Manager gateway to find out why it is not responding.

CTW003E taskName : COMMUNICATION SLOWDOWN

Explanation: IOAGATE buffers are full. IOAGATE can not accept any new messages from the Control-M Application Server. IOAGATE informs the Application Server. The taskName task of the Application Server tries to transmit again several times and, if it does not succeed, issues this message.

The Control-M Application Server stops.

Corrective Action: Check IOAGATE messages to try to identify and fix the problem. If necessary, contact BMC Software Customer Support.

CTW004E taskName : MBX INTERNAL ERROR ENCOUNTERED. FUNCTION: funcName RC= rc

Explanation: An internal error occurred in the MBX API.

The Control-M Application Server terminates.

Corrective Action: Contact BMC Software Customer Support.
CTW046S BLDL/LOAD FAILED FOR THE MODULE "modName"

Explanation: Loading of the modName module failed.
Possible causes are:
- The IOA Load library is not in the load modules search list (STEPLIB + Linklist).
- There is insufficient memory.
- There is some other system-oriented reason, which may be found in the syslog.
Execution might stop.
Corrective Action: Prepare the Control-M monitor full output and contact BMC Customer Support.

Messages CTW100 through CTW1xx
This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

CTW125W FOLDER LIBRARY NOT FOUND
Explanation: The specified job scheduling library is not correct.
Corrective Action: Correctly specify the library.

Messages CTW300 through CTW3xx
This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

CTW392S OPEN OF DDNAME ddName FAILED
Explanation: The opening of the data set referenced by the ddName DD statement failed.
Possible causes are:
- the DD statement referring to the data set referenced by the ddName DD statement is missing.
- The data set referenced by the ddName DD statement does not exist.
System action depends on the calling program. Execution may continue, or it may stop.
Corrective Action: Correct the JCL and rerun.

Messages CTW500 through CTW5xx
This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.
CTW581S OPEN OF IOA SYNCHRONIZATION FILE FAILED. DDNAME "DASINC"

Explanation: The opening of the IOA Conditions Synchronization file failed (DD statement DASINC).
Possible causes are:
- The DD statement DASINC is missing.
- The file allocated to the DD statement DASINC is not the IOA Synchronization file.
- The file allocated to DD statement DASINC is the IOA Synchronization file, but it is of a different version or of a different Control-M monitor.

Corrective Action: Correct the JCL for the job or the allocations for the CLIST.

CTW586S OPEN OF IOA CONDITIONS FILE FAILED. DDNAME "DACNDSF"

Explanation: Open of IOA Conditions file failed (DD statement DACNDF).
Possible causes are:
- The DD statement DACNDF is missing.
- The file allocated to the DD statement DACNDF is not an IOA Conditions file.
- The file allocated to the DD statement DACNDF is the IOA Conditions file, but it is of a different version or of a different IOA Installation.

Corrective Action: Correct the JCL for the job or the allocations for the CLIST.

Messages CTW900 through CTW9xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

CTW912S ERROR IN CONTROL- \x INSTALLATION PARAMETERS - INVALID DAYTIME

Explanation: Invalid format of Control- \x Installation DAYTIME parameter. DAYTIME is the start time of the Control-M work day in your installation. Valid formats are +hhmm or -hhmm.

For more details see the section that describes installation parameters in the chapter for the appropriate products in the INCONTROL for z/OS Installation Guide.

The requested function terminates.

Corrective Action: Call your system programmer to correct the DAYTIME parameter in the CT \x:PARM member.

CTW913S OPEN OF DDNAME "SYSPRINT" FAILED

Explanation: The opening of a print file failed.
Possible causes are:
The DD statement SYSPRINT is missing.

The data set referenced by the DD statement SYSPRINT cannot be accessed for sequential write.

The program stops executing.

**Corrective Action:** Correct the JCL and submit again.

CTW914S ERROR IN IOA INSTALLATION PARAMETERS - INVALID DATETYP

**Explanation:** Highlighted, unrollable message.

The DATETYP IOA Installation Parameter is invalid. DATETYP is the type of date format used in the installation. Valid formats are:

- **A** - mmdyy
- **W** - ddmmyy
- **J** - yymmdd

For more details refer to the section that describes how to set IOA installation parameters in the IOA chapter of the INCONTROL for z/OS Installation Guide.

The requested function stops.

**Corrective Action:** Call your system programmer to correct the DATETYP parameter in the IOAPARM member.

CTW916W PROGRAM pgm WAITING FOR resourceName

**Explanation:** One of the IOA monitor internal programs detected an IOA resource in use by a TSO user or batch job. This message normally appears a few times a day.

The variables in this message are:

- **pgm** - the name of the internal program that is waiting for the resource that is in use
- **resourceName** - the name of the resource that is in use

Valid values are:

<table>
<thead>
<tr>
<th>name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNDF</td>
<td>The IOA Conditions file</td>
</tr>
<tr>
<td>RESF</td>
<td>The Control-M Resources file</td>
</tr>
<tr>
<td>LOG</td>
<td>The IOA Log file</td>
</tr>
<tr>
<td>Control-M</td>
<td>The Control-M New Day procedure</td>
</tr>
<tr>
<td>JES_SSRQ</td>
<td>A JES subsystem request</td>
</tr>
<tr>
<td>CKPT</td>
<td>The Control-M Active Jobs file or the Control-D Active Missions file</td>
</tr>
</tbody>
</table>
The message is displayed on the operator console.

**Corrective Action:** The user response depends on the circumstances, as follows:

- If the message appears many times every few seconds, the file may be hung. This situation must be resolved by determining which program is holding the specified `resourceName`. Look for the IOA QNAME that is specified in the IOA Installation Parameter and take appropriate corrective action.
- If `pgm` is CTMFRM and `resourceName` is CONTROLM, some possible reasons are:
  - there are several Control-M monitors running with the same QNAME
  - there is a user daily job running that has a date control record in which columns 60 through 65 are not blank, meaning that it is acting as the Control-M New Day procedure and therefore Control-M has been enqueued
  - the Control-M New Day procedure was started externally (manually) rather than being started by the monitor, and as a result waits for the monitor to be suspended

Take appropriate corrective action.

- If the program name `pgm` is CTM|ES and the `resourceName` is JES_SSRQ, then Control-M (in its postprocessing phase) has called the JES2 interface using IEFSSREQ (a JES2 subsystem request) and is waiting for some function to be executed by JES2, but the execution of that function is being delayed in JES2. If the message persists in this situation, prepare the Control-M monitor full output and contact BMC Customer Support.

**CTW918S INSUFFICIENT MEMORY TO RUN CONTROL-**

**Explanation:** Highlighted, unrollable message.

More memory is required for the INCONTROL monitor.

The specified monitor will shut down.

**Corrective Action:** Increase the REGION size of the specified monitor.

**CTW919S INTERNAL ERROR IN CONTROL-M MONITOR**

**Explanation:** Highlighted, unrollable message.

An internal error occurred in the Control-M monitor.

The Control-M monitor abends with the user abend 0008.

**Corrective Action:** Try to start the Control-M monitor again. In any case, keep the dump and call BMC Software Customer Support for assistance.

**Messages CTWG00 through CTWGxx**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**CTWG00I ENTERPRISE/CS MAINFRAME GATEWAY STARTED, RELEASE=**

**Explanation:** This information message indicates a normal start of MVS Gateway for Enterprise Controlstation.
**Corrective Action:** No action is required.

**CTWG01I ENTERPRISE/CS MAINFRAME GATEWAY DEBUG LEVEL IS SET TO debugLevel**

*Explanation:* This information message indicates that the Enterprise Controlstation Mainframe Gateway DEBUG level was set by an operator modify command (F).

The TRACE level is set to a new level. Each TRACE level activates the trace option on different components of the Enterprise Controlstation Mainframe Gateway.

*Corrective Action:* No action is required.

**CTWG02E ENTERPRISE/CS MAINFRAME GATEWAY NOT APF-AUTHORIZED**

*Explanation:* The Enterprise Controlstation Mainframe Gateway is not APF-authorized. The CTWGTW module is not in an APF-authorized library or does not have the AC=1 attribute.

The Enterprise Controlstation Mainframe Gateway shuts down.

*Corrective Action:* Either add the library name in which CTWGTW resides to the IEAAPF00 member in SYS1.PARMLIB, or relink the module with the AC=1 attribute.

**CTWG03E INVALID MODIFY PARAMETER. VALID PARAMETERS ARE:**

*Explanation:* An operator modify command (F) passed an erroneous parameter to the Enterprise Controlstation Mainframe Gateway. One or more GTWG25I messages are displayed on the operator console after this message, each containing a valid modify parameter.

The modify command is rejected.

*Corrective Action:* Enter a valid modify parameter.

**CTWG04E BLDL/ATTACH FAILED FOR TASK taskName**

*Explanation:* Initialization of one of the Enterprise Controlstation Mainframe Gateway's internal tasks failed. The system code indicating the exact reason can be found in the system log.

This may be due to one of the following:

- Task taskName is not found in the IOA Load library.
- Insufficient storage is available for the Enterprise Controlstation Mainframe Gateway.

The Enterprise Controlstation Mainframe Gateway shuts down.

*Corrective Action:* Call your system programmer for assistance. If necessary, increase the Enterprise Controlstation Mainframe Gateway REGION size.

**CTWG05E UNRECOVERABLE ERROR ENCOUNTERED**

*Explanation:* An unrecoverable error occurred in the operation of the Enterprise Controlstation Mainframe Gateway. The IOA Log, or the Enterprise Controlstation Mainframe Gateway JES messages file or SYSPRINT file, should contain a message with more details about the error. See also, CTWA01W.

The Enterprise Controlstation Mainframe Gateway shuts down.
**Corrective Action:** Call your system programmer for assistance. If the problem is not resolved, call BMC Software Customer Support for assistance.

**CTWG06E ONE OF THE SUBTASKS HAS ABENDED**

**Explanation:** One of MVS Gateway for Enterprise Controlstation’s internal subtasks has abended.

MVS Gateway for Enterprise Controlstation shuts down with user abend 0006. A dump of the abending task is included in the SYSABEND output file.

**Corrective Action:** Call your system programmer for assistance. If the problem is not resolved, contact BMC Software Customer Support.

**CTWG07I SHUT DOWN UPON REQUEST FROM OPERATOR**

**Explanation:** This information message confirms that an operator command (P) was issued, requesting shutdown of MVS Gateway for Enterprise Controlstation. This message is followed by message GTWG20I, indicating completion of the shutdown.

MVS Gateway for Enterprise Controlstation starts to shut down.

**Corrective Action:** No action is required.

**CTWG10E TRACE LEVEL MUST BE A NUMBER BETWEEN 0 AND 255**

**Explanation:** An invalid TRACE level was entered, either in the operator modify command (F) or in the operator start command (S). When activating the Enterprise Controlstation trace facilities, specify a number from 0 through 255, inclusive, for the TRACE level. 0 specifies no tracing.

**Corrective Action:** Issue the command again with the correct TRACE level. The required TRACE level should be supplied by BMC Software Customer Support.

**CTWG11I SERVICE ID "id" IS {ENABLED | DISABLED}**

**Explanation:** This information message confirms the current enable or disable status of service ID, after the operator has issued an operator modify command (F) that enables or disables it.

**Corrective Action:** No action is required.

**CTWG12E INVALID PARAMETERS (parms) PASSED TO THE ENTERPRISE/CS MAINFRAME GATEWAY**

**Explanation:** One or more parameters which were passed to the Enterprise Controlstation Mainframe Gateway in an operator start command (S) were invalid.

The Enterprise Controlstation Mainframe Gateway shuts down.

**Corrective Action:** Restart the Enterprise Controlstation Mainframe Gateway with valid parameters.

**CTWG13E OPEN OF CONTROL-M ACTIVE JOBS FILE FAILED. DDNAME "DACKPT"**

**Explanation:** Open of the Control-M Active Jobs file failed (the DACKPT DD statement). This may be due to one of the following:
The DACKPT DD statement is missing.
The data set pointed to by the DACKPT DD statement is not the Control-M Active Jobs file.
The program stops executing.

**Corrective Action:** Correct the JCL for the job or started task and rerun or restart it.

CTWG14I ENTERPRISE/CS MAINFRAME GATEWAY `subtaskName (id)` STARTED

**Explanation:** This information message indicates that a Control-M NJE subtask started normally.

**Corrective Action:** No action is required.

CTWG15I ENTERPRISE/CS MAINFRAME GATEWAY `subtaskName (id)` SHUT DOWN UPON REQUEST FROM MAIN TASK

**Explanation:** This information message indicates that a Control-M NJE subtask terminated normally.

**Corrective Action:** No action is required.

CTWG16E OPEN OF CONTROL-M STATISTICS FILE FAILED. DDNAME "DASTAT"

**Explanation:** The program is unable to open the Control-M Job Execution Statistics file (DD statement DASTAT). Possible causes are:

- The DASTAT DD statement is missing.
- The data set pointed to by the DACKPT DD statement is not the Control-M Job Execution Statistics file.
- VSAM open error.

The program continues executing, but without accessing the Job Execution Statistics file.

**Corrective Action:** Look for VSAM messages or other system messages. Correct the JCL for the job or started task and rerun or restart it.

CTWG17E FILE ALLOCATED TO DDNAME "DACKPT" IS NOT YOUR CONTROL-M ACTIVE JOBS FILE

**Explanation:** The data set pointed to by the DACKPT DD statement is not your Control-M Active Jobs file. This is due to one of the following:

- The data set pointed to by the DACKPT DD statement is not the Control-M Active Jobs file.
- The data set pointed to by the DACKPT DD statement is the Control-M Active Jobs file, but of another monitor, or of a different Control-M version.

The program stops executing.

**Corrective Action:** Correct the JCL of the job or started task and rerun or restart it.
CTWG19W DUPLICATE processing parm FOUND IN JOB jobName
ORDERD orderId

Explanation: During download of the Control-M Active Jobs file or update of the Active network, a job was encountered that contained a duplicate processing parameter entry. Only one of the duplicate entries will be downloaded.

Corrective Action: It is advisable to correct the job definition in the mainframe so that it does not contain any duplicate processing parameter entries.

CTWG20I ENTERPRISE/CS MAINFRAME GATEWAY SHUTTING DOWN

Explanation: This information message is issued when the Control-M NJE Gateway shuts down, either as a result of an operator command (P), or due to internal Control-M NJE Gateway events. The Control-M NJE Gateway log, the Control-M NJE Gateway JES messages file, or the SYSPRINT file usually contain additional messages concerning the reason for the shutdown.

The Control-M NJE Gateway shuts down.

Corrective Action: No action is required.

CTWG21S ENTERPRISE/CS MAINFRAME GATEWAY ENDED WITH ERRORS

Explanation: The Enterprise Controlstation Mainframe Gateway ended with an error. The IOA Log, or the Enterprise Controlstation Mainframe Gateway JES messages file or SYSPRINT file, should contain additional messages concerning the specific error.

The Enterprise Controlstation Mainframe Gateway shuts down.

Corrective Action: Check the IOA Log or the system log for the reason. Call your system programmer for assistance if needed. Try to start the Enterprise Controlstation Mainframe Gateway again.

CTWG22W DUPLICATE processing parm FOUND IN JOB jobName TABLE tableName

Explanation: During table download, a job was encountered that contained a duplicate processing parameter entry. Only one of the duplicate entries will be downloaded.

Corrective Action: It is advisable to correct the job definition in the mainframe so that it does not contain any duplicate processing parameter entries.

CTWG23I CONTROL-M NJE GATEWAY INTERVAL IS SET TO nn SECONDS

Explanation: This information message displays the current NJE Gateway sleeping interval after it is set by an operator Modify command (F). The NJE Gateway wakes up every nn seconds to check what it must do.

Corrective Action: No action is required.
CTWG24E INTERVAL MUST BE A TWO-DIGIT NUMBER BETWEEN 03 AND 99 SECONDS

**Explanation:** Invalid Enterprise Controlstation Mainframe Gateway sleeping interval specified in an operator modify command (F). The Enterprise Controlstation Mainframe Gateway sleeping interval must be a 2-digit number from 03 to 99 seconds.

The modify command is rejected.

**Corrective Action:** Enter a valid sleeping interval.

CTWG25I valid parm

**Explanation:** This information message accompanies message GTWG03E, which indicates that an invalid modify parameter was specified. This message contains a valid modify parameter. This message may appear more than once. Each occurrence lists another valid modify parameter.

**Corrective Action:** No action is required.

CTWG26E MAXIMUM "ON" CODES EXCEEDED IN JOB jobName TABLE tableName

**Explanation:** During Table Download, a job was encountered that contained too many ON codes. There is insufficient space in the internal buffer for the number of ON codes in the job definition.

The table download fails.

**Corrective Action:** It is advisable to correct the job definition in the mainframe so that it contains fewer ON codes.

CTWG27S INSUFFICIENT STORAGE FOR CONTROL-M APPLICATION SERVER

**Explanation:** Insufficient storage available for the Control-M Application Server to execute.

The Control-M Application Server shuts down.

**Corrective Action:** Increase the REGION size parameter for the CTMAS procedure. If it is already REGION=0M, contact BMC Software Customer Support.

CTWG28E MAXIMUM "ON" CODES EXCEEDED IN JOB jobName ORDERID orderId

**Explanation:** During download of the Active Jobs file or update of the Active network, a job was encountered that contained too many ON codes. There is insufficient space in the internal buffer for the number of ON codes in the job definition.

Download of the Active Jobs file or update of the Active network will continue, but the specific job will not be downloaded.

**Corrective Action:** It is advisable to correct the job definition in the mainframe so that it contains fewer ON codes.
CTWG29E CTWGNRL FAILED. TASK ID= id FUNCTION= func RC= rc

**Explanation:** MVS Gateway for Enterprise Controlstation detected an internal error beyond user control. This error message is issued by the CTWGTW program, which is activated as part of MVS Gateway for Enterprise Controlstation.

MVS Gateway for Enterprise Controlstation shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

CTWG30E CTWPUT FAILED. TASK ID= taskId PUT ID= putId RC= rc

**Explanation:** Control-M NJE Gateway detected an internal error. Internal CTWPUT operation that was issued by PUTID putId, under subtask number taskId, failed with a return code of rc. If rc=20, a GETMAIN failure occurred above the 16M line.

For some errors, Control-M NJE Gateway shuts down. For other errors, operation continues.

**Corrective Action:** If Control-M NJE Gateway shuts down, contact BMC Software Customer Support. If rc=20, increase the region size.

CTWG31W YOUR ENTERPRISE/CS MAINFRAME GATEWAY IS ALREADY ACTIVE. QNAME qName

**Explanation:** Highlighted, unrollable message.

An attempt was made to start an Enterprise Controlstation Mainframe Gateway which was already active. It is impossible to run two Enterprise Controlstation Mainframe Gateways with the same QNAME at the same time.

The newly started Enterprise Controlstation Mainframe Gateway shuts down.

**Corrective Action:** No action is required.

CTWG32E CONTROL-M RELEASE NOT SUPPORTED (rel)

**Explanation:** The Enterprise Controlstation Mainframe Gateway was started on a Control-M installation with a release (rel) that is not supported. The Enterprise Controlstation supports Control-M Release 3.0.0 and above.

The Enterprise Controlstation Mainframe Gateway shuts down.

**Corrective Action:** No action is required.

CTWG33E INCOMPATIBLE GATEWAY VERSIONS. MAINFRAME GATEWAY VERSION mainframe_version. WORKSTATION GATEWAY VERSION workstation_version

**Explanation:** The version of MVS Gateway for Enterprise Controlstation is not compatible with the Workstation Gateway version. The two gateways should be installed from the same installation version. If only one gateway was upgraded, the link cannot become active.

MVS Gateway for Enterprise Controlstation shuts down.

**Corrective Action:** Either upgrade the lower version gateway, or restore the upgraded gateway to the previous version.
CTWG34E CONTROL-M APPLICATION SERVER DOES NOT SUPPORT COMPATIBILITY MODE

**Explanation:** The Control-M compatibility mode in IOAPARM is set to 2 (MODECTM=3). The Control-M application server can work in no compatibility mode (MODECTM=3).

The Control-M application server terminates with a return code of 8.

**Corrective Action:** Correct the error and try again, or start a Control-M application server from an earlier version.

CTWG41I CURRENT STATE: DOWN, REQUIRED STATE: UP

**Explanation:** This information message indicates that the Control-M monitor component being monitored by the Control-M/CM Application Server is DOWN, while its desired state is UP.

**Corrective Action:** Start the Control-M monitor, or change the desired state to DOWN.

CTWG42I CURRENT STATE: UP, REQUIRED STATE: DOWN

**Explanation:** This information message indicates that the Control-M monitor component being monitored by the Control-M/CM Application Server is UP, while its desired state is DOWN.

**Corrective Action:** Stop the Control-M monitor, or change the desired state to UP.

CTWG43E CTMCAS CANNOT START, *param* PARAMETER IS MISSING

**Explanation:** The Control-M/CM Application Server could not be started, because mandatory parameter *param* is missing from the CTMPARM member.

The Control-M/CM Application Server shuts down.

**Corrective Action:** Specify the missing parameters in CTMPARM and then restart the Control-M/CM Application Server.

CTWG51E ENTERPRISE/CS MAINFRAME GATEWAY INTERNAL ERROR. RC=rc

**Explanation:** An internal error occurred. A call to internal routine ECAPUT failed with return code rc. The IOA Gateway shuts down.

**Corrective Action:** Contact your INCONTROL administrator.

Messages CTWH00 through CTWHxx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

CTWH00I DOWNLOAD OF ACTIVE DATABASE STARTED

**Explanation:** Information message issued by the Control-M Application Server indicating that the download of the IOA and Control-M database is currently in progress.

**Corrective Action:** No action is required.
CTWH01I  DOWNLOAD OF ACTIVE DATABASE ENDED SUCCESSFULLY

**Explanation:** Information message issued by the Control-M Application Server indicating that the download of the IOA and Control-M database has ended successfully.

**Corrective Action:** No action is required.

CTWH02I  SERVER IS READY TO RECEIVE REQUESTS

**Explanation:** This information message indicates that the Enterprise Controlstation Workstation Gateway server has finished its initialization. The server is now ready to receive requests issued by the Enterprise Controlstation Workstation Gateway.

**Corrective Action:** No action is required.

CTWH03E  DOWNLOAD OF ACTIVE DATABASE FAILED

**Explanation:** Download of the IOA and Control-M database failed.

The download of the IOA and Control-M database, performed by the Control-M Application Server, has ended with an error.

The Control-M Application Server shuts down.

**Corrective Action:** Look in the job log, SYSPRINT and IOA Log for messages containing the reason for the failure. After the problem has been resolved, restart the Control-M Application Server.

CTWH04E  MODULE modName SHOULD BE REUSABLE

**Explanation:** This message indicates that an IOA module that should have been reusable, is not.

The `modName` module is supplied with the IOA installation tape with the reusable attribute bit on. However, the reusable attribute has become corrupted.

The program stops executing.

**Corrective Action:** Copy the `modName` module from the IOA installation tape to the IOA load library, refresh LLA, and rerun the program.

CTWH05E  ERROR DETECTED BY WORKSTATION GATEWAY DURING DOWNLOAD

**Explanation:** Download of the Active Jobs file failed due to an error encountered by the Workstation Gateway.

Download of the Active Jobs file was initiated, but the Workstation Gateway indicated that an error was encountered on the workstation side.

Download of the Active Jobs file fails.

**Corrective Action:** Look for error messages issued by the workstation and correct the problem accordingly.
INCONTROL for z/OS Messages Manual

CTWH06I WORKSTATION DATABASE IS SYNCHRONIZED WITH THE MAINFRAME DATABASE

**Explanation:** This information message is issued after establishment of communication, and indicates either that download of the Active Jobs file has ended successfully, or that it is not required.

**Corrective Action:** No action is required.

CTWH07E KSL INTERNAL ERROR TYPE type, RC = rc

**Explanation:** The Control-M Application Server encountered problems interfacing with the KSL subtask. In this message, type is one of the following:

<table>
<thead>
<tr>
<th>type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE 0001</td>
<td>Attempt to initialize KSL subtask.</td>
</tr>
<tr>
<td>TYPE 0002</td>
<td>Waiting for KSL subtask to perform a request.</td>
</tr>
<tr>
<td>TYPE 0003</td>
<td>KSL subtask ended abnormally.</td>
</tr>
</tbody>
</table>

The return code contains the system abend code.

The Control-M Application Server shuts down.

**Corrective Action:** Check the messages in the job log and the output in file DAKSLOUT. If message CTM555S appears, increase the REGION size. If no relevant messages appear, contact BMC Software Customer Support.

CTWH08I DOWNLOAD OF {CONTROL-M ACTIVE JOBS | IOA CONDITIONS/RESOURCES} FILE {STARTED | ENDED}

**Explanation:** This information message indicates that downloading of the specified file started or ended. The specified file is being downloaded from Control-M on the mainframe to an Enterprise Controlstation. This message indicates which phase of the download process was reached.

**Corrective Action:** No action is required.

CTWH09E OPEN OF KSL COMMUNICATION FILE FAILED. DDNAME "KSLCOMM"

**Explanation:** Open of the KSL Communication file failed (the KSLCOMM DD statement). This error message is issued by the Control-M Application Server and may be due to one of the following:

- The KSLCOMM DD statement is missing.
- The Control-M Application Server JCL procedure has been modified.

The Control-M Application Server shuts down.

**Corrective Action:** Correct the Control-M Application Server JCL procedure, and restart the Control-M Application Server.
CTWH10I {CTWSRVE | CTWDET} {STARTED | ENDED}

**Explanation:** This information message indicates that the Control-M Application Server initiated or shut down subtasks.

**Corrective Action:** No action is required.

CTWH12E SERVER INTERNAL ERROR TYPE type

**Explanation:** The server program detected an internal error.

This error message is issued by the CTWSRVR program, which is activated as part of the Control-M Application Server, and is due to reasons beyond the user's control.

The Control-M Application Server shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

CTWH53E FORMAT OF ACTIVE JOBS FILE ABENDED

**Explanation:** An abend occurred when the Active Jobs file was last formatted. The New Day process did not finish OK. ECSGATE cannot work with the AJF, because the AJF might be corrupted.

The Control-M Application Server shuts down.

**Corrective Action:** Inform your INCONTROL administrator.

CTWH57I ACTIVE JOBS FILE IS BEING FORMATTED

**Explanation:** This information message indicates that the Control-M Active Jobs File (AJF) is currently being formatted.

The Control-M Application Server holds updates. After formatting is finished, it executes a full download to the Enterprise Controlstation.

**Corrective Action:** No action is required.

CTWH60W RUN NUMBERS run_num1 TO run_num2 OF jobName HAVE NOT BEEN CAPTURED

**Explanation:** The Control-M Application Server detected that during its last sleeping period it missed some events.

This message is issued by the Control-M Application Server when it detects that the run number of the jobName job in the Control-M Active Jobs file has changed by more than one during the last sleeping period of the Control-M Application Server. This means that run numbers run_num1 to run_num2 of the job have not been captured by the Control-M Application Server.

**Corrective Action:** Consider decreasing the SLEEPINT parameter in the relevant APSERVER statement in the ECAPARM member.

CTWH61E DETECTOR INTERNAL ERROR TYPE type

**Explanation:** The detector program detected an internal error. This error message is issued by the Control-M Application Server, and is due to reasons not in user control.

The Control-M Application Server shuts down.
Corrective Action: Please have your INCONTROL administrator contact BMC Software Customer Support.

CTWH67I  DOWNLOAD PROCESS WILL TAKE PLACE SINCE rsn  
Explanation: This information message indicates that a download will be executed, and the reason.
Possible causes of this message are:
- The Control-M Active Jobs File (AJF) was formatted since the last Application Server cycle.
- The Control-M Application Server received a STARTLINK modify command.
Possible values for rsn are:
- ACTIVE JOBS FILE WAS FORMATTED
- STARTLINK COMMAND WAS ISSUED
The Control-M Application Server requests and will execute a full download to the Enterprise Controlstation.
Corrective Action: No action is required.

Messages CTWI00 through CTWIxx
This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

CTWI00I  DOWNLOAD OF IOA DATA BASE STARTED  
Explanation: This information message is issued by the Enterprise Controlstation Download utility to indicate that downloading of the IOA and Control-M database is currently in progress.
Corrective Action: No action is required.

CTWI01I  DOWNLOAD OF IOA DATA BASE ENDED SUCCESSFULLY  
Explanation: Information message issued by the Enterprise Controlstation Download utility, indicating that the download of the IOA and Control-M database has ended successfully.
Corrective Action: No action is required.

CTWI02E  RESOURCE resourceName CONTAINS NULL, INTERNAL CODE code  
Explanation: A resource containing nulls in its name was encountered during download or database update. A null is not valid in the name of a quantitative or control resource.
The Control-M Application Server terminates with a condition code of 08.
Corrective Action: Report the occurrence to BMC Software Customer Support.
CTWI03E OPEN OF ENTERPRISE/CS INFO DOWNLOAD FILE FAILED. DDNAME "DWNINFO"

**Explanation:** The Enterprise Controlstation Download utility could not open the Download Info file (DD statement DWNINFO).

Possible causes are:
- The DWNINFO DD statement is missing.
- The download JCL procedure or the JCL of the download job has been modified.

The Enterprise Controlstation Download utility stops executing.

**Corrective Action:** Correct the download JCL procedure or the JCL for the download job and rerun the download job.

CTWI04E OPEN OF ENTERPRISE/CS JOBS DOWNLOAD FILE FAILED. DDNAME "DWNJ OBS"

**Explanation:** The Enterprise Controlstation Download utility could not open the Download Jobs file (DD statement DWNJ OBS).

Possible causes are:
- The DWNJ OBS DD statement is missing.
- The download JCL procedure or the JCL of the download job has been modified.

The Enterprise Controlstation Download utility stops executing.

**Corrective Action:** Correct the download JCL procedure or the JCL for the download job and rerun the download job.

CTWI06E INSUFFICIENT STORAGE FOR THE ENTERPRISE/CS DOWNLOAD UTILITY

**Explanation:** The Enterprise Controlstation Download utility requires more storage in order to execute.

The Enterprise Controlstation Download utility stops executing.

**Corrective Action:** Increase the REGION size and rerun the download job.

CTWI07E DOWNLOAD INTERNAL ERROR TYPE *type*

**Explanation:** An internal error occurred during execution of the Enterprise Controlstation Download utility.

The Enterprise Controlstation Download utility stops executing.

**Corrective Action:** Have your INCONTROL administrator contact BMC Software Customer Support.

CTWI08E OPEN OF ENTERPRISE/CS APPLICATION-GROUP DEFINITION FILE FAILED. DDNAME "DAGROUP"

**Explanation:** The Control-M Application Server or Download utility is unable to open the Application-Group Definition file (DD statement DAGROUP). This may be due to one of the following:
The DAGROUP DD statement is missing.

The Control-M Application Server JCL procedure, or the download JCL procedure, or the JCL of the download job, has been modified.

The Control-M Application Server or Download utility continues executing, but without processing the applications.

**Corrective Action:** Correct the Control-M Application Server JCL procedure and restart the Control-M Application Server, or correct the download JCL procedure or the JCL for the download job and rerun the download job.

**CTWI09E** MAXIMUM APPLICATIONS IN ENTERPRISE/CS APPLICATION-GROUP DEFINITION FILE EXCEEDED. DDNAME "DAGROUP"

**Explanation:** The Control-M Application Server or Download utility is unable to process all the applications in the Application-Group Definition file (the DAGROUP DD statement). Too many applications were defined in the Application-Group Definition file.

The Control-M Application Server or Download utility continues executing, but processes only some of the applications.

**Corrective Action:** Check the Application-Group Definition file, and if it is correct, contact BMC Software Customer Support.

**CTWI10E** MAXIMUM GROUPS IN ENTERPRISE/CS APPLICATION-GROUP DEFINITION FILE EXCEEDED. DDNAME "DAGROUP"

**Explanation:** The Control-M Application Server or Download utility is unable to process all the groups in the Application-Group Definition file (the DAGROUP DD statement). Too many groups were defined in the Application-Group Definition file.

The Control-M Application Server or Download utility continues executing, but processes only some of the groups.

**Corrective Action:** Check the Application-Group Definition file, and if it is correct, contact BMC Software Customer Support.

**CTWI11E** INVALID STATEMENT IN ENTERPRISE/CS APPLICATION-GROUP DEFINITION FILE. DDNAME "DAGROUP"

**Explanation:** The Control-M Application Server or Download utility is unable to process a statement in the Application-Group Definition file (the DAGROUP DD statement). An invalid statement appeared in the Application-Group Definition file.

The Control-M Application Server or Download utility continues executing, but skips processing of the invalid instruction.

**Corrective Action:** Correct the syntax in the Application-Group Definition file, and restart the Control-M Application Server or rerun the Enterprise Controlstation Download utility.
CTWI14E OPEN OF ENTERPRISE/CS CONTROL RESOURCES DOWNLOAD FILE FAILED. DDNAME "DWNCNTRL"

**Explanation:** The Enterprise Controlstation Download utility could not open the Download Control Resources file (the DWNCNTRL DD statement). Possible causes are:

- The DWNCNTRL DD statement is missing.
- The download JCL procedure or the JCL of the download job has been modified.

The Enterprise Controlstation Download utility stops executing.

**Corrective Action:** Correct the download JCL procedure or the JCL for the download job and rerun the download job.

CTWI15E OPEN OF ENTERPRISE/CS QUANTITATIVE RESOURCES DOWNLOAD FILE FAILED. DDNAME "DWNQUANT"

**Explanation:** The Enterprise Controlstation Download utility is unable to open the Download Quantitative Resources file (the DWNQUANT DD statement).

Possible causes are:

- The DWNQUANT DD statement missing.
- The download JCL procedure or the JCL of the download job has been modified.

The Enterprise Controlstation Download utility stops executing.

**Corrective Action:** Correct the download JCL procedure or the JCL for the download job and rerun the download job.

CTWI50I BUILDING OF ECS COMMUNICATION DATASET STARTED

**Explanation:** This information message indicates that the Enterprise Controlstation Communication Dataset formatting utility started allocating and formatting the Enterprise Controlstation Communication Dataset file.

**Corrective Action:** No action is required.

CTWI51I BUILDING OF ECS COMMUNICATION DATASET ENDED

**Explanation:** This information message indicates that the Enterprise Controlstation Communication Dataset formatting utility completed allocation and formatting of the Enterprise Controlstation Communication Dataset file normally.

**Corrective Action:** No action is required.

CTWI52E BUILDING OF ECS COMMUNICATION DATASET FAILED

**Explanation:** The Enterprise Controlstation Communication Dataset formatting utility failed.

The utility fails.

**Corrective Action:** Look for an earlier error message that describes the type of error.
CTWI53E OPEN OF DDNAME DAM2G FAILED

**Explanation:** The Enterprise Controlstation Communication Dataset formatting utility failed to open the Enterprise Controlstation Communication Dataset file that is allocated to DD statement DAM2G. Possible causes are:

- The DAM2G DD statement is missing.
- There is insufficient memory for the job.

The utility stops executing with a condition code of 08.

**Corrective Action:** Correct the JCL and rerun the job.

CTWI54E I/O ERROR OCCURRED WHILE BUILDING THE ECS COMMUNICATION DATASET

**Explanation:** An I/O error occurred in the Enterprise Controlstation Communication Dataset formatting utility while formatting the Enterprise Controlstation Communication Dataset file.

The utility stops executing with a condition code of 08.

**Corrective Action:** Correct the file DCB parameters, and rerun the job. If necessary, contact BMC Software Customer Support.

CTWI55E THE SIZE OF SHOUT TO ECS COMMUNICATION DATASET IS NOT SET CORRECTLY

**Explanation:** An invalid value was specified on installation for the M2GSIZE parameter. The utility stops executing with a condition code of 08.

**Corrective Action:** Specify a valid value for the M2GSIZE parameter, and rerun the file creation process, as follows:

If this message was issued in a customized installation, do the following to set a valid value for the M2GSIZE parameter:

1. Open the IOA Installation and Customization Engine (ICE).
2. On the ICE Main Menu, select Installation.
3. On the IOA Installation screen, select Customized installation.
4. Set the Product ID to IOA, type 2 (INSTALL IOA) in the OPTION field, and press Enter.
5. Select Major Step 21 (Install Control-M Application Server), Minor Step 2 (Shout to Control-M/EM Parameters).
6. Change the value of the M2GSIZE parameter.

If this message was issued in a Default installation, save and exit the installation, change the value using the ICE Main Menu Customization option, run the job, and then return to the Default installation.

If this message was issued in a cloning installation, you first need to finish the cloning installation and then change the value using the ICE Main Menu Customization option. For more information, see the “Customizing INCONTROL products” section of the INCONTROL for z/OS Installation Guide.
CTWI56W SHOUT TO ECS COMMUNICATION DATASET OVERFLOWED. SOME MESSAGES MAY BE LOST.

Explanation: The number of Shout messages written to the Enterprise Controlstation Communication Dataset file exceeded the available space. The Enterprise Controlstation Communication Dataset file contains a fixed number of blocks determined by the M2GSIZE parameter. Each block may contain one Shout message. Each time a Shout message is read from the file, a block is freed. Messages are being written to the file faster than they are read.

Old messages in the file are overwritten by newer Shout messages.

Corrective Action: If this condition occurs regularly, increase the size of the Enterprise Controlstation Communication Dataset file.

Messages CTWJ 00 through CTWJ xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

CTWJ 01E UPD INTERNAL ERROR. TYPE type

Explanation: An internal error of the type type occurred during processing of the UPD subtask.

The Control-M Application Server shuts down.

Corrective Action: Contact BMC Software Customer Support.

CTWJ 02E OVERRUN OF THE UPDATE MESSAGES QUEUE. TRANSMISSION TOO SLOW OR NOT ENOUGH MEMORY

Explanation: The storage available for database update messages is full.

New database update messages have overwritten old messages that have not yet been sent. This may be due to a lack of memory or may happen when a large number (usually several thousand) of update messages have been accumulated without being sent, due to slow transmission of the messages.

Slow transmission may be due to one of the following:

- Communications bottleneck, such as inadequate communication bandwidth
- Mainframe bottleneck, such as high paging of the Control-M Application Server
- Workstation bottleneck, such as CPU overload

The Control-M Application Server shuts down.

Corrective Action: If an xxxJ07E message (for example, UPDJ07E) precedes this message, implement the User Action from that message. Otherwise, determine where the bottleneck is and resolve it.

CTWJ 03E ADD INTERNAL ERROR. TYPE type

Explanation: An internal error of the type type occurred during processing of the CTWADD subroutine.

The Control-M Application Server shuts down.

Corrective Action: Contact BMC Software Customer Support.
CTWJ 04E DEL INTERNAL ERROR. TYPE type
Explanation: An internal error of the type type occurred during processing of the CTWDEL subroutine. The Control-M Application Server shuts down.
Corrective Action: Contact BMC Software Customer Support.

CTWJ 05E READ INTERNAL ERROR. TYPE type
Explanation: An internal error of the type type occurred during processing of the CTWREAD subroutine. The Control-M Application Server shuts down.
Corrective Action: Contact BMC Software Customer Support.

CTWJ 06E LOCK OF UPD CHAIN FAILED. STD= std FUNC= func
Explanation: Locking of the update messages chain has failed. Access to the update messages chain is serialized by a locking mechanism. The number std subtask in the func function attempted to lock the chain several times but was unsuccessful. The Control-M Application Server shuts down.
Corrective Action: Contact BMC Software Customer Support.

CTWJ 07E GETMAIN FOR UPD MESSAGE FAILED. OLDEST MESSAGE(S) WILL BE DELETED
Explanation: The storage available for database update messages is full. New database update messages have overwritten old messages that have not yet been sent. This happens when a large number (usually several thousand) of update messages have been accumulated without being sent, due to slow transmission of the messages. Slow transmission may be due to one of the following:

- Communications bottleneck, such as inadequate communication bandwidth
- Mainframe bottleneck, such as high paging of the Control-M Application Server
- Workstation bottleneck, such as CPU overload

Storage space is made available for these messages by deleting the oldest message not yet sent. The Control-M Application Server continues processing. As long as there is a lack of storage space, old messages not yet sent will continue to be deleted to make room for new messages.
Corrective Action: Increase the storage space available by increasing the REGION size of the Control-M Application Server. If slow transmission is a problem, determine where the bottleneck is and resolve it.

CTWJ 08E MAXIMUM MESSAGES IN UPD CHAIN REACHED. OLDEST MESSAGE WILL BE DELETED
Explanation: The storage available for database update messages is full.
New database update messages have overwritten old messages that have not yet been sent. This happens when a large number (usually several thousand) of update messages have been accumulated without being sent, due to slow transmission of the messages.

Slow transmission may be due to one of the following:

- Communications bottleneck, such as inadequate communication bandwidth
- Mainframe bottleneck, such as high paging of the Control-M Application Server
- Workstation bottleneck, such as CPU overload

Storage space is made available for these messages by deleting the oldest message not yet sent. The Control-M Application Server continues processing. As long as there is a lack of storage space, old messages not yet sent will continue to be deleted to make room for new messages.

**Corrective Action:** Determine where the bottleneck is and resolve it.

**CTWJ 50I CTWUPD STARTED**

**Explanation:** This information message indicates that the Control-M Application Server started the CTWUPD subtask.

**Corrective Action:** No action is required.

**CTWJ 51I LOGICAL CONNECTION IS SUSPENDED WHILE THE ACTIVE JOBS FILE IS BEING FORMATTED**

**Explanation:** This information message indicates that the logical connection between the Control-M Application Server and the Workstation Gateway is temporarily suspended, because the Active Jobs file is currently being formatted.

The workstation database is not up-to-date, and no requests issued by the Enterprise Controlstation Control Application will be handled, until the format of the Active Jobs file is completed.

**Corrective Action:** No action is required.

**CTWJ 52I LOGICAL CONNECTION RESUMED**

**Explanation:** This information message indicates that the logical connection between the Control-M Application Server and the Workstation Gateway has been resumed.

The workstation database may now request synchronization, and other requests issued by the Enterprise Controlstation Control Application will now be handled.

**Corrective Action:** No action is required.

**CTWJ 58E DATABASE UPDATES SENT TO THE WORKSTATION GATEWAY HAVE NOT BEEN CONFIRMED IN TIME**

**Explanation:** The Control-M Application Server sent database updates to the Enterprise Controlstation Workstation Gateway, but did not receive confirmation for them in time.

This error message is issued by the Control-M Application Server and is due to one of the following:
The Workstation Gateway has stopped responding, due to an error condition in the software or hardware.

Responses are delayed because of poor performance.

**Corrective Action:** Check if the workstation is hanging and if there are any error messages at the workstation which indicate the cause of the problem. If the workstation is not hanging, there must be some performance bottleneck in the system. Try to determine whether this bottleneck is at the workstation side, in the communication media, or at the mainframe.

**CTWJ 59E CONFIRMATION SEQUENCE NUMBER ERROR. EXPECTED= exp_num RECEIVED= rcv_num**

**Explanation:** The Control-M Application Server has received an out of sequence confirmation of a database update.

This error message is issued by the Control-M Application Server. The Mainframe Gateway expects to receive confirmations for database updates in increasing order, but a confirmation with a sequence number of `rcv_num` has been received, when a confirmation with a sequence number of at least `exp_num` was expected.

The Control-M Application Server continues executing.

**Corrective Action:** Contact BMC Software Customer Support.

**CTWJ 60E DATA BASE UPDATE TYPE msgType HAS BEEN REJECTED BY THE WORKSTATION GATEWAY**

**Explanation:** The Enterprise Controlstation gateway rejected a message of the `msgType` type from the Control-M Application Server.

This message is issued each time a database update message is rejected by the Enterprise Controlstation gateway.

Valid values for `msgType` are:

<table>
<thead>
<tr>
<th>msgType</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Update of full Active Jobs file record.</td>
</tr>
<tr>
<td>B</td>
<td>Short update of an Active Jobs file record.</td>
</tr>
<tr>
<td>N</td>
<td>New job that was added to the Active Jobs file.</td>
</tr>
<tr>
<td>O</td>
<td>Update of full Active Jobs file record.</td>
</tr>
<tr>
<td>X</td>
<td>Update of only the fixed part of an active jobs.</td>
</tr>
<tr>
<td>C</td>
<td>Condition update.</td>
</tr>
<tr>
<td>R</td>
<td>Control resource update.</td>
</tr>
</tbody>
</table>
The gateway continues processing. Rejected database updates rejected are written to the file referenced by the DASNAP DD statement.

**Corrective Action:** Look for error messages on the workstation side and correct the problem accordingly. Review the rejected database updates in the file referenced by DASNAP.

## CVI Messages

This group includes messages for the Control-V product.

### Messages CVIG00 through CVIGxx

This group includes messages for the Control-V product.

**CVIGC0S INTERNAL ERROR IN CONVERSION PROGRAM**

**Explanation:** An internal error occurred when converting index records from VSAM into IOA Access Method records. The error occurred during the transfer of internal parameters.

The database conversion utility terminates with an error. The VSAM file is not converted into an IOA Access Method file.

**Corrective Action:** Supply BMC Software Customer Support with the sysout of the conversion job.

**CVIGC1E CLOSE OF INDEX FILE fileName FAILED**

**Explanation:** An internal error occurred when converting index records from VSAM into IOA Access Method records. The conversion utility was unable to close an index file.

The database conversion utility terminates with an error. The VSAM file is not converted into an IOA Access Method file.

**Corrective Action:** Supply BMC Software Customer Support with the sysout of the conversion job and the name of the index file identified in the message.

**CVIGC5S INTERNAL ERROR - FREEMAIN ERROR. RC = rc**

**Explanation:** The FREEMAIN macro failed to free space that is controlled by GETMAIN.

The executing program may stop. The system response varies with the environment that issued the message.

**Corrective Action:** Contact BMC Software Customer Support.
CVI GC6E INSUFFICIENT MEMORY - GETMAIN ERROR. RC = rc

**Explanation:** There is not enough memory to convert a VSAM file into an IOA Access Method file. The database conversion utility terminates with an error. The VSAM file is not converted into an IOA Access Method file.

**Corrective Action:** Increase the region size and rerun the utility.
This group includes messages for the Control-M for z/OS, Control-M/Analyzer, Control-D, Control-O, Control-V, and IOA products.

DAS messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages DAS600 through DAS6xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

DAS613I DELETE OF ARCHIVED SYSOUTS STARTED

**Explanation:** This information message indicates that the New Day procedure started deleting archived SYSDATA sysouts.

**Corrective Action:** No action is required.

DAS614I DELETE OF ARCHIVED SYSOUTS ENDED

**Explanation:** This information message indicates that the New Day procedure finished deleting archived SYSDATA sysouts.

**Corrective Action:** No action is required.

DAS615W DELETION OF num ARCHIVED SYSOUT DATASET(S) FAILED

**Explanation:** Some Archived Sysout Data Sets were not deleted by the Control-M New Day procedure or during compression of the Control-M Active Jobs file.

This message follows other messages that explain the nature of the error for each archived sysout data set.

The New Day procedure or CTMCOP utility continues processing.

**Corrective Action:** See the messages that precede this message for the reasons for deletion failure.

DAS616E INVALID CARD IN THE "DASCRLST" FILE - data

**Explanation:** During deletion of unneeded SYSDATA, a record describing archived SYSDATA contained invalid information. Control-M creates records with data describing SYSDATA to be deleted.

This record is skipped. Processing continues.
Corrective Action: Save the console and job output listing, and contact BMC Software Customer Support for assistance.

DAS617I  dsn ARCHIVED DATASETS DELETED
Explanation: This information message indicates that the FORMAT or COPY process deleted SYSDATA files.
Corrective Action: No action is required.

Messages DASL00 through DASLxx
This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

DASL71E INVALID RECORD FOUND ON AJF - FILE USAGE VERIFICATION SKIPPED
Explanation: The CDAM file deletion utility detected an invalid record type when verifying the CDAM records in the Active Jobs file (AJF). Before deleting a CDAM file, the CDAM file deletion utility verifies that the file names in the JOBLIST file are not referenced by any jobs in the AJF.
Verification of the AJF is aborted, and deletion of CDAM files proceeds based on previous checks of the AJF.
Corrective Action: Check the integrity of the AJF with the IOAVERFY utility.

DCI messages
This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages DCI D00 through DCI Dxx
This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

DCI DA0I  CTDCI TSB PROCESSING ERROR: EIBFN= func EIBRCODE= err
Explanation: This information message indicates that the CTDCI TSB program failed due to an internal error. The CTDCI TSB program builds a temporary storage queue containing data from input CDAM files for transfer to a PC using the CICS 3270-PC file Transfer Program.
Where the error is a result of an EXEC CICS command, func indicates the function code and err indicates the error code.
The CTDCI TSB program stops executing and a CICS transaction dump is produced.
Corrective Action: Check the dump and any relevant messages in the system log. If the problem is related to CICS customization, or to storage violations as a result of user transactions, correct the problem. Otherwise, have your CICS system programmer contact BMC Software Customer Support.
INCONTROL for z/OS Messages Manual

DCIDA11  CTDCITSB PROGRAM ABEND: ABEND= *abend*

**Explanation:** This information message indicates that the CTDCITSB program failed due to an internal error. The CTDCITSB program builds a temporary storage queue containing data from input CDAM files for transfer to a PC using the IBM CICS 3270-PC file Transfer Program. This message indicates a program check, and *abend* indicates the CICS abend code.

The CTDCITSB program stops executing and a CICS transaction dump is produced.

**Corrective Action:** Check the dump and any relevant messages in the system log. If the problem is related to CICS customization, or to storage violations as a result of user transactions, correct the problem. Otherwise, have your CICS system programmer contact BMC Software Customer Support.

DCIDA21  INVALID INPUT DATA LENGTH

**Explanation:** This information message indicates that the CTDCITSB program detected an error in the input data while processing input data for transaction DPCT. The correct format for data for transaction DPCT is DPCT *dsn*, where *dsn* is the name of the CDAM file to be transferred to the PC.

The CTDCITSB program stops executing.

**Corrective Action:** Verify that in the GOTOCICS.SCR script file, the DPCT transaction is correctly specified, and that a valid data set name is included in the data. If you cannot determine the cause of the error, have your CICS system programmer contact BMC Software Customer Support for assistance.

DCIDA31  INVALID INPUT DATA SPECIFIED

**Explanation:** This information message indicates that the CTDCITSB program detected an error in the input data while processing input data for the DPCT transaction. The correct format for data for the DPCT transaction is DPCT *dsn*, where *dsn* is the name of the CDAM file to be transferred to the PC.

The CTDCITSB program stops executing.

**Corrective Action:** Verify that in the GOTOCICS.SCR script file, the DPCT transaction is correctly specified, and that a valid data set name is included in the data. If you cannot determine the cause of the error, have your CICS system programmer contact BMC Software Customer Support for assistance.

DCIDA41  DDNAME= *ddName* NOT DEFINED IN FCT

**Explanation:** This information message indicates that the CICS FCT does not contain an entry DD name that can be used by the CTDCITSB program to read the CDAM file in order to set up Control-D/WebAccess Server file transfer.

The CTDCITSB program allocates the CDAM file in CICS using the DD name convention specified by *ddName*. The allocated file is then read, using standard CICS BDAM file access. Therefore, an entry must exist in the CICS FCT for the CDAM files.

The CTDCITSB program stops executing.

**Corrective Action:** Define at least one FCT entry in the format indicated by *ddName*, where the first five characters are a fixed prefix, followed by three digit numbers in ascending order, beginning with 000. For a full description of the required FCT definitions, see the $$DOCDPC member in the IOA CICSSAMP library.
DCIDA5I CONCURRENT USER LIMIT REACHED - TRY LATER

**Explanation:** This information message indicates that the maximum number of CICS FCT entries defined for Control-D/WebAccess Server file transfer was reached. The CTDCITSB program attempted to initiate a file transfer session, but found that there were no file transfer FCT entries available for use.

The CTDCITSB program stops executing.

**Corrective Action:** Wait until the current file transfer sessions have ended. If more concurrent sessions are required, contact your CICS system programmer for assistance.

DCIDA6I FILE IS DISABLED - CANNOT BE ACCESSED

**Explanation:** This information message indicates that the CDAM file allocated by the CTDCITSB program to a DD name defined in the CICS FCT file for Control-D/WebAccess Server file transfer was disabled, and could not be opened for processing.

The CTDCITSB program stops executing.

**Corrective Action:** Make sure that all FCT entries used for Control-D/WebAccess Server file transfer are enabled.

DCIDA7I SECURITY AUTHORIZATION REQUIRED FN= func

**Explanation:** This information message indicates that the CTDCITSB program could not perform the `func` function because the necessary security authorization was not available.

The CTDCITSB program stops executing.

**Corrective Action:** Contact your CICS system programmer to define the correct security level in the CICS PCT entry of the DPCT and DPCC transactions using the RSL parameter.

DCIDA8I I/O ERROR OCCURRED DURING FILE ACCESS

**Explanation:** This information message indicates that an I/O error occurred while attempting to read a CDAM file. This error message is issued by the CTDCITSB program, while it is reading a CDAM file in preparation for transfer to the PC.

The CTDCITSB program stops executing.

**Corrective Action:** Verify that the file being accessed is a CDAM file and that the contents of the file have not been corrupted. If possible, correct the problem. If the error persists, have your CICS system programmer contact BMC Software Customer Support.

DCIDA9I I/O ERROR ON TEMPORARY STORAGE FILE

**Explanation:** This information message indicates that an I/O error occurred while attempting to write to the CICS Temporary Storage file. This error message is issued by the CTDCITSB program, which writes the data from a CDAM file to CICS Temporary Storage in preparation for transfer to the PC.

Possible causes are:
INCONTROL for z/OS Messages Manual

- invalid record size
- CICS customization error
- file corruption

The CTDCITSB program stops executing.

**Corrective Action:** Check the status of the Temporary Storage file, and, if possible, correct the problem. If the error persists, contact BMC Software Customer Support.

**DCIDB0I** NO SPACE ON TEMPORARY STORAGE FILE

**Explanation:** This information message indicates that a NOSPACE condition occurred during an attempt to write to the CICS Temporary Storage file. This error message is issued by the CTDCITSB program, which writes the data from a CDAM file to CICS Temporary Storage in preparation for transfer to the PC.

The CTDCITSB program stops executing.

**Corrective Action:** Delete unnecessary records from the Temporary Storage file or increase the file size.

**DCIDB1I** FILE PROCESSING COMPLETE

**Explanation:** This information message indicates that the CDAM file was successfully placed in Temporary Storage. It is now ready for transfer to the PC by means of the CICS 3270-PC file Transfer Program.

**Corrective Action:** No action is required.

**DCIDB2I** QUEUE DELETION PROCESSING COMPLETE

**Explanation:** This information message indicates that transaction DPCC has successfully deleted the Temporary Storage Queue used for transferring the CDAM file to the PC.

**Corrective Action:** No action is required.

**DCIDB3I** ERROR INVOKING DYNAMIC ALLOCATION SUBTASK. INLINE SVC WILL BE USED

**Explanation:** This information message indicates that an error occurred during an ATTACH of a dynamic allocation subtask. The CTDCITSB program, which writes the data from a CDAM file to CICS Temporary Storage in preparation for transfer to the PC, issues this message.

The dynamic allocation SVC is invoked from the CTDCITSB mainline program.

**Corrective Action:** Check the CICS job log for any additional messages. If the cause of the error cannot be determined, have your CICS system programmer contact BMC Software Customer Support for assistance.

**DCIDB4I** DYNAMIC ALLOCATION ERROR= rc error reason

**Explanation:** This information message indicates that the CTDCITSB program attempted to allocate a CDAM file in CICS. However, an error occurred during file allocation processing. The specified return code (rc), error, and reason are produced by the dynamic allocation routine.

The CTDCITSB program stops executing.
Corrective Action: For an explanation of the return codes, see the IBM manual *MVS Programming: Authorized Assembler Services Guide*. Contact your CICS system programmer for assistance if necessary.

DCI DB5 I  DYNAMIC UNALLOCATION ERROR= rc err rsn

Explanation: This information message indicates that the CTDCITSB program attempted to deallocate a CDAM file in CICS. However, an error occurred during file deallocation processing. The specified return code (rc), err, and rsn are produced by the dynamic allocation routine.

The CTDCITSB program stops executing.

Corrective Action: For an explanation of the return codes, see the IBM manual *MVS Programming: Authorized Assembler Services Guide*. Contact your CICS system programmer for assistance if necessary.

DCI DB6 I  FILE OPEN ERROR: EIBFN= func EIBRCODE= errCode

Explanation: This information message indicates that an error occurred while attempting to open a CDAM file allocated to CICS. This error message is issued by the CTDCITSB program, which writes the data from a CDAM file to CICS Temporary Storage in preparation for transfer to the PC.

The CTDCITSB program stops executing.

Corrective Action: Check the appropriate CICS manual for an explanation of error errCode for function func. If the cause of the error cannot be determined, have your CICS system programmer contact BMC Software Customer Support.

DCI DB7 I  FILE CLOSE ERROR: EIBFN= func EIBRCODE= errCode

Explanation: This message indicates that an error occurred while attempting to close a CDAM file allocated to CICS. This error message is issued by the CTDCITSB program, which writes the data from a CDAM file to CICS Temporary Storage in preparation for transfer to the PC.

The CTDCITSB program stops executing.

Corrective Action: Check the appropriate CICS manual for an explanation of the errCode error for the func function. If the cause of the error cannot be determined, have your CICS system programmer contact BMC Software Customer Support for assistance.

DCI DB8 I  UNABLE TO LOAD CTDPARM

Explanation: This information message indicates that the CTDCITSB program failed to load CTDPARM, because CTDPARM was disabled or was not defined in the CICS PPT. The CTDCITSB program builds the Temporary Storage Queue containing data from input CDAM files for transfer to a PC using the IBM CICS 3270-PC file Transfer Program. CTDCITSB attempted to load the module because it requires some data from CTDPARM.

The CTDCITSB program stops executing.

Corrective Action: Check that the CTDPARM program is enabled, and that it is correctly defined in the CICS PPT. For more information, refer to the installation instructions in the IOA CICSSAMP library.
DCIDB9I TRANSACTION transid NOT RECOGNIZED

**Explanation:** This information message indicates that transaction *transid* is not recognized by the CTDCITSB program. The CTDCITSB program builds a temporary storage queue containing data from input CDAM files for transfer to a PC using the IBM CICS 3270-PC file Transfer Program.

The CTDCITSB program stops executing.

**Corrective Action:** Check that the correct transactions are defined for the CTDCITSB program. The required transactions are DPCT and DPCC. For more information, refer to the installation instructions in the IOA IC CSSAMP library.

**DDI messages**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**Messages DDIG00 through DDIGxx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**DDIG01I UTILITY CTDDIG STARTED**

**Explanation:** This information message indicates that the CTDDIG utility started normally.

The CTDDIG utility checks the integrity of the following types of User Report List files:

- Active
- Permanent
- History
- Migration

**Corrective Action:** No action is required.

**DDIG02E ERROR DETECTED IN func RC= rc DURING ACCESS TO IOA ACCESS METHOD FILE**

**Explanation:** The CTDDIG utility detected an internal error while accessing the IOA Access Method (IAM) file.

In this message, *func* is the function that was executing when the error occurred.

The requested function func is not performed.

**Corrective Action:** Note the values of *func* and *rc* and contact BMC Software Customer Support.

**DDIG03I file INDEX ENTRY DETECTED WITHOUT DATA RECORD**

**Explanation:** While checking the integrity of the User Report List file, the CTDDIG utility found an index record without a corresponding data record.
In this message, file is name of the IOA Access Method component.
The problematic index record is printed out.

**Corrective Action:** Rebuild the index of the User Report List file.

**DDI G04I INDEX ENTRY DOES NOT MATCH DATA RECORD.**

**Explanation:** The CTDDIG utility reads the User Report List file to determine if either a data record exists without an index to this record, or an index record exists without a corresponding data record. If such a index or data record is found, this message is issued.
The problematic index and data records are printed out.

**Corrective Action:** Rebuild the index of the User Report List file.

**DDI G05I DATA RECORD DETECTED WITHOUT file INDEX**

**Explanation:** While checking the integrity of the User Report List file, the CTDDIG utility found a data record without a corresponding index record.

In this message, file is name of the IOA Access Method component.
The problematic data record is printed out.

**Corrective Action:** Rebuild the index of the User Report List file.

**DDI G06I UTILITY CTDDIG ENDED.**

**Explanation:** This information message indicates that the CTDDIG utility ended.

**Corrective Action:** No action is required.

**DDI G07E ERROR DETECTED IN func RC= rc DURING ACCESS TO IOA ACCESS METHOD FILE**

**Explanation:** The CTDDIG utility detected an internal error while accessing the IOA Access Method (IAM) file.

In this message, func is the function that was executing when the error occurred.
The requested function (func) is not performed.

**Corrective Action:** Note the values of func and rc and contact BMC Software Customer Support.

**DDI G09S INVALID VALUE IN PARAMETER DBFILE. VALID VALUES ARE: ACT, PRM, HST, MIG, MG1-MG9.**

**Explanation:** An attempt has been made to run the CTDDIG utility when the DBFILE parameter value was invalid or missing.
The DBFILE parameter in the CTDDIG utility must be set to one of the following values:
The CTDDIG utility terminates.

Corrective Action: Insert the appropriate valid value in the DBFILE parameter and rerun the utility.

DDI.G0AI DUPLICATE RECORD FOUND IN file DATA FILE

Explanation: This information message indicates that a duplicate record has been found in the data file. In this message, file is name of the IOA Access Method component.

Duplication of a record in the data file may be the result of a computer malfunction. The problematic record is printed out. The CTDDIG utility continues processing.

Corrective Action: No action is required.

DDI.G0CE INVALID PARAMETER, VALID MODE PARAMETER: TEST, TESTMRK OR CHANGE

Explanation: A MODE parameter error was detected for the CTDDIG utility. The CTDDIG utility terminates with a condition code of 28.

Corrective Action: Correct the JCL and rerun the job. The MODE parameter in the CTDDIG utility must be set to one of the following values:

- TEST - Messages are issued about detected problems, but errors are not fixed. Default.
- TESTMRK - Messages are issued about detected problems, but errors are not fixed. If no errors are detected, all alternative index components are marked as ready to use.
- CHANGE - Messages are issued and errors are fixed. If no errors are detected, all alternative index components are marked as ready to use.

DDI.G10I NUMBER OF RECORDS READ FROM DATA FILE= num

Explanation: This information message indicates that the CTDDIG utility read num records from the IOA Access Method data file.

Corrective Action: No action is required.

DDI.G11I NUMBER OF INDEXES READ FROM INDEX file FILE= num

Explanation: This information message indicates that the CTDDIG utility read num records from the IOA Access Method index file. In this message, file is name of the IOA Access Method component.

Corrective Action: No action is required.
DDIG12I NUMBER OF DUPLICATE RECORDS IN file DATA FILE= num

Explanation: This information message indicates that the CTDDIG utility found num duplicate records in the IOA Access Method data file.

In this message, file is name of the IOA Access Method component.

Corrective Action: No action is required.

DDIG13I NUMBER OF RECORDS DELETED FROM file DATA FILE= num

Explanation: This information message indicates that the CTDDIG utility deleted num records from the IOA Access Method data file.

In this message, file is name of the IOA Access Method component.

Corrective Action: No action is required.

DDIG14I NO ERRORS DETECTED.

Explanation: This information message indicates that the CTDDIG utility ended with no errors detected.

Corrective Action: No action is required.

DDIG15I NUMBER OF INDEXES TO BE UPDATED IN file FILE= num

Explanation: This information message indicates that the CTDDIG utility found in the IOA Access Method index file num records that are to be updated.

In this message, file is name of the IOA Access Method component.

Corrective Action: No action is required.

DDIG16I NUMBER OF INDEXES TO BE DELETED FROM file FILE= num

Explanation: This information message indicates that the CTDDIG utility found num records that are to be deleted from the IOA Access Method index file.

In this message, file is name of the IOA Access Method component.

Corrective Action: No action is required.

DDIG17I NUMBER OF INDEXES TO BE ADDED TO file FILE= num

Explanation: This information message indicates that the CTDDIG utility found num records that are to be added to the IOA Access Method index file.

In this message, file is name of the IOA Access Method component.

Corrective Action: No action is required.

DDIG18I file INDEX IS MARKED AS READY TO USE

Explanation: This information message indicates that the CTDDIG utility checked or repaired, or both, the alternative index component and marked it as ready to use in a report list search.

In this message, file is the name of an IOA Access Method component.
Corrective Action: No action is required.

DDR messages

This group includes messages for the IOA (infrastructure) product.

Messages DDRJ 00 through DDRJ xx

This group includes messages for the IOA (infrastructure) product.

DDRJ 81I UTILITY IOADDR STARTED

Explanation: This information message indicates that IOADDR utility started.
Corrective Action: No action is required.

DDRJ 82I UTILITY IOADDR ENDED

Explanation: This information message indicates that the IOADDR utility ended.
Corrective Action: No action is required.

DDRJ 83S INVALID PARAMETER SPECIFICATION

Explanation: The parameter passed to the IOADDR utility was either invalid or missing. The IOADDR utility terminates.
Corrective Action: Verify that a valid DSNAME was passed as a parameter to the IOADDR utility.

DDRJ 84S OPEN OF FILE "SYSPRINT" FAILED

Explanation: Opening of the print file failed.
Possible causes are:
  ▪ The SYSPRINT DD statement is missing from the step.
  ▪ The file allocated to the SYSPRINT DD statement is not a valid print file.
The IOADDR utility terminates.
Corrective Action: Correct the JCL for the IOADDR utility so that it contains a valid SYSPRINT DD statement.

DDRJ 85S OPEN OF CONTROL FILE FAILED. DDNAME " ddName "

Explanation: The IOADDR utility failed to open one of its control files.
The IOADDR utility terminates.
Corrective Action: Correct the JCL for the IOADDR utility so that it has a correct control member allocated to it.
DDRJ 86S ALLOCATION FOR MEMBER \textit{memName} LIBRARY \textit{lib} FAILED

\textbf{Explanation:} Allocation of the specified member failed because the member does not exist in the specified library or is inaccessible.

The IOADDR utility terminates.

\textbf{Corrective Action:} Verify that the \texttt{@IDCNTL} control member contains a valid library and member name for each user.

DDRJ 87S ALLOCATION FOR TABLE FAILED

\textbf{Explanation:} Allocation of one of the IOADDR members failed, because one of the members pointed to by \texttt{@IDCNTL} does not exist or is inaccessible.

The missing member is skipped. Processing continues for the following members.

\textbf{Corrective Action:} Verify that the \texttt{@IDCNTL} control member contains a valid library and member name for each user.

DDRJ 88S BAD OP-CODE "\textit{op\_code}" 

\textbf{Explanation:} A user table contained an invalid operation code.

The event definition with the bad OP-CODE is skipped. Processing continues with the following entries.

\textbf{Corrective Action:} Prepare the Control-M monitor full output and contact BMC Customer Support.

DDRJ 89S LOAD FAILED FOR MEMBER "\textit{memName}" 

\textbf{Explanation:} Load of one of the IOA modules failed.

The IOADDR utility terminates.

\textbf{Corrective Action:} Verify that your STEPLIB DD statement points to the IOA LOAD library.

DDRJ 8AW NO TRIGGERED EVENTS MATCHED TRIGGER \textit{dsn}

\textbf{Explanation:} A CONNECT DIRECT request \textit{dsn} did not match any of the triggered events specified in the \texttt{@@IDCNTL} event lists.

No further action is taken in respect of this CONNECT DIRECT request.

\textbf{Corrective Action:} Check whether any trigger event in the event lists specified in the \texttt{@@IDCNTL} parameter member matches the trigger \textit{dsn}. If you wish, add a trigger event that matches the \textit{dsn}, then repeat the CONNECT DIRECT request.

DDRJ 8BW NO SUCCESSFULLY TRIGGERED EVENTS WERE PROCESSED FOR TRIGGER \textit{dsn}

\textbf{Explanation:} During the processing of a CONNECT DIRECT request, no triggered events were successfully processed.

If a file-in-use condition occurs during the execution of a CONNECT DIRECT request, Control-M may try again to execute it, depending on the values set for the \texttt{FORCE#RT} and \texttt{FORCE#WI} installation parameters.
For more information on the FORCE#RT and FORCE#WI installation parameters, see the customization chapter of the *INCONTROL for z/OS Installation Guide*.

**Corrective Action:** No action is required.

**DDRJ 90S ACCESS RC= rc FOR LIBRARY lib MEMBER memName**

**Explanation:** An error occurred in the IOADDR utility when reading the *memName* member from the *lib* PDS library. The return code (*rc*) describes the reason for the error.

Possible return codes are:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>Premature end of file.</td>
</tr>
<tr>
<td>8</td>
<td>Storage allocation error.</td>
</tr>
<tr>
<td>12</td>
<td>Member not found.</td>
</tr>
<tr>
<td>16</td>
<td>Data set name is not the name of a PDS library.</td>
</tr>
<tr>
<td>20</td>
<td>Data set is not a fixed format dataset.</td>
</tr>
<tr>
<td>24</td>
<td>Logical record length of the file is not 80.</td>
</tr>
<tr>
<td>28</td>
<td>Data set in use.</td>
</tr>
<tr>
<td>32</td>
<td>Internal error.</td>
</tr>
<tr>
<td>36</td>
<td>Data set is not cataloged.</td>
</tr>
<tr>
<td>40</td>
<td>Data set allocation failed.</td>
</tr>
<tr>
<td>44</td>
<td>Invalid request.</td>
</tr>
<tr>
<td>48</td>
<td>Internal error.</td>
</tr>
<tr>
<td>52</td>
<td>Error accessing the directory.</td>
</tr>
</tbody>
</table>

The entry that caused the error is skipped.

**Corrective Action:** Correct the cause of the error, and retry the operation. In case of an internal error, supply BMC Software Customer Support with a copy of the input file and the parameters specified for the IOADDR utility.

**DDRJ 91S INSUFFICIENT STORAGE FOR PROCESS**

**Explanation:** The IOADDR utility failed to allocate storage for its operation.

The IOADDR utility terminates.
Corrective Action: Increase the REGION size.

DDRJ 92S JOB jobName NOT FOUND IN TABLE tableName OF LIB lib

Explanation: A request to order a job could not be fulfilled because the job did not exist in the scheduling table.

The event definition pointing to the missing job is skipped. Processing continues with the subsequent entries.

Corrective Action: Add the missing definition to the specified scheduling table.

DDRJ 93S BAD DATE date SPECIFIED

Explanation: The order date specified in the event definition is invalid.

The event definition with the bad date is skipped. Processing continues with the subsequent entries.

Corrective Action: Correct the date in the event definition.

DDRJ 94I USER: userId TABLE: tableName LIBRARY: lib

Explanation: This information message completes a preceding message stating the reason for the error.

Corrective Action: Use this information to locate the cause of the error.

DDRJ 9CE QNAME TABLE ENTRY ERROR. FLAG= num STC= stcName STR= structName LSN= logStreamName HLQ= hiLevelQualifier

Explanation: The IOADDC program found an invalid entry in the QNAME table for the QNAME specified by the IOADDC request.

The variables in this message are:

- num - a hexadecimal number representing the communication vehicle used to transfer the IOADDC input trigger to Control-MPossible values are:
  - 40 - use the MVS system logger
  - 20 - call the IOADR routine directly
- stcName - the name of the started task
- structName - the name of the CF structure
- logStreamName - the name of the log stream
- hiLevelQualifier - the high-level qualifier of the log stream file

The IOADDC request is aborted.

Corrective Action: Rerun the IOADDI job for the specified IOA installation, and verify that it was successful.
**DDRJ9DE cbName CONTROL BLOCK NOT FOUND - DATA SET TRIGGERING REQUEST ABORTED**

**Explanation:** The IOADDC program was unable to find the `cbName` system-wide control block. The IOADDC request is aborted.

**Corrective Action:** Run the IOADDI job for each IOA installation that requires it.

**DDRJ9EE qName QNAME TABLE ENTRY NOT FOUND - DATA SET TRIGGERING REQUEST ABORTED**

**Explanation:** The IOADDC program was unable to find an entry in the QNAME table that matched the `qName` QNAME. The IOADDC request is aborted.

**Corrective Action:** Rerun the IOADDI job for the specified IOA installation, and verify that it was successful.

**DDRJ A11 IOADDS: dsn**

**Explanation:** This information message indicates that the IOADDC utility was activated in an environment with no authorization to issue modify commands to the IOADDS started task. It can be used to issue a MODIFY command to IOADDS by a console automation product, such as Control-O.

Execution continues.

**Corrective Action:** If you have already defined this message to your console automation software, no intervention is required. Otherwise, make sure either that IOADDC is activated in an APF-authorized environment, or that measures have been taken to handle this message.

**DDRJ A2S IOADDS FUNCTIONAL SERVER IS NOT OPERATIONAL. DATASET TRIGGERING REQUESTS MAY BE LOST.**

**Explanation:** The IOADDS started task was not operational during an IOADDC-related data set event. The IOADDC utility attempted to start the IOADDS started task automatically, but IOADDS was not initialized.

The event that triggered this action is not processed.

**Corrective Action:** Check the output of the IOADDS utility. It should point to the problem which prevented the initialization. Proceed accordingly.

**DDRJ A31 AJF IS BEING FORMATTED. IOADDS WILL WAIT TILL FORMAT FINISHES.**

**Explanation:** The CONNECT DIRECT interface module has attempted to order a job as a result of a user request but the AJF is currently being formatted.

The interface module waits until the formatting has completed and then retries the request.

**Corrective Action:** No action is required.
**DDRJ A4S SYSPLEX TABLE MISSING - DATA SET TRIGGERING REQUEST ABORTED**

**Explanation:** The CONNECT DIRECT interface module has attempted to read the Sysplex table and failed.

Possible causes are:
- The Sysplex table is not in the PARM library
- The Sysplex table has an invalid internal format.

The interface module aborts the request.

**Corrective Action:** Do one of the following, then retry the request:
- If the Sysplex table is not in the PARM library, determine why, and correct the problem.
- If the internal format of the Sysplex table is invalid, correct the problem.

**DDRJ A5S CMMPLEX TABLE MISSING - DATA SET TRIGGERING REQUEST ABORTED**

**Explanation:** The CONNECT DIRECT interface module has attempted to read the CMMPLEX table and failed.

Possible causes are:
- The CMMPLEX table is not in the PARM library.
- The CMMPLEX table has an invalid internal format.

The interface module aborts the request.

**Corrective Action:** Do one of the following, then retry the request:
- If the CMMPLEX table is not in the PARM library, determine why, and correct the problem.
- If the internal format of the CMMPLEX table is invalid, correct the problem.

**DDRJ A6E SYSTEM LOGGER REQUEST log_req FAILED: R15= r15 RETURN= rc REASON= rsn**

**Explanation:** One of the following System Logger requests failed:
- `DEFCFS, IXGINVNT` (define the coupling facility structure)
- `DEFLGS, IXGINVNT` (define the log stream)
- `CONLGS, IXGCONN` (connect to the log stream)
- `WRITEL, IXGWRITE` (write a log stream log block)
- `DISLGS, IXGCONN` (disconnect from log stream)
- `DELLGS, IXGINVNT` (delete the log stream)
- `DELCFS, IXGINVNT` (delete coupling facility structure)

`r15` has one of the following values:
08 - minor System Logger request error
12 - intermediate System Logger request error
16 - major System Logger request error
20 - permanent System Logger request error
28 - operating system does not support System Logger interface

For information about the System Logger request that failed (log_req), and the return and reason codes (r15, rc and rsn), see the IBM manual MVS Programming: Assembler Services Reference.

Corrective Action: No action is required.

DDRJ A7E NAME/TOKEN SERVICES REQUEST serviceRequest FAILED: R15 = r15

Explanation: One of the following MVS name or token services requests failed:
- CREATE, IEANTCR (name or token create)
- RETRIEVE, IEANTRT (name or token retrieve)
- DELETE, IEANTDL (name or token delete)

For information about the service request that failed (serviceRequest), and the return code (r15), see the IBM manual MVS Programming: Assembler Services Reference.

Corrective Action: No action is required.

DDRJ A8E PARAMETER (DATA SET NAME) LENGTH ERROR - DATA SET TRIGGERING REQUEST ABORTED

Explanation: The data set name used as a CONNECT DIRECT interface trigger was either not specified, or longer than 44 characters.

The interface module aborts the request.

Corrective Action: Set the data set name trigger to a value comprised of 44 characters or less, and retry the request.

DDRJ A9S IOACPRM TABLE MISSING - DATA SET TRIGGERING REQUEST ABORTED

Explanation: The CONNECT DIRECT interface module has attempted to read the IOACPRM table and failed.

Possible causes are:
- The IOACPRM table is not present in the PARM library
- The table has an invalid internal format.

The interface module aborts the request.

Corrective Action: Do one of the following, then retry the request:
If the IOACPRM table is not in the PARM library, determine why, and correct the problem.
If the internal format of the IOACPRM table is invalid, correct the problem.

**DDRJAAS SYSTEM LOGGER INTERFACE NOT ENABLED BY USER - DATA SET TRIGGERING REQUEST ABORTED**

**Explanation:** The system logger interface was not enabled in the IOACPRM table.
The interface module aborts the request.
**Corrective Action:** Set the value of SYSTLOGR in the IOACPRM table to Y.

**DDRJABW SYSTEM LOGGER INTERFACE NOT OPERATIVE - DATA SET TRIGGERING REQUEST PROCESSED BY IOADDR**

**Explanation:** The System Logger interface is not enabled (the SYSTLOGR parameter value in the IOACPRM parm member is set to 'N') so IOADDI cannot pass the data set name argument to Control-M by the System Logger.
Instead of passing the data set name argument to Control-M using the System Logger, IOADDI directly calls to IOADDR to trigger the corresponding data set event. For more information, see the Control-M chapter in the INCONTROL for z/OS Installation Guide.
**Corrective Action:** If required, set up the System Logger interface. For information on setting up the System Logger, see the Control-M chapter in the INCONTROL for z/OS Administration Guide.

**DDRJA CI qName QNAME TABLE ENTRY SUCCESSFULLY REGISTERED**

**Explanation:** The IOADDI job successfully registered the qName QNAME table entry.
**Corrective Action:** No action is required.

**DDRJADE cbName CONTROL BLOCK CREATION ERROR - REGISTRATION ABORTED**

**Explanation:** The IOADDI job was unable to build the cbName system-wide control block.
The IOADDI job does not register the required IOA installation.
**Corrective Action:** Rerun the IOADDI job for the required IOA installation, and verify that it was successful.

**DDRJAEE NO AVAILABLE ENTRIES IN QNAME TABLE - REGISTRATION ABORTED**

**Explanation:** The IOADDI job was unable to register the required IOA installation because no remaining QNAME table entries are available.
The IOADDI job does not register the required IOA installation.
**Corrective Action:** Delete any entries in the QNAME table that are no longer required. If all existing entries are required, prepare the Control-M monitor full output and contact BMC Customer Support.
DET messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages DETH00 through DETHxx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

DETH51I LOGICAL CONNECTION IS INTERRUPTED WHILE THE ACTIVE JOBS FILE IS BEING FORMATTED

Explanation: This information message indicates that the logical connection between the Control-M Application Server and Control-M/Enterprise Manager (Control-M/EM) Workstation Gateway is temporarily suspended because the Active Jobs file is currently being formatted.

The workstation database is not up-to-date, and no requests issued by the Control-M/EM GUI will be handled, until the format of the Active Jobs file is completed.

Corrective Action: No action is required.

DETH52I LOGICAL CONNECTION RESUMED AFTER FORMAT OF THE ACTIVE JOBS FILE

Explanation: This information message indicates that the logical connection between the Control-M Application Server and Control-M/Enterprise Manager (Control-M/EM) Workstation Gateway has resumed because the process of formatting the Active Jobs file has finished.

The workstation database may now request synchronization, and other requests issued by the Control-M/EM GUI will now be handled.

Corrective Action: No action is required.

DETH53E FORMAT OF ACTIVE JOBS FILE ABENDED

Explanation: An abend occurred when the Active Jobs file (AJF) was last formatted. The New Day process did not finish OK. ECSGATE cannot work with the AJF, because the AJF might be corrupted.

The Control-M Application Server shuts down.

Corrective Action: Inform your INCONTROL administrator.

DETH55E FILE ALLOCATED TO DDNAME "DARESF" OR "DACNDF" IS NOT YOUR IOA SYNCHRONIZATION FILE

Explanation: The data set pointed to by the "DARESF" OR "DACNDF" DD statement is not your IOA Synchronization file. This error message is issued by the CTWDET Control-M Application Server program, and is due to one of the following:
The file allocated to the DARESF or DACNDF DD statement is not the IOA Synchronization file.

The file allocated to the DARESF or DACNDF DD statement is the IOA Synchronization file, but it is of a different version or from a different Control-M monitor.

The Control-M Application Server shuts down.

**Corrective Action:** Correct the JCL for the Control-M Application Server and restart it.

**DETH56E THE NEW JOB RECORDS ARE INCOMPLETE. CONTINUATION RECORD IS MISSING. RBA add**

**Explanation:** The Control-M Application Server detected that a job on the Active Jobs file does not have all related continuation records.

In this message, *add* is the Relative Byte address of the problematic job.

The problematic job is ignored, meaning that it is not downloaded to Control-M/Enterprise Manager. The Application Server continues to work, handling other jobs.

**Corrective Action:** Have your system programmer call BMC Software Customer Support.

**DETH57I ACTIVE JOBS FILE IS BEING FORMATTED**

**Explanation:** This information message indicates that the Control-M Active Jobs File (AJF) is currently being formatted.

The Control-M Application Server holds updates. After formatting is finished, it executes a full download to the Control-M/Enterprise Manager.

**Corrective Action:** No action is required.

**DETH58E DATA BASE UPDATES SENT TO THE WORKSTATION GATEWAY HAVE NOT BEEN CONFIRMED IN TIME**

**Explanation:** The Control-M Application Server sent database updates to the Control-M/Enterprise Manager (Control-M/EM) Workstation Gateway, but did not receive confirmation for them in time. This error message is issued by the CTWDET Control-M Application Server program, and is due to one of the following:

- The Control-M/EM Workstation Gateway has stopped responding, due to an error condition in the software or hardware.
- Responses are delayed because of poor performance.

**Corrective Action:** Check if the workstation is hanging and if there are any error messages at the workstation which indicate the cause of the problem. If the workstation is not hanging, there must be some performance bottleneck in the system. Try to determine whether this bottleneck is at the workstation side, in the communication media, or at the mainframe.

**DETH59E CONFIRMATION SEQUENCE NUMBER ERROR. EXPECTED= exp_num RECEIVED= rcv_num**

**Explanation:** The Control-M Application Server has received an out of order confirmation of a database update.
This error message is issued by the CTWDET Control-M Application Server program. The Mainframe Gateway expects to receive confirmations for database updates in increasing order, but a confirmation with a sequence number of \( \text{rcv\_num} \) has been received, when a confirmation with a sequence number of at least \( \text{exp\_num} \) was expected.

The Control-M Application Server continues executing.

**Corrective Action:** Have your INCONTROL administrator contact BMC Software Customer Support.

**DETH60W** RUN NUMBERS \( \text{run\_num1} \) TO \( \text{run\_num2} \) OF jobName HAVE NOT BEEN CAPTURED

**Explanation:** The Control-M Application Server detected that during its last sleeping period it missed some events.

This message is issued by the CTWDET Control-M Application Server program. The Mainframe Gateway has detected that the run number of the `jobName` job in the Control-M Active Jobs file has changed by more than one during the Mainframe Gateway's last sleeping period. This means that run numbers \( \text{run\_num1} \) to \( \text{run\_num2} \) of the job have not been captured by the Mainframe Gateway.

**Corrective Action:** Consider decreasing the SLEEPINT parameter in the relevant APSERVER statement in the ECAPARM member.

**DETH61E** DETECTOR INTERNAL ERROR TYPE `type`

**Explanation:** The detector program detected an internal error. This error message is issued by the Control-M Application Server, and is due to reasons not in user control.

The Control-M Application Server shuts down.

**Corrective Action:** Have your INCONTROL administrator contact BMC Software Customer Support.

**DETH67I** DOWNLOAD PROCESS WILL TAKE PLACE SINCE < `rsn\_Text` >

**Explanation:** This information message indicates that a download will be executed, and the reason.

Possible causes of this message are:

- The Control-M Active Jobs File (AJF) was formatted since the last Application Server cycle.
- The Control-M Application Server received a STARTLINK modify command.

Possible values for `rsn\_Text` are:

- ACTIVE JOBS FILE WAS FORMATTED
- STARTLINK COMMAND WAS ISSUED

The Control-M Application Server requests and will execute a full download to the Control-M/Enterprise Manager.

**Corrective Action:** No action is required.

**DFG messages**

This group includes messages for the Control-O product.
Messages DFG400 through DFG4xx
This group includes messages for the Control-O product.

DFG410I ALLOCATION OF GLOBAL AUTOEDIT LIBRARY STARTED
Explanation: This information message indicates the normal start of the CTODFG program that allocates the Global library.
Corrective Action: No action is required.

DFG411E INVALID PARAMETERS: parms
Explanation: The CTODFG program detected invalid parameters.
The program terminates with a return code of 08.
Corrective Action: Verify the parameters, correct them, and resubmit the utility.

DFG412W THIS CPU HAS SMF ID cpuSmfId AND NOT parmSmfId
Explanation: The SMF ID of the CPU on which the CTODFG program is running (cpuSmfId) does not match the SMF ID passed as a parameter to the program (parmSmfId).
No error is issued when the systems share the catalog, where the file is cataloged, and the disk, where the file was allocated.
The program terminates with a condition code of 04.
A problem starting Control-O monitor might occur when the systems do not share the catalogs or the disk. This usually occurs when the file should have been cataloged in the MASTER catalog of the target system (parmSmfId) and not the Master catalog of the system where the job was executed (cpuSmfId).
In such a case, messages CTM686E and CTO458S are issued and Control-O monitor terminates with RC 8.
Corrective Action: Verify that the file was cataloged in the correct CATALOG. If it was not, DELETE the file and rerun the job on the correct system where parmSmfId and cpuSmfId are the same.

DFG416E DYNAMIC ALLOCATION ERROR RC=rc, ERROR=rsn, DSN=dsn
Explanation: The CTODFG program failed while attempting to dynamically allocate the Global library.
The CTODFG program terminates with a condition code of 08.
Corrective Action: Refer to the IBM OS/390 Authorized Assembler Services Guide for an explanation of the return and reason codes.

DFG417E CTMMEM ERROR, RC=rc
Explanation: The CTODFG program received the return code rc from the CTMMEM module while attempting to update the Global library. The error occurred when the CTODFG program attempted to create the $$GLOBAL member in the Global library.
Possible causes indicated by values of rc are:
- 08 - The region size is too small.
- 28 - The data set is in use.
- 32 - Internal error.
- 56 - The library is full or an abend occurred.
- 64 - The member already exists.

The CTODFG program terminates with a condition code of 08.

**Corrective Action:** If possible, correct the problem with the library, and resubmit the utility. If the error persists, contact BMC Software Customer Support.

**DFG418E ALLOCATION OF GLOBAL AUTOEDIT LIBRARY FAILED**

**Explanation:** Allocation of the Global library failed. This error message, which is issued by the CTODFG program, is preceded by another message detailing the reason for the failure.

The CTODFG program terminates with a condition code of 08.

**Corrective Action:** See the preceding message.

**DFG419I ALLOCATION OF GLOBAL AUTOEDIT ENDED**

**Explanation:** This information message indicates that the CTODFG program successfully allocated the Global library.

**Corrective Action:** No action is required.

**DFL messages**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**Messages DFL0 through DFL0xx**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**DFL030I TAPE PULL UTILITY IS SUBMITTING JOBS WITH TYPRUN=SCAN**

**Explanation:** Highlighted, unrollable message.

This information message indicates that the Tape Pull List is currently submitting jobs with TYPRUN set to SCAN. To perform JCL checking, the tape pull utility submits jobs through the internal reader with the TYPRUN parameter set to SCAN. It then reads the sysout of the jobs being submitted, and deletes the sysout from the spool.

**Corrective Action:** No action is required.
DFL031I  UNKNOWN TYPE OF JCL CARD - *stmt*

**Explanation:** This information message indicates that an unknown type of JCL statement was found while reading sysout from the spool.

**Corrective Action:** Check the JCL statement. If the format is valid, have your INCONTROL administrator call BMC Software Customer Support for assistance.

DFL032E  READING OF SIMULATION ACTIVE JOBS FILE FAILED

**Explanation:** The reading of the file allocated to the DACKPTIN DD statement failed. Possible causes are:
- The file allocated to the DACKPTIN DD statement is not the Active Jobs file.
- The file allocated to the DACKPTIN DD statement is the Active Jobs file, but of a different version of the Control-M.
- There is insufficient memory to read the Active Jobs file into storage.
- The DACKPTIN DD statement is missing.

The utility terminates with a condition code of 08.

**Corrective Action:** Look for previous error messages that describe the type of error.

DFL033E  OPEN OF SIMULATION LOG FILE FAILED. DD NAME "DALOGI N"

**Explanation:** Open of the simulation facility output log file failed. Possible causes are:
- The DALOGI N DD statement is missing.
- The file allocated to the DALOGI N DD statement is neither the IOA Log file nor the log file which was produced by the Control-M simulation.

The utility is terminated with a condition code of 08.

**Corrective Action:** Correct the JCL of the job.

DFL034E  SUBMIT OF MEMBER *memName* FROM THE LIBRARY *lib* FAILED

**Explanation:** The specified member in the specified library was not submitted by the Tape Pull List utility.

**Corrective Action:** Look for the previous error messages which will describe the type of error.

DFL035E  MEMBER *memName* SHOULD BE SUBMITTED BUT IS NOT IN THE ACTIVE JOBS FILE

**Explanation:** A message indicating job submission was found in the simulation output log file, but the Active Jobs file does not contain an entry for that job. The Tape Pull List utility submits a job only if a message indicating job submission is found in the log file and the Active Jobs file contains the entry for that job.

**Corrective Action:** Check whether the Active Jobs file allocated to the DACKPTIN DD statement was changed since the last run of the simulation.
DFL036E UNRESOLVED VOL=AFF= IN DDNAME *ddName*

**Explanation:** The VOL=AFF= val parameter was specified for the *ddName* DD statement but it could not be resolved within the job.

The information for this DD statement is ignored by the utility.

**Corrective Action:** Look for the next message to identify the job name and step name where the error was detected.

DFL037E JCL ERROR WAS FOUND IN MEMBER *memName*

**Explanation:** A JCL error was found in the indicated member.

**Corrective Action:** Look for earlier error messages that describe the type of error.

DFL038I TAPE PULL LIST UTILITY STARTED

**Explanation:** This information message indicates that the Tape Pull List utility started.

**Corrective Action:** No action is required.

DFL039I TAPE PULL LIST UTILITY ENDED

**Explanation:** This information message indicates that the Tape Pull List utility ended.

**Corrective Action:** No action is required.

DFL045S SIMULATION LOG DOES NOT CONTAIN MESSAGES ON JOB SUBMISSION

**Explanation:** Messages indicating job submission were not found in the log file allocated to the DALOGIN DD statement.

The utility is terminated with a condition code of 08.

**Corrective Action:** Check the results of the Control-M Simulation Facility.

DFL049W DATASET *dsn* IS NOT FOUND IN CATALOG. DDNAME *ddName*

**Explanation:** The specified data set is not cataloged in the computer where the utility is executing. This data set is ignored during utility processing.

**Corrective Action:** Look for the next error message to identify the job name and step name where the error was detected. This data set may fail the job on execution JCL error.

DFL050E INVALID DISPOSITION IS SPECIFIED IN DDNAME *ddName*

**Explanation:** The disposition specified for the *ddName* DD statement is invalid or conflicts with the current status of the DSNAME.

The information for the *ddName* DD statement is ignored by the utility.

**Corrective Action:** Look for the next error message to identify the job name and step name where the error was detected.
Messages DFL100 through DFL1xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

DFL185E ERROR WHILE READING SYSOUT FOR MEMBER memName JOBID jobId

Explanation: Reading of sysout for the specified job failed. The tape pull list performs JCL checking by submitting the jobs with TYPRUN set to SCAN and reading the results from spool. A typical cause is a manual purge at the job from spool.

Corrective Action: Check earlier error messages that describe the type of error.

DFL187W UNRESOLVED BACKWARD REFERENCE FOR DDNAME ddName

Explanation: Backward reference was not resolved for the ddName DD statement. The information for this DD statement is ignored by the utility.

Corrective Action: Check the next error message to identify the job name and step name where the error was detected.

DFL188W UNIT NAME NOT SPECIFIED FOR NEW DATASET IN DDNAME ddName

Explanation: No UNIT specification was found for the NEW data set allocated to the specified DD name. The information for this DD statement is ignored by utility.

Corrective Action: Look for the next error message to identify the job name and step name where the error was detected.

DFL189I MEMBER memName PGMSTEP pgmStep PROCSTEP procStep

Explanation: The information message identifies the location of the errors described by the previous message.

Corrective Action: No action is required.

DFL190W NOT CATLGD2 MAY BE ENCOUNTERED FOR DDNAME ddName

Explanation: The data set allocated to the specified DD statement is already cataloged. It is possible that the data set is not currently cataloged, but will be created and cataloged before the execution of the specified job.

Corrective Action: Look for the next error message to identify the job name and step name where the error was detected.

DIB messages

This group includes messages for the IOA (infrastructure) product.
Messages DIB900 through DIB9xx

This group includes messages for the IOA (infrastructure) product.

**DIB911I UTILITY IOADBIB STARTED**

**Explanation:** This information message indicates that utility IOADBIB has started creating an IOA Access Method index file based on existing data.

**Corrective Action:** No action is required.

**DIB912E ERROR err AT LINE line. CURRENT STATEMENT: stmt**

**Explanation:** Control-M/Analyzer utility CTBDBIB failed while reading the indicated input statement from the data set referenced by the SYSIN DD statement.

The utility stops executing with a condition code of 08.

**Corrective Action:** Notify your INCONTROL administrator.

**DIB914I PROGRAM ENDED: num KEYS BUILT**

**Explanation:** This information message indicates the normal termination message of Control-M/Analyzer Index file rebuilding utility CTBDBIB.

**Corrective Action:** No action is required.

**DIB915S ERROR OPENING SYSPRINT**

**Explanation:** An error was detected during an attempt to open the file referenced by the SYSPRINT DD statement.

The file referenced by the SYSPRINT DD statement is not opened.

**Corrective Action:** the system job log, and correct the problem accordingly. Rerun the job.

**DIB916E NO INPUT PARAMETERS. PROGRAM STOPPED**

**Explanation:** The input file for the CTBDBIB Control-M/Analyzer utility is empty (the SYSIN DD statement).

The utility stops executing with a condition code of 04.

**Corrective Action:** Fill in the input statements and rerun the job.

**DIB917S INTERNAL ERROR WHILE PROCESSING DDNAME ddName**

**Explanation:** Control-M/Analyzer utility CTBDBIB failed while processing of the data set referenced by the indicated DD name. This message is followed by message DIB918S, which contains additional details about the error.

The utility stops executing with a nonzero condition code.

**Corrective Action:** Contact your INCONTROL administrator with the details displayed in this and the following message.
DI B918S RETURN CODE rc FROM routineName ROUTINE, FUNCTION func

Explanation: Control-M/Analyzer utility CTBDBIB failed while processing the data set referenced by the DD name indicated in message DIB917S. The utility stops executing with the indicated return code.

Corrective Action: Notify your INCONTROL administrator.

DI B919E INPUT PARAMETERS CONTAIN DUPLICATE DDNAMES

Explanation: The CTBDBIB parameter Control-M/Analyzer utility could not process the input parameters due to duplicate DD names in the input statements. The utility stops executing with a condition code of 36.

Corrective Action: Correct the input statements, and rerun the job.

DI B91AS INSUFFICIENT STORAGE TO RUN UTILITY IOADBIB

Explanation: The IOADBIB parameter requires more storage to rebuild an index file. The utility stops executing with a condition code of 12.

Corrective Action: Increase the REGION size, and rerun the job.

DI B91BS INDEX FILE IS FULL. UNABLE TO ADD A KEY

Explanation: The utility that builds index entries for the IOA Access Method file was not able to add an index element to the index file because it was full. The utility stops.

Corrective Action: Allocate a new index file with more space than the original, and rerun this utility.

Messages DIBG00 through DIBGxx

This group includes messages for the IOA (infrastructure) product.

DIBG60I BUILD INDEX UTILITY STARTED

Explanation: This information message indicates that the index file creation process started. This message is issued by the CTDDIB utility, which generates an index file based on an existing data file.

Corrective Action: No action is required.

DIBG61I INDEX BUILT SUCCESSFULLY

Explanation: This information message indicates that the index file was successfully built based on the existing data file. This message is issued by the CTDDIB utility.

Corrective Action: No action is required.
DIBG62S BUILD INDEX UTILITY ENDED WITH ERROR

Explanation: An error was encountered during index file creation. This message is issued by the CTDDIB utility. Other error messages indicate the cause of the error.

The index file is not usable.

Corrective Action: Correct the problem, and rerun the CTDDIB utility to generate the index based on the existing data file.

DIBG63S TOO MANY ERRORS DETECTED

Explanation: The number of errors detected exceeds a fixed threshold.

The CTDDIB utility terminates.

Corrective Action: Correct the errors, and resubmit the job.

DIBG64S NOT ENOUGH SPACE IN INDEX FILE

Explanation: There is insufficient space for the CTDDIB utility to add a new index element to the index file.

The CTDDIB utility terminates with a return code of 28.

Corrective Action: Expand the index file using the IOADBF utility, and resubmit the job.

DIBG66S INVALID VALUE IN PARAMETER DBFILE. VALID VALUES ARE: ACT, PRM, HST, MIG, MG1-MG9

Explanation: The DBFILE parameter in the CTDDIB utility is not set to ACT, PRM, HST, MIG or MGn.

The CTDDIB utility creates an index file from an existing data file. The user tried to run the CTDDIB utility without a valid DBFILE parameter.

The CTDDIB utility terminates.

Corrective Action: Rerun the CTDDIB utility after setting the DBFILE parameter to ACT, PRM, HST, MIG, or MGn depending on the type of file for which the index is being created, as follows:

- ACT - Active User file
- PRM - Permanent User file
- HST - History User file
- MIG - Migrated User file
- MGn - Migrated User file partition, where n is the partition number

DIBG67E BUILD INDEX DETECTED AN ERROR WHILE ADDING A NEW INDEX RECORD

Explanation: An error was encountered by function ADDI (Add Index) of the CTDDIB utility.

After a number of attempts to write the record, the CTDDIB utility terminates with an error code of 22. The problematic record is not indexed but is written to file DATTRACE.
**Corrective Action:** If necessary, correct data file records in accordance with other error messages and resubmit the job.

**DIBG68I** DUPLICATE RECORD FOUND IN DATA FILE

**Explanation:** This information message indicates that a duplicate record exists in the data file. The duplicate record may be the result of a computer malfunction.

The CTDDIB utility continues processing.

**Corrective Action:** No action is required.

**DIBG69E** A DATA FILE READ ERROR WAS DETECTED, PROBLEMATIC RECORD WRITTEN TO FILE DATRACE

**Explanation:** An error occurred while reading an IOA Access Method data file. The problematic record is written to file DATRACE.

**Corrective Action:** Correct data file records and resubmit the job.

**DIBG6AI** NUMBER OF RECORDS READ FROM DATA FILE=num

**Explanation:** This information message indicates that the CTDDIB utility read num records from the IOA Access Method data file to be indexed.

**Corrective Action:** No action is required.

**DIBG6BI** NUMBER OF RECORDS ADDED TO file INDEX FILE=num

**Explanation:** This information message indicates that the CTDDIB utility added num records to the IOA Access Method index file.

In this message, file is name of the IOA Access Method component.

**Corrective Action:** No action is required.

**DIBG6CI** NUMBER OF DUPLICATE RECORDS IN DATA FILE=num

**Explanation:** This information message indicates that the CTDDIB utility found num duplicate records in the IOA Access Method data file to be indexed.

Duplicate records are not indexed.

**Corrective Action:** No action is required.

**DIBG6DE** file INDEX FILE MUST BE REFORMATTED PRIOR TO REBUILDING INDEX

**Explanation:** The index file was not reformatted. The index component of the IOA Access Method must be reformatted prior to running the CTDDIB utility.

In this message, file is name of the IOA Access Method component.

The CTDDIB utility terminates.

**Corrective Action:** Reformat the index file with the IOADBF utility and resubmit the job.
DIBG6EE ERROR IN THE SORT PROGRAM. SEE SORT MESSAGES.

**Explanation:** The SORT program called by the CTDDIB utility ended with errors. This error probably indicates that insufficient storage was allocated for sort processing.

The CTDDIB utility terminates.

**Corrective Action:** Allocate more space for the SORT program and rerun the CTDDIB utility.

DIBG6FI NUMBER OF DUPLICATE RECORDS NOT ADDED TO file INDEX FILE= num

**Explanation:** This information message indicates that the CTDDIB utility detected duplicated records in a data component. The corresponding index records were not added to the alternative index component.

In this message, file is the name of the IOA Access Method component.

**Corrective Action:** No action is required.

DIG messages

This group includes messages for the IOA (infrastructure) product.

Messages DIG900 through DIG9xx

This group includes messages for the IOA (infrastructure) product.

DIG901I UTILITY IOADIG STARTED

**Explanation:** This information message indicates the normal start of the IOADIG utility. The IOADIG utility performs IOA Access Method data file integrity checking.

**Corrective Action:** No action is required.

DIG902S WARNING: RBA INCONSISTENT AT BLOCK= blk RECORD= rec

**Explanation:** An RBA error was detected by the IOADIG utility while checking the rec record of the input IOA Access Method data file. This message indicates the specific block and record that contain the error.

The IOADIG utility continues executing.

**Corrective Action:** Rerun the IOADIG utility with ACT set to W to correct the error. If the error remains, save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you continue to encounter problems with the IOA Access Method files, see the section on reorganizing the IOA Access Method File in the INCONTROL for z/OS Administrator Guide to learn how to reorganize the files.
DIG903S HEADER CORRUPT. POINTER TO START OF FREE RECORD CHAIN INVALID

**Explanation:** An error was detected by the IOADIG utility in the header of the input IOA Access Method data file.

The IOADIG utility continues executing.

**Corrective Action:** Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the *INCONTROL for z/OS Administrator Guide* to learn how to reorganize the files.

DIG904I NO FREE RECORDS DETECTED. CHECK NOT REQUIRED

**Explanation:** This information message indicates normal termination of data file integrity checking by the IOADIG utility when the file to be checked is full.

**Corrective Action:** No action is required.

DIG905S INTEGRITY CHECK ENDED ABNORMALLY. FREE RECORD CHAIN CREATION FAILED

**Explanation:** The IOADIG utility is unable to perform integrity checking on the requested IOA Access Method data file.

The IOADIG utility terminates with a condition code of 32.

**Corrective Action:** Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the *INCONTROL for z/OS Administrator Guide* to learn how to reorganize the files.

DIG906I CHECK COMPLETED NORMALLY. ERRORS CORRECTED

**Explanation:** This information message indicates that the IOADIG utility ended normally, and errors were corrected successfully.

**Corrective Action:** No action is required.

DIG907I DATABASE INTEGRITY CHECK ENDED OK: NO ERRORS DETECTED

**Explanation:** This information message indicates that the IOADIG utility ended and no errors were detected.

**Corrective Action:** No action is required.
DIG908S NUMBER OF FREE RECORDS IN HEADER DOES NOT MATCH THE ACTUAL NUMBER OF FREE RECORDS

Explanation: The IOADIG utility detected in the header of the IOA Access Method data file that the number of free records in the data file and the number of free records recorded in the header record are not the same.

The utility continues executing.

Corrective Action: Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the INCONTROL for z/OS Administrator Guide to learn how to reorganize the files.

DIG909S ACTIVE RECORD ENCOUNTERED IN FREE RECORD CHAIN

Explanation: The IOADIG utility detected an active record in the free record chain of the IOA Access Method data file.

The utility continues executing.

Corrective Action: Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the INCONTROL for z/OS Administrator Guide to learn how to reorganize the files.

DIG90AS INVALID FREE LIST POINTER ENCOUNTERED

Explanation: The IOADIG utility detected an invalid free list pointer while integrity checking the IOA Access Method data file. One or more records pointed to by the free list pointer are not free records.

The utility continues executing.

Corrective Action: Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the INCONTROL for z/OS Administrator Guide to learn how to reorganize the files.

DIG90BS CROSS-LINKED FREE RECORDS ENCOUNTERED

Explanation: The IOADIG utility detected a recursive pointer error in the free record chain while integrity checking the IOA Access Method data file.

The utility continues executing.

Corrective Action: Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the INCONTROL for z/OS Administrator Guide to learn how to reorganize the files.

1447
If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the *INCONTROL for z/OS Administrator Guide* to learn how to reorganize the files.

**DIG90CS INVALID RECORD ID IN THE RECORD HEADER**

**Explanation:** The IOADIG utility detected an invalid record ID in the data file header while integrity checking the IOA Access Method data file.

The utility continues executing.

**Corrective Action:** Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the *INCONTROL for z/OS Administrator Guide* to learn how to reorganize the files.

**DIG90DS FREE RECORD OUT OF CHAIN AT BLOCK= blk RECORD= rec**

**Explanation:** While integrity checking the IOA Access Method data file, the IOADIG utility detected a free record that is not in the free record chain.

The utility continues executing.

**Corrective Action:** Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the *INCONTROL for z/OS Administrator Guide* to learn how to reorganize the files.

**DIG90ES INSUFFICIENT STORAGE TO RUN UTILITY**

**Explanation:** The IOADIG utility requires more storage to perform an integrity check on the IOA Access Method data file.

The utility terminates with a condition code of 12.

**Corrective Action:** Increase the REGION size and rerun the utility.

**DIG90FS OPEN OF FILE FAILED**

**Explanation:** The IOA Access Method data file for which integrity checking was requested cannot be opened. Possible causes are causes:

- The DD statement which references the data file is missing.
- The file referenced by the DD statement is not an IOA Access Method data file.
- An internal error occurred while attempting to open the file referenced by the DD statement.

The IOADIG utility terminates with a condition code of 16.

**Corrective Action:** Correct the JCL and rerun the job. If the error persists, notify your INCONTROL administrator.
DIG911S ERROR DETECTED: BLOCK= blk RECORD= rec

Explanation: The IOADIG utility detected an error in the rec record in the blk block.

The utility continues executing.

Corrective Action: Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the INCONTROL for z/OS Administrator Guide to learn how to reorganize the files.

DIG912S POINTER TO THIS RECORD IS AT BLOCK= blk RECORD= rec

Explanation: The IOADIG utility detected an error in a pointer at the rec record in the blk block.

The utility continues executing.

Corrective Action: Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the INCONTROL for z/OS Administrator Guide to learn how to reorganize the files.

DIG913I DATABASE INTEGRITY ERRORS DETECTED. TO CORRECT, SPECIFY "FUNC=W"

Explanation: This information message indicates that the IOADIG utility detected one or more integrity errors.

The utility terminates with a return code of 32.

Corrective Action: To correct the errors, rerun the IOADIG utility after setting the FUNC parameter to W. If the problem persists, save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the INCONTROL for z/OS Administrator Guide to learn how to reorganize the files.

DIG914S ERROR OPENING SYSPRINT

Explanation: An error occurred while opening the SYSPRINT DD statement. The DD statement is probably missing.

The IOADIG utility terminates with a return code of 8.

Corrective Action: Notify your INCONTROL administrator.

DIG916S DATABASE INTEGRITY ERRORS DETECTED

Explanation: The IOADIG utility detected one or more integrity errors.
The IOADIG utility continues executing.

Corrective Action: Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the INCONTROL for z/OS Administrator Guide to learn how to reorganize the files.

DIG917S WARNING: INCORRECT RBA IN BLOCK blk
Explanation: The IOADIG utility detected an invalid Relative Block Address (RBA) in the blk block.

The utility continues executing.

Corrective Action: Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the INCONTROL for z/OS Administrator Guide to learn how to reorganize the files.

DIG918S WARNING: INCORRECT RECORD ID IN BLOCK blk
Explanation: The IOADIG utility detected an invalid record ID in the block identified in the message.

The utility continues executing.

Corrective Action: Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the INCONTROL for z/OS Administrator Guide to learn how to reorganize the files.

DIG919S HEADER CORRUPT: INCORRECT {BLOCK SIZE | RECORD LENGTH | DATASET NAME}
Explanation: The IOA Access Method data file header does not contain the correct block size, record length, or data set name information (as indicated in the wording of the message). The error was detected by the IOADIG utility.

The utility stops executing.

Corrective Action: Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the INCONTROL for z/OS Administrator Guide to learn how to reorganize the files.
DIG920S QUANTUM NOT IN ASCENDING ORDER - PROBLEM NOT CORRECTED

**Explanation:** The values specified for the QUANT1, QUANT2 and QUANT3 parameters are not in ascending order. These parameters are used with variable record length IOA Access Method Database file components for managing free space areas when new records are written. They must correlate with the BLKSIZE parameter as follows: QUANT1 < QUANT2 < QUANT3 < BLKSIZE.

The utility continues executing.

**Corrective Action:** Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the *INCONTROL for z/OS Administrator Guide* to learn how to reorganize the files.

DIG921S WARNING: INCORRECT FREE SPACE COUNTER IN BLOCK blk

**Explanation:** The free space counter in the blk block is not accurate. This error was detected by the IOADIG utility.

The utility continues executing.

**Corrective Action:** Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the *INCONTROL for z/OS Administrator Guide* to learn how to reorganize the files.

DIG922S WARNING: INCORRECT RECORD ORDER IN BLOCK blk

**Explanation:** One or more records are out of sequence in the block identified in the message. This error was detected by the IOADIG utility.

The utility continues executing.

**Corrective Action:** Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the *INCONTROL for z/OS Administrator Guide* to learn how to reorganize the files.

DIG923S WARNING: INCORRECT RECORD COUNTER IN BLOCK blk

**Explanation:** The IOADIG utility detected that the record counter in the blk block is not accurate.

The utility continues executing.
Corrective Action: Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the INCONTROL for z/OS Administrator Guide to learn how to reorganize the files.

**DIG924W WARNING: INCORRECT FREE SPACE QUANTUM FOR BLOCK blk**

Explanation: The IOADIG utility detected that the amount of free space designated for the `blk` block is incorrect. These parameters are used with variable record length IOA Access Method Database file components for managing free space areas when new records are written. They must correlate with the BLKSIZE parameter as follows: QUANT1 < QUANT2 < QUANT3 < BLKSIZE.

The utility continues executing.

Corrective Action: Check that all started tasks or jobs in Control-D or Control-V that are working with user files are running on LPARs which are synchronized by software such as GRS or MIM.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the INCONTROL for z/OS Administrator Guide to learn how to reorganize the files.

**DIG925S HEADER CORRUPTED: INCORRECT TYPE IN RECORD ZERO**

Explanation: The IOADIG utility detected that the record type recorded in the IOA Access Method data file header record is incorrect.

The utility continues executing.

Corrective Action: Save the output of the job. Create a copy of the IOA Access Method index and data files by means of the IEBGENER utility, and contact BMC Software Customer Support. Include all the extents of the files.

If you encounter more problems with the IOA Access Method files, refer to the section that describes IOA Access Method file reorganization in the INCONTROL for z/OS Administrator Guide to learn how to reorganize the files.

**DIG926S DYNAMIC ALLOCATION ERROR OF EXTENT= dsn RC= rc REASON= rsc**

Explanation: The IOADIG utility detected an error during allocation of an extent.

The utility terminates with a return code of 12.

Corrective Action: For a description of the reason code received, refer to the IBM manual MVS Programming: Authorized Assembler Services Guide. If you cannot resolve the problem, report the reason code to BMC Software Customer Support.

**DIG927I INTEGRITY CHECKED OK FOR DATASET dsn**

Explanation: This information message indicates that the IOADIG utility did not find any integrity problems in the `dsn` data set.

The utility continues executing.
Corrective Action: No action is required.

DIG928I DATABASE INTEGRITY CHECKED OK: NO ERRORS DETECTED
Explanation: This information message indicates the normal end of the IOADIG utility. No errors were detected.
The utility terminates with a return code of 0.
Corrective Action: No action is required.

DIG929I INTEGRITY CHECKED OK FOR MAIN DATASET
Explanation: This information messages indicates that the IOADIG utility found no errors in the main data set.
Corrective Action: No action is required.

DIG92AS DEALLOCATION ERROR FOR DATASET dsn
Explanation: The IOADIG utility detected an error during deallocation of an extent of the dsn data set.
The utility terminates with a return code of 12.
Corrective Action: For a description of the return code received, see the IBM manual MVS Programming: Authorized Assembler Services Guide. If you cannot resolve the problem, report the reason code to BMC Software Customer Support.

DIG92BS FOR DSN=
Explanation: This message is the header for other messages which indicate the relevant data set names.
Corrective Action: No action is required.

DIG92CS INVALID PARAMETER, VALID PARAMETERS ARE ACT=R/W, TYPE=F/V
Explanation: An invalid parameter was passed to the IOADIG utility.
Valid values for the ACT parameter:
- R - Perform a read-only check. Do not correct detected errors.
- W - If an error is detected, correct it.
Valid values for the ACT parameter:
- F - Fixed length records in data file.
- V - Variable length records in data file.
The utility terminates with a return code of 24.
Corrective Action: Rerun the IOADIG utility after setting its parameters to valid values.
DIG92DI INPUT PARAMETERS ARE

**Explanation:** This information message is the header for a list of input parameters.

**Corrective Action:** No action is required.

DIG92ES DATASET NAME *dsn* IN CONTROL BLOCK IS TOO LONG

**Explanation:** This message indicates that the IOADIG utility detected that the dataset name (*dsn*), in the control block of the IOA Access Method data file, is longer than 38 bytes.

The utility terminates with a condition code of 16.

**Corrective Action:** Use the following procedure:

1. Save the output of the job.
2. Use the IEBGENER utility to create a copy of the IOA Access Method index and data files. Be sure to include all the extents of the files.

If you encounter more problems with the IOA Access Method files, see the *INCONTROL for z/OS Administrator Guide* for information on how to reorganize the files.

DII messages

This group includes messages for the IOA (infrastructure) product.

Messages DII900 through DII9xx

This group includes messages for the IOA (infrastructure) product.

DII941I UTILITY IOADII STARTED

**Explanation:** This information message indicates that the IOADII utility started performing IOA Access Method index file integrity checking.

**Corrective Action:** No action is required.

DII942S OPEN OF INDEX FILE FAILED

**Explanation:** The IOA Access Method index file could not be opened.

Processing is stopped.

**Corrective Action:** Check the IOA log and system job log for more information. Correct the problem and rerun the utility.

DII943S INDEX INTEGRITY ERRORS DETECTED. SEE DATRACE FILE

**Explanation:** The IOADII utility detected an integrity error in the IOA Access Method index file. The problematic record is written to file DATRACE.

Processing is stopped.
Corrective Action: Rebuild the index using the CTDDIB utility.

DII945I NUMBER OF RECORDS READ FROM INDEX FILE=num
Explanation: This information message indicates that nnnn records were read from the IOA Access Method index file.
Corrective Action: No action is required.

DII945S INDEX INTEGRITY ERRORS DETECTED AT: BLOCK=block RECORD=record
Explanation: The Control-M/Analyzer CTBDII utility found integrity problems in the Index file at the indicated location.
The utility stops executing with a condition code of 32.
Corrective Action: Inform your INCONTROL administrator.

DII946S ERROR OPENING SYSPRINT
Explanation: The IOADII utility detected an error when opening the file referenced by the SYSPRINT DD statement.
The file referenced by the SYSPRINT DD statement is not opened.
Corrective Action: Check the system job log, and correct the problem accordingly. Rerun the job.

DII947I UTILITY IOADII ENDED SUCCESSFULLY
Explanation: This information message indicates that the IOADII utility ended normally.
Corrective Action: No action is required.

DIP messages
This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages DIP900 through DIP9xx
This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

DIP930I DELETE PAGES STARTED IN mode MODE
Explanation: This information message is issued routinely when the CTDDIP utility starts.
In this message, mode is the mode in use. Valid values are:
- TEST - simulation mode
- PROD - production mode

**Corrective Action:** No action is required.

**DI P931I DELETE PAGES ENDED**

**Explanation:** This information message is issued routinely when the CTDDIP utility ends.

**Corrective Action:** No action is required.

**DI P932I LAST PHASE ENDED WITH ERRORS**

**Explanation:** This information message is issued when the last phase of the operation of the CTDDIP utility ended with severe errors. The problem is identified in accompanying messages. The utility ends with a return code of 08.

**Corrective Action:** Correct the problem identified in the accompanying messages and rerun the utility.

**DI P933E DELETE PAGES ENDED WITH ERRORS**

**Explanation:** The CTDDIP utility ended with errors. The errors are described in the accompanying messages. The CTDDIP utility ends with a return code of 04 or 08.

**Corrective Action:** Correct the problem identified in the accompanying messages and rerun the job.

**DI P934I numStmts INPUT STATEMENTS WERE SPECIFIED, numErrors ERRORS WERE DETECTED**

**Explanation:** This information message provides statistics about the input stream statements that have been processed by the CTDDIP utility.

The variables in this message are:
- **numStmts** - the number of input statements
- **numErrors** - the number of errors

**Corrective Action:** No action is required.

**DI P935I numIndexVals INDEX VALUES AND numPages PAGES WERE DELETED**

**Explanation:** This information message provides statistics about the index values in index files, and pages in CDAM, that the CTDDIP utility identified for deletion.

- When operating in TEST mode, the identified index values and CDAM pages will be deleted.
- When operating in production mode, the CTDDIP utility deleted the identified index values and CDAM pages.

The variables in this message are:
INCONTROL for z/OS Messages Manual

- **numIndexVals** - the number of index values deleted (or to be deleted) from index files
- **numPages** - the number of CDAM pages deleted (or to be deleted)

**Corrective Action:** No action is required.

**DIP936E INVALID PARAMETER parm IN STMT stmt**

**Explanation:** An invalid parameter was encountered in the input data stream of the CTDDIP utility.

The variables in this message are:

- **parm** - the identity of the invalid parameter
- **stmt** - the number of the statement that contains parm

The CTDDIP utility continues, but will end with a condition code of 04. The index values and CDAM pages identified in the stmt statement are not deleted.

**Corrective Action:** Correct the parameter syntax in the input statement of the CTDDIP utility.

**DIP937E MISSING PARAMETER parm IN STMT stmt**

**Explanation:** A parameter was missing from the input data stream of the CTDDIP utility.

The variables in this message are:

- **parm** - the identity of the missing parameter
- **stmt** - the number of the statement that contains parm

The CTDDIP utility continues, but ends with a condition code of 04. The index values and CDAM pages identified in the stmt statement are not deleted.

**Corrective Action:** Correct the parameter syntax in the input statement of the CTDDIP utility.

**DIP938E ILLEGAL comp IN STMT stmt**

**Explanation:** The CTDDIP utility detected in an input statement a reference to a prohibited component.

The variables in this message are:

- **comp** - the prohibited component Valid values are:
  - **INDEX LEVEL** - The specified index is a record level index, and values cannot be deleted in the case of such an index.
  - **NO. OF REPORTS** - The number of reports that have been selected exceeds the value of the specified RMODE parameter.
  - **MIGR MEDIA TYPE** - the last stage migration media type is either not specified in the IOASPRM member of the IOA PARM library, or is not the specified DASD.
- **stmt** - the number of the problematic statement

The CTDDIP utility continues, but ends with a condition code of 04. The index values and CDAM pages identified in the stmt statement are not deleted.

**Corrective Action:** The user response varies according to the value of **comp**, as follows:
INDEX LEVEL - The CTDDIP utility cannot be used to delete the specified index values. Therefore, take into account that the specified values remain undeleted.

NO. OF REPORTS - Do one of the following:
- Set the criteria of report selection more accurately, so as to select only necessary reports.
- To delete indexes from multiple reports, set the value of the RMODE parameter to M.

MIGR MEDIA TYPE - The CTDDIP utility cannot be used to delete the specified index values. Therefore, take into account that the specified values remain undeleted from the migrated CDAM and index files.

DIP939W DUPLICATED INDEX VALUE FOUND FOR STMT stmt
Explanation: A duplicate index value was found in the input data stream of the CTDDIP utility. In this message, stmt is the number of the problematic statement.
The CTDDIP utility continues, but ends with a condition code of 04.
Corrective Action: Correct the input statement of the CTDDIP utility as necessary.

DIP93AE DYNAMIC ALLOCATION ERROR RC= rc RSN= rsn FOR STMT stmt
Explanation: During the execution of the CTDDIP utility, dynamic allocation failed (SVC 99). Additional information is provided in the DIP94AE message, which follows this message.
The variables in this message are:
- rc - the return code
- rsn - the reason code
- stmt - the number of the problematic statement
For information about the return code (rc) and the reason code (rsn), see the IBM manual MVS Programming: Authorized Assembler Services Guide.
The CTDDIP utility continues, but ends with a condition code of 04. The index values and CDAM pages identified in the stmt statement are not deleted.
Corrective Action: No action is required.

DIP93BI numValues GLOBAL INDEX VALUES WERE DELETED
Explanation: This information message indicates the number of global index values identified by the CTDDIP utility for deletion from the DB2 Global Index database.
The system action depends on whether the utility is operating in PROD mode or TEST mode, as follows:
- In PROD mode, the message indicates the number of global index values that were deleted.
- In TEST mode, the message indicates the number of global index values that will be deleted when the utility is run in PROD mode.
In this message, numValues is the number of global index values deleted, or to be deleted, from the DB2 Global Index database.
Corrective Action: No action is required.

DIP93FI INPUT PARAMETERS: STAMP= stmp, CHAR= chr, REPLIST= rlist, PORTION= portn

Explanation: This message is displayed by the CTDDIP utility and provides information about the values of EXEC input parameters.

The variables in this message are:
- stmp - the value of the STAMP input parameter
- chr - the value of the CHAR input parameter
- rlist - the value of the REPLIST input parameter
- portn - the value of the PORTION input parameter

Corrective Action: No action is required.

DIP93GI 1. INPUT STREAM TESTED

Explanation: This information message is issued routinely when data testing of the CTDDIP utility input stream has ended.

Corrective Action: No action is required.

DIP93HI 2. REPORT ENTRIES SELECTED

Explanation: This information message is issued routinely when the CTDDIP utility has completed the selection of report entries in the Active and Migrated User files.

Corrective Action: No action is required.

DIP93II 3. SYSDATA AND INDEX RECORDS SELECTED

Explanation: This information message is issued routinely when the CTDDIP utility has completed the selection of SYSDATA and index records in the Active and Migrated User files.

Corrective Action: No action is required.

DIP93JI 4. INDEX VALUES SELECTED

Explanation: This information message is issued routinely when the CTDDIP utility has completed the selection of index values in the Index files.

Corrective Action: No action is required.

DIP93KI 5. NUMBER OF REPORTS PER STATEMENT CHECKED

Explanation: This information message is issued routinely when the CTDDIP utility has finished checking the number of selected records in each CTDDIP input statement.

Corrective Action: No action is required.
DIP93LI 6. CDAM FILES UPDATED

**Explanation:** This information message is issued routinely when the CTDDIP utility has finished updating the CDAM files.

**Corrective Action:** No action is required.

DIP93MI 7. GLOBAL INDEX DATABASES UPDATED

**Explanation:** This information message is issued routinely when the CTDDIP utility has finished updating the index values in the Global Index Database tables.

**Corrective Action:** No action is required.

DIP93NI 8. INDEX FILES UPDATED

**Explanation:** This information message is issued routinely when the CTDDIP utility has finished updating the index values in the Index files.

**Corrective Action:** No action is required.

DIP93OI 9. GLOBAL INDEXES ARE NOT USED

**Explanation:** This information message is issued routinely instead of the DIP93MI message when the Global Index Database is not used.

**Corrective Action:** No action is required.

DIP93PI LIST OF INPUT STATEMENTS

**Explanation:** This information message is issued routinely at the beginning of a list of the CTDDIP utility input statements.

**Corrective Action:** No action is required.

DIP93QI LIST OF SELECTED REPORTS

**Explanation:** This information message is issued routinely at the beginning of a list of the reports selected by the CTDDIP utility.

**Corrective Action:** No action is required.

DIP93RI END OF LIST OF SELECTED REPORTS

**Explanation:** This information message is issued routinely at the end of a list of the reports selected by the CTDDIP utility.

**Corrective Action:** No action is required.

DIP940E elem NOT FOUND FOR STMT stmt

**Explanation:** During execution of the CTDDIP utility, a report element was not found in the database or index file.

The variables in this message are:
**elem** - the missing report element

Valid values of **elem** are:

<table>
<thead>
<tr>
<th>elem</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>REPORT ENTRY</td>
<td>any user record for the report that fits the specified criteria in the input statement but was not found in the Active user file nor in the Migrated user file</td>
</tr>
<tr>
<td>INDEX NAME</td>
<td>the specified index for the report that fits the specified criteria in the input statement but was not found in the Active user file nor in the Migrated user file</td>
</tr>
<tr>
<td>INDEX VALUE</td>
<td>the specified index value was not found in the Index file for the report that matches the specified criteria in the input statement</td>
</tr>
</tbody>
</table>

**stmt** - the number of the problematic statement

The CTDDIP utility continues, but ends with a condition code of 04. The index values and CDAM pages identified in the **stmt** statement are not deleted.

**Corrective Action:** Correct the criteria in the input statement of the CTDDIP utility.

DI P941E MISSING *filetyp* elem FOR STMT *stmt* KEY= *recordId*

**Explanation:** During execution of the CTDDIP utility, a database element was not found.

The variables in this message are:

- **filetyp** - the type of user file that lacked elem
  - Valid values are:
    - ACTIVE
    - MIGRATED

- **elem** - the type of database element that was missing
  - Valid values are:
    - USER RECORD
    - SYSDATA RECORD
    - INDEX RECORD
    - USER RBA ENTRY

- **stmt** - the number of the problematic statement

**Corrective Action:** Ask your INCONTROL administrator to contact BMC Software Customer Support.

DI P942E INVALID *filetyp* elem FOR STMT *stmt*

**Explanation:** During execution of the CTDDIP utility, an invalid database element was detected.
Additional information is provided in the DIP94AE message, which follows this message.

The variables in this message are:

- **filetyp** - the type of user file that contained the invalid database element
  Valid values are:
  - ACTIVE
  - MIGRATED

- **elem** - the invalid database element
  Valid values are:
  - CDAM RBA - The CDAM RBA in an Index file does not refer to the start or end position in the CDAM page, or exceeds the block or file space. The Index file is identified in the DIP94AE message.
  - INDEX RBA - The internal index RBA exceeds the block or file space in the Index file. The Index file is identified in the DIP94AE message.
  - USER RBA ENTRY - The first and last page numbers of the CDAM RBA in the user record of the Active or Migrated user file are unbalanced. The last page number precedes the first page number.
  - INDEX RBA ENTRY - The first and last page numbers of the CDAM RBA in the index value entry of the Index file are unbalanced. The last page number precedes the first page number. The CDAM and the Index file are identified in the DIP94AE message.
  - CDAM FDB BLOCK - Either the header or the version of the File Description Block (FDB) of the migrated CDAM is invalid. The CDAM and the Index file are identified in the DIP94AE message.

- **stmt** - the number of the problematic statement

The CTDDIP utility continues, but ends with a condition code of 04. The index values and CDAM pages identified in the **stmt** statement are not deleted.

**Corrective Action:** Ask your INCONTROL administrator to contact BMC Software Customer Support.

**DIP943E MIGRATED elem CONVERSION ERROR WHILE PROCESSING STMT stmt**

**Explanation:** During execution of the CTDDIP utility, a return code was received that indicated an invalid conversion of a database element from an original to a migrated file

Additional information is provided in the DIP94AE message, which follows this message.

The variables in this message are:

- **elem** - the problematic database element
  Valid values are:
  - CDAM RBA - The invalid conversion was of the original CDAM RBA from an Index file to a migrated CDAM RBA. The CDAM and Index files are identified in the DIP94AE message.
  - CDAM NAME - The invalid conversion was of the original CDAM name to a migrated CDAM name. The CDAM file is identified in the DIP94AE message.
  - INDEX FILE NAME - The invalid conversion was of the original Index file name to a migrated Index file name. The Index file is identified in the DIP94AE message.
stmt - the number of the problematic statement

The CTDDIP utility continues, but ends with a condition code of 04. The index values and CDAM pages identified in the stmt statement are not deleted.

**Corrective Action:** Ask your INCONTROL administrator to contact BMC Software Customer Support.

DIP944E OPEN FILE ERROR WHILE PROCESSING STMT stmt

**Explanation:** During execution of the CTDDIP utility, the opening of an Index or CDAM file failed. Additional information is provided in the DIP94AE message, which follows this message.

In this message, stmt is the number of the problematic statement.

The CTDDIP utility continues, but ends with a condition code of 04. The index values and CDAM pages identified in the stmt statement are not deleted.

**Corrective Action:** Ask your INCONTROL administrator to contact BMC Software Customer Support.

DIP945S UNEXPECTED RC= rc AFTER PHASE phase FOR STMT stmt

**Explanation:** An unexpected internal return code was issued at the conclusion of some phase of the execution of the CTDDIP utility.

The variables in this message are:

- rc - the internal return code
- phase - the identity of the phase that had concluded
- stmt - the number of the problematic statement

The CTDDIP utility ends with a condition code of 08.

**Corrective Action:** Ask your INCONTROL administrator to contact BMC Software Customer Support.

DIP946S SORT ERROR RC= rc

**Explanation:** During execution of the CTDDIP utility, a sort program was activated internally, but the sort program ended with an unexpected internal return code.

In this message, rc is the unexpected internal return code.

The CTDDIP utility ends with a condition code of 08.

**Corrective Action:** Examine the messages issued by the sort program and the documentation relating to that program to determine the cause of the error, and take appropriate corrective action.

DIP947S OPEN FILE ddName ERROR

**Explanation:** During execution of the CTDDIP utility, the opening of a file failed.

Possible causes are:
The ddName DD statement is missing.

The data set described by the ddName DD statement contains incorrect DCB parameters.

The data set described by the ddName DD statement cannot be opened for sequential read or write operations.

In this message, ddName is the name of the problematic DD statement.

The CTDDIP utility ends with a condition code of 08.

**Corrective Action:** Do one of the following:

- Correct the JCL of the CTDDIP utility and rerun the job.
- Delete either the two working data sets or the input data set, and rerun the job. In this case, when the job is rerun, CTDDIP recreates the necessary data sets.

**DIP948S INSUFFICIENT MEMORY**

**Explanation:** There is insufficient available storage to run the CTDDIP utility.

The CTDDIP utility ends with a condition code of 08.

**Corrective Action:** Increase the REGION size of the utility, and rerun the utility.

**DIP94AE dsn_typ DSN= dsn**

**Explanation:** An invalid data set name was encountered.

This message is accompanied by another message providing more information.

The variables in this message are:

- dsn_typ - the data set type of the data set with the invalid name
  Valid values are:
  - CDAM FILE
  - INDEX FILE
- dsn - the invalid data set name

**Corrective Action:** Examine the accompanying messages for information about the error and the resulting System Action, and take the appropriate corrective action.

**DIV messages**

This group includes messages for the Control-M/Analyzer product.

**Messages DIV900 through DIV9xx**

This group includes messages for the Control-M/Analyzer product.
DIV961I CONTROL-M/ANALYZER UTILITY CTBDBVIG STARTED

**Explanation:** This information message indicates the normal start of the CTBDBVIG Control-M/Analyzer database integrity-checking utility.

**Corrective Action:** No action is required.

DIV962S INSUFFICIENT STORAGE TO RUN UTILITY CTBDBVIG

**Explanation:** The CTBDBVIG Control-M/Analyzer utility requires more storage to perform an integrity check on a Control-M/ Data file.

The utility stops executing with a condition code of 12.

**Corrective Action:** Increase the REGION size, and rerun the job.

DIV963S CONTROL-M/ANALYZER DATA FILE OPEN FAILED

**Explanation:** The CTBDBVIG Control-M/Analyzer utility could not open the Control-M/Analyzer Data file for which integrity checking was requested. Possible causes are:

- The DAMODD DD statement is missing.
- The DAVARD DD statement is missing.
- The file referenced by the DAMODD or DAVARD DD statement is not a Control-M/Analyzer data file.
- An error occurred while attempting to open one of the files pointed to by the DAMODD or DAVARD DD statement.

The utility stops executing with a condition code of 20.

**Corrective Action:** Correct the JCL, and rerun the job. If the error persists, notify your INCONTROL administrator.

DIV965I INTEGRITY ERRORS DETECTED. TO CORRECT, SPECIFY "ACT=W"

**Explanation:** This information message indicates that the CTBDBVIG Control-M/Analyzer utility detected integrity errors while checking the Control-M/Analyzer database.

The utility stops executing with a condition code of 32.

**Corrective Action:** Notify your INCONTROL administrator before rerunning the utility.

DIV966S ERROR UPDATING CONTROL-M/ANALYZER DATA FILES

**Explanation:** The CTBDBVIG Control-M/Analyzer utility failed due to an internal error.

The utility stops executing with a nonzero condition code.

**Corrective Action:** Notify your INCONTROL administrator.

DIV967S BAD RBA ENCOUNTERED WHILE SCANNING MODELS FILE AT BLOCK= blk RECORD= rec

**Explanation:** The CTBDBVIG Control-M/Analyzer utility detected an invalid RBA while checking the rec record.
The utility continues executing.

**Corrective Action:** Notify your INCONTROL administrator.

**DIV968S I NCONSISTENT NAMING AT BLOCK= blk RECORD= rec IN MODELS FILE**

**Explanation:** The CTBDBVIG Control-M/Analyzer utility detected an error while checking the rec record. The utility continues executing.

**Corrective Action:** Notify your INCONTROL administrator.

**DIV969S BAD RBA ENCOUNTERED WHILE SCANNING VARIABLES AT BLOCK= blk RECORD= rec**

**Explanation:** The CTBDBVIG Control-M/Analyzer utility detected an error while checking the rec record in the modules file. The utility continues executing.

**Corrective Action:** Notify your INCONTROL administrator.

**DIV96AS MULTIPLE REFERENCES TO BASE AT BLOCK= blk RECORD= rec**

**Explanation:** The CTBDBVIG Control-M/Analyzer utility detected an error while checking the rec record. The utility continues executing.

**Corrective Action:** Notify your INCONTROL administrator.

**DIV96BS MULTIPLE REFERENCES TO VARIABLE AT BLOCK= blk RECORD= rec**

**Explanation:** The CTBDBVIG Control-M/Analyzer utility detected an error while checking the rec record. The utility continues executing.

**Corrective Action:** Notify your INCONTROL administrator.

**DIV96CS UNREFERENCED VARIABLE AT BLOCK= blk RECORD= rec**

**Explanation:** The CTBDBVIG Control-M/Analyzer utility detected an unreferenced variable while checking the rec record. The utility continues executing.

**Corrective Action:** Notify your INCONTROL administrator.

**DIV96DI CONTROL-M/ANALYZER UTILITY CTBDBVIG ENDED**

**Explanation:** This information message indicates the normal termination of the CTBDBVIG Control-M/Analyzer utility, the Control-M/Analyzer database integrity-checking utility.

**Corrective Action:** No action is required.
DIV96ES INCONSISTENT NAMING AT BLOCK= blk RECORD= rec IN VARIABLES FILE

**Explanation:** The CTBDBVIG Control-M/Analyzer utility detected an error while checking the record identified in the message.

The utility continues executing.

**Corrective Action:** Notify your INCONTROL administrator.

DIV96FI VARIABLES DATA BASE INTEGRITY HAS BEEN VALIDATED

**Explanation:** This information message indicates the database integrity validation process has been completed by the CTBDBVIG Control-M/Analyzer utility.

**Corrective Action:** No action is required.

DIV970S UNREFERENCED BASE AT BLOCK= blk RECORD= rec

**Explanation:** The CTBDBVIG Control-M/Analyzer utility detected an error while checking the record indicated in the message.

The utility continues executing.

**Corrective Action:** Notify your INCONTROL administrator.

DIV971S ERROR OPENING SYSPRINT

**Explanation:** This information message indicates that the CTBDBIV Control-M/Analyzer utility failed to open the print file referenced by the SYSPRINT DD statement.

Possible causes are:
- The SYSPRINT DD statement is missing.
- The data set referenced by the SYSPRINT DD statement cannot be accessed for sequential write.

The utility stops executing with a condition code of 08.

**Corrective Action:** Correct the JCL and rerun the job.

DIX messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages DIXG00 through DIXGxx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.
DI XGA0I DELETE OF UNNEEDED INDEX FILES STARTED

Explanation: This information message identified that the CTVDELI utility began execution. This utility scans the Migrated User Report List file and erases index files and index records that are no longer needed.

Corrective Action: No action is required.

DI XGA1I DELETE OF UNNEEDED INDEX FILES ENDED OK

Explanation: This information message indicates that the CTVDELI utility finished executing without errors. This utility scans the Migrated User Report List file and erases index files and index records which are no longer needed.

Corrective Action: No action is required.

DI XGA2S DELETE OF UNNEEDED INDEX FILES ENDED WITH ERRORS

Explanation: The CTVDELI utility ended with errors. This utility scans the Migrated User Report List file and erases index files and index records that are no longer needed. The problem is described in one or more preceding messages.

The CTVDELI utility terminates with a return code of 08.

Corrective Action: Check preceding error messages, correct the problem, and rerun the job.

DI XGA3I DATASET dsn WILL BE DELETED

Explanation: This information message indicates that the CTVDELI utility will delete the dsn index file. The CTVDELI utility scans the Migrated User Report List file and erases index files that are no longer needed.

Corrective Action: No action is required.

DI XGA4E INVALID PARAMETER: - parm

Explanation: The parm parameter is not valid for the CTVDELI utility. This message is issued by the CTVDELI Control-V utility, which scans the Migrated User Report List file, and erases index files that are no longer needed.

The CTVDELI utility terminates with a condition code of 08.

Corrective Action: Correct the parameter syntax and resubmit the job. For more information, refer to the CTVDELI utility in the INCONTROL for z/OS Utilities Guide.

DI XGA5E MISSING PARAMETER AFTER: - parm

Explanation: A subparameter of the parm parameter is missing. This message is issued by the CTVDELI Control-V utility, which scans the Migrated User Report List file, and erases index files that are no longer needed.

The CTVDELI utility terminates with a condition code of 08.

Corrective Action: Correct the parameter syntax, and resubmit the job. For more information, refer to the CTVDELI utility in the INCONTROL for z/OS Utilities Guide.
DIXGA6E REDUNDANT PARAMETER: - parm

**Explanation:** The parm parameter is specified more than once in the CTVDELI utility. This message is issued by the CTVDELI Control-V utility, which scans the Migrated User Report List file, and erases index files that are no longer needed.

The CTVDELI utility terminates with a condition code of 08.

**Corrective Action:** Remove the redundant parameter, and resubmit the job. For more information, see the CTVDELI utility in the *INCONTROL for z/OS Utilities Guide*.

DIXGA7E OPEN OF MIGRATED USER REPORTS LIST FILE FAILED. DDNAME "DAVMIG"

**Explanation:** Open of the Control-V Migrated User Report List file failed. This file is referenced by the DAMIG DD statement. This message is issued by the CTVDELI utility, which scans the Migrated User Report List file and erases index files that are no longer needed.

Possible causes are:

- The DAMIG DD statement is missing.
- The data set referenced by the DAMIG DD statement is not a Control-V Migrated User Report List file.
- The Migrated User Report List file referenced by the DAMIG DD statement belongs to another monitor, or was produced by a different version of Control-V.

The CTVDELI utility terminates with a condition code of 08.

**Corrective Action:** Correct the JCL for the CTVDELI utility, and rerun the job. For more information, refer to the CTVDELI utility in the *INCONTROL for z/OS Utilities Guide*.

DIXGA8E OPEN OF PARAMETERS FILE FAILED. DDNAME DADELIN

**Explanation:** Open of the Parameters file for the CTVDELI utility failed. Possible causes are:

- The DADELIN DD statement is missing.
- The data set referenced by the DADELIN DD statement cannot be opened for sequential read.

The CTVDELI utility terminates with a condition code of 12.

**Corrective Action:** Correct the JCL, and rerun the job. For more information, see the CTVDELI utility in the *INCONTROL for z/OS Utilities Guide*.

DIXGA9E OPEN OF SORT FILE FAILED. DDNAME ddName

**Explanation:** The SORT utility invoked by the CTVDELI utility failed to open the data set referenced by the ddName DD statement.

The CTVDELI utility stops.

**Corrective Action:** Ensure all DD statements are valid. Rerun the CTVDELI utility. For more information, see the CTVDELI utility in the *INCONTROL for z/OS Utilities Guide*. 

1469
DIXGAAE INVALID RETURN CODE FROM SORT, RC=rc

Explanation: The internal sort program ended with errors. This message is issued by the CTVDELI utility, which scans the Migrated User Report List file and erases index files that are no longer needed. The utility uses the site sort program.

The CTVDELI utility terminates with a condition code of 08.

Corrective Action: Check the explanations of the sort messages for the job in the manual for your sort facility.

DIXGABI WAITING FOR A CTDDELRP, RESTORE OR ANOTHER CTVDELI JOB TO TERMINATE

Explanation: This information message indicates that the CTVDELI utility is waiting for a CTDDELRP job, a restore job, or another CTVDELI job to terminate. The CTVDELI utility scans the Migrated User Report List file, and erases index files that are no longer needed. To ensure data integrity, CTVDELI cannot run concurrently with the CTDDELRP utility, a restore job, or another CTVDELI job.

When the contending job terminates, the CTVDELI utility resumes processing.

Corrective Action: No action is required.

DIXGACE NO INPUT PARAMETERS WERE SUPPLIED

Explanation: The CTVDELI utility did not receive input parameters by means of a SYSIN DD statement.

The CTVDELI utility scans the Migrated User Report List file, and erases index files that are no longer needed. The utility requires input parameters indicating which actions it should perform.

The CTVDELI utility terminates with a condition code of 08.

Corrective Action: Verify that input parameters are specified by means of a SYSIN DD statement. Rerun the CTVDELI utility.

DIXGADI *** PARM=TEST SPECIFIED - SIMULATION MODE ***

Explanation: This information message indicates that the CTVDELI utility is running in SIMULATION mode. In SIMULATION mode, the CTVDELI utility produces a report that indicates which indexes would have been deleted if the utility were running in PRODUCTION mode.

Corrective Action: Examine CTVDELI output to determine if the proper indexes would have been deleted from disk. Make any changes required to prevent the incorrect deletion of indexes that are needed for any reason. Rerun the utility in PRODUCTION mode to actually delete unneeded indexes from disk.

DIXGAEE LOCATE ERROR FOR INDEX dsn

Explanation: The CTVDELI utility encountered index dsn, which could not be located, possibly because the data set is not cataloged. The CTVDELI utility scans the Migrated User Report List file and erases unneeded index files.

The index whose data set name is dsn is not deleted.

Corrective Action: Determine why the data set could not be located. Correct the problem. Rerun the CTVDELI utility if necessary.
DI XGAFE ERROR DELETING INDEX dsn - FILE SKIPPED

**Explanation:** The CTVDELI utility encountered index dsn, which could not be deleted. This message is issued by the CTVDELI utility, which scans the Migrated User Report List file, and erases index files that are no longer needed. Possible reasons:

- The data set was not found on the device indicated in the catalog.
- The device on which the data set exists is not online.
- Another reason.

The index whose data set name is dsn is not deleted.

**Corrective Action:** Determine why the data set could not be deleted. Correct the problem. Rerun the job if necessary.

DI XGAGE ERROR UNCATALOGING INDEX dsn - FILE SKIPPED

**Explanation:** The CTVDELI utility encountered the dsn index, which could not be uncataloged. This message is issued by the CTVDELI utility, which scans the Migrated User Report List file, and erases index files that are no longer needed.

The index is not uncataloged.

**Corrective Action:** Determine why the data set could not be uncataloged. Correct the problem. Rerun the job if necessary.

DLD messages

This group includes messages for the IOA (infrastructure) product.

Messages DLD900 through DLD9xx

This group includes messages for the IOA (infrastructure) product.

DLD952S ERROR OPENING SEQUENTIAL FILE

**Explanation:** The IOADLD utility detected an error while opening a sequential file from which it is to read the records.

The IOADLD utility terminates with a return code of 16.

**Corrective Action:** Check the IOA Log and the system job log for more information. Correct the error, and rerun the job. If the error persists, contact BMC Software Customer Support.

DLD953S ERROR OPENING DATABASE FILE

**Explanation:** The IOADLD utility detected an error while opening the IOA Access Method Database file.

The IOADLD utility terminates with a return code of 20.

**Corrective Action:** Check the IOA Log and the system job log for more information. Correct the error, and rerun the job. If the error persists, contact BMC Software Customer Support.
DLD955I UTILITY IOADLD STARTED

**Explanation:** This information message indicates the normal start of the IOADLD utility. The IOADLD utility creates an IOA Access Method data file from the data in a sequential file that was previously created by the IOADUL utility.

**Corrective Action:** No action is required.

DLD956I UTILITY ENDED WITH RETURN CODE `num`

**Explanation:** This information message indicates that the IOADLD utility terminated.

The IOADLD utility terminates with a return code of `num`.

**Corrective Action:** If the IOADLD utility ended with a non-zero return code, check for other error messages to determine the problem.

DLD957S ERROR IN IOAPARM LOADING

**Explanation:** The IOADLD utility detected an error while loading the IOAPARM member.

The IOADLD utility terminates with a return code of 4.

**Corrective Action:** Check the IOA Log and the system job log for more information. Correct the error, and rerun the job. If the error persists, contact BMC Software Customer Support.

DLD958S ERROR IN WRITE INTO THE DATABASE FILE

**Explanation:** The IOADLD utility detected an error while adding records to the IOA Database Access Method. A likely reason is that there is not enough space for the IOA Database Access Method.

The IOADLD utility terminates with a return code of 4.

**Corrective Action:** Do the following:
1. Check the system job log for more information.
2. Use the IOADBF utility to allocate a new file with bigger SPACE parameter values.
3. Re-run the job.
4. If the error persists, contact your INCONTROL administrator.

DLD960S ERROR WHILE CLOSING THE DATABASE FILE

**Explanation:** The IOADLD utility detected an error while closing the IOA Access Method file.

The IOADLD utility terminates with a return code of 30.

**Corrective Action:** Check the IOA Log and the system job log for more information. Correct the error, and rerun the job. If the error persists, contact BMC Software Customer Support.

DLD970I RENUM INDICATOR IS R

**Explanation:** This information message indicates that the RENUM parameter was specified when running the IOADLD load utility.

**Corrective Action:** No action is required.
DLD971S OFFSET IS NOT NUMERIC

**Explanation:** A nonnumeric offset value was specified for the RENUM parameter. Three values are specified for the RENUM parameter. The second value, the offset, must be numeric.

The IOADLD utility terminates.

**Corrective Action:** Correct the parameter values, and resubmit the job. For more information, see the IOADLD utility in the *INCONTROL for z/OS Utilities Guide*.

---

DLD972S LENGTH IS NOT NUMERIC

**Explanation:** A nonnumeric length was specified for the RENUM parameter. Three values are specified for the RENUM parameter. The third, length, must be numeric.

The IOADLD utility terminates.

**Corrective Action:** Correct the parameter values, and resubmit the job. For more information, see the IOADLD utility in the *INCONTROL for z/OS Utilities Guide*.

---

DLD973S INPUT FILE IS NOT SORTED CORRECTLY

**Explanation:** When loading the input file to the Control-O Variables file, the RENUM parameter was specified for the IOADLD load utility. However, the input file had not been sorted. This message occurs when loading the input file to the Control-O Variables file.

If the RENUM parameter is specified for the IOADLD utility, the records of the input file are sorted, renumbered, and then sorted in the positions specified by the offset and length values. However, after the renumbering process, the IOADLD utility found that the records were not sorted properly.

The IOADLD utility terminates.

**Corrective Action:** Correct the parameter values, and resubmit the job. For more information, see the IOADLD utility in the *INCONTROL for z/OS Utilities Guide*.

---

**DMI messages**

This group includes messages for the Control-O product.

**Messages DMI 600 through DMI 6xx**

This group includes messages for the Control-O product.

---

**DMI 670E ACB CONTROL BLOCK IS NOT VALID**

**Explanation:** The alternate subsystem encountered an ACB control block that does not have a valid identifier.

The Control-O subsystem terminates the connection between the alternate subsystem and the Control-O subsystem.

**Corrective Action:** Contact BMC Software Customer Support.
DMI 671E SSI ROUTINE SUBSYSTEM IS INACTIVE

**Explanation:** The CTODMI alternate subsystem module failed to invoke the Control-O subsystem. Because the Control-O subsystem is not active, there is no connection between the alternate subsystem and the Control-O subsystem. Communication between the alternate subsystem and the Control-O subsystem fails.

**Corrective Action:** Reactivate Control-O in order to reestablish communication.

DMI 672E SSI ROUTINE DETECTED AN ERROR

**Explanation:** Control-O encountered an internal error (a return code of 16) while attempting to process the SSI request to transmit information from the alternate subsystem to the Control-O subsystem. The information is not transmitted.

**Corrective Action:** Contact BMC Software Customer Support.

DMI 673E SSI ROUTINE RETURNED AN UNDEFINED RETURN CODE

**Explanation:** Control-O encountered an internal error (a return code of 20) while processing an SSI request. The alternate subsystem was trying to transmit data to the Control-O subsystem. The data is not transmitted.

**Corrective Action:** Contact BMC Software Customer Support.

DMI 674E CTO SSCT POINTER NOT SET - SSI ROUTINE INVOCATION BYPASSED

**Explanation:** The pointer to the Control-O subsystem SSCT was not set. The initialization process normally sets the pointer to the Control-O subsystem SSCT. Communication between the Control-O subsystem and the alternate subsystem terminates.

**Corrective Action:** Contact BMC Software Customer Support.

DSH messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages DSH900 through DSH9xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**DSH947I TAPE num - EXPIRED**

**Explanation:** This is an information message of the CTVCLMIG utility, which indicates that all datasets residing on the specified tape volume are expired. All entries referred to this volume are deleted from the Migrated User File.
Corrective Action: Return the expired tape to the Global Tape Pool.

DSH948E INSUFFICIENT MEMORY TO COMPLETE PROCESSING OF THE FILE. RUN THE UTILITY AGAIN
Corrective Action: Increase the REGION size. Increase the memory allocation for $SYSDATA records that can be set as the DATA parameter in optional Wish WD2403. Run the CTVCLMIG utility again.

Messages DSHD00 through DSHDxx
This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

DSHD73E INVALID RETURN CODE FROM SORT, RC=rc
Explanation: A failure was detected in the SORT utility phase of the CTVCLMIG utility. The main program of the CTVCLMIG utility received a return code higher than zero from the SORT utility phase. The program terminates with a return code of 08.
Corrective Action: Additional information is in the Job log and the SORT messages. Correct all reported problems, and rerun the CTVCLMIG utility.

DSHD74E OPEN OF SORT FILE FAILED. DDNAME dsn
Explanation: An OPEN failure for the dsn DD name was detected for the CTVCLMIG utility. The main program of the CTVCLMIG utility could not open the dsn DD statement. The specified DD statement is probably missing in the JCL for the CTVCLMIG utility. The program terminates with a return code of 08.
Corrective Action: Add the missing DD statement and rerun the CTVCLMIG utility.

DSHD75I WAITING FOR CTVCLMIG JOB TO TERMINATE dsn
Explanation: This information message indicates that the CTVCLMIG Control-D utility is waiting for another CTVCLMIG job to terminate. The CTVCLMIG utility clears unnecessary entries from the Migrated User Report List file. To maintain data integrity, the CTVCLMIG utility cannot run concurrently with another CTVCLMIG job. When the contending job terminates, CTVCLMIG resumes processing.
Corrective Action: No action is required.

DSHD76E INVALID PARAMETER, VALID PARAMETER: MODE=TEST OR MODE=PROD
Explanation: An invalid MODE parameter was specified when running for the CTVCLMIG utility. The CTVCLMIG utility terminates with a return code of 12.
Corrective Action: Correct the MODE parameter to either TEST or PROD, and rerun the CTVCLMIG utility.

DSHD77I *** PARM=TEST SPECIFIED - SIMULATION MODE ***

Explanation: This information message indicates that the CTVCLMIG utility ran in simulation mode. In this mode, messages are generated that indicate what actions would normally be performed. These actions are not performed, nor are any files changed.

Corrective Action: Before rerunning the CTVCLMIG utility in production mode, check its sysout.

DSHD78I NUMBER OF DELETED USER RECORDS = num

Explanation: This information message indicates how many user records were deleted by the CTVCLMIG utility.

Corrective Action: No action is required.

DSHD79I NUMBER OF DELETED SYSDATA RECORDS = num

Explanation: This information message indicates how many SYSDATA records were deleted by the CTVCLMIG utility.

Corrective Action: No action is required.

DSHD7AI NUMBER OF DELETED NOTEPAD RECORDS = num

Explanation: This information message indicates how many notepad records were deleted by the CTVCLMIG utility.

Corrective Action: No action is required.

DSHD7BI NUMBER OF DELETED $INDEX RECORDS = num

Explanation: This information message indicates how many index records were deleted by the CTVCLMIG utility.

Corrective Action: No action is required.

DSHD7CI RECORD WITH INCORRECT TYPE type FOR userName jobName IS DELETED

Explanation: This information message indicates that the CTVCLMIG utility found a record with an invalid type for the Migrated Report List file. Records of type type cannot appear in the Migrated Report list. The problematic record might have been created by a previous version of Control-D.

The variables in this message are:

- **userName** - the value in the USERNAME field of the problematic record
- **jobName** - the value in the JOBNAME field of the problematic record

The problematic record is deleted by the CTVCLMIG utility.

Corrective Action: No action is required.
DSHD7DI DELETING ORPHAN INDEX RECORDS

**Explanation:** This information message is issued by the CTVCLMIG utility and indicates that the utility has entered the stage where it is deleting orphaned INDEX records.

**Corrective Action:** No action is required.

DSHD7GI DELETING USER AND ORPHAN INDEX RECORDS

**Explanation:** This information message is issued by the CTVCLMIG utility and indicates that the utility has entered the stage where it is deleting expired USER and orphaned INDEX records.

**Corrective Action:** No action is required.

Messages DSHG00 through DSHGxx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

DSHG80I CLEANING OF MIGRATED USER REPORTS LIST FILE STARTED

**Explanation:** This information message indicates that the CTVCLMIG utility, which cleans entries from the Migrated User Report List file, has started.

**Corrective Action:** No action is required.

DSHG82E LOCATE ERROR FOR "dsn", RC=rc

**Explanation:** The CTVCLMIG utility encountered a CDAM file name that could not be found in the catalog. The dsn data set may have been deleted or uncataloged.

The dsn data set is ignored.

**Corrective Action:** Check the output of the CTVCLMIG utility, and try to resolve the problem.

DSHG83I CLEANING OF MIGRATED USER REPORTS LIST FILE ENDED OK

**Explanation:** This information message indicates that the CTVCLMIG utility, which cleans entries from the Migrated User Report List file, has ended without errors.

**Corrective Action:** No action is required.

DSHG84S CLEANING OF MIGRATED USER REPORTS LIST FILE ENDED WITH ERRORS

**Explanation:** The CTVCLMIG utility, which cleans entries from the Migrated User Report List file, ended with errors. The problem is described by earlier messages.

The utility ends with a return code of 08.

**Corrective Action:** Check the earlier error messages, correct the problem, and rerun the job.
DSHG85S INVALID INPUT PARAMETER

**Explanation:** An invalid parameter was specified in the PARM field of the EXEC JCL statement activating the CTVCLMIG utility and passed to the CTVCLMIG utility. The only valid parameter values are MIG or blank.

The utility ends with a return code of 08.

**Corrective Action:** Correct the JCL and rerun the job.

DSHG86W NOLOCATE OPTION IS NOT ALLOWED WHEN TAPE LIST IS REQUIRED

**Explanation:** The NOLOCATE parameter was specified for the CTVCLMIG utility while the utility was being used to produce a list of expired tapes. To produce a list of expired tapes, CTVCLMIG must issue a LOCATE option for migrated files.

LOCATE is issued for the migrated files.

**Corrective Action:** Refer to the INCONTROL for z/OS Utilities Guide to determine what parameters are required for CTVCLMIG to produce a list of current tapes. Adjust the utility parameters as necessary and rerun CTVCLMIG.

DSHG88I READING SYSDATA RECORDS

**Explanation:** This information message indicates that the CTVCLMIG utility started reading SYSDATA records. To calculate the time used for this stage of the utility, compare the time stamp of this message with the time stamp of the next DSHG8AI message.

**Corrective Action:** No action is required.

DSHG89I num SYSDATA RECORDS READ

**Explanation:** This information message indicates the number of records in the SYSDATA file.

**Corrective Action:** No action is required.

DSHG8AI DELETING USER RECORDS

**Explanation:** This information message indicates that the CTVCLMIG utility started deleting user records. To calculate the time used for this stage of the utility, compare the time stamp of this message with the time stamp of message the next DSHG8BI message.

**Corrective Action:** No action is required.

DSHG8BI DELETING SYSDATA RECORDS

**Explanation:** This information message indicates that the CTVCLMIG utility started deleting SYSDATA records. To calculate the time used for this stage of the utility, compare the time stamp of this message with the time stamp of the next DSHG8CI message.

**Corrective Action:** No action is required.
DSHG8CI  num USER RECORDS READ

**Explanation:** This information message indicates the total number of records that have been read.

**Corrective Action:** No action is required.

DSHG8DE SYSDATA RECORD NOT FOUND FOR USER RECORD userName
jobName

**Explanation:** During a run of the CTVCLMIG utility, Control-V found a USER record with no matching SYSDATA record. Unless requested by means of the NOSYS parameter, the utility scans all user records in the Migrated User Report file, and checks if each has a matching SYSDATA record. If a SYSDATA record is not found, this message is issued and the user record is deleted.

The variables in this message are:
- **userName** - User name for the report entry.
- **jobName** - Job name for the report entry.
- **recordOdate** - ODATE for the report entry.
- **recordKey** - Full key for the report entry.

The user record is deleted. IOA should not be able to delete SYSDATA records from the User screen.

**Corrective Action:** Investigate the cause of this error. This error may indicate a problem with the SORT utility used by the CTVCLMIG utility.

DSHG8EE SYSDATA RECORD NOT FOUND FOR INDEX RECORD jobName

**Explanation:** During a run of the CTVCLMIG utility, Control-V found an index record with no matching SYSDATA record. The CTVCLMIG utility scans all index records in the Migrated User Report List file and checks if they have a matching SYSDATA record.

The variables in this message are:
- **jobName** - the job name for the index record
- **odate** - the ODATE for the index record
- **key** - the index key for the index record

The index record and the index file are deleted. IOA should not be able to delete SYSDATA records from the User Report List screen.

**Corrective Action:** Investigate the cause of this error. If the cause is not found, contact BMC Software Customer Support.

DSHG8FE USER RECORD IS NOT FOUND FOR SYSDATA RECORD jobName

**Explanation:** The Migrated User Report file contains an “orphan” SYSDATA record, meaning a record that is not referred to by any USER record.
This message might also be issued when the CTVCLMIG utility is called with the NOSYS parameter set to S.

The variables in this message are:
- `jobName` - the name of the job to which the orphan SYSDATA record belongs
- `jobId` - the MVS identifier of the job to which the orphan SYSDATA record belongs
- `odate` - the originating date of the report to which the orphan SYSDATA record belongs
- `counter` - the counter part of the orphan SYSDATA record key

The orphan SYSDATA record is removed from the Migrated User Report file.

**Corrective Action:** No action is required.

**DSHG8GE**  
**CONTROL-M/TAPE API START ERROR**  
**RC= rc REASON= rsn**  
**URC= urc**

**Explanation:** An error occurs when the CTVCLMIG utility tries to start the Control-M/TAPE interface CTTAPI.

The variables in this message are:
- `rc` - return code from CTTAPI
- `rsn` - reason code from CTTAPI
- `urc` - user reason code from CTTAPI

The CTVCLMIG utility ends with a return code of 08.

**Corrective Action:** Perform the following steps:
1. Examine the return and reason code to identify the problem. Refer to message CTT203I for an explanation of these codes.
2. Correct the problem.
3. Rerun the utility.

**DSHG8HE**  
**CTT SCRATCH ERROR**  
**dsname VOL= volser LAB= label RC= rc**  
**REASON= rsn URC= urc**

**Explanation:** An error occurs when the CTVCLMIG utility calls CTTAPI to scratch data set `dsname` stored on volume `volser` with seq.number `label`.

The variables in this message are:
dsname - the data set name
volser - the volume name
label - the sequence number of the volume
rc - return code from CTTAPI
rsn - reason code from CTTAPI
urc - user reason code from CTTAPI

The CTVCLMIG utility continues to work.

**Corrective Action:** Perform the following steps:

1. Examine the return and reason code to identify the problem. Refer to message CTT203I for an explanation of these codes.
2. Contact your INCONTROL administrator.

DSHG8IE CTT SCRATCH ERROR VOLSER= volser RC= rc REASON= rsn URC= urc

**Explanation:** An error occurs when the CTVCLMIG utility calls CTTAPI to scratch volume volser.

The variables in this message are:

- volser - the volume name
- rc - return code from CTTAPI
- rsn - reason code from CTTAPI
- urc - user reason code from CTTAPI

The CTVCLMIG utility continues to work.

**Corrective Action:** Perform the following steps:

1. Examine the return and reason code to identify the problem. Refer to message CTT203I for an explanation of these codes.
2. Contact your INCONTROL administrator.

DSHG8KE PARAMETER CTT IS SPECIFIED WHEN CONTROL-M/TAPE IS NOT ACTIVE

**Explanation:** The user specified the CTT parameter to the CTVCLMIG utility to notify Control-M/Tape of deleted Control-V data sets or released volumes, but Control-M Tape is not active in the system.

The CTVCLMIG utility ends with a return code of 08.

**Corrective Action:** Start the CTTINIT procedure to activate Control-M/TAPE. Then rerun the CTVCLMIG utility.
DSHG8ME PARAMETER CTT IS SPECIFIED WHEN PARAMETER CTVINTR IN CTTPARM IS NONE

Explanation: The user specified the CTT parameter to the CTVCLMIG utility to notify Control-M/Tape of deleted Control-V datasets or released volumes, but parameter CTVINTR in the CTTPARM member is set to NONE.

The CTVCLMIG utility ends with a return code of 08.

Corrective Action: Check the CTTPARM member. Refer Control-M/Tape experts to set the needed value of the parameter CTVINTR. Then rerun the CTVCLMIG utility.

DSHG8NE INVALID EXPDATE PARAMETER

Explanation: An invalid date is specified in the EXPDATE parameter or this parameter is specified in the PROD mode, although it should be specified in the TEST mode only.

The CTVCLMIG utility ends with a return code of 12.

Corrective Action: Correct the EXPDATE parameter and rerun the utility.

DSHG8PW FILE dsName MOVED FROM vsavol TO catvol OUTSIDE OF CONTROL-V

Explanation: The CTVCLMIG utility detected an expired migrated file, which was moved from the tape volume to which it was migrated to another volume outside of Control-V. This warning message is issued when the utility runs in the modes LOC=NOLOCATE and TAPELIST=YES.

The variables in this message are:

- dsName - Migrated dataset name.
- vsavol - Volume serial number to which the file was migrated.
- catvol - Volume serial number where the file currently resides.

Corrective Action: This message warns the user that the list of expired tapes issued by the utility can be incorrect. The user should try to find out if the vsavol tape volume has been completely moved to catvol, or only some files have been moved to catvol. In the first case, the list of expired tapes issued by the utility is correct and the message can be ignored. In the second case, the message means that the list of expired tapes issued by the utility can be incorrect and should not be used. If the migrated files are moved from one tape volume to another outside of Control-V, CTVCLMIG can issue a correct list of expired tapes in LOC=LOCATE mode only.

DSM messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.
Messages DSMC00 through DSMCxx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

DSMC01I UPDATING OF ACTIVE USER REPORTS FILE STARTED

**Explanation:** This information message indicates that the CTDDSM program started. The CTDDSM program is the second step of the CTDDELRP utility. It updates and deletes records from the Active User Report file according to information in the work file built by the first step of the CTDDELRP utility.

**Corrective Action:** No action is required.

DSMC02I UPDATING OF ACTIVE USER REPORTS FILE ENDED OK

**Explanation:** This information message indicates that the CTDDSM program ended without errors. The CTDDSM program is the second step of the CTDDELRP utility. It updates and deletes records from the Active User Report file, according to information in the work file built by the first step of the CTDDELRP utility.

**Corrective Action:** No action is required.

DSMC03S UPDATING OF ACTIVE USER REPORTS FILE ENDED WITH ERRORS

**Explanation:** An unrecoverable processing error was encountered by the CTDDSM program. The CTDDSM program, which is the second step of the CTDDELRP utility, updates and deletes records from the Active User Report file, according to information in the work file built by the first step of the CTDDELRP utility.

The CTDDSM program terminates with a condition code of 8.

**Corrective Action:** Check previously issued IOA Log file and system log messages to determine the cause of the error. Correct the problem and rerun the job.

DSMC05E OPEN OF INPUT FILE FAILED. DDNAME ‘DADSOIN’

**Explanation:** The CTDDSM program failed to open the work file referenced by the DADSOIN DD statement.

The CTDDSM program is the second step of the CTDDELRP utility. It updates and deletes records from the Active User Report file, according to information in the work file built by the first step of the CTDDELRP utility.

The CTDDSM program terminates with a condition code of 08.

**Corrective Action:** Check previously issued IOA Log file and system log messages to determine the cause of the error. Correct the problem and rerun the job.

DSMC06E OPEN OF REPORT LIST FAILED. DDNAME "DAREPLA"

**Explanation:** The CTDDELRP utility was called with the REPLIST parameter set to YES, but one of the following occurred:
It failed to open the data set specified in the DAREPLA DD statement.

The JCL of the utility contains no DAREPLA DD statement.

The utility terminates with a return code of 8.

**Corrective Action:** Correct the JCL and recall the utility.

---

### DSMC07E INVALID PARAMETER: - parmValue

**Explanation:** The CTDDELRP utility has been called with the REPLIST parameter set to a value that is invalid.

Valid values for the REPLIST parameter are:

- YES
- NO

In this message, `parmValue` is the incorrect value that was entered for the REPLIST parameter.

The utility terminates with a return code of 8.

**Corrective Action:** Call your INCONTROL administrator.

---

### DSO messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

### Messages DSO900 through DSO9xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

#### DSO930I DELETE OF UNNEEDED REPORTS STARTED

**Explanation:** This information message is the normal start message of the CTDDELRP utility. CTDDELRP is used to clean unnecessary entries from the Active User Report List file, and to erase the compressed sysout data sets that belong to them from the disk.

**Corrective Action:** No action is required.

#### DSO931I DELETE OF UNNEEDED REPORTS ENDED OK

**Explanation:** This information message is the normal end message of the CTDDELRP utility. CTDDELRP is used to clean unnecessary entries from the Active User Report List file, and to erase the compressed sysout data sets that belong to them from the disk.

**Corrective Action:** No action is required.

#### DSO933S DELETE OF UNNEEDED REPORTS ENDED WITH ERRORS

**Explanation:** The CTDDELRP utility ended with errors. Earlier messages describe the problem.
The CTDDELRP utility ends with a return code of 08.

**Corrective Action:** Check the earlier messages, correct the problem, and rerun the job.

**DSO934E INSUFFICIENT STORAGE. ATTEMPT TO RERUN**

**Explanation:** Insufficient storage to run the CTDDELRP utility.

**Corrective Action:** Increase the REGION size of the utility and rerun.

**DSO935I DATASET dsn WILL BE DELETED**

**Explanation:** This information message is from the CTDDELRP utility, which cleans unnecessary entries from the Active User Report List file and deletes CDAM data sets. It is issued when the compressed data set is added to list of data sets to be scratched. The data set is deleted in the next step of the job.

**Corrective Action:** No action is required.

**DSO936I JOB jobName JOBID jobId IS WAITING FOR BACKUP BY missionName missionName missionName missionName missionName**

**Explanation:** This information message from the CTDDELRP utility, which cleans unnecessary entries from the Active User Report List file, indicates that the jobName job is ready for backup by any of the Backup Missions listed. The sysout compressed data sets for the jobName job are not deleted until one of the Backup Missions listed runs successfully.

**Corrective Action:** No action is required.

**DSO937E INVALID PARAMETER: - parm**

**Explanation:** Invalid parameter for the CTDDELRP Control-D utility. This error message is issued by the CTDDELRP Control-D utility, which cleans unnecessary entries from the Active User Report List file. For more details, refer to the CTDDELRP utility in the INCONTROL for z/OS Utilities Guide.

The CTDDELRP Control-D utility terminates with a condition code of 08. The Active User Report List file is not cleaned.

**Corrective Action:** Correct the parameter syntax in the CTDDELRP utility.

**DSO938E MISSING PARAMETER AFTER: - parm**

**Explanation:** The subparameter after parm is missing. This error message is issued by the CTDDELRP Control-D utility, which cleans unnecessary entries from the Active User Report List file. For details, refer to the CTDDELRP utility in the INCONTROL for z/OS Utilities Guide.

The CTDDELRP Control-D utility terminates with a condition code of 08. The Active User Report List file is not cleaned.

**Corrective Action:** Correct the parameter syntax in the CTDDELRP utility.
DSO939E REDUNDANT PARAMETER: - parm

Explanation: There is a redundant parameter for the CTDDELRP Control-D utility. The CTDDELRP Control-D utility, which cleans unnecessary entries from the Active User Report List file, issues this message. For details, refer to the CTDDELRP utility in INCONTROL for z/OS Utilities Guide.

The CTDDELRP Control-D utility terminates with a condition code of 08. The Active User Report List file is not cleaned.

Corrective Action: Correct the parameter syntax in the CTDDELRP utility.

DSO93CI PRIMARY RECORD IS MISSING FOR USER recipient JOB jobname JOBID JobID

Explanation: The CTDDELRP utility cannot find the primary USER record (the first record in a chain of metadata records describing a report) in the Active User Reports file. CTDDELRP removes any metadata records related to the report from the Active User Report file.

Corrective Action: No user response is required.

DSO93DS THERE ARE REPORTS REQUESTED FOR MIGRATION. CONTROL-V SHOULD BE INSTALLED

Explanation: The CTDDELRP utility discovered that although in the Active User Reports file there are reports requested for migration, no Control-V environment is installed. CTDDELRP is terminated.

Corrective Action: Install a Control-V environment.

DSO93EI JOB jobname JOBID JobID IS HELD BY BACKUP MISSION mission OR mission OR ... ODATE= orgdate TIMESTAMP= timestamp

Explanation: The CTDDELRP utility did not delete the jobname report from the Active User Report file, because the report is held by the pending or running backup mission.

Corrective Action: You can use the BKPRESET utility to reset the status of pending backup missions and their reports.

DSO93FI JOB jobname JOBID JobID IS HELD BY MIGRATION migration MISSION mission TIMESTAMP=timestamp

Explanation: The CTDDELRP utility did not delete the jobname report from the Active User Report file, because the report is held by the pending or running migration mission.

Corrective Action: You can use the MIGRESET utility to reset the status of pending migration missions and their reports.

DSO942E OPEN OF PARAMETERS FILE FAILED. DDNAME "DADELIN"

Explanation: Open of parameters file for the CTDDELRP utility failed. Possible causes are:
- The **DADELIN DD statement is missing.**
- The data set described by the **DADELIN DD statement** cannot be opened for sequential read.

The utility stops executing with condition code 12.

**Corrective Action:** Correct the JCL of the job, and rerun it.

**DSO943I** JOB jobName JOBID jobID USER usr IS WAITING FOR PRINT BY missionName missionName missionName missionName

**Explanation:** This information message indicates that the jobName job is ready for printing by any of the Printing Missions listed. The sysout compressed data sets for the jobName job is not deleted until one of the Printing Missions listed runs successfully, that is, until the report is printed.

The information about the requested report is provided in message CTDI0CI, which follows this message.

**Corrective Action:** No action is required.

**DSO945I** JOB jobName ODATE odate USER user IS REJECTED BY approvalName

**Explanation:** This information message indicates that the report with the specified jobName, odate, user has not been deleted by the utility because it has been rejected by the approvalName. The report name is provided in the CTDI0CI message which follows this message. CTDDELRP does not delete such reports, if the special parameter REJECTED is not specified for this utility.

**Corrective Action:** No action is required.

**Messages DSOA00 through DSOAxx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**DSOA30E** OPEN OF SORT FILE FAILED. DDNAME ddName

**Explanation:** The SORT utility invoked by the CTDDELRP utility failed to open ddName DD name.

The CTDDELRP utility stops.

**Corrective Action:** Ensure all DD statements are valid. Restart the CTDDELRP utility.

**DSOA31E** INVALID RETURN CODE FROM SORT, RC= rc

**Explanation:** Internal sort program ended with errors. This message is from the CTDDELRP utility, which cleans unnecessary entries from the Active User Report List file. The utility uses the site sort program internally.

The utility terminates with a condition code of 08.

**Corrective Action:** Refer to the sort messages for the job and to the user manual for the sort facility used at your site.
DSOA32I SYSADATA RECORD IS MISSING FOR USER userid JOB jobName JOBID jobID reportName

Explanation: This information message indicates that the CTDDELRP utility cannot find a SYSDATA record indicated by a user record in the Active User Report List file.

CTDDELRP cleans unnecessary entries from the Active User Report List file. The SYSDATA record was probably manually deleted from the Active User Reports List.

The user record is deleted to maintain database integrity; processing continues.

Corrective Action: No action is required.

DSOA33I SYSADATA RECORD WITHOUT USERS: JOB jobName JOBID jobID

Explanation: This information message indicates that no user report entry points to this SYSDATA record in the Active User Report List file. The CTDDELRP utility, which is used to clean unnecessary entries from the Active User Report List file and to delete CDAM data sets, issues this message. The user records were probably deleted from the Active User Report List. The report does not belong to any user.

If the NOREPORT parameter was specified, the SYSDATA record and CDAM data set are deleted to maintain database consistency, and processing continues.

Corrective Action: No action is required.

DSOA34E OPEN OF SCRATCH LIST FAILED. DDNAME "DASCRLST"

Explanation: The CTDDELRP Control-D utility, which cleans unnecessary entries from the Active User Report List file, failed to open the scratch list file using a DASCRLST DD statement.

Possible causes are:
- The DASCRLST DD statement is missing.
- The data set described by the DASCRLST DD statement cannot be opened for a sequential write.

The utility terminates with a condition code of 08.

Corrective Action: Correct the JCL and rerun the job.

DSOA35I WAITING FOR ANOTHER CTDDELRP OR RESTORE JOB TO TERMINATE

Explanation: This information message indicates that the CTDDELRP utility is waiting for another CTDDELRP job or a restore job to terminate. CTDDELRP is cleans unnecessary entries from the Active User Report List file. To maintain data integrity, CTDDELRP cannot run concurrently with another CTDDELRP or a restore job.

When the contending job terminates, CTDDELRP resumes processing.

Corrective Action: No action is required.

DSOA36E OPEN OF "DAWORK" DD CARD FAILED

Explanation: Open of the Active Transition file failed. This file is referenced by the DAWORK DD statement. The DAWORK DD statement is probably missing.
This error message is issued by the CTDDSO program, which is the first step of the CTDDELRP utility. CTDDSO terminates with a condition code of 08.

**Corrective Action:** Check for previous messages indicating the reason for the open failure. Correct the problem, and rerun the CTDDELRP utility.

DSOA37I JOB jobName JOBID jobID IS WAITING FOR MIGRATION BY missionName

**Explanation:** This information message is produced by the CTDDELRP utility. It indicates the jobName job is ready for migration by the missionName Migration Mission. The sysout compressed data sets for the jobName job is not deleted until the Migration Mission runs successfully.

**Corrective Action:** No action is required.

DSOA38I SYSDATA RECORD IS MISSING FOR INDEX index. JOB jobName JOBID jobID WILL BE DELETED

**Explanation:** This information message indicates that the CTDDELRP utility, which cleans unnecessary entries from the Active User Report List file, cannot find a SYSDATA record that corresponds to an index record in the Active User Report List file. The SYSDATA record was probably manually deleted from the Active User Reports List file.

The index record and index file are deleted to maintain database integrity. Processing continues.

**Corrective Action:** No action is required.

DSOA39E NO INPUT PARAMETERS WERE SUPPLIED

**Explanation:** The CTDDELRP Control-D utility, which is used to clean unnecessary entries from the Active User Report List file, did not receive input parameters from a DADELIN DD statement. The CTDDELRP Control-D utility should be supplied with input parameters indicating actions for the utility to perform.

The CTDDSO program terminates with a condition code of 08.

**Corrective Action:** Verify that input parameters are specified by means of a DADELIN DD statement, and rerun the job.

DSOA3AE OPEN OF "DAXREP" FAILED

**Explanation:** The CTDDELRP utility, which cleans unnecessary records from the Active User Report List file, failed to open the Print Control Record Scratch file referenced by the DAXREP DD statement. The DAXREP DD statement is probably missing.

This error message is issued by the CTDDSO program, which is the first step of the CTDDELRP utility. The CTDDSO program terminates with a condition code of 08.

**Corrective Action:** Correct the error, and rerun the CTDDELRP utility.

DSOA3BE I/O ERROR WRITING TO XREP DELETE FILE. DDNAME "DAXREP"

**Explanation:** An I/O error occurred while writing the file referenced by the DAXREP DD statement.
This message is issued by the CTDDSO program, which is the first step of the CTDDELRP utility.
The CTDDELRP utility terminates.

**Corrective Action:** Run the CTDBLXRP utility to rebuild the Print Control Record. Rerun the CTDDELRP utility.

**DSOA3CE INSUFFICIENT SPACE ALLOCATED TO XREP DELETE FILE. DDNAME "DAXREP"**

**Explanation:** The file referenced by the DAXREP DD statement has insufficient space allocated. This message is issued by the CTDDSO program, which is the first step of the CTDDELRP utility.

The CTDDELRP utility continues processing.

**Corrective Action:** To prevent this problem in the future, allocate more space to the file referenced by the DAXREP DD statement. Run the CTDBLXRP utility to rebuild the Print Control Record.

**DSOA3DE "FE" PRINT SUPPORT ERROR. RETURN CODE rc**

**Explanation:** An error was encountered while trying to delete a Print Control Record. This message is issued by the CTDDSO program, which is the first step of the CTDDELRP utility.

Possible values of rc are:
- 016 - Invalid Function.
- 024 - Open Error.
- 028 - Error in Sort.

The CTDDELRP utility continues processing.

**Corrective Action:** Run the CTDBLXRP utility to rebuild the Print Control Record.

**DSOA3EI *** PARM=TEST SPECIFIED - SIMULATION MODE *****

**Explanation:** This information message indicates that the CTDDELRP utility is running in SIMULATION mode. In SIMULATION mode, the CTDDELRP utility produces a report that indicates which entries would have been deleted and which data sets would have been erased if the utility were running in PRODUCTION mode.

**Corrective Action:** Examine the output of the CTDDELRP utility to determine if the proper entries would have been deleted from the Active User Report List file and the proper CDAM data sets would have been erased. Make any changes required to prevent the deletion of needed Active User Report List entries or CDAM data sets.

Rerun the utility in PRODUCTION mode to delete unneeded entries in the Active User Report List file and to erase CDAM data sets that no longer have references in that file.

**DSOA3FI MESSAGE= integer msg**

**Explanation:** This information message is issued during the first step of the termination of the CTDDELRP utility. It provides statistics about the number of records processed by the CTDDELRP utility.
Possible values for `msg`, which explains `integer`, are shown in the following table:

<table>
<thead>
<tr>
<th>msg</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>RECORDS READ FROM ACTIVE USER FILE</td>
<td>The total number of records in the Active User file</td>
</tr>
<tr>
<td>USER RECORDS WILL BE DELETED</td>
<td>The number of user records to be deleted from the Active User file</td>
</tr>
<tr>
<td>USER RECORDS COPIED TO HISTORY FILE</td>
<td>The number of user records copied from the Active User file to the History Report List file</td>
</tr>
<tr>
<td>USER RECORDS COPIED TO MIGRATION FILE</td>
<td>The number of user records copied from the Active User file to the Migrated Report List file</td>
</tr>
<tr>
<td>SYSDATA RECORDS WILL BE DELETED</td>
<td>The number of sysdata records to be deleted from the Active User file</td>
</tr>
<tr>
<td>SYSDATA RECORDS COPIED TO HISTORY FILE</td>
<td>The number of sysdata records copied from the Active User file to the History Report List file</td>
</tr>
<tr>
<td>SYSDATA RECORDS COPIED TO MIGRATION FILE</td>
<td>The number of sysdata records copied from the Active User file to the Migrated Report List file</td>
</tr>
<tr>
<td>INDEX RECORDS WILL BE DELETED</td>
<td>The number of index records to be deleted from the Active User file</td>

<td>The number of Notepad records copied from the Active User file to the History Report file</td>
</tr>
<tr>
<td>NOTEPAD RECORDS COPIED TO MIGRATION FILE</td>
<td>The number of Notepad records copied from the Active User file to the Migrated Report List file</td>
</tr>
</tbody>
</table>

**Corrective Action:** No action is required.

**Messages DSOB00 through DSOBxx**

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

**DSOB39I** RC=16 IN READKEY FROM HST. RECORD WITH KEY= `userName jobName` counter IS ADDED

**Explanation:** This information message indicates that the CTDDELRP utility added the record with the specified key, because it did not find that record when it was performing the READKEY function.
A return code of 16 means that the specified record was not in the History User file.
The record key is composed of the user name (8 characters), the job name (8 characters), and the
counter (16 characters).
The CTDDELRP utility adds the missing record.

**Corrective Action:** No action is required.

## DSP messages

This group includes messages for the IOA (infrastructure) product.

### Messages DSP100 through DSP1xx

This group includes messages for the IOA (infrastructure) product.

**DSP1A0I** `mediaName` - **NUMBER OF DEVICES = iii NUMBER OF ACTIVE DEVICES = jjj**

**Explanation:** This information message is sent by the IOA Archive Server to the console in response to a
**DISPLAY** command to indicate the following:

- **iii** devices are assigned to media `mediaName`.
- **jjj** active devices are assigned to media `mediaName`.

This message is preceded by message **IOA1A1I** or **DSP1A1I**, which supplies the IOA Archive Server name
and media name for which the **DISPLAY** message was issued.

**Corrective Action:** No action is required.

**DSP1A1I** `server` - **MEDIA mediaName STATUS DISPLAY:**

**Explanation:** This information message is sent by the IOA Archive Server to the console in response to a
**DISPLAY** command. This message is the header for messages that provide information about the status of
media `mediaName`.

**Corrective Action:** No action is required.

**DSP1A2I** `mediaName` - **MEDIA TYPE = media_typ SYSTEM UNIT NAME = name**

**Explanation:** This information message is sent by the IOA Archive Server to the console in response to a
**DISPLAY** command. This message identifies the media type and system unit name defined in the
**IOASPRM** member in the IOA Archive Server Installation Parameters.

**Corrective Action:** No action is required.

**DSP1A3I** `mediaName` - **STATUS = status**

**Explanation:** This information message is sent by the IOA Archive Server to the console in response to a
**DISPLAY** command to provide information about the current status of media `mediaName`.
Corrective Action: No action is required.

**DSP1A4I**  *mediaName* - NUMBER OF PENDING REQUESTS = *num*

Explanation: This information message is sent by the IOA Archive Server to the console in response to a DISPLAY command to provide information about the number of pending requests for media *mediaName*.

Corrective Action: No action is required.

**DSP1A5I**  *mediaName* - DEVICE STATUS PLATTER VOLSER DSN

Explanation: This information message is sent by the IOA Archive Server to the console in response to a DISPLAY command. It is the header for I0A1A6i or DSP1A6i messages, which provide information about the status of each device assigned to media *mediaName*.

Corrective Action: No action is required.

**DSP1A6I**  *mediaName* - device status platter volser dsn

Explanation: This information message is sent by the IOA Archive Server to the console in response to a DISPLAY command. Each message describes a device assigned to media *mediaName*. This message follows message I0A1A5I or DSP1A5I, which provides the header for each field.

Corrective Action: No action is required.

**DSP1A7I**  *mediaName* - DEVICE USE STATUS USER-ID VOLSER DSN

Explanation: This information message is sent by the IOA Archive Server to the console in response to a DISPLAY command. It is the header for I0A1A8i or DSP1A8i messages, which provide information about the status of each device assigned to media *mediaName*.

Corrective Action: No action is required.

**DSP1A8I**  *mediaName* - device use status userId volume dsn

Explanation: This information message is sent by the IOA Archive Server to the console in response to a DISPLAY command. It follows message I0A1A7I, which provides the header for each field. Each occurrence of this message describes a device assigned to media *mediaName*.

The variables in this message are:

- **device** - the name of the assigned device
- **use** - Dedicated or Dynamic
- **status** - Active, Inactive or Idle
- **userId** - the user ID of the owner of the data set being retrieved by the device
- **volume** - the serial number of the volume on which the data set is found
- **dsn** - the data set name

Note:
The **userId**, **volume**, and **dsn** fields have values only when the device is active.
INCONTROL for z/OS Messages Manual

**Corrective Action:** No action is required.

DSP1A9I  *mediaName* - DEVICE STATUS USER-ID DSN

**Explanation:** This information message is sent by the IOA Archive Server to the console in response to a DISPLAY command. This message is the header for message IOA1AAI, which provides information about the status of each device assigned to the media identified in the message.

**Corrective Action:** No action is required.

DSP1AAI  *mediaName* -  *deviceStatus* userI d ds

**Explanation:** This information message is sent by the IOA Archive Server to the console in response to a DISPLAY command. Each message provides information about a device assigned to the media identified in the message. A message is issued for each device defined in the MAXCONN parameter in IOASPRM. These messages are preceded by message IOA1A9I, which provides the header for each field.

Possible values of *deviceStatus* are:
- **INACTIVE** - Device not yet activated.
- **ACTIVE** - Retrieving data requested by specified user from specified data set.
- **IDLE** - Device is ACTIVE, but currently not working on any request.

**Corrective Action:** No action is required.

DSP1AEI  *mediaName* - TVL: OWNER-ID *deviceTask*,  NUM OF REQUESTS - *num* DSN *dsn*

**Explanation:** This information message displays the content of the TVL, an element in the queue of the retrieval requests for tape *mediaName*.

The variables in this message are:
- **deviceTask** - the owner-ID of the device task currently working on the request
- **num** - the number of pending requests on that tape volume
- **dsn** - the name of the data set

**Corrective Action:** No action is required.

**DUL messages**

This group includes messages for the IOA (infrastructure) product.

**Messages DUL900 through DUL9xx**

This group includes messages for the IOA (infrastructure) product.

**DUL951S INSUFFICIENT STORAGE TO RUN UTILITY**

**Explanation:** There is insufficient memory to run the IOADUL utility.
The utility terminates with a return code of 12.

**Corrective Action:** Increase the REGION size and rerun the utility.

**DUL952S ERROR OPENING SEQUENTIAL FILE**

**Explanation:** The IOADUL utility detected an error while opening a sequential file to which it is to unload the data.

The utility terminates with a return code of 16.

**Corrective Action:** Check the IOA Log and the system job log for more information. Correct the error and rerun the job. If error persists, contact BMC Software Customer Support.

**DUL953S ERROR OPENING FILE**

**Explanation:** The IOADUL utility detected an error when opening the IOA Access Method file referenced by the DADBS DD statement.

The utility terminates with a return code of 20.

**Corrective Action:** Check the IOA Log and the system job log for more information. Correct the error and rerun the job. If error persists, contact BMC Software Customer Support.

**DUL955I UTILITY IOADUL STARTED**

**Explanation:** This information message indicates that the IOADUL utility started. The IOADUL utility unloads the records of an IOA Access Method file to a sequential file.

**Corrective Action:** No action is required.

**DUL956I UTILITY ENDED WITH RETURN CODE num**

**Explanation:** This information message indicates that the IOADUL utility terminated with a return code of num.

The IOADUL utility terminates.

**Corrective Action:** Check the IOA Log and the system job log for more information. Correct the error and rerun the job. If error persists, contact BMC Software Customer Support.

**DUL957S ERROR IN IOAPARM LOADING**

**Explanation:** The IOADUL utility detected an error while loading the IOAPARM member.

The IOADUL utility terminates with a return code of 4.

**Corrective Action:** Check the IOA Log and the system job log for more information. Correct the error, and rerun the job. If the error persists, contact BMC Software Customer Support.

**DUL958S ERROR READING THE DATABASE**

**Explanation:** The IOADUL utility detected an error while reading the IOA Access Method file.

The IOADUL utility terminates with a return code of 24.

**Corrective Action:** Check the IOA Log and the system job log for more information. Correct the error, and rerun the job. If the error persists, contact BMC Software Customer Support.
DUL959S INVALID INPUT PARAMETERS

Explanation: Invalid input parameters were specified when running the IOADUL utility. The IOADUL utility ends with a return code of 28.

Corrective Action: Rerun the IOADUL utility using valid input parameters. For information on the valid parameters, see the IOADUL utility in the INCONTROL for z/OS Utilities Guide.

DUL960S MISSING INPUT PARAMETERS

Explanation: No input parameters were specified for the IOADUL utility. The IOADUL utility ends with a return code of 32.

Corrective Action: Rerun the IOADUL utility using valid input parameters. See the IOADUL utility in the INCONTROL for z/OS Utilities Guide for valid parameters.

DUL961I NUMBER OF COPIED RECORDS num

Explanation: This information message displays the number of records copied from a database to a sequential file by the IOADUL utility.

Corrective Action: No action is required.

DVB messages

This group includes messages for the Control-O product.

Messages DVB300 through DVB3xx

This group includes messages for the Control-O product.

DVB331S AUTOMATION LOG FILE MUST CONTAIN AT LEAST 100 RECORDS

Explanation: The specified Automation Log file contains less than one hundred records. The CTODVB program checks the value specified for the ALREC# parameter in the CTOPARM member. It must indicate at least one hundred records.

Formatting of the Automation Log ends with a return code of 08.

Corrective Action: Check the ALREC# parameter in the CTOPARM member.

DVB332S ERROR OPENING AUTOMATION LOG FILE

Explanation: The CTODVB program was unable to open the Automation Log file. The formatting of the Automation Log ends with a return code of 08.

Corrective Action: Do both of the following:
Check the CTOPARM member.

Ensure that the JCL matches the parameters specified in the CTOPARM member.

**DVB333S ERROR FORMATTING AUTOMATION LOG FILE**

**Explanation:** An I/O error was detected. The CTODVB program failed to execute an I/O operation with the Automation Log file.

Formatting of the Automation Log ends with a return code of 08.

**Corrective Action:** Check associated MVS messages detailing the cause of the error, for example, disk failure, incorrect data set, incorrect name or allocation parameters.

**DVB334I FORMATTING OF AUTOMATION LOG FILE STARTED**

**Explanation:** This information message indicates that formatting of the Automation Log file has begun.

**Corrective Action:** No action is required.

**DVB335I FORMATTING OF AUTOMATION LOG FILE ENDED**

**Explanation:** This information message indicates that formatting of the Automation Log file has ended successfully.

**Corrective Action:** No action is required.

**DVB336S AUTOMATION LOG FILE WAS NOT BUILT**

**Explanation:** Formatting of the Automation Log file failed. This message follows other messages detailing the problem.

The formatting of the Automation Log ends with a return code of 08.

**Corrective Action:** Consult previous messages detailing the reason for the error.

**DVB337S AUTOMATION LOG DYNAMIC ALLOCATION ERROR rc/rsn/dsn**

**Explanation:** A dynamic allocation problem occurred. The CTODVB program attempted to dynamically allocate the Automation Log file but failed.

Formatting of the Automation Log file ends with return code 08.

**Corrective Action:** Do the following:

1. Refer to the IBM OS/390 Authorized Assembler Services Guide for an explanation of return code (rc) and the reason (rsn), and proceed accordingly.
2. Check the CTOPARM member.
3. Verify that an Automation Log file already exists for this CPU.

**DVB338S INVALID PARAMETERS PASSED TO PROGRAM**

**Explanation:** The CTODVB program detected an error in the parameters passed to it.

Formatting of the Automation Log file ends with a return code of 08.

**Corrective Action:** Check the parameters passed to the program and correct them.
DVB339S NULL PARAMETERS PASSED TO PROGRAM

**Explanation:** The CTODVB program was called with no parameters.
Formatting of the Automation Log file ends with a return code of 08.

**Corrective Action:** Check and correct the JCL.

DVL messages

This group includes messages for the Control-O product.

Messages DVL300 through DVL3xx

This group includes messages for the Control-O product.

DVL341S AUTOMATION LOG FILE LEVEL INCONSISTENT WITH LEVEL OF CONTROL-O

**Explanation:** The Automation Log file is not compatible with this release of Control-O. While opening an Automation Log file, the CTODVL program checks the file validity and usability. A mismatch was found between the release number of the Automation Log file and the release number of the program accessing it.

Action fails. The Automation Log file is not accessed.

**Corrective Action:** Do either or both of the following:
- Check if the libraries specified in the STEPLIB and LINKLIST concatenation contain modules from different releases.
- Check the Automation Log file data set name. If you are using an older release of the program or an old file, correct the error.

DVL342S ERROR OPENING AUTOMATION LOG FILE

**Explanation:** The CTODVL program was unable to open the Automation Log file.

The action fails. The Automation Log file is not accessed.

**Corrective Action:** Do any or all of the following:
- Check the definitions in the CTOPARM member.
- Check the JCL for errors.
- Check the data set name for the Automation Log file.

DVL343S AUTOMATION LOG DYNAMIC ALLOCATION ERROR rc/rsn/dsn

**Explanation:** The CTODVL program was unable to dynamically allocate the Automation Log file.

Action fails. The Automation Log file is not accessed.

**Corrective Action:** Do any or all of the following:
See documentation on dynamic allocation in the IBM authorized guide to Assembler services for explanations of the return code (rc) and the reason code (rsn), and proceed accordingly.

- Check the CTOPARM member.
- Ensure that an Automation Log file exists for this CPU.

**DVL344S AUTOMATION WRITE ERROR**

**Explanation:** An I/O error occurred. The CTODVL program did not succeed in performing an I/O operation on the Automation Log file.

Action fails. The Automation Log file is not accessed.

**Corrective Action:** If you cannot determine the reason for this I/O error (for example, a disk failure), contact BMC Software Customer Support.

**DVL345S ERROR EXECUTING RDJ FCB**

**Explanation:** The CTODVL program received a non-zero return code from system service RDJ FCB. The CTODVL program failed to read the J FCB of the dynamically allocated Automation Log file.

Action fails. The Automation Log file is not accessed.

**Corrective Action:** Contact BMC Software Customer Support.

**DVL346S ABEND abCode I INTERCEPTED WHILE PROCESSING THE AUTOMATION LOG**

**Explanation:** The CTODVL program intercepted an abend while processing the Automation Log.

The action fails. The Automation Log file is not accessed.

**Corrective Action:** Contact BMC Software Customer Support.

**DVL347S THE ALLOCATED AUTOMATION LOG FILE BELONGS TO ANOTHER CONTROL-O INSTALLATION**

**Explanation:** The specified Automation Log file refers to another Control-O. While opening an Automation Log file, the CTODVL program checks the validity and usability of the file being opened. A mismatch was found between the current value specified for the CTOQNAME parameter in the CTOPARM member and the value of that parameter when the Automation Log file was formatted.

Action fails. The Automation Log file is not accessed.

**Corrective Action:** Do either or both of the following:

- Ensure that you are not using load libraries that belong to another installation of Control-O.
- Check if the CTOPARM member has changed.

**DVL348S FILE NOT AN AUTOMATION LOG FILE**

**Explanation:** The specified file is not a Control-O Automation Log file. While opening an Automation Log file, CTODVL checks the validity and usability the file. The specified file was not an Automation Log file.

Action fails. The Automation Log file is not accessed.
Corrective Action: Check if the formatting of the Automation Log file ended successfully. If it failed, redefine (reformat) the Automation Log.

DVL349S AUTOMATION LOG FILE IS BEING FORMATTED IT CANNOT BE ACCESSED
Explanation: The specified Automation Log file is currently being formatted. While opening the Automation Log file, the CTODVL program checks the validity and usability of the file. The specified file has a status incompatible with the requirements of the program.
Action fails. The Automation Log is not accessed.
Corrective Action: Check if the formatting of the Automation Log file ended successfully. If it failed, redefine (reformat) the Automation Log.

DVT messages
This group includes messages for the Control-V product.

Messages DVT100 through DVT1xx
This group includes messages for the Control-V product.

DVT170I mediaName - DEVICE deviceId - IS STARTING
Explanation: This information message indicates that IOA Archive Server device deviceId allocated to media mediaName started.
Corrective Action: No action is required.

DVT171I mediaName - DEVICE deviceId - SHUT DOWN UPON REQUEST OF MAIN TASK
Explanation: This information message indicates that the main task requested shutting down IOA Archive Server mediaName device deviceId.
Corrective Action: No action is required.

DVT172I mediaName - DEVICE deviceId - REASON: AN EMPTY REQUEST RECEIVED
Explanation: This message indicates that due to an internal error, a cache request received by the IOA Archive Server from device deviceId was empty. See accompanying message DVT178I or IOA178I for the name of the requested file.
The cache request is ignored.
Corrective Action: Notify your INCONTROL administrator.
DVT173E mediaName - DEVICE deviceId - REASON: EXTENT ext IS OUT OF FILE

Explanation: The IOA Archive Server received a cache request from device deviceId for a relative byte address (RBA) with an extent that is not included in the migrated file. See accompanying message DVT178I or IOA178I for the name of the requested file.

The cache request is ignored.

Corrective Action: Check the validity of the RBA ranges in the user record. Notify your INCONTROL administrator.

DVT174E mediaName - DEVICE deviceId - REASON: RC rc IN TRANSLATION TTRZ ttttrrzz

Explanation: An internal error occurred when the IOA Archive Server translated a relative block number to a relative block address (RBA). See accompanying message DVT178I or IOA178I for the name of the requested file.

The request is ignored.

Corrective Action: Notify your INCONTROL administrator.

DVT175E mediaName - DEVICE deviceId - REASON: BLOCK blockNum IS OUT OF FILE

Explanation: The IOA Archive Server received a cache request from device deviceId with a relative block address (RBA) that caused return code rc in translating the TTR to a relative block number. See accompanying message DVT178I or IOA178I for the name of the requested file.

The request is ignored.

Corrective Action: Check the validity of the RBA ranges in the user record. Notify your INCONTROL administrator.

DVT176E mediaName - DEVICE deviceId - REASON: RC rc IN TRANSLATION BLOCK blk_num

Explanation: An internal error occurred when the IOA Archive Server translated a relative block number to a relative block address (RBA). See accompanying message DVT178I or IOA178I for the name of the requested file.

The request is ignored.

Corrective Action: Notify your INCONTROL administrator.

DVT177I mediaName - DEVICE deviceId - REASON: USER DOES NOT EXIST

Explanation: This information message indicates that a user who issued a cache request to the IOA Archive Server is no longer logged on. See accompanying message DVT178I or IOA178I for the name of the requested file.

The cache request is ignored.
Corrective Action: Notify your INCONTROL administrator if this message is issued while the user is still logged on.

DVT178I mediaName - DEVICE deviceId - REQUEST FOR FILE dsn IGNORED

Explanation: This information message indicates that the user that issued a cache request to the IOA Archive Server is no longer logged on. See messages: DVT172I or IOA172I, DVT173E or IOA173E, DVT174E or IOA174E, DVT175E or IOA175E, DVT176E or IOA176E, DVT177E or IOA177E, or DVT17DI or IOA17DI. The cache request is ignored.

Corrective Action: If this message is issued while the user is still logged on, notify your INCONTROL administrator.

DVT179W mediaName - DEVICE deviceId - TEST ENQ FOR USER OF FILE dsn FAILED, RC rc

Explanation: A system error occurred while testing the ENQ that indicates whether a user is logged on. The system assumes that the user who issued the cache request is still logged on. The request is performed.

Corrective Action: Notify your INCONTROL administrator.

DVT17AI mediaName - DEVICE deviceId - UNABLE TO ALLOCATE DEDICATED DEVICE

Explanation: This information message indicates that the IOA Archive Server could not allocate device deviceId even though it is dedicated to the Server explicitly by means of the DEVADDR parameter or implicitly by a quantity of a unit name in the DEVQTY parameter.

If dedicated explicitly, the device possibly is disconnected. If dedicated implicitly, probably no device in the device group specified in the IOASPRM member for the mediaName media is available. See messages DVT190E or IOA190E and DVT192E or IOA192E in the IOA Log file for the error code and information code. The Server tries to allocate the device at 3-minute intervals until stopped by a MODIFY command.

Corrective Action: Use the error code and information code to determine why the allocation failed. See the IBM manual MVS Programming: Authorized Assembler Services Guide for a description of the return code received. Ask the operator to correct the problem and restart the device.

DVT17BI mediaName - DEVICE deviceId - UNABLE TO ALLOCATE DEVICE DYNAMICALLY

Explanation: This information message indicates that the IOA Archive Server could not allocate device deviceId which should be allocated dynamically. Probably none of the devices in the device group specified in the IOASPRM member for the mediaName media is available. See messages DVT190E or IOA190E and DVT192E or IOA192E in the IOA Log file for the error code and info code.
The Archive Server tries to allocate the device five times, at two minute intervals. If it does not succeed, device deviceId is terminated.

**Corrective Action:** Use the error code and information code to determine why the allocation failed. See the IBM manual *MVS Programming: Authorized Assembler Services Guide* for a description of the return code received. Ask the operator to correct the problem and restart the device.

**DVT17CI mediaName - DEVICE deviceId - SHUT DOWN BECAUSE OF INTERNAL ERROR**

**Explanation:** Highlighted, unrollable message.

This message indicates that an internal error occurred while accessing device deviceId.
The cache request that generated the error is ignored. The activity that used this device is restarted.

**Corrective Action:** Notify your INCONTROL administrator.

**DVT17DI mediaName - DEVICE deviceId - SHUT DOWN BECAUSE OF ABEND Snnn**

**Explanation:** Highlighted, unrollable message.

This message indicates that an abend occurred while accessing device deviceId.
The cache request which caused the abend is ignored. The activity which used this device will be restarted.

**Corrective Action:** Notify your INCONTROL administrator.

**DVT17EE mediaName - DEVICE deviceId - ERROR IN FDB OF FILE fileName**

**Explanation:** The file descriptor block that is the first block of the migrated CDAM file contains invalid information.
The migrated report cannot be accessed.

**Corrective Action:** Print the first block of the migrated CDAM file, for example, using IDCAMS Print Dump. Then, contact BMC Software Customer Support.

**DVT17GI mediaName USER: userId, TIME: time, READS: reads, CPU: cpu, BLOCKS: blocks, FILE: dsName**

**Explanation:** This information message is sent to IOALOG when the cache request is performed by the IOA Archive Server. The message is optional. It is issued only when the STATV parameter in the IOASPRM member is set to Y.
The variables in this message are:
- **mediaName** - name of the media where the migrated CDAM resides
- **userId** - the ID of the user who issued the request
- **time** - the elapsed time (seconds)
- **reads** - the total number of blocks read from the migrated CDAM
- **cpu** - the CPU usage time (milliseconds)
- **blocks** - the number of blocks cached
- **dsName** - the CDAM dataset name

**Corrective Action:** No action is required.

**DVT180S mediaName - DEVICE deviceId - UNABLE TO ACQUIRE STORAGE FOR blockId, RC IS rc**

**Explanation:** IOA Archive Server device **deviceId** is unable to acquire storage space for a BLKLST, FDB, CMP, CACHE or RDBUF block. See accompanying message DVT178I or IOA178I for the name of the requested file.

Execution of the task on device **deviceId** is terminated.

**Corrective Action:** Restart the IOA Archive Server. Re-IPL if necessary. Notify your INCONTROL administrator.

**DVT181S mediaName - DEVICE deviceId - UNABLE TO {ENQ | DEQ} ON resourceName. RC IS rc**

**Explanation:** The IOA Archive Server for device **deviceId** was unable to ENQ or DEQ on a key resource, where **resourceName** is the name of a volume, platter or device.

Execution of the task on device **deviceId** is terminated.

**Corrective Action:** Restart the IOA Archive Server. Re-IPL if necessary. Notify your INCONTROL administrator.

**DVT190E mediaName - DEVICE deviceId - UNABLE TO ALLOCATE FILE dsn**

**Explanation:** File **dsn** could not be dynamically allocated on media **mediaName** by the IOA Archive Server device **deviceId**. See message DVT192E or IOA192E for the error code and info code.

The request is ignored.

**Corrective Action:** Use the error code and information code to determine why the allocation failed. See the IBM manual *MVS Programming: Authorized Assembler Services Guide* for a description of the return code received. Correct the problem. Restart the IOA Archive Server.
DVT191E mediaName - DEVICE deviceId - UNABLE TO DEALLOCATE FILE dsn

Explanation: The specified file could not be deallocated on the specified media when switching to another file in the IOA Archive Server device task. See message DVT192E or IOA192E for the error code and info code.

The next request and all future requests are ignored until deallocation succeeds.

Corrective Action: Use the error code and information code to determine why deallocation failed. Correct the problem. Restart the IOA Archive Server.

DVT192E mediaName - DEVICE deviceId - ERR + INFO CODE IS error+infoCode

Explanation: This message accompanies messages IOA190E or DVT190E and IOA191E or DVT191E. It provides the error code and information code for a failed dynamic allocation or deallocation.

Corrective Action: Use the error code and information code to determine the problem and correct it.

DVT193E mediaName - DEVICE deviceId - I/O ERROR error

Explanation: The I/O error identified in this message occurred.
The request that caused the I/O error is ignored.

Corrective Action: Correct the problem in the file. Retry.

DVT194E mediaName - DEVICE deviceId - UNABLE TO OPEN FILE dsn

Explanation: IOA Archive Server device deviceId could not open the specified file.
The request is ignored.

Corrective Action: Verify that the file exists and can be accessed.

DVT195I mediaName - DEVICE deviceId - PLEASE MOUNT REQUIRED VOLUME, OR ANSWER NO

Explanation: This information message indicates that a request was issued to mount a tape volume on device deviceId, and the requested tape volume was not mounted. The previous tape mount message was issued after an attempt to open a file on a tape volume that was not mounted on the device.

If this WTOR is answered NO, the mount request is canceled and the user request is ignored.

Corrective Action: If the requested volume cannot be mounted, or to cancel the mount request for any reason, reply NO to this WTOR. Otherwise, mount the requested volume.

DVT196E mediaName - DEVICE num - ERROR IN READ SMN st.maName SSN smName DSN dsn RC: rc

Explanation: The FileTek storage-machine ASREAD_RECORD function that was activated by an IOASMON monitor failed.
The variables in this message are:
**mediaName** - the Filetek storage machine media defined in IOASPRM

**num** - the number of the IOASMON device in which the error occurred

**st.maName** - the name of the Filetek storage machine. When this does not appear in the message, the name indicates the storage machine defined in the storage machine configuration member.

**smName** - SM subsystem name

**dsn** - the name of the file in which the ASREAD_RECORD function failed

**rc** - the return code from the ASREAD_RECORD function

Online viewing or printing of the report from the Filetek storage machine fails.

**Corrective Action:** Check the return code of the ASREAD_RECORD function against the Filetek documentation, and correct the problem accordingly.

**DVT197E** mediaName - DEVICE num - ECBADDR FAILED SMN st.maName SSN smName DSN dsn RC: rc

**Explanation:** The Filetek storage-machine ECBADDR function that was activated by an IOASMON monitor after the ASREAD_RECORD function failed.

The variables in this message are:

- **mediaName** - the Filetek storage machine media defined in IOASPRM
- **num** - the number of the IOASMON device in which the error occurred
- **st.maName** - the name of the Filetek storage machine. When it does not appear in the message, the name indicates the storage machine defined in the storage machine configuration member.
- **smName** - the SM subsystem name
- **dsn** - the name of the file in which the ECBADDR function failed
- **rc** - the return code from the ECBADDR function

Online viewing or printing of the report from the Filetek storage machine fails.

**Corrective Action:** Check the return code of the ECBADDR function against the Filetek documentation, and correct the problem accordingly.

**DVT198E** mediaName - DEVICE num - CHECK FAILED SMN st.maName SSN smName DSN dsn RC: rc

**Explanation:** The Filetek storage-machine CHECK function that was activated by an IOASMON monitor after the ECBADDR function failed.

The variables in this message are:
- **mediaName** - Name of the Filetek storage machine media defined in IOASPRM.
- **num** - Number of the IOASMON device in which the error occurred.
- **st.maName** - Name of the Filetek storage machine. When it does not appear in the message, the name is that of the storage machine defined in the storage machine configuration member.
- **smName** - SM subsystem name.
- **dsn** - Name of the file in which the CHECK function failed.
- **rc** - Return code from the CHECK function.

Online viewing or printing of the report from the Filetek storage machine fails.

**Corrective Action:** Check the return code of the CHECK function against the Filetek documentation, and correct the problem accordingly.

### DWL messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

#### Messages DWLI00 through DWLIxx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**DWLI00I DOWNLOAD OF IOA DATABASE STARTED**

**Explanation:** This information message is issued by the Enterprise Controlstation Download utility to indicate that downloading of the IOA and Control-M database is currently in progress.

**Corrective Action:** No action is required.

**DWLI01I DOWNLOAD OF IOA DATABASE ENDED SUCCESSFULLY**

**Explanation:** Information message issued by the Enterprise Controlstation Download utility, indicating that the download of the IOA and Control-M database has ended successfully.

**Corrective Action:** No action is required.

**DWLI02E RESOURCE resourceName CONTAINS NULLS, INTERNAL CODE code**

**Explanation:** A resource containing nulls in its name was encountered during download or database update. A null is not valid in the name of a quantitative or control resource.

The Control-M Application Server terminates with a condition code of 08.

**Corrective Action:** Report the occurrence to BMC Software Customer Support.
DWLI03E OPEN OF ENTERPRISE/CS INFO DOWNLOAD FILE FAILED.
DDNAME "DWNINFO"

Explanation: The Enterprise Controlstation Download utility could not open the Download Info file (the DWNINFO DD statement).

Possible causes are:
- The DWNINFO DD statement is missing.
- The download JCL procedure or the JCL of the download job has been modified.

The Enterprise Controlstation Download utility stops executing.

Corrective Action: Correct the download JCL procedure or the JCL for the download job and rerun the download job.

DWLI04E OPEN OF ENTERPRISE/CS JOBS DOWNLOAD FILE FAILED.
DDNAME "DWNJOBS"

Explanation: The Enterprise Controlstation Download utility could not open the Download Jobs file (the DWNJOBS DD statement).

Possible causes are:
- The DWNJOBS DD statement is missing.
- The download JCL procedure or the JCL of the download job has been modified.

The Enterprise Controlstation Download utility stops executing.

Corrective Action: Correct the download JCL procedure or the JCL for the download job and rerun the download job.

DWLI06E INSUFFICIENT STORAGE FOR THE ENTERPRISE/CS DOWNLOAD UTILITY

Explanation: The Enterprise Controlstation Download utility requires more storage in order to execute.

The Enterprise Controlstation Download utility stops executing.

Corrective Action: Increase the REGION size and rerun the download job.

DWLI07E DOWNLOAD INTERNAL ERROR TYPE type

Explanation: An internal error occurred during execution of the Enterprise Controlstation Download utility.

The Enterprise Controlstation Download utility stops executing.

Corrective Action: Have your INCONTROL administrator contact BMC Software Customer Support.

DWLI08E OPEN OF ENTERPRISE/CS APPLICATION-GROUP DEFINITION FILE FAILED. DDNAME "DAGROUP"

Explanation: The Control-M Application Server or Download utility is unable to open the Application-Group Definition file (the DAGROUP DD statement). This may be due to one of the following:
The DAGROUP DD statement is missing.

The Control-M Application Server JCL procedure, or the download JCL procedure or the JCL of the download job has been modified.

The Control-M Application Server or Download utility continues executing, but without processing the applications.

**Corrective Action:** Correct the Control-M Application Server JCL procedure and restart the Control-M Application Server, or correct the download JCL procedure or the JCL for the download job and rerun the download job.

**Explanation:**

**DWLI09E MAXIMUM APPLICATIONS IN ENTERPRISE/CS APPLICATION-GROUP DEFINITION FILE EXCEEDED. DDNAME "DAGROUP"**

The Control-M Application Server or Download utility is unable to process all the applications in the Application-Group Definition file (the DAGROUP DD statement). Too many applications were defined in the Application-Group Definition file.

The Control-M Application Server or Download utility continues executing, but processes only some of the applications.

**Corrective Action:** Check the Application-Group Definition file, and if it is correct, contact BMC Software Customer Support.

**Explanation:**

**DWLI10E MAXIMUM GROUPS IN ENTERPRISE/CS APPLICATION-GROUP DEFINITION FILE EXCEEDED. DDNAME "DAGROUP"**

The Control-M Application Server or Download utility is unable to process all the groups in the Application-Group Definition file (the DAGROUP DD statement). Too many groups were defined in the Application-Group Definition file.

The Control-M Application Server or Download utility continues executing, but processes only some of the groups.

**Corrective Action:** Check the Application-Group Definition file, and if it is correct, contact BMC Software Customer Support.

**Explanation:**

**DWLI11E INVALID STATEMENT IN ENTERPRISE/CS APPLICATION-GROUP DEFINITION FILE. DDNAME "DAGROUP"**

The Control-M Application Server or Download utility is unable to process a statement in the Application-Group Definition file (the DAGROUP DD statement). An invalid statement appeared in the Application-Group Definition file.

The Control-M Application Server or Download utility continues executing, but skips processing of the invalid instruction.

**Corrective Action:** Correct the syntax in the Application-Group Definition file, and restart the Control-M Application Server or rerun the Enterprise Controlstation Download utility.
DWLI14E OPEN OF ENTERPRISE/CS CONTROL RESOURCES DOWNLOAD FILE FAILED. DDNAME "DWNCNTRL"

**Explanation:** The Enterprise Controlstation Download utility could not open the Download Control Resources file (the DWNCNTRL DD statement).

Possible causes are:
- The DWNCNTRL DD statement is missing.
- The download JCL procedure or the JCL of the download job has been modified.

The Enterprise Controlstation Download utility stops executing.

**Corrective Action:** Correct the download JCL procedure or the JCL for the download job and rerun the download job.

DWLI15E OPEN OF ENTERPRISE/CS QUANTITATIVE RESOURCES DOWNLOAD FILE FAILED. DDNAME "DWNQUANT"

**Explanation:** The Enterprise Controlstation Download utility is unable to open the Download Quantitative Resources file (the DWNQUANT DD statement).

Possible causes are:
- The DWNQUANT DD statement missing.
- The download JCL procedure or the JCL of the download job has been modified.

The Enterprise Controlstation Download utility stops executing.

**Corrective Action:** Correct the download JCL procedure or the JCL for the download job and rerun the download job.

**ECA messages**

This group includes messages for the IOA (infrastructure) product.

**Messages ECAA00 through ECAAxx**

This group includes messages for the IOA (infrastructure) product.

**ECAA00I APPLICATION SERVER(D001) MANAGER STARTED, RELEASE(releaseId) CREATED (timeStamp) CCID(changeLevel)**

**Explanation:** This information message indicates normal startup of the address space of the application server.

The variables in this message are:
INCONTROL for z/OS Messages Manual

- **releaseId** - the official release and the maintenance level of the IOAGATE
- **timeStamp** - the date and time when the main module of the application server manager was compiled
- **changeLevel** - the level of the change that was last applied to the main module of the manager of the application server

**Corrective Action:** No action is required.

**ECAA01I APPLICATION SERVER GOES DOWN DUE TO IOAGATE SHUTDOWN**

**Explanation:** This information message indicates that the manager of the application server detected that the IOAGATE is down. The shutdown may be due to an operator request or to an error.

The server address space shuts down.

**Corrective Action:** If the shutdown was due to a problem, check the IOAGATE messages for errors that may have caused the shutdown.

**ECAA02I APPLICATION SERVER GOES DOWN DUE TO STOP REQUEST FROM CONSOLE(consoleId)**

**Explanation:** This information message indicates that the application server was shut down because a STOP command was issued to its address space.

In this message, **consoleId** is the identity of the console from which the STOP request was issued. The value of **consoleId** depends on whether this request was issued from a physical or virtual console. If it was a virtual console, the value of **consoleId** may coincide with the user ID of the operator who issued this request, depending on your local configuration.

The address space of the application server shuts down.

**Corrective Action:** No action is required.

**ECAA03I APPLICATION SERVER EXCLUSIVELY OWNS HEARTBEAT RESOURCE Q(qName)R(rName)**

**Explanation:** This information message indicates that the application server successfully acquired the specified heartbeat resource.

During initialization, an application server issues an ENQ request to acquire the indicated resource exclusively. The resource acts as a heartbeat mechanism between the IOAGATE and the address space of the server. If the resource becomes available in the address space of the IOAGATE, it indicates an application server failure.

The variables in this message are:

- **qName** - major name of a heartbeat resource of the application server
- **rName** - minor name of a heartbeat resource of the application server

**Corrective Action:** No action is required.
ECAA04S ECAAMGR INTERNAL ERROR, TASKLIST EXHAUSTED

Explanation: The manager of an application server encountered a severe internal error. The address space of the server shuts down with a return code of 44.

Corrective Action: Contact BMC Software Customer Support.

ECAA05E APPLICATION SERVER ENDED DUE TO CRITICAL TASK TERMINATION

Explanation: A critical server task terminated. A server task may be defined as critical in the address space of an application server. If a critical task fails, the server address space goes down. The CD server task is always critical.

The server address space shuts down with a return code of 68.

Corrective Action: Check the error messages of the server address space for the cause of the critical task termination. If there are no other active application server address spaces, recycle the IOAGATE.

ECAA06W SERVER TASK(type, taskId) TERMINATED

Explanation: This message warns that one server task of the server address space terminated. The message may be accompanied by error messages issued by the failed server task itself.

The variables in this message are:
- type - server task type:
  - CM - manager of the address space of an application server
  - CS - application server
  - CD - detector server
  - CU - updater server
- taskId - the internal ID of a server task

If the terminated task was critical or was a single CS task, the server address space shuts down. Otherwise, normal processing continues, and, if recovery is not blocked for this server task, the IOAGATE tries to recover the server task, when message ECAB41I may be issued.

Corrective Action: If there are any error messages that relate to the server address space, check them to determine and fix the cause of the task termination. Restart the server task using the F IOAGATE,STARTTID=taskId command.

ECAA07E APPLICATION SERVER GOES DOWN DUE TO TERMINATION OF ALL CS SERVER TASKS

Explanation: The last CS server task ended. The application server address space cannot function when there is no CS server task available.

The server address space shuts down with a return code of 12.
Corrective Action: Check the other error messages that relate to the server address space to determine the cause of the CS task termination. If there are no other active server address spaces, recycle the IOAGATE.

ECAA08E APPLICATION SERVER GOES DOWN DUE TO IOAGATE NOT RESPONDING

Explanation: IOAGATE does not respond to the application server address space. The IOAGATE probably experienced internal problems and could not respond to an application server.

The server address space shuts down with a return code of 64.

Corrective Action: Do the following:

1. Examine the error messages that relate to the IOAGATE.
2. Increase the system priority of both
   - the IOAGATE
   - an application server address space
3. Recycle the IOAGATE.

ECAA09E APPLICATION SERVER GOES DOWN DUE TO CHANNEL(channelId) DISABLING

Explanation: Application server manager ended. An application server address space cannot function when there is no channel available to communicate with the partner or client.

The server address space shuts down.

Corrective Action: Examine the error messages that relate to the channelId channel. Recycle the IOAGATE.

ECAA0A1 CHAN PROT TASK VENDOR SUBS PORT/LU STATUS LINKS APPL

Explanation: This information message provides header information about communication channels defined in the ECAPARM configuration file. ECAA0BI messages that follow provide details for each channel. This message is issued once, in response to an F IOAGATE,CHANNEL (or CHAN) command.

Corrective Action: No action is required.

ECAA0BI channelId protocol task softwareVendor subsystem port / luName status links applications

Explanation: This information message provides detailed information about a single communication channel. It is issued for each communication channel in response to an F IOAGATE,CHANNEL (or CHAN) command.

Each occurrence of this message identifies a communication channel defined in the ECAPARM configuration file. If you have enabled a DC (dual connection) communication channel, the information is provided in two ECAA0BI messages. A set of these messages provides information about all the channels. The ECAA0AI message provides headings for the set.

The variables in this message are:
channelId - This channel ID consists of two subfields:
- the communication model specifier for the channel
- a 2-character channel ID assigned by the user in the ECAPARM configuration file. Valid communication model specifiers are: MC - a multiple connection channel DC - a dual connection channel

protocol - The current channel uses this communication protocol. Valid values are:
- TCP - TCP/IP communication protocol
- SNA - SNA communication protocol

task - the name of a communication task. This variable is used only for an enabled DC channel. Valid values are:
- SNDR - the sender communication task of the DC channel
- RCVR - the receiver communication task of the DC channel

softwareVendor - the vendor of the TCP/IP software. Valid values are:
- IBM - IBM TCP/IP software is used by the channel
- CA - TCPaccess software of Computer Associated International, Inc. is used by the channel

subsystem - subsystem name for the TCPaccess software

port - the TCP/IP communication port number used by a TCP channel to listen for connection. In the case of an enabled DC communication channel, two consecutive port numbers are used, and these are identified in two ECAA0BI messages.

luName - VTAM LU 6.2 (APPC) application ID used by an SNA channel to communicate over the APPC network

status - the current status of the channel. Valid values are:
- DOWN - the channel is not started
- UP/OPEN - the channel is open, up and running
- UP/CLOSED - the channel has been closed for new incoming connections, but it is still up and running
- DISABLED - the channel was disabled, either in the ECAPARM configuration file by the CHANNEL parameter set to DISABLE, or by IOAGATE during initialization

links - the number of current connections this channel supports

applications - a list of application identities. An application refers to this channel in the ECAPARM configuration file.

Corrective Action: No action is required.

ECAA0CS I NVALID ECAPARM(suffix) OBTAINED, THERE'S NO APSERVER STATEMENT FOR APPL.SERVER

Explanation: The application server address space obtained an improper ECAPARM configuration member. The most likely cause was an incorrect PARM library allocated by the DAPARM DD statement.
In this message, suffix is a 1-character ID that specifies a unique ECAPARM configuration file. The server address space shuts down with a return code of 60.

**Corrective Action:** Check and correct the ECAPARM configuration file, the DAPARM DD allocation, or both.

**ECAA0DS APPL.SERVER FAILED TO ACQUIRE HEARTBEAT RESOURCE Q(qName)R(rName)**

**Explanation:** An application server failed to acquire the specified heartbeat resource.

During initialization, an application server issues an ENQ request to acquire the indicated resource exclusively. The resource acts as a heartbeat mechanism between the IOAGATE and the address space of the server. An application server failure is indicated if the resource becomes available in the address space of the IOAGATE. Failure to acquire the heartbeat resource by an application server is a severe error.

The variables in this message are:

- qName - the major name of a heartbeat resource of the application server
- rName - the minor name of a heartbeat resource of the application server

The application server shuts down.

**Corrective Action:** Do the following:

1. Examine the other error messages that relate to the server address space to determine the cause of the failure.
2. Try to correct the problem.
3. Restart IOAGATE.
4. If the problem persists, call your systems programmer for assistance.

**ECAA0ES UNRECOVERABLE INTERNAL ERROR ENCOUNTERED: rsn**

**Explanation:** The application server manager encountered a severe internal error when handling the MAXMSGSZ ECAAPPL parameter.

Valid values for rsn are:

- no SDT address
- no SDT of CS
- no MAXMSGSZ

The address space of the server shuts down with a return code of 96.

**Corrective Action:** Contact BMC Software Customer Support.

**ECAA0FS UNRECOVERABLE APPLICATION ERROR ENCOURTENDED**

**Explanation:** A severe internal application error occurred in the application server.

The application server shuts down.
Corrective Action: Examine any other error messages that relate to the server address space to determine the cause of the failure, take appropriate corrective action, and restart IOAGATE.

ECAA0HI IOAGATE HAS GONE DOWN

Explanation: This information message in an application server address space indicates that this application has detected IOAGATE going down.

The application server address space goes down with a return code of 112.

Corrective Action: Attempt to identify and correct the problem that caused IOAGATE to go down.

ECAA0IW SERVER TASK(type, taskId) CANCELLED(U007) BY ioagateName BECAUSE THE TASK WAS BUSY FOR TOO LONG

Explanation: The ioagateName application server manager cancelled the taskId task of the application server with a completion code of U007.

When a server task is busy for longer than the period defined for this application server by the BUSYDUR parameter, the following events occur:

- A request to cancel the task is generated automatically by IOAGATE.
- Message ECAB4BW is issued.

This message (ECAA0IW) is followed by message ECAA06W.

The variables in this message are:

- **type** - the server task type. Valid values are:
  - CM - manager of the address space of the application server
  - CS - application server
  - CD - detector server
  - CU - updater server
- **taskId** - the internal ID of a server task
- **ioagateName** - the name of the IOAGATE started task that generated the cancel request

The system action depends on the nature of the terminated task, as follows:

- If the terminated task was either critical or a single CS task, the server address space shuts down. If recovery is not blocked for this application server, the IOAGATE tries to recover the server.
- Otherwise, normal processing continues, and, if recovery is not blocked for this server task, the IOAGATE tries to recover the server task.

Corrective Action: Attempt to find the cause for the cancellation of the taskId server task. Try increasing the value of the BUSYDUR parameter.
ECAA0JW SERVER TASK(type, taskId) CANCELED(U007) FROM CONSOLE (consoleId)

**Explanation:** This message warns that the application server manager has cancelled a server task of the application server with a completion code of U007. This is the result of a CANCTID=taskId request issued by the operator in the IOAGATE address space.

This message is followed by message ECAA06W.

The variables in this message are:
- **type** - the server task type. Valid values are:
  - CM - manager of the address space of the application server
  - CS - application server
  - CD - detector server
  - CU - updater server
- **taskId** - the internal ID of a server task
- **consoleId** - the identity of the console from which the CANCTID request was issued. The value of consoleId depends on whether this request was issued from a physical or virtual console. If it was a virtual console, the value of consoleId may coincide with the user ID of the operator who issued this request, depending on your local configuration.

The system action depends on the nature of the terminated task, as follows:
- If the terminated task was either critical or a single CS task, the server address space shuts down. If recovery is not blocked for this application server, the IOAGATE tries to recover the server.
- Otherwise, normal processing continues, and, if recovery is not blocked for this server task, IOAGATE tries to recover the server task.

**Corrective Action:** No action is required.

ECAA0LW APPL.SERVER TASK(type, taskId) ABENDED; COMPLETION CODE ({Sxxx | Uxxx})

**Explanation:** This message warns that one server task of the application server address space abended.

The variables in this message are:
- **type** - server task type. Valid values are:
  - CS - application server
  - CD - detector server
  - CU - updater server
- **taskId** - the internal identity of a server task
- **compCode** - completion code

If the terminated task was critical or was a single CS task, the server address space shuts down. Otherwise, normal processing continues, and, if recovery is not blocked for this server task, IOAGATE tries to recover the server task, when message ECAB41I may be issued.
Corrective Action: If there are any error messages that relate to the server address space, check them to determine and fix the cause of the task abend. Restart the server task using the `MODIFY IOAGATE,STARTTID=taskId` command.

ECAA0MS SSL=NO FOR CTM/ appl1 DOESN'T MATCH SSL=YES FOR CTM/ appl2 ON ioagateName/ systemID

Explanation: When IOAGATE started, it discovered that SSL support is not defined the same way (either YES or NO) in the corresponding channels for CTMAS and for CTMCAS, which are defined in different IOAGATEs.

The IOAGATE that issues this message has SSL=NO in the ECAPARM configuration file, while another IOAGATE that is already up has SSL=YES in its ECAPARM configuration file.

The variables in this message are:
- `appl1` - either EM or CM, depending on whether this IOAGATE supports CTMAS or CTMCAS
- `appl2` - either EM or CM, depending on whether the other IOAGATE supports CTMAS or CTMCAS
- `ioagateName` - the name of the other IOAGATE
- `systemID` - the system identification of the other IOAGATE

Since the other IOAGATE has SSL=YES and this IOAGATE has SSL=NO, the lower security level for this IOAGATE is not accepted. IOAGATE disables the channel and goes down if there is no other active channel.

Corrective Action: ECAPARM channel definitions should be corrected so that the channel definitions for both CTMAS and CTMCAS will have either SSL=YES or SSL=NO.

ECAA0MW SSL=YES FOR CTM/ appl1 DOESN'T MATCH SSL=NO FOR CTM/ appl2 ON ioagateName/ systemID

Explanation: When IOAGATE started, it discovered that SSL support is not defined the same way (either YES or NO) in the corresponding channels for CTMAS and for CTMCAS, which are defined in different IOAGATEs.

The IOAGATE that issues this message has SSL=YES in the ECAPARM configuration file, while another IOAGATE that is already up has SSL=NO in its ECAPARM configuration file.

The variables in this message are:
- `appl1` - either EM or CM, depending on whether this IOAGATE supports CTMAS or CTMCAS
- `appl2` - either EM or CM, depending on whether the other IOAGATE supports CTMAS or CTMCAS
- `ioagateName` - the name of the other IOAGATE
- `systemID` - the system identification of the other IOAGATE

IOAGATE continues the startup.

Corrective Action: ECAPARM channel definitions should be corrected so that the channel definitions for both CTMAS and CTMCAS will have either SSL=YES or SSL=NO.
ECAA0NS SSL=NO FOR CTM/ appl1 DOESN'T MATCH SSL=YES FOR CTM/ appl2

**Explanation:** When IOAGATE started, it discovered that SSL support is not defined the same way (either YES or NO) in the corresponding channels for CTMAS and for CTCMAS, which are defined in the same IOAGATE.

This was discovered when the second channel was initializing and had SSL=NO, while another channel that was already initialized had SSL=YES.

The variables in this message are:

- **appl1** - either EM or CM, depending on whether this channel supports CTMAS or CTCMAS
- **appl2** - either EM or CM, depending on whether the other channel supports CTMAS or CTCMAS

IOAGATE disables the channel that has SSL=NO and goes down if there is no other active channel.

**Corrective Action:** ECAPARM channel definitions should be corrected so that the channel definitions for both CTMAS and CTCMAS will have either SSL=YES or SSL=NO.

ECAA0NW SSL=YES FOR CTM/ appl1 DOESN'T MATCH SSL=NO FOR CTM/ appl2

**Explanation:** When IOAGATE started, it discovered that SSL support is not defined the same way (either YES or NO) in the corresponding channels for CTMAS and for CTCMAS, which are defined in the same IOAGATE.

This was discovered when the second channel was initializing and had SSL=YES, while another channel that was already initialized had SSL=NO.

The variables in this message are:

- **appl1** - either EM or CM, depending on whether this channel supports CTMAS or CTCMAS
- **appl2** - either EM or CM, depending on whether the other channel supports CTMAS or CTCMAS

IOAGATE continues the initialization of the channel with SSL=YES.

**Corrective Action:** ECAPARM channel definitions should be corrected so that the channel definitions for both CTMAS and CTCMAS will have either SSL=YES or SSL=NO.

ECAA0OS IOAGATE name IS ALREADY ACTIVE FOR THE SAME ENVIRONMENT ON lpar

**Explanation:** An attempt to start IOAGATE failed because another IOAGATE for the same Control-M environment is already active on another LPAR.

**Corrective Action:** If the IOAGATE is required to run on this LPAR, first stop IOAGATE name on LAPR lpar.

ECAA10S IOAGATE MIGHT BE DOWN, HEARTBEAT RESOURCE Q(qName)R(rName) AVAILABLE

**Explanation:** An application server determined that the specified IOAGATE heartbeat resource is available.
During initialization, an application server checks the IOAGATE heartbeat resource availability to see if the IOAGATE is up and running. If the resource is available, then the IOAGATE is down. For more information, see the ECAG38I message.

The variables in this message are:

- \textit{qName} - the major name of a heartbeat resource of the IOAGATE
- \textit{rName} - the minor name of a heartbeat resource of the IOAGATE

The application server address space shuts down with a return code of 16.

**Corrective Action:** Check the IOAGATE logs to determine why IOAGATE is down, try to fix the problem and restart IOAGATE.

### ECAA11S ECAAMGR INTERNAL ERROR, \textit{func} CALL FAILED WITH RC(rsn)

**Explanation:** The application server manager encountered a severe internal error when trying to call the \textit{func} function.

Possible \textit{func} and \textit{rsn} (reason code) combinations, and their explanations, are shown in the following table:

<table>
<thead>
<tr>
<th>call</th>
<th>rsn</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>MBXATTCC1</td>
<td>20</td>
<td>ATTACH for the first mailbox failed.</td>
</tr>
<tr>
<td>MBXATTCC2</td>
<td>24</td>
<td>ATTACH for the second mailbox failed.</td>
</tr>
<tr>
<td>MBXREAD</td>
<td>28</td>
<td>A mailbox READ failed.</td>
</tr>
<tr>
<td>MBXWRIT1</td>
<td>32</td>
<td>WRITE of the first Ready message after ATTACH failed.</td>
</tr>
<tr>
<td>MBXWRIT2</td>
<td>36</td>
<td>WRITE of the Task Terminated message failed.</td>
</tr>
<tr>
<td>MBXWRIT3</td>
<td>40</td>
<td>WRITE of the Communication Update or Service Done internal management message failed.</td>
</tr>
</tbody>
</table>

The application server address space shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

### ECAA12I INITIALIZATION PROCEDURE( mod) COMPLETED SUCCESSFULLY

**Explanation:** This information message indicates that the application server invoked the \textit{mod} initialization module, and that the module completed successfully. During initialization, an application server invokes an initialization module if it is specified in the ECAPARM configuration file for that server.

**Corrective Action:** No action is required.
ECAA13E INITIALIZATION PROCEDURE(\textit{mod}) FAILED WITH RC(\textit{rsn})

\textbf{Explanation:} The application server invoked the \textit{mod} initialization module, and the module failed. During initialization, an application server invokes an initialization module if it is specified in the ECAPARM configuration file for the application server.

The variables in this message are:

- \textit{mod} - the module that failed
- \textit{rsn} - the reason code indicating the failure level. Failure levels of 08 and above are fatal, and bring the application server down.

The application server address space shuts down with a return code of 56.

\textbf{Corrective Action:} Do the following.

1. Examine the log of the application server for other error messages.
2. Correct any problems.
3. Restart IOAGATE.
4. If the problem persists, report the module name and reason code to BMC Software Customer Support.

ECAA14I MODIFY HANDLER (\textit{modName}) WAS LOADED

\textbf{Explanation:} This information message indicates that the application server successfully loaded the \textit{modName} module. The loaded module is a handler that performs MODIFY commands dedicated for the application server. The application server loads this module during initialization.

\textbf{Corrective Action:} No action is required.

ECAA15I PINGING(\textit{pingId}) NODE(\textit{node})

\textbf{Explanation:} Message indicates that the F CTOAS,PING MODIFY command was issued in the Control-O application server address space and a PING message was sent to the partner Control-O application server.

The variables in this message are:

- \textit{pingId} - the internal identity of this ping message
- \textit{node} - the node identity of the partner application server

\textbf{Corrective Action:} No action is required.

ECAA16I PING(\textit{pingId}) REQUEST RECEIVED FROM(\textit{node}) SERVER(\textit{serverId})

\textbf{Explanation:} This information message indicates that the F CTOAS,PING MODIFY command was issued in the Control-O application server of the partner and a PING request message has arrived at the local Control-O application server.

The variables in this message are:
**ECAA17I** PING(pingId) RESPONSE FROM(node) ARRIVED IN nnn MILLISECONDS

**Explanation:** This information message indicates that the F CTOAS,PING MODIFY command was issued in the Control-O Application server and the response ping message has arrived from the pinging partner Control-O application server.

The variables in this message are:

- **pingId** - the internal identity of this ping message
- **node** - the node identity of the partner Control-O application server
- **nnn** - the time interval in milliseconds required for a ping message to travel in both directions

**Corrective Action:** No action is required.

**ECAA18W** PING DROPPED, NODE (node) rsn

**Explanation:** This information message indicates that the F CTOAS,PING MODIFY command was issued in the Control-O Application server, but the command was not performed for the reason rsn.

Valid values for rsn are:

- **NOT FOUND IN PDT** - severe internal error
- **NOT FOUND IN PLT** - severe internal error
- **MBX WRITE DISABLED** - mailbox error encountered
- **COMMUNICATION ERROR** - an IOAGATE-to-IOAGATE connection was not established

**Corrective Action:** No action is required.

**ECAA19I** ctrl_msg received for Server(servr_id).

**Explanation:** The application server servr_id received the internal control message ctrl_msg from IOAGATE.

Valid values for ctrl_msg are:

- **INITIALIZE** - internal control command to initialize an application server
- **ATTACHSERVER** - internal control command to start an application server task
- **CONNECTIONUP** - internal control command to inform an application server task that the communication channel is up and running

**Corrective Action:** No action is required.
Messages ECAB00 through ECABxx

This group includes messages for the IOA (infrastructure) product.

**ECAB01I** CHANNEL\((channelId)\) ECAPARM PORT SUCCESSFULLY OVERRIDDEN BY THE EXEC PARM VALUE

**Explanation:** This information message indicates that the PORT value specified in the EXEC PARM parameters successfully replaced the ECAPARM PORT value of the indicated channel.

During initialization, IOAGATE checks for any EXEC PARM parameters specified at startup. If a TCP/IP port number was specified in EXEC PARM, then IOAGATE replaces the PORT value specified in the ECAPARM configuration file for the indicated channel with the value from EXEC PARM. If the channel is not specified, IOAGATE modifies the first channel in the ECAPARM configuration file.

In this message, \(channelId\) identifies the channel with the PORT value that was replaced.

**Corrective Action:** No action is required.

**ECAB02I** CHANNEL\((channelId)\) ECAPARM APPLIDS SUCCESSFULLY OVERRIDDEN BY THE EXEC PARM VALUE

**Explanation:** This information message indicates that the APPLIDS values specified in the EXEC PARM parameters successfully replaced the ECAPARM APPLIDS values of the specified channel.

During initialization, IOAGATE checks for any EXEC PARM parameters specified at startup. If VTAM LU 6.2 (APPC) APPLIDS was specified in EXEC PARM, IOAGATE tries to replace the APPLIDS values specified in the ECAPARM configuration file for the indicated channel with values from EXEC PARM. If the channel is not specified, IOAGATE modifies the first channel in the ECAPARM configuration file.

In this message, \(channelId\) identifies the channel with the APPLIDS values that were replaced.

**Corrective Action:** No action is required.

**ECAB03W** PORT AND APPLID CANNOT BE SPECIFIED FOR THE SAME CHANNEL SIMULTANEOUSLY

**Explanation:** A PORT value and an APPLID value were specified in the EXEC PARM parameters simultaneously.

During initialization, IOAGATE checks for any EXEC PARM parameters specified at startup. A TCP/IP port number and a VTAM LU 6.2 (APPC) APPLID were specified in the EXEC PARM parameters simultaneously. These values cannot be specified together.

Both the PORT and APPLID values are ignored. Normal processing continues.

**Corrective Action:** Correct the indicated parameters and restart IOAGATE.

**ECAB04I** CHANNEL\((channelId)\) ECAPARM APPLID SUCCESSFULLY OVERRIDDEN BY THE EXEC PARM VALUE

**Explanation:** This information message indicates that the APPLID value specified in the EXEC PARM parameters successfully replaced the ECAPARM APPLID value of the specified channel.
During initialization, IOAGATE checks for any EXEC PARM parameters specified at startup. If VTAM LU 6.2 (APPC) APPLID was specified in EXEC PARM, IOAGATE tries to replace the APPLID value specified in the ECAPARM configuration file for the indicated channel, with the value from EXEC PARM. If the channel is not specified, IOAGATE modifies the first channel in the ECAPARM configuration file.

In this message, channelId identifies the channel for which the APPLID value was replaced.

**Corrective Action:** No action is required.

**ECAB05W PORT(port) SPECIFIED BY THE EXEC PARM WAS NOT APPLIED**

**Explanation:** The PORT value in the EXEC PARM parameters was not used, and the ECAPARM PORT value is still valid.

During initialization, IOAGATE checks for any EXEC PARM parameters specified at startup. When a TCP/IP port number is specified in EXEC PARM, the IOAGATE tries to replace the PORT value specified in the ECAPARM configuration file for the intended channel with the value from EXEC PARM.

The current attempt failed and the ECAPARM PORT value is still valid. The channel for which the specified PORT value was intended may have been disabled during initialization.

In this message, port is the TCP/IP communication port value specified in EXEC PARM.

**Corrective Action:** Do the following:
1. Look for more information in
   - IOAGATE JES log
   - the DAIGLOG log
   - the DATRACE log
2. Try to correct the problem.
3. If you cannot correct the problem, contact BMC Software Customer Support.

**ECAB06W APPLIDS(applId1, applId2) SPECIFIED BY THE EXEC PARM WERE NOT APPLIED**

**Explanation:** The APPLIDS values specified in the EXEC PARM parameters were not used, and the ECAPARM APPLIDS values are still valid.

During initialization, IOAGATE checks for any EXEC PARM parameters specified at startup. When VTAM APPLIDS application IDs are specified in EXEC PARM, the IOAGATE tries to replace the APPLIDS values specified in the ECAPARM configuration file for the intended channel with the values from EXEC PARM.

The current attempt failed and the ECAPARM APPLIDS values are still valid. The channel for which the specified APPLIDS values were intended may have been disabled during the initialization.

In this message, applId1 and applId2 are VTAM LU 6.2 (APPC) application IDs specified by the APPLIDS parameter in EXEC PARM for a dual connection (DC) SNA channel.

**Corrective Action:** Do the following:
1. Look for more information in
   - the IOAGATE JES log
   - the DAIGLOG log
• the DATTRACE log

2. Try to correct the problem.
3. If you cannot correct the problem, contact BMC Software Customer Support.

**ECAB08E PORT SPECIFIED BY THE EXEC PARM FOR SNA CHANNEL(channelId) CANNOT BE USED**

**Explanation:** A PORT value that was specified in the EXEC PARM parameters was not applied.

During initialization, IOAGATE checks for any EXEC PARM parameters specified at startup, and tries to modify the channel that is explicitly specified in the EXEC PARM parameters. If the channel is not specified, IOAGATE modifies the first channel in the ECAPARM configuration file.

The TCP/IP port number was specified in the EXEC PARM parameters. However, IOAGATE could not apply the PORT value.

In this message, **channelId** is the identity of the SNA channel.

Possible causes are:

- A specific CHAN parameter was specified in EXEC PARM parameters, but this is an SNA channel.
- IOAGATE tried to apply the PORT value to the first ECAPARM channel, but this channel is an SNA channel.

The PORT parameter in EXEC PARM is ignored. Normal processing continues.

**Corrective Action:** Correct the EXEC PARM parameters and restart IOAGATE.

**ECAB09E applIdParm SPECIFIED BY THE EXEC PARM FOR CHANNEL(channelId.TCP) CANNOT BE USED**

**Explanation:** The APPLID or APPLIDS values set in the EXEC PARM parameters cannot be used. During initialization, IOAGATE checks for any EXEC PARM parameters specified at startup, and tries to modify the channel that is explicitly specified in the EXEC PARM parameters. If the channel is not specified, IOAGATE modifies the first channel in the ECAPARM configuration file.

APPLID or APPLIDS values were specified in the EXEC PARM parameters. However, IOAGATE could not apply the specified values.

Possible causes are:

- An explicit CHAN parameter was specified in the EXEC PARM parameters, but this is a TCP channel.
- IOAGATE tried to apply the specified value to the first ECAPARM channel, but this channel is a TCP channel.

The variables in this message are:

- **applIdParm** - the APPLID or APPLIDS parameter specified by the user in the EXEC PARM parameters
- **channelId** - the identity of the TCP channel

The APPLID or APPLIDS EXEC PARM parameter is ignored. Normal processing continues.

**Corrective Action:** Correct the EXEC PARM parameter **applIdParm** and restart IOAGATE.
ECAB0AE IMPROPER CHANNEL(channel, chEntryId) SPECIFIED TO SUPPORT MAP(mapId), APSERVER(applName, apEntryId) DISABLED

**Explanation:** IOAGATE detected an invalid channel reference from an APSERVER definition in the ECAPARM configuration file.

During initialization, IOAGATE reads and verifies definitions specified in the ECAPARM configuration file. The specified channel cannot serve IOAGATE-to-IOAGATE communication over a multiple connection (MC) channel with the network map specified.

The variables in this message are:

- **channel** - the channel identity assigned by the user in the ECAPARM configuration file
- **chEntryId** - the sequential number of the channel definition entry in the ECAPARM configuration file
- **mapId** - the name of a member in the IOA PARM library that describes a map of network connections between IOAGATEs allowing one IOAGATE to communicate with another over a multiple connection (MC) channel
- **applName** - the full name of the application declared by an APSERVER definition
- **apEntryId** - the sequential number of an APSERVER definition entry in the ECAPARM configuration file

The specified APSERVER definition is disabled. Processing continues.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

---

ECAB0BE CHANNEL(channel, chEntryId) MAP MUST BE SPECIFIED, APSERVER(applName, apEntryId) DISABLED

**Explanation:** IOAGATE detected an improper channel specification for the application.

During initialization, IOAGATE reads and verifies definitions specified in the ECAPARM configuration file. It detected that the specified channel does not have a network map specification that is required for the indicated application server.

The variables in this message are:

- **channel** - the channel identity assigned by the user in an APSERVER definition
- **chEntryId** - the sequential number of the channel definition entry in the ECAPARM configuration file
- **applName** - the full name of the application declared by an APSERVER definition
- **apEntryId** - the sequential number of an APSERVER definition entry in the ECAPARM configuration file

The specified APSERVER definition is disabled. Processing continues.

**Corrective Action:** Correct the APSERVER and CHANNEL definitions and restart IOAGATE.
ECAB0DI  processor PROCESSOR CREATED(timeStamp) CCID(changeLevel)

**Explanation:** This information message indicates the program level of the specified processor of IOAGATE.

The variables in this message are:
- **processor** - the name of the parameter member. Valid values are:
  - ECAAPPL
  - ECAPARM
  - NWORKMAP
- **timeStamp** - the date and time when the specified processor was compiled
- **changeLevel** - the level of the change that was last applied to the specified processor

**Corrective Action:** No action is required.

ECAB10W EXEC PARM PARAMETER CHAN= MUST BE 2 CHARACTERS EXACTLY, PARAMETER IGNORED

**Explanation:** The value of the CHAN parameter that was specified at startup of the IOAGATE is invalid. The channel ID specified by the CHAN parameter must have two characters exactly.

**Corrective Action:** Correct the value of the CHAN parameter and restart IOAGATE.

ECAB11S INSUFFICIENT MEMORY(area_size) GETMAIN FOR (area_id) FAILED

**Explanation:** The GETMAIN request issued by IOAGATE or the application server address space failed. IOAGATE issued a GETMAIN request during initialization to obtain main storage for the specified area. However the call failed because there was not enough main storage.

The variables in this message are:
- **area_size** - the size of the area GETMAIN requested
- **area_id** - the internal identity of the area for which main storage resources were requested.

The IOAGATE or application server address space shuts down with a return code of 56 or 08, respectively.

**Corrective Action:** Increase the region size and restart the IOAGATE. If you cannot resolve the problem, contact BMC Software Customer Support.

ECAB17W EXEC PARM PARAMETER PORT= MUST BE A NUMERIC VALUE IN THE RANGE FROM 1024 TO 65534

**Explanation:** The value set for the PORT parameter in the EXEC PARM parameters is invalid. The PORT parameter value must be in the range from 1024 through 65534. The PORT parameter value specified in the ECAPARM configuration file remains valid.
Corrective Action: Specify a valid value for the PORT parameter in the EXEC PARM parameters, and restart IOAGATE.

ECAB18W EXEC PARM PARAMETER APPLID= MUST BE UP TO 8 ALPHANUMERIC CHARACTERS

Explanation: The APPLID parameter value specified in the EXEC PARM parameters is invalid. The APPLID parameter must comply with VTAM naming conventions. The value of the APPLID parameter specified in the ECAPARM configuration file is still valid.

Corrective Action: Specify a valid value for the APPLID parameter in the EXEC PARM parameters and restart IOAGATE.

ECAB22I EXEC PARM PARAMETERS: params

Explanation: This information message displays the EXEC PARM parameters that were specified in the PARM field of the EXEC JCL statement.

Corrective Action: No action is required.

ECAB27I START FOR SERVER TASK(type, taskId, addrSpaceId) INITIATED

Explanation: This information message indicates that the operator issued the F IOAGATE,STARTTID=taskId command. IOAGATE submitted a STARTTID command for the specified task.

The variables in this message are:
- type - the CS (application server) task type
- taskId - the internal identity of a server task
- addrSpaceId - the internal identity of the application server address space to which this task belongs

Corrective Action: No action is required.

ECAB30E AN ATTEMPT TO LAUNCH SERVER TASK(taskId) FAILED

Explanation: An attempt to launch an application server task failed. During initialization or automatic recovery, IOAGATE launches the server tasks for all application servers defined in the ECAPARM configuration file. However, an attempt to launch a server task failed.

In this message, taskId identifies the server task that failed.

Corrective Action: Examine the IOAGATE JES log, DAIGLOG, DATRACE logs for more information about the problem. Try to find the cause and correct the problem.

ECAB32S ECAGTW INTERNAL ERROR, ADDRESS/VALUE(value_id) LOST

Explanation: IOAGATE encountered a severe internal error. IOAGATE may shut down or continue, depending on the severity of the error.
Corrective Action: Contact BMC Software Customer Support.

ECAB36E SERVER TASK(\textit{type}, \textit{taskId}, \textit{addrSpaceId}) CANNOT BE STOPPED BY OPERATOR

Explanation: IOAGATE rejected an \texttt{F IOAGATE,STOPTID=taskId} command, because an operator is not allowed to stop this task. A STOPTID command was issued for a CM, CD or CU server task. The specified server task can be stopped only if an entire application server address space is stopped.

The variables in this message are:

- \textit{type} - the server task type Possible values are:
  - CM - the manager of the address space of an application server
  - CD - a detector server
  - CU - an updater server
- \textit{taskId} - the internal identity of a server task
- \textit{addrSpaceId} - the internal identity of the application server address space to which this task is assigned

The modify command is rejected.

Corrective Action: Use the \texttt{F IOAGATE,STATUS} command to specify the task ID, and reissue the command.

ECAB38I AUTOMATIC RECOVERY \textit{(recoveryId)} FOR APPL.SERVER \textit{(applServerName, addrSpaceId)} INITIATED

Explanation: This information message indicates that an application server address space abended, and IOAGATE initiated an automatic recovery. IOAGATE initiates an automatic recovery for an abended server address space if a nonzero value is specified for the MAXRECOV parameter in the APSERVER definition for this application server.

The variables in this message are:

- \textit{recoveryId} - the internal sequence number of this recovery incident
- \textit{applServerName} - the full name of the application server
- \textit{addrSpaceId} - the internal identity of the application server address space

Corrective Action: No action is required.

ECAB39W APPL.SERVER \textit{(applServerName, addrSpaceId)} CANNOT BE RECOVERED, THRESHOLD(\textit{threshold}) REACHED

Explanation: An application server address space abended, and IOAGATE cannot initiate the automatic recovery for the server. IOAGATE does not initiate an automatic recovery for the abended application server, because the maximum number of subsequent recovery retries was already performed. This threshold is specified by the MAXRECOV parameter in the APSERVER definition in the ECAPARM configuration file for this application server.

Note:
Recovery retries are subsequent if the interval between retries is shorter than the time specified by the 
RECVRSET parameter in the ECAPARM configuration file.

The variables in this message are:

- `applServerName` - the name of the application server
- `addrSpaceId` - the internal identity of the application server address space
- `threshold` - the maximum number of subsequent recovery retries

**Corrective Action:** Examine the IOAGATE JES log, the DAIGLOG log, and the DATRACE log for more 
messages about the problem. Try to determine why the application server failed and correct the problem. 
If you cannot correct the problem, call your system programmer for assistance.

**Explanation:** A server task abended, and IOAGATE cannot initiate an automatic recovery for this server 
task.

IOAGATE does not initiate an automatic recovery for the abended application server task, because the 
maximum number of subsequent recovery retries was already performed. The MAXRECOV parameter in 
the APSERVER definition in the ECAPARM configuration file for this application server specifies the 
maximum number of subsequent retries allowed.

Note:

Recovery retries are subsequent if the interval between retries is shorter than the time specified by the 
RECVRSET parameter in the ECAPARM configuration file.

The variables in this message are:

- `type` - the CS (application server) task type
- `taskId` - the internal identity of a server task
- `addrSpaceId` - the internal identity of the application server address space to which this task 
belongs
- `threshold` - the maximum number of subsequent recovery retries

**Corrective Action:** Call your system programmer for assistance.

**Explanation:** This information message indicates that an application server task abended, and IOAGATE 
initiated an automatic recovery.

IOAGATE initiates an automatic recovery for the abended application server task, if a nonzero value was 
specified for the MAXRECOV parameter in the APSERVER definition for this application server.

The variables in this message are:
• **recoveryId** - the internal sequence number of this recovery incident
• **type** - the CS application server task type
• **taskId** - the internal identity of the server task
• **addrSpaceId** - the internal identity of the application server address space

**Corrective Action:** No action is required.

**ECAB42I ***** text date *******

**Explanation:** This information message displays the current local date at the system on which the IOAGATE is running. It is first issued when IOAGATE initialization is completed. It is issued again, at the beginning of each day.

The variables in this message are:

• **text** - Valid values are:
  • LOCAL CURRENT DATE (after initialization)
  • NEW DAY STARTED (beginning of new day)

• **date** - the local current date. The date format is defined in the IOAPARM member. The format can be redefined for IOAGATE by the DATETYPE parameter in the ECAPARM configuration file. Valid formats are:
  • MMDDYYYY
  • DDMMYYYY (default)
  • YYYYDDD
  • YYYYMMDD

**Corrective Action:** No action is required.

**ECAB43W SERVER TASK(type.taskId.addrSpaceId) BUSY duration units, WARNING interval(repeater) SECs USER(userId) SIID(serviceInstanceId)**

**Explanation:** The status of the application server task stayed BUSY with the same SIID service for longer than the warning interval allowed by the ECAPARM configuration file. This message indicates a possible internal problem in IOAGATE.

The variables in this message are:

• **type** - the server task type Valid values are:
  • CM - the manager of the address space of an application server
  • CS - an application server
  • CD - a detector server
  • CU - an updater server
taskId - the internal identity of the problematic server task. If this server task is busy handling a request for an alias application, taskId is the short application code of the alias.

addrSpaceId - the internal identity of the server address space to which this task is assigned.

duration - the number of time units during which the server task handles the same service for the same user.

units - the type of time unit in which the actual duration is expressed. Valid values are:
  - secs - The duration is expressed in seconds
  - mins - The duration is expressed in minutes

If the actual duration is less than 5 minutes, duration is expressed in seconds. If the actual duration is 5 minutes or more, duration is expressed in minutes.

interval - the number of units to wait before issuing this message. The first time this message is issued, interval is defined by the SERVDUR parameter in the ECAPARM configuration file.

The value of interval for the second warning, and all subsequent warnings, is defined by the SERVDUR and NWARNING parameters that can be set in the ECAPARM configuration file. If both parameters are set, then interval is the value of SERVDUR multiplied by the value of NWARNING.

Setting SERVDUR to 0 in the ECAPARM configuration file for this server disables the message completely for this server. Setting NWARNING to 0 disables the second and all subsequent warnings. The default for SERVDUR is 60 seconds; the default for NWARNING is 10.

repeater - the number of interval periods before a second or subsequent warning is issued. The value of repeater can be specified in the NWARNING parameter in the ECAPARM configuration file. Valid values are 0 through 99. The default is 0, meaning that this message (ECAB43W) is issued only once.

userId - the identity of the user whose request is in process.

serviceInstanceId - the service instance identity (SIID) that determines the which service request is handled by the server task.

**Corrective Action:** Examine the IOAGATE JES log, the DAIGLOG log, and the DATRACE log for more information. Try to determine the cause and correct the problem. Consider reassigning the SERVDUR and NWARNING parameters. If the problem persists, contact BMC Software Customer Support.

**ECAB44W APPL.SERVER(addrSpaceId) DOES NOT EXIST**

**Explanation:** An attempt to stop a specified application server using an FIOAGATE, STOPASID=addrSpaceId command failed, because the specified application server address space identity is incorrect. The application server address space identity addrSpaceId must be the correct internal identity of an application server address space.

The modify command is rejected. Normal processing continues.

**Corrective Action:** Use the F IOAGATE,STATUS command to identify the correct application server address space identity, and then reissue the command correctly.
ECAB47I SERVER TASK(aplServerName.type.taskId.addrSpaceId) RECOVERED SUCCESSFULLY

**Explanation:** This information message indicates that an application server task recovered successfully.

The variables in this message are:
- `aplServerName` - the name of the application server
- `type` - the CS server task type
- `taskId` - the internal identity of the server task
- `addrSpaceId` - the internal identity of the application server address space

**Corrective Action:** No action is required.

ECAB48I APPL.SERVER (aplServerName.addrSpaceId.stcId) RECOVERED SUCCESSFULLY

**Explanation:** This information message indicates that the specified application server recovered successfully.

The variables in this message are:
- `aplServerName` - the name of the application server
- `addrSpaceId` - the internal identity of the application server address space
- `stcId` - the name of the JCL procedure used to start the application server address space

**Corrective Action:** No action is required.

ECAB49I SERVER TASK(aplServerName.type.taskId.addrSpaceId) STARTED SUCCESSFULLY

**Explanation:** This information message indicates that IOAGATE launched the specified application server task, and it started successfully.

The variables in this message are:
- `aplServerName` - the full name of the application server
- `type` - the server task type Valid values are:
  - `CM` - the manager of the address space of an application server
  - `CS` - application server
  - `CD` - a detector server
  - `CU` - updater server
- `taskId` - the internal identity of the server task
- `addrSpaceId` - the internal identity of the application server address space

**Corrective Action:** No action is required.
ECAB4AW CHANNEL(channelId.protocol) TASK(taskId) TIMEOUT OCCURRED WHILE AWAITING REPLY FROM USER(userId) SIID(serviceInstanceId) SID(serviceId)

**Explanation:** This warning message indicates that a time-out occurred while awaiting reply from a partner or client because the partner or client did not respond to the message sent by IOAGATE during the time-out interval.

The variables in this message are:

- **channelId** - the identity of the channel that detected the event
- **protocol** - the communication protocol used by the channel.
  
  Valid values are:
  
  - TCP - TCP/IP communication protocol
  - SNA - SNA communication protocol

- **taskId** - the internal identity of the communication task that detected the event.
  
  Valid values are:
  
  - COMTASK
  - RECEIVER

- **userId** - the identity of the user whose request was in process

- **serviceInstanceId** - the service instance identity (SIID) that indicates the service request being handled by IOAGATE

- **serviceId** - the code of a transaction to be performed by IOAGATE

The connection is assumed to be broken and the service is discarded.

**Corrective Action:** Check status of the partner or client and its communication link to IOAGATE.

ECAB4BW SERVER TASK(type.taskId.addrSpaceId) WILL BE CANCELLED DUE TO BEING BUSY FOR duration MINs, USER(userId) SIID(serviceInstanceId)

**Explanation:** The application server task is going to be terminated, because it has been in BUSY status with the same SIID service for more than the maximum time allowed by the BUSYDUR parameter in the ECAPARM configuration file. This may indicate a potential internal problem in IOAGATE or in the application server address space.

The variables in this message are:

- **type** - the server task type.
  
  Valid values are:
  
  - CM - the manager of the address space of an application server
  - CS - application server
  - CD - detector server
  - CU - updater server
The specified application server task is terminated. If it is a critical task, then the whole application server address space is terminated due to this server task failure.

**Corrective Action:** Do the following:

1. If the problem persists, examine the IOAGATE JES log, DAI GLOG log, and DATRACE log for additional information about the potential problem.
2. Try to find the cause and correct the problem.
3. Consider re-assigning a BUSYDUR parameter.
4. If the problem is not resolved, contact BMC Software Customer Support.

ECAB50I
APPL.SERVER( applServerName.addrSpaceId.proc.stcId.channelId/jobId)
STARTED SUCCESSFULLY

**Explanation:** This information message indicates that the specified application server started successfully.

The variables in this message are:

- **applServerName** - the name of the application server
- **addrSpaceId** - the internal identity of the application server address space
- **proc** - the name of the procedure of the application server address space
- **stcId** - the name of the JCL procedure used to start the application server address space
- **channelId** - the channel identity referenced from the APSERVER definition that creates this application server
- **jobId** - the STC JOBID of the application server assigned by JES to its address space

**Corrective Action:** No action is required.

ECAB51W APPL.SERVER( applServerName.addrSpaceId.stcId.channelId) HAS NOT BECOME AVAILABLE IN THE LAST interval SECONDS

**Explanation:** The application server has not started in the specified time interval, either since IOAGATE launched the application server, or since the last occurrence of the same warning. There might be a problem that prevents the application server from starting in time.

The variables in this message are:
- `applServerName` - the name of the application server
- `addrSpaceId` - the internal identity of the application server address space
- `stcId` - the name of the JCL procedure used to start the application server
- `channelId` - the channel identity referenced from the APSERVER definition that creates this application server
- `interval` - the number of seconds to wait before issuing this warning message. The default is 180 seconds.

**Corrective Action:** Check the application server log, the IOAGATE log, the JES log, the DAI GLOG log, and the DATRACE log for more information. If you cannot correct the problem, contact BMC Software Customer Support.

**Explanation:** An internal timer did not start for the specified server task due to an internal problem.

The variables in this message are:

- `type` - the server task type. Valid values are:
  - `CM` - the manager of the address space of an application server
  - `CS` - application server
  - `CD` - detector server
  - `CU` - updater server

- `taskId` - the internal identity of this server task
- `addrSpaceId` - the internal identity of the application server address space

**Corrective Action:** If the problem persists, contact BMC Software Customer Support.

**Explanation:** IOAGATE detected that the specified server task has had the same temporary status for longer than the maximum time interval defined in the ECAPARM configuration file. This condition might indicate an internal problem in IOAGATE.

The variables in this message are:

- `type` - the server task type. Valid values are:
  - `CM` - the manager of the address space of an application server
  - `CS` - application server
  - `CD` - detector server
  - `CU` - updater server
INCONTROL for z/OS Messages Manual

- **taskId** - the internal identity of the problematic server task
- **addrSpaceId** - the internal identity of the application server address space to which the indicated task belongs
- **status_id** - the internal identity of the status in which the server task stays
  
  Valid values are:
  - WAIT
  - PENDING
- **interval** - the number of seconds to wait before issuing this warning message
  
  This value can be assigned by the STATDUR parameter in the ECAPARM configuration file. The default is 60 seconds.

Normal processing continues. However, the further consequences of the event are unpredictable.

**Corrective Action:** If the problem persists, call BMC Software Customer Support.

ECAB55W SERVER TASK (type.taskId.addrSpaceId) HAS NOT BECOME AVAILABLE IN THE LAST interval SECONDS

**Explanation:** The server task did not start within the indicated time interval.

There might be a problem that prevents a server task from being started in time.

The variables in this message are:

- **type** - the server task type
  
  Valid values are:
  - CM - the manager of the address space of an application server
  - CS - application server
  - CD - detector server
  - CU - updater server
- **taskId** - the internal identity of the server task
- **addrSpaceId** - the internal identity of the application server address space to which the indicated server task belongs
- **interval** - the time interval in seconds to wait before issuing this warning

**Corrective Action:** Check the application server log, the IOAGATE JES log, the DAI GLOG log, and the DATRACE log for more information. If you cannot correct the problem, contact BMC Software Customer Support.

ECAB56W SERVER TASK (type.taskId.addrSpaceId) FAILED TO RECOVER IN THE LAST interval SECONDS

**Explanation:** The specified server task did not recover successfully during the specified time interval.

There might be a problem that prevented the application server task from recovering in time.

The variables in this message are:
ECAB57W APPL.SERVER (applServerName.addrSpaceId.stcId.channelId)
FAILED TO RECOVER IN THE LAST time SECONDS

Explanation: The specified application server did not recover successfully within the specified time interval. There might be a problem that prevented the application server from recovering in time.

The variables in this message are:

- **applServerName** - the name of the application server
- **addrSpaceId** - the internal identity of the server address space
- **stcId** - the JCL procedure used to start the application server address space
- **channelId** - the channel used by this application server
- **time** - the actual time in seconds during which the application server did not recover

Corrective Action: Check the IOAGATE JES log, the DAIGLOG log, and the DATRACE log for more information. Try to correct the problem. Consider reassigning a SERVDUR parameter. For more assistance, contact BMC Software Customer Support.

ECAB60I STATISTICS COLLECTION STARTED. INTERVAL IS interval MINUTES

Explanation: This information message indicates that statistics collection for IOAGATE communication started. It is issued during IOAGATE startup when STAT is set to YES in the ECAPARM configuration file, and when the command F IOAGATE,STATON,INTERVAL= interval is issued.

Up to six columns of statistics are collected and saved. After that, existing columns are overwritten. For example, the seventh column of statistics replaces the first.

In this message, interval is the number of minutes during which statistics are collected for each column. After interval minutes, statistics collection for the next column begins.

Corrective Action: No action is required.

ECAB61I STATISTICS COLLECTION STOPPED

Explanation: This information message indicates that statistics collection stopped in response to an F IOAGATE,STATOFF command. Collected data is purged and will not be available.

Corrective Action: No action is required.
ECAB62I STATISTICS DATA WAS RESET

Explanation: This information message indicates that the command F IOAGATE,STATRESET was issued. Data collected earlier is purged, and collection of new data restarts immediately.
Corrective Action: No action is required.

ECAB63W STATISTICS COLLECTION IS ALREADY ON

Explanation: An F IOAGATE,STATON command was issued, but statistics collection for IOAGATE was already active. To reset the statistics collected data, use the command F IOAGATE,STATRESET instead. IOAGATE statistics collection is not restarted. The modify command is rejected.
Corrective Action: No action is required.

ECAB64W STATISTICS COLLECTION IS ALREADY OFF

Explanation: An F IOAGATE,STATOFF command was issued, but statistics collection for IOAGATE was not active. The modify command is rejected. Normal processing continues.
Corrective Action: No action is required.

ECAB65W INVALID STATISTICS INTERVAL WAS SPECIFIED

Explanation: The value of interval in the command F IOAGATE,STATON,INTERVAL=interval is not valid. The statistics interval sets the time scale for statistics collection and presentation. It must be in the range from 1 through 999 (minutes). For example, if INTERVAL is set to 5, the statistics report will maintain and present the figures at intervals of 5 minutes. The modify command is rejected. Normal processing continues.
Corrective Action: Correct the value of interval and reissue the command.

Messages ECAC00 through ECACxx

This group includes messages for the IOA (infrastructure) product.

ECAC60E CHANNEL(channelId.protocol) TASK(taskId.type) SIB ALLOCATION FAILED FOR msgType.reqType MESSAGE

Explanation: IOAGATE encountered an internal problem when trying to allocate a SIB (Service Instance Block) control block for the current transaction (message).
The variables in this message are:
The variables in this message are:

- **channelId** - the identity of the channel that detected the problem
- **protocol** - the current channel uses this communication protocol. Valid values are:
  - TCP - TCP/IP communication protocol
  - SNA - SNA communication protocol
- **taskId** - the internal identity of the channel task that detected the problem
- **type** - the internal type of the channel task that detected the problem
- **msgType** - the type of the message. Valid values are:
  - INCOMING
  - OUTGOING
  - INTERNAL
- **reqType** - the type of the request. This variable may not appear. Valid values are:
  - NOTIFY
  - STOP
  - CANCEL
  - MODIFY
  - INIT
  - ATTTACH

Corrective Action: If the message persists, contact BMC Software Customer Support.

ECAC61E CHANNEL(\texttt{channelId.protocol}) TASK(\texttt{taskId.type}) SIB LOCK FAILED FOR \texttt{msgType.reqType} MESSAGE

Explanation: IOAGATE encountered an internal problem when processing the SIB (Service Instance Block) control block of the current transaction (message).

The variables in this message are:

- **channelId** - the identity of the channel that detected the problem
- **protocol** - the current channel uses this communication protocol. Valid values are:
  - TCP - TCP/IP communication protocol
  - SNA - SNA communication protocol
- **taskId** - the internal identity of the channel task that detected the problem
- **type** - the internal type of the channel task that detected the problem
- **msgType** - the type of the message. Valid values are:
  - INCOMING
  - OUTGOING
  - INTERNAL
 reqType - the type of the request. This variable may not appear. Valid values are:

- NOTIFY
- STOP
- CANCEL
- MODIFY
- INIT
- ATTACH

**Corrective Action:** Contact BMC Software Customer Support if the message persists.

ECAC62E CHANNEL((channelId.protocol) TASK(taskId.type) msgType
MESSAGE FAILED DUE TO DISCONNECTION, PORT(port) / APPL ID(appId)

**Explanation:** IOAGATE failed to process the specified message due to disconnection on the indicated port (TCP protocol) port or the VTAM application ID (SNA protocol) appId.

The variables in this message are:

- channelId - the identity of the channel that detected the problem
- protocol - the current channel uses this communication protocol. Valid values are:
  - TCP - TCP/IP communication protocol
  - SNA - SNA communication protocol
- taskId - the internal identity of the channel task that detected the problem
- type - the internal type of the channel task that detected the problem
- msgType - the type of the message. Valid values are:
  - INCOMING
  - OUTGOING
  - INTERNAL
- port - the port number for TCP disconnection
- applId - the VTAM application identity for SNA disconnection

**Corrective Action:** Contact BMC Software Customer Support if the message persists.

ECAC63I CHANNEL((channelId.SNA) DEALLOCATE SENT TO PARTNER
LU(luName) OUT_CONV_ID(out_conversation_id)
IN_CONV_ID(in_conversation_id)

**Explanation:** This information message indicates that a DEALLOCATE command was sent to the partner IOAGATE, because either the partner or the local IOAGATE terminated.

The variables in this message are:
If the partner IOAGATE is terminating, the local IOAGATE sends a termination message to the partner IOAGATE. If the local IOAGATE is terminating, it sends termination messages to its partner IOAGATEs.

**Corrective Action:** No action is required.

**Explanation:** IOAGATE rejected the specified message because no Application server was available.

The variables in this message are:

- `channelId` - the identity of the channel that rejected the message
- `protocol` - the current channel uses this communication protocol. Valid values are:
  - TCP - TCP/IP communication protocol
  - SNA - SNA communication protocol
- `taskId` - the internal identity of the channel task that rejected the message
- `type` - the internal type of the channel task that rejected the message
- `msgType` - the type of the message. Valid values are:
  - INCOMING
  - OUTGOING
  - INTERNAL

**Corrective Action:** Contact BMC Software Customer Support if the message persists.

**Explanation:** IOAGATE rejected the specified message because the required Application server was down.

The variables in this message are:

- `channelId` - the identity of the channel that rejected the message
- `protocol` - the current channel uses this communication protocol. Valid values are:
  - TCP - TCP/IP communication protocol
  - SNA - SNA communication protocol
INCONTROL for z/OS Messages Manual

- taskId - the internal identity of the channel task that rejected the message
- type - the internal type of the channel task that rejected the message
- msgType - the type of the message. Valid values are:
  - INCOMING
  - OUTGOING
  - INTERNAL
- addrSpaceId - the internal identity of the address space of the Application

Corrective Action: Contact BMC Software Customer Support if the message persists.

ECAC66E CHANNEL(channelId.protocol) TASK(taskId.type) msgType
MESSAGE REJECTED, CHANNEL DOES NOT SUPPORT APPLICATION(applCode)

Explanation: IOAGATE rejected the specified message because an invalid application was specified in the message.

The variables in this message are:
- channelId - the identity of the channel that rejected the message
- protocol - the current channel uses this protocolValid values are:
  - TCP - TCP/IP communication protocol
  - SNA - SNA communication protocol
- taskId - the internal identity of the channel task that rejected the message
- type - the internal type of the channel task that rejected the message
- msgType - the type of the messageValid values are:
  - INCOMING
  - OUTGOING
  - INTERNAL
- applCode - the application code

Corrective Action: Contact BMC Software Customer Support if the message persists.

ECAC67E CHANNEL(channelId.protocol) TASK(taskId.type) msgType
MESSAGE REJECTED, APPL. SERVER(applServer) IS UNAVAILABLE

Explanation: IOAGATE rejected the specified message because the required application server was unavailable.

The variables in this message are:
\begin{itemize}
  \item \textit{channelId} - the identity of the channel that rejected the message
  \item \textit{protocol} - the current channel uses this communication protocol
    \begin{itemize}
      \item TCP - TCP/IP communication protocol
      \item SNA - SNA communication protocol
    \end{itemize}
  \item \textit{taskId} - the internal identity of the channel task that rejected the message
  \item \textit{type} - the internal type of the channel task that rejected the message
  \item \textit{msgType} - the type of the message
    \begin{itemize}
      \item INCOMING
      \item OUTGOING
      \item INTERNAL
    \end{itemize}
  \item \textit{applServer} - the name of the unavailable application server
\end{itemize}

**Corrective Action:** Contact BMC Software Customer Support if the message persists.

ECAC68E CHANNEL(\textit{channelId.protocol}) TASK(\textit{taskId.type}) \textit{hshakeType}
HANDSHAKE(FROM=\textit{local_node_id} TO=\textit{target_node_id}) \textit{action}

**Explanation:** IOAGATE is about to ignore or reject the specified handshake message for the reason indicated in the message that accompanies this ECAC68E message.

The variables in this message are:
\begin{itemize}
  \item \textit{channelId} - the identity of the channel that rejected the handshake
  \item \textit{protocol} - the current channel uses this communication protocol
    \begin{itemize}
      \item TCP - TCP/IP communication protocol
      \item SNA - SNA communication protocol
    \end{itemize}
  \item \textit{taskId} - the internal identity of the channel task that detected the problem
  \item \textit{type} - the internal type of the channel task that detected the problem
  \item \textit{hshakeType} - the type of the handshake
    \begin{itemize}
      \item CONNECT
      \item CONFIRM
      \item REJECT
      \item INFORM
      \item UNKNOWN
    \end{itemize}
  \item \textit{local_node_id} - the identity of the local node in which the local IOAGATE is running
  \item \textit{target_node_id} - the identity of the partner node in which the partner IOAGATE is running
  \item \textit{action} - the action that IOAGATE is about to perform to the received handshake
    \begin{itemize}
      \item TO BE REJECTED
    \end{itemize}
\end{itemize}
IOAGATE disconnects from the IOAGATE that sent this handshake message.

**Corrective Action:** Correct the IOAGATE-to-IOAGATE connection configuration in the network map. For more information on configuring the network map, see the *INCONTROL for z/OS Installation Guide*.

**ECAC69I** REASON: NO PARTNER NODE IN MAP(mapId) MATCHES SENDER NODE(node_id) IN HANDSHAKE

**Explanation:** This message follows the ECAC68E message, and specifies the exact reason for the handshake rejection, which is that the network map does not contain the node name obtained in the handshake message.

The variables in this message are:

- `mapId` - the identity of the network map
- `node_id` - the identity of the partner node in which the partner IOAGATE is running

IOAGATE disconnects from the IOAGATE that sent this handshake message.

**Corrective Action:** Correct the IOAGATE-to-IOAGATE connection configuration in the network map. For more information on configuring the network map, refer to the *INCONTROL for z/OS Installation Guide*.

**ECAC6AI** LOCAL NODE(local_node_id) OF CHANNEL(channel) DOES NOT MATCH TARGET NODE(target_node_id) OF HANDSHAKE

**Explanation:** The message follows the ECAC68E message, and specifies an exact reason for the handshake rejection, that is, the local node name does not match the target node name obtained in the handshake message.

The variables in this message are:

- `local_node_id` - the identity of the local node in which the local IOAGATE is running
- `channel` - the identity of the channel that detected the problem
- `target_node_id` - the identity of the partner node in which the partner IOAGATE is running

IOAGATE disconnects from the partner IOAGATE that sent this handshake message.

**Corrective Action:** Correct IOAGATE-to-IOAGATE connection configuration in the network map. For more information on configuring the network map, see the *INCONTROL for z/OS Installation Guide*.

**ECAC6BI** REASON: INVALID HANDSHAKE RECEIVED: rsn

**Explanation:** This message follows the ECAC68E message, and specifies an exact reason for the handshake rejection, which is that the handshake message has an illegal format.

In this message, `rsn` is the reason for the identification of the handshake as invalid. Valid values are:
Bad HANDSHAKE ID
Bad Type-Message
Bad Type-Record
Bad Product-ID
Bad Software-Lvl

IOAGATE disconnects from the IOAGATE that sent the handshake message.

**Corrective Action:** Contact BMC Software Customer Support.

ECAC6CE CHANNEL(\textit{channelId.protocol}) TASK(\textit{taskId.type}) \textit{msgType} MESSAGE REJECTED, INVALID SEQUENCE NUMBER(\textit{seqNumber})

**Explanation:** IOAGATE rejected the specified message due to an invalid sequence number in the message.

The variables in this message are:

- \textit{channelId} - the identity of the channel that rejected the message
- \textit{protocol} - the current channel uses this communication protocol. Valid values are:
  - TCP - TCP/IP communication protocol
  - SNA - SNA communication protocol
- \textit{taskId} - the internal identity of the channel task that rejected the message
- \textit{type} - the internal type of the channel task that rejected the message
- \textit{msgType} - the type of the message. Valid values are:
  - INCOMING
  - OUTGOING
  - INTERNAL
- \textit{seqNumber} - the invalid sequence number that appears in the message

**Corrective Action:** If the message persists, contact BMC Software Customer Support.

ECAC6DE CHANNEL(\textit{channelId.protocol}) TASK(\textit{taskId.type}) ALLOCATED SIB NOT FOUND FOR \textit{msgType.reqType} MESSAGE

**Explanation:** IOAGATE encountered an internal problem. It was unable to find the SIB (Service Instance Block) control block for the current transaction although this SIB must exist.

The variables in this message are:

- \textit{channelId} - the identity of the channel that detected the problem
- \textit{protocol} - the current channel uses this communication protocol. Valid values are:
  - TCP - TCP/IP communication protocol
  - SNA - SNA communication protocol
• taskId - the internal identity of the channel task that detected the problem
• type - the internal type of the channel task that detected the problem
• msgType - the type of the message. Valid values are:
  • INCOMING
  • OUTGOING
  • INTERNAL
• reqType - the type of the request. This variable may not appear. Valid values are:
  • NOTIFY
  • STOP
  • CANCEL
  • MODIFY
  • INIT
  • ATTACH

Corrective Action: If the message persists, contact BMC Software Customer Support.

ECAC6EE CHANNEL(channelId.protocol) TASK(taskId.type) msgType
MESSAGE REJECTED, INVALID SERVICE ID (serviceId)

Explanation: IOAGATE rejected the specified message due to an invalid service identity (or transaction code) in the message.

The variables in this message are:
• channelId - the identity of the channel that rejected the message
• protocol - the current channel uses this communication protocol. Valid values are:
  • TCP - TCP/IP communication protocol
  • SNA - SNA communication protocol
• taskId - the internal identity of the channel task that detected the problem
• type - the internal type of the channel task that detected the problem
• msgType - the type of the message. Valid values are:
  • INCOMING
  • OUTGOING
  • INTERNAL
• serviceId - the transaction code

Corrective Action: If the message persists, contact BMC Software Customer Support.
ECAC6FE CHANNEL(channelId.protocol) TASK(taskId.type) msgType MESSAGE REJECTED, INVALID ADDR.SPACE ID(addrSpaceId)

**Explanation:** IOAGATE rejected the specified message because there was an invalid address space internal ID in the message.

The variables in this message are:

- **channelId** - the identity of the channel that rejected the message
- **protocol** - the current channel uses this communication protocol. Valid values are:
  - TCP - TCP/IP communication protocol
  - SNA - SNA communication protocol
- **taskId** - the internal identity of the channel task that rejected the message
- **type** - the internal type of the channel task that rejected the message
- **msgType** - the type of the message. Valid values are:
  - INCOMING
  - OUTGOING
  - INTERNAL
- **addrSpaceId** - the internal identity of the application address space

**Corrective Action:** If the message persists, contact BMC Software Customer Support.

ECAC6GE CHANNEL(channelId.protocol) TASK(taskId.type) msgType MESSAGE REJECTED, SERVICE(serviceId DISABLED)

**Explanation:** IOAGATE rejected the specified message because the service indicated by the service_id transaction code was disabled by IOAGATE.

The variables in this message are:

- **channelId** - the identity of the channel that rejected the message
- **protocol** - the current channel uses this communication protocol. Valid values are:
  - TCP - TCP/IP communication protocol
  - SNA - SNA communication protocol
- **taskId** - the internal identity of the channel task that rejected the message
- **type** - the internal type of the channel task that rejected the message
- **msgType** - the type of the message. Valid values are:
  - INCOMING
  - OUTGOING
  - INTERNAL
- **serviceId** - the code of a transaction to be performed by IOAGATE

**Corrective Action:** If the message persists, contact BMC Software Customer Support.

**ECAC6HE CHANNEL(channelId.protocol) TASK(taskId.type) msgType EXTENDED MESSAGE REJECTED, INVALID APPLICATION(appl)**

**Explanation:** IOAGATE rejected the specified extended message due to an invalid application code specified in the message. An extended message format is used in IOAGATE-to-IOAGATE communication.

The variables in this message are:
- **channelId** - the identity of the channel that rejected the message
- **protocol** - the current channel uses this communication protocol. Valid values are:
  - TCP - TCP/IP communication protocol
  - SNA - SNA communication protocol
- **taskId** - the internal identity of the channel task that rejected the message
- **type** - the internal type of the channel task that rejected the message
- **msgType** - the type of the message. Valid values are:
  - INCOMING
  - OUTGOING
  - INTERNAL
- **appl** - the invalid application code

**Corrective Action:** If the message persists, contact BMC Software Customer Support.

**ECAC6IE CHANNEL(channelId.protocol) TASK(taskId.type) msgType MESSAGE REJECTED, INVALID APPLICATION CODE(appl)**

**Explanation:** IOAGATE rejected the specified message due to an invalid application code specified in the message.

The variables in this message are:
- **channelId** - the identity of the channel that rejected the message
- **protocol** - the current channel uses this communication protocol. Valid values are:
  - TCP - TCP/IP communication protocol
  - SNA - SNA communication protocol
- **taskId** - the internal identity of the channel task that rejected the message
- **type** - the internal type of the channel task that rejected the message
- **msgType** - the type of the message. Valid values are:
  - INCOMING
  - OUTGOING
INTERNAL

- appl - the invalid application code

**Corrective Action:** If the message persists, contact BMC Software Customer Support.

**ECAC6JI REASON:** LOCAL NODE(*local_node_id*) ALREADY CONNECTED TO PARTNER(*partner_node_id*)

**Explanation:** This message follows the ECAC68E message and specifies an exact reason for the handshake rejection. The reason is that the local IOAGATE received a handshake message from the partner IOAGATE, but connection between these IOAGATEs had been already established. This may happen when both IOAGATEs are configured with the CONNECTOR parameter set to LOCAL and the local IOAGATE had already succeeded in initiating and establishing the connection.

The variables in this message are:

- *local_node_id* - the identity of the local node in which the local IOAGATE is running
- *partner_node_id* - the identity of the partner node in which the partner IOAGATE is running

**Corrective Action:** No action is required.

**ECAC6KI REASON:** LOCAL NODE(*local_node_id*) IS CONNECTING TO PARTNER(*partner_node_id*)

**Explanation:** This message follows the ECAC68E message and specifies an exact reason for the handshake rejection. The reason is that both IOAGATEs are configured with the CONNECTOR parameter set to LOCAL and the local IOAGATE is not able to accept a handshake because it has been connecting to the specified Partner node.

The variables in this message are

- *local_node_id* - the identity of the local node in which the local IOAGATE is running
- *partner_node_id* - the identity of the partner node in which the partner IOAGATE is running

IOAGATE ignores the handshake message.

**Corrective Action:** Correct the IOAGATE-to-IOAGATE connection configuration in the network map. For more information on configuring the network map, see the INCONTROL for z/OS Installation Guide.

**ECAC6LI REJECTION NOTICE (msgId) RECEIVED FROM PARTNER(*partnerId*)**

**Explanation:** A diagnostic message has been received from the *partnerId* partner IOAGATE.

This ECAC6LI message is followed by the ECAC6QI message, which displays the diagnostic message that was received.

The variables in this message are:

- *msgId* - the identity of the diagnostic message
- *partnerId* - the identity of the partner IOAGATE

**Corrective Action:** No action is required.
ECAC6ME CHANNEL(*channelId.*protocol*) TASK(*taskId.*type*)  
GET-IOAGATE-ID REQUEST REJECTED, *rsn*  

Explanation: The message indicates that either IOAGATE received an invalid GET-IOAGATE-ID request from a client or IOAGATE failed to create a response to this request.

The variables in this message are:

- **channelId** - the identity of the channel that detected the problem
- **taskId** - the internal identity of the channel task that detected the problem
- **type** - the internal type of the channel task that detected the problem
- **rsn** - the reason for the rejection of the request. Valid values for *rsn* are:
  - Failure to set the IP address/Hostname
  - Invalid request received

Processing continues. The client that sent the invalid request has been disconnected.

Corrective Action: If the message persists, contact BMC Software Customer Support.

ECAC6NE CHANNEL(*channelId.*TCP*) TASK(*taskId.*type*) CHECKSUM ENCRYPTION REQUEST REJECTED, *rsn*  

Explanation: The message indicates that IOAGATE rejected a checksum encryption request from a client for the reason *rsn*.

The variables in this message are:

- **channelId** - the identity of the channel that rejected the request
- **taskId** - the internal identity of the channel task that rejected the request
- **type** - the internal type of the channel task that rejected the request
- **rsn** - the reason for the rejection of the request. Valid values for *rsn* are:
  - Invalid CheckSum request
  - Encryption not configured
  - Encryption disabled
  - No Encryption processor
  - No CheckSum prepared
  - Invalid CheckSum arrived
  - Invalid algorithm given
  - Channel is not eligible

Processing continues. The client that sent the request has disconnected.

Corrective Action: Do the following:

1. Ensure that IOAGATE and the client use the same file of encryption keys.
2. Examine the JES log, DAIGLOG, and DATRACE outputs from IOAGATE for additional error indications and try to correct the problem.

3. If the message persists, contact BMC Software Customer Support.

**ECAC6OE CHANNEL(channelId.TCP) TASK(taskId.type) INCOMING MESSAGE REJECTED, rsn.**

**Explanation:** IOAGATE rejected an incoming message from a client for the reason rsn.

The variables in this message are:
- `channelId` - the identity of the channel that rejected the message
- `taskId` - the internal identity of the channel task that rejected the message
- `type` - the internal type of the channel task that rejected the message
- `rsn` - the reason for the rejection of the message

Valid values for `rsn` are:
- Message must be encrypted
- Encryption not configured
- Encryption disabled

Processing continues. The client that sent the message has disconnected.

**Corrective Action:** Do the following:

1. Ensure that IOAGATE and the client use the same file of encryption keys.
2. Examine the JES Log, DAIGLOG, and DATRACE outputs from IOAGATE for further information about the error and take appropriate corrective action.
3. If the message persists, contact BMC Software Customer Support.

**ECAC6PI REASON NOTICE (msgId) RECEIVED FROM PARTNER(partnerId):**

**Explanation:** The message indicates that a diagnostic message has come from the partner IOAGATE. This ECAC6PI message is followed by the ECAC6QI message that displays the diagnostic message itself.

The variables in this message are:
- `msgId` - the identity of the diagnostic message
- `partnerId` - identity of the partner IOAGATE

**Corrective Action:** No action is required.

**ECAC6QI diagMsg**

**Explanation:** This information message follows messages ECAC6LI and ECAC6PI, and displays the diagnostic message that arrived from the partner IOAGATE that issued it.

In this message, `diagMsg` is the text of the diagnostic message that arrived from the partner IOAGATE.

**Corrective Action:** No action is required.
ECAC70I PROBABLE LOGMODE DEFINITIONS ERROR

Explanation: This information message indicates that the probable cause of the error reported in the preceding message is that an IOAGATE attempted to connect to a partner IOAGATE over the multiple connection (MC) SNA communication channel. However, the LOGMODE definitions of the partners probably do not match.

When two IOAGATES attempt to connect, both send their LOGMODE parameters during the BIND process. If these parameters do not match, connection fails.

The ECAG89W, ECAG90E, or ECAG95E message, which precedes this message, provides more details about the error.

The ECAC70I message is issued for a multiple connection (MC) SNA communication channel only.

Correction: Check the LOGMODE definition for each partner in the appropriate SYS1.VTAMLST library. Ensure they are defined according to instructions in the appropriate step of the Control-O chapter of the INCONTROL for z/OS Installation Guide, and restart the IOAGATE.

ECAC71I PROBABLE ALLOCATION FAILURE NO RETRY

Explanation: This information message indicates that the probable cause of the connection failure reported in the preceding message is that a local IOAGATE attempted to connect to a partner IOAGATE over the multiple connection (MC) SNA communication channel, and perform a VTAM LU 6.2 allocation request. It also indicates that no attempt will be made to connect again.

The ECAG89W, ECAG90E, or ECAG95E message, which precedes this message, provides more details about the error.

The ECAC70I message is issued for a multiple connection (MC) SNA communication channel only.

Correction: Check that the partner Gateway LU is active in VTAM and that it is defined according to instructions in the appropriate step in the Control-O chapter of the INCONTROL for z/OS Installation Guide. Then restart the IOAGATE. If the problem persists, call your system programmer for assistance.

ECAC72I PROBABLE ALLOCATION FAILURE RETRY

Explanation: This information message indicates that the probable cause of the connection failure reported in the preceding message is that a local IOAGATE attempted to establish a connection with a partner IOAGATE over the multiple connection (MC) SNA communication channel and performed a VTAM LU 6.2 allocation request. It also indicates that an attempt will be made to connect again.

The ECAG89W, ECAG90E, or ECAG95E message, which precedes this message, provides more details about the error.

The ECAC70I message is issued for a multiple connection (MC) SNA communication channel only.

Processing continues. Connection is retried after one minute.

Correction: Ensure that the partner Gateway LU is active in VTAM and that it is defined according to instructions in the appropriate step in the Control-O chapter of the INCONTROL for z/OS Installation Guide. Then restart the IOAGATE. If the problem persists, call your system programmer for assistance.
ECAC73I PROBABLE MISMATCH IN VTAM DEFINITIONS

Explanation: This information message indicates that the probable cause of the connection failure reported in the preceding message, is that there is a mismatch in the IOAGATE LU definitions. An IOAGATE attempted to establish connection with a partner IOAGATE over the multiple connection (MC) SNA communication channel. However, the VTAM 6.2 LU is defined incorrectly.

The ECAG99W, ECAG90E, or ECAG95E message, which precedes this message, provides more details about the error.

The ECAC70I message is issued for a multiple connection (MC) SNA communication channel only. The multiple connection SNA channel shuts down. Processing continues.

Corrective Action: Define the IOAGATE VTAM 6.2 LU according to instructions in the appropriate step in the Control-O chapter of the INCONTROL for z/OS Installation Guide. Then restart the IOAGATE.

Messages ECAE00 through ECAExx

This group includes messages for the IOA (infrastructure) product.

ECAE01I ENCRYPTION ENVIRONMENT INITIALIZED SUCCESSFULLY

Explanation: This information message indicates that ENCRYPT was set to YES in the ECAPARM configuration file for at least one Application server, and that IOAGATE has successfully initialized the encryption environment.

Corrective Action: No action is required.

ECAE02W CHANNEL(channelId.TCP) TASK(taskId.type) ENCRYPTION PROPAGATED ON APPL.SERVER(applServerName.addrSpaceId)

Explanation: This message indicates that more than one application server is linked in the ECAPARM configuration file to the channelId channel, and that ENCRYPT was set to YES for at least one of these servers. The specified channel automatically propagates the ENCRYPT=YES setting on all the servers linked to the channel.

The variables in this message are:
- channelId - the identity of the channel that propagates ENCRYPT=YES for all application servers linked to this channel
- taskId - the internal identity of the channel task that propagates ENCRYPT=YES for each application server linked to this channel
- type - the internal type of the channel task that propagates ENCRYPT=YES for each application server linked to this channel
- applServerName - the full name of the application server for which ENCRYPT was set to YES
- addrSpaceId - the internal ID of the application server address space

IOAGATE has propagated the setting of ENCRYPT to YES for the indicated Application server. Normal processing continues.

Corrective Action: No action is required.
ECAE0VE FAILURE TO DECRYPT AN INCOMING MESSAGE: \textit{rsn}

**Explanation:** IOAGATE encountered an internal error when trying to decrypt an incoming message.

In this message, \textit{rsn} is a reason code that shows the reason for the failure.

Valid values for \textit{rsn} are:

- Failure to get ENC\_key - failure to retrieve an encryption key
- ENC\_decr function failed - the decryption function failed

**Corrective Action:** Contact BMC Software Customer Support.

ECAE0WE APPL.SERVER(\textit{applServerName.addrSpaceId}) HAS BEEN DISABLED DUE TO FAILURE TO INITIALIZE ENCRYPTION

**Explanation:** IOAGATE failed to initialize the encryption environment requested by the setting of ENCRYPT to YES in the ECAPARM configuration file for the Application server \textit{applServerName}.

The variables in this message are:

- \textit{applServerName} - the name of the Application server that requested the encryption
- \textit{addrSpaceId} - the internal identity of the address space of the Application server that requested the encryption

Processing continues. The indicated Application server is not started.

**Corrective Action:** Check the JES log, DAI GLOG, and DATRACE outputs of IOAGATE for additional error indications. Try to correct the problem. If the problem persists, contact BMC Software Customer Support.

ECAE0XE ENCRYPTION DISABLED DUE TO FAILURE TO LOAD THE FILE OF KEYS

**Explanation:** When establishing the encryption environment, IOAGATE failed to load the file of keys that is used to perform encryption and decryption.

Processing continues. The encryption function has been disabled. The Application server that requests encryption is not started.

**Corrective Action:** Transfer the appropriate file of keys from the client side. If the problem persists, contact BMC Software Customer Support.

ECAE0YS ENCRYPTION PROCESSOR FAILED: INVALID ACTION CODE(\textit{actn\_code}) RECEIVED

**Explanation:** IOAGATE encountered a severe internal error when trying to perform an internal encryption or decryption function.

In this message, \textit{actn\_code} is the invalid action code that was received by the encryption processor.

The Application server that tried to perform the internal encryption or decryption function shuts down.

**Corrective Action:** Contact BMC Software Customer Support.
ECAE0ZS  ENCRYPTION  PROCESSOR  FAILED:  MCT  UNAVAILABLE

**Explanation:** IOAGATE encountered a severe internal error when trying to perform an internal encryption or decryption function.
The Application server that tried to perform the internal encryption or decryption function shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

ECAE40I  CHANNEL( channelId.TCP) ALL TASKS STARTED, PORT(port) APPLICATION(applicId)

**Explanation:** This information message indicates that all communication tasks belonging to the specified dual connection (DC) TCP communication channel started successfully. During initialization, IOAGATE starts the tasks of all communication channels defined in the ECAPARM configuration file.
The variables in this message are:
- `channelId` - the channel identity assigned by the user in the ECAPARM configuration file
- `port` - the TCP/IP communication port number used by the specified TCP channel to listen for connection
- `applicId` - the application linked to the specified channel

**Corrective Action:** No action is required.

ECAE41I  CHANNEL( channelId.SNA) ALL TASKS STARTED, APPLIDS(applId1,applId2) APPLICATION(applicId)

**Explanation:** This information message indicates that all communication tasks of the indicated dual connection (DC) SNA communication channel started successfully. During initialization, IOAGATE starts the tasks of all communication channels defined in the ECAPARM configuration file.
The variables in this message are:
- `channelId` - the channel identity assigned by the user in the ECAPARM configuration file
- `applId1`, `applId2` - VTAM 6.2 (APPC) LU application IDs specified by the APPLIDS parameter in the ECAPARM configuration file for the channel
- `applicId` - the application linked to the channel

**Corrective Action:** No action is required.

ECAE42I  CHANNEL( channelId.TCP) ALL TASKS STARTED, PORT(port) APPLICATIONS(applicId)

**Explanation:** This information message indicates that all communication tasks of the specified multiple connection (MC) TCP communication channel started successfully. During initialization, IOAGATE starts the tasks of all communication channels defined in the ECAPARM configuration file.
The variables in this message are:
- **channelId** - the channel identity assigned by the user in the ECAPARM configuration file
- **port** - the number of the TCP/IP communication port that the specified TCP channel uses to listen for connection
- **applId** - a list of the applications linked to the channel

**Corrective Action:** No action is required.

**ECAE43I CHANNEL(channelId.SNA) ALL TASKS STARTED, APPLID(applId) APPLICATIONS(applId)**

**Explanation:** This information message indicates that all communication tasks belonging to the indicated multiple connection (MC) SNA channel started successfully. During initialization, IOAGATE starts the tasks of all communication channels defined in the ECAPARM configuration file.

The variables in this message are:
- **channelId** - the channel identity assigned by the user in the ECAPARM configuration file
- **applId** - VTAM 6.2 (APPC) LU APPLID parameter specified in the ECAPARM configuration file for a multiple connection SNA channel
- **applId** - List of applications linked to the channel

**Corrective Action:** No action is required.

**ECAE44I CHANNEL(channelId.protocol) RUNNING IN NODE(node_id) WITH NETWORK MAP(mapId)**

**Explanation:** This information message indicates that the indicated multiple connection (MC) communication channel supporting IOAGATE to IOAGATE communication started successfully. During initialization, IOAGATE starts the communication channels defined in the ECAPARM configuration file.

The variables in this message are:
- **protocol** - the communication protocol used by the current channel, which may be TCP (TCP/IP) or SNA
- **channelId** - the channel identity assigned by the user in the ECAPARM configuration file
- **node_id** - the node in which the local IOAGATE is running
- **mapId** - a member in the IOA PARM library that describes a map of network connections between IOAGATEs that enables one IOAGATE to communicate with another over a multiple connection SNA channel

**Corrective Action:** No action is required.

**ECAE45I CHANNEL(channelId.TCP) IS UP, PORT(port) APPLICATION(applicId)**

**Explanation:** This information message indicates that the specified dual connection (DC) TCP communication channel of the IOAGATE is up. The dual connection TCP communication channel was initialized successfully, and is ready for communication.
The variables in this message are:

- channelId - the channel identity assigned by the user in the ECAPARM configuration file
- port - the number of the TCP/IP communication port used by the TCP channel to listen for connection
- applicId - the identity of the application supported by the application server that is linked to the channel

Corrective Action: No action is required.

**ECAE46I CHANNEL(channelId.TCP) IS UP, PORT(port) APPLICATIONS(applicId)**

Explanation: This information message indicates that the specified multiple connection (MC) TCP communication channel of the IOAGATE is up. The multiple connection TCP communication channel was initialized successfully, and is ready for communication.

The variables in this message are:

- channelId - the channel identity assigned by the user in the ECAPARM configuration file
- port - the number of the TCP/IP communication port that the TCP channel uses to listen for connection
- applicId - the identity of the application supported by the application server that is linked to the channel

Corrective Action: No action is required.

**ECAE47I CHANNEL(channelId.SNA) IS UP, APPLIDS(applId1,applId2) APPLICATIONS(applicId)**

Explanation: This information message indicates that the specified dual connection (DC) SNA communication channel of the IOAGATE is up. The dual connection SNA communication channel was initialized successfully, and is ready for communication.

The variables in this message are:

- channelId - the channel identity assigned by the user in the ECAPARM configuration file
- applId1, applId2 - VTAM 6.2 (APPC) LU application identities specified by the APPLIDS parameter in the ECAPARM configuration file for the channel
- applicId - the identity of the application supported by the application server that is linked to the channel

Corrective Action: No action is required.

**ECAE48I CHANNEL(channelId.SNA) IS UP, APPLID(applId) APPLICATIONS(applicId)**

Explanation: This information message indicates that the specified multiple connection (MC) SNA communication channel is up. The multiple connection SNA communication channel was initialized successfully, and is ready for communications.
The variables in this message are:

- **channelId** - the channel identity assigned by the user in the ECAPARM configuration file
- **applId** - VTAM 6.2 (APPC) LU application ID specified by APPLID parameter in the ECAPARM configuration file for the channel
- **applicId** - the identity of the application supported by the application server that is linked to the channel

**Corrective Action:** No action is required.

ECAE49W CHANNEL(channelId.TCP) PORT(port), RECYCLING INITIATED DUE TO APPL.SERVER (applServerName.addrSpaceId) FAILURE

**Explanation:** IOAGATE detected a failure of the specified application server. As a result of the application server failure, IOAGATE initiated recycling of the indicated TCP channel.

The variables in this message are:

- **channelId** - the channel identity assigned by the user in the ECAPARM configuration file
- **port** - the number of the TCP/IP communication port that the TCP channel uses to listen for connection
- **applServerName** - the name of the failed application server
- **addrSpaceId** - the internal identity of the failed application server address space

**Corrective Action:** No action is required.

ECAE4AW CHANNEL(channelId.SNA) APPLIDS(applId1,applId2), RECYCLING INITIATED DUE TO APPL.SERVER (applServerName.addrSpaceId) FAILURE

**Explanation:** IOAGATE detected a failure of the specified application server. As a result of the application server failure, IOAGATE initiated recycling of the indicated SNA channel.

The variables in this message are:

- **channelId** - the channel identity assigned by the user in the ECAPARM configuration file
- **applId1**, **applId2** - VTAM 6.2 (APPC) LU application identities specified by APPLIDS parameter in the ECAPARM configuration file for the channel
- **applServerName** - the name of the failed application server
- **addrSpaceId** - the internal identity of the failed application server address space

**Corrective Action:** No action is required.

ECAE50S LOAD FAILED FOR MODULE(mod)

**Explanation:** An attempt to load the *mod* module into the main memory of either the IOAGATE or application server address space failed. The system completion code indicates the exact reason for the failure.
Possible causes are:

- The `mod` module is not in the IOA Load library,
- There is not enough storage.

The IOAGATE or application server address space shuts down, with a return code of 52 in either case.

**Corrective Action:** Do the following:

1. Examine the reason code for the failure in the system log.
2. Try to correct the problem.
3. If necessary, increase the region size.
4. If the problem persists, call your system programmer for assistance.

**ECAE51W ERROR IN MODASID COMMAND `rsn`**

**Explanation:** IOAGATE detected an error in the `F IOAGATE,MODASID modifyCommand, modifyCommandParms` command that was issued. The MODASID command is used to submit a modify command, expressed as MODASID parameters, that will be executed in the address space of the application server.

Possible values of `rsn` are:

- COMMAND IS EMPTY - there are no parameters in the MODASID command
- ADDR.SPACe IS DOWN - the address space of the application server specified in the MODASID command is not active
- BAD APPL.SERVER ID - the address space of the application server specified in the MODASID command does not exist

The MODASID command is not processed. Normal processing continues.

**Corrective Action:** Correct and reissue the MODASID command.

**ECAE52I MODIFY(modifyCommand, modifyCommandParms) FOR SERVER(applServerName.type.taskId.addrSpaceId) SUBMITTED**

**Explanation:** This information message indicates that IOAGATE accepted and submitted the command `F IOAGATE,MODASID=modifyCommand, modifyCommandParms`. The MODASID command is used to submit a modify command, expressed as MODASID parameters, that will be executed in the address space of the application server.

The variables in this message are:
.modifyCommand - the modify command to be performed in an application server address space
.modifyCommandParms - the parameters, if any, required by modifyCommand
.applServerName - the name of the application server
.type - the CD server task type
.taskId - the internal identity of the server task
.addrSpaceId - the internal identity of the application server address space

Corrective Action: No action is required.

ECAE53W NO APPLICATION SERVER HAS BECOME AVAILABLE IN THE LAST interval MINUTES

Explanation: No application server address space started in the specified time interval, either since IOAGATE launched the application servers defined in the ECAPARM configuration file or since the previous ECAE53W warning. There might be a problem that prevents an application server from being started in time.

In this message, interval is the number of minutes between occurrences of this warning message. The default interval is three minutes.

Processing continues. If the STAYUP parameter is set to YES in the ECAPARM configuration file, this message is issued every three minutes until at least a single application server becomes available. Otherwise, after issuing five ECAE53W warnings, IOAGATE shuts down.

Corrective Action: Check the IOAGATE JES log, the DAIGLOG log, and the DATRACE log for more information. Try to correct the problem. If the problem persists, contact BMC Software Customer Support.

ECAE54S IOAGATE IS GOING DOWN, NO APPLICATION SERVER HAS BECOME AVAILABLE IN THE LAST num MINUTES

Explanation: No application server address started in the specified number (num) of minutes since IOAGATE launched the application servers defined in the ECAPARM configuration file. Some problem is preventing application servers from starting in time. Several ECAE53W warnings precede this message.

This message can be issued only if the STAYUP parameter is set to NO in the ECAPARM configuration file. For more information, see message ECAE53W.

Corrective Action: Check the IOAGATE JES log, the DAIGLOG log, and the DATRACE log for more information. Try to correct the problem. If the problem persists, contact BMC Software Customer Support.

ECAE56S module INTERNAL ERROR, INVALID PARAMETERS PASSED TO module

Explanation: IOAGATE encountered a severe internal problem during initialization. IOAGATE shuts down.

Corrective Action: Contact BMC Software Customer Support.
ECAE57I  *monitorId* is staying up due to STAYUP=YES specification in ECAPARM

**Explanation:** This information message indicates that all Application servers either failed or did not start. IOAGATE cannot go down, because the STAYUP parameter is set to UP in the ECAPARM configuration file.

In this message, *monitorId* is the started task (STC) name of the IOAGATE.

The IOAGATE monitor continues to run.

**Corrective Action:** No action is required.

Messages ECAF00 through ECAFxx

This group includes messages for the IOA (infrastructure) product.

ECAF01I  CHANNEL(*channelId*.TCP) COMTASK(*taskId*) SOCKET(*socket*) FILE TRANSFER(*transfer_id*) STARTED, FILE(*file*)

**Explanation:** This information message indicates that the specified multiple connection (MC) TCP channel successfully initiated a file transfer in response to the current request from a client of the Control-D File Transfer Option (FTO) client request.

The variables in this message are:

- *channelId* - the identity of the channel that performs the file transfer
- *taskId* - the internal identity of the communication task that performs the file transfer
- *socket* - the TCP/IP socket number assigned to the connection with the file transfer client within the indicated communication task
- *transfer_id* - the internal identity assigned by the channel to this file transfer
- *file* - the name of the file transferred. If the client that resides on the mainframe platform initiated the request, then this is the DD name by which the file was allocated.

**Corrective Action:** No action is required.

ECAF07I  TRANSFER(*transfer_id*) ProtVer(*protocol_versn*) Elapsed=(*elapsed_time*) Blocks=(*blocks_no*) Bytes=(*bytes_no*) Compr.rate=(*compression_rate%*)

**Explanation:** This information message follows the ECAF08I message issued for the *transfer_id* file transfer and provides statistical data for that transfer.

The variables in this message are:
**ECAF08I** CHANNEL(channelId.TCP) COMTASK(taskId) SOCKET(socket) FILE TRANSFER(transfer_id) complCode, FILE(file)

**Explanation:** This information message indicates that the specified multiple connection (MC) TCP channel finished processing the current request from a client of the Control-D Option (FTO).

This message may be followed by the ECAF07I message, which provides statistical data relating to the file transfer that has just been completed.

The variables in this message are:
- **channelId** - the identity of the channel that handled the file transfer
- **taskId** - the internal identity of the communication task that handled the file transfer
- **socket** - the TCP/IP socket number assigned to the connection with the Control-D File Transfer option client within the indicated communication task
- **transfer_id** - the internal identity assigned by the channel to this file transfer
- **complCode** - a code indicating how the specified file transfer ended. Valid values are:
  - COMPLETED - the file transfer completed successfully
  - REJECTED - the application server rejected the file
- **file** - the name of the file to be transferred. If the client that resides on the mainframe platform initiated the request, then this is a DD name by which the file was allocated.

**Corrective Action:** No action is required.
ECAF09S CHANNEL(channelId.TCP) COMTASK(taskId) SOCKET(socket), FTC CONNECTION CELL NOT FOUND

Explanation: A severe internal error occurred during processing of the current request from a client of Control-D File Transfer Option (FTO).

The variables in this message are:

- channelId - the identity of the channel that encountered the error
- taskId - the internal identity of the communication task that encountered the error
- socket - the TCP/IP socket number assigned to the connection with the Control-D FTO client within the specified communication task

The current request is discarded, and processing continues.

Corrective Action: Contact BMC Software Customer Support.

ECAF0AS CHANNEL(channelId.TCP) COMTASK(taskId) ECAFTCM FAILED, RC(rsn)

Explanation: The ECAFTCM internal routine failed to perform the required function during processing of an incoming request from a client of the Control-D File Transfer Option (FTO). This is a severe internal error.

The variables in this message are:

- channelId - the identity of the channel that encountered the error
- taskId - the internal identity of the communication task that encountered the error
- rsn - the reason code returned by the ECAFTCM internal routine to indicate the severity of the failure

Valid values are:

- 08 - the error enables processing to continue
- 12 - unrecoverable error

If an unrecoverable error occurred, processing stops. Otherwise, processing continues.

Corrective Action: Contact BMC Software Customer Support.

ECAF0BS CHANNEL(channelId.TCP) COMTASK(taskId) ECAFTCM OBTAINED BAD PARAMETER(parameter) FUNCTION(func)

Explanation: This is a severe internal error. During processing of an incoming request from the Control-D File Transfer Option (FTO) client, the ECAFTCM internal routine obtained an invalid value for the indicated parameter.

The variables in this message are:
- **channelId** - the identity of the channel that encountered the error
- **taskId** - the internal identity of the communication task that encountered the error
- **parameter** - the name of the parameter for which the invalid value was obtained
- **func** - the identity of the function that was passed to the routine when it was invoked

**Corrective Action:** Contact BMC Software Customer Support.

ECAF0CW CHANNEL(\textit{channelId}.TCP) COMTASK(\textit{taskId}) COUNTER OF CTD/FTO CONNECTIONS HAS BEEN RESET

**Explanation:** The ECAFTCM internal routine reset the internal counter of connections initiated by the Control-D File Transfer Option (FTO) client, because the counter exceeded the allowed maximum during processing of an incoming request.

**Corrective Action:** No action is required.

ECAF0DS CHANNEL(\textit{channelId}.TCP) COMTASK(\textit{taskId}) CLIENT(\textit{client}) ECAFLTR OBTAINED BAD CALLMODE(\textit{callmode})

**Explanation:** This is a severe internal error. The ECAFLTR internal routine of the specified multiple connection (MC) TCP channel was invoked with an invalid parameter during processing of a request.

The variables in this message are:
- **channelId** - the identity of the channel processing the request
- **taskId** - the internal identity of the communication task processing the request
- **client** - 1-character code of the client associated with the request
- **callmode** - the internal mode that is passed to the specified communication task as a parameter
  - Valid values are:
    - R - the call occurred after the communication task performed a RECEIVE
    - S - the call occurred before the communication task performed a SEND
    - T - the call occurred after the communication task performed a SEND
    - E - the call occurred before the communication task performed a SEND of the error message

**Corrective Action:** Contact BMC Software Customer Support.

**Messages ECAG00 through ECAGxx**

This group includes messages for the IOA (infrastructure) product.

ECAG00I IOAGATE STARTED, RELEASE(\textit{relId}) CCI.D(\textit{changeLevel})

**Explanation:** This information message indicates that the IOAGATE monitor started normally.

The variables in this message are:
INCONTROL for z/OS Messages Manual

- **relId** - the official release and the maintenance level of the IOAGATE
- **changeLevel** - the change that was last applied to the main module of IOAGATE

**Corrective Action:** No action is required.

**ECAG01W MAINTENANCE LEVEL MODULE(ECALVL) UNAVAILABLE**

**Explanation:** The ECALVL module that contains the release and maintenance level information relating to IOAGATE was not found in the STEPLIB load library.

**Corrective Action:** No action is required.

**ECAG02E IOAGATE NOT APF AUTHORIZED**

**Explanation:** IOAGATE is not APF-authorized. The main module of IOAGATE either resides in a non-APF-authorized library or does not have the AC=1 attribute. All Load libraries concatenated to IOAGATE STEPLIB must be APF authorized.

IOAGATE shuts down.

**Corrective Action:** Either add all STEPLIB library names to the IEAAPF00 member in SYS1.PARMLIB, or use some other means available at the site to make the STEPLIB libraries APF-authorized.

**ECAG03I ****.channelId. protocol SECTION OF THE mapId NETWORK MAP ******

**Explanation:** This message is a header for the section of the network map that is in use by the indicated channel.

The variables in this message are:

- **channelId** - the identity of the channel that uses the network map **mapId**
- **protocol** - the communication protocol used by the current channel

Valid values are:
- TCP - TCP/IP communication protocol
- SNA - SNA communication protocol

- **mapId** - the name of the member in the IOA PARM library that describes a map of network connections between IOAGATEs that enable one IOAGATE to communicate with another over a multiple connection (MC) channel

**Corrective Action:** No action is required.

**ECAG04E ATTACH FOR(mod) HAS FAILED**

**Explanation:** IOAGATE could not attach an internal IOAGATE task during initialization. The system completion code indicates the exact reason for the failure.

Possible causes are:

- The **mod** module is not in the IOA Load library.
- There is not enough storage available for the IOAGATE.

IOAGATE shuts down.
Corrective Action: Find the reason code in the system log, and try to fix the problem. If necessary, increase the region size. If the problem persists, call your system programmer for assistance.

ECAG05S task (taskId.type-channelId) UNRECOVERABLE ERROR ENCOUNTERED, REASON (rsn): explanation

An unrecoverable error occurred in the identified channel task.

The variables in this message are:
- task - the name of the channel task in which the error occurred
- taskId - the internal identity of the channel task in which the error occurred
- type - the internal type of the task in which the error occurred
- channelId - the identity of the channel to which the task belongs
- rsn - the reason code of the error
- explanation - short explanation for the error

IOAGATE shuts down.

Contact BMC Software Customer Support.

ECAG06S FAILURE(rsn) TO OBTAIN A NEW LINKAGE INDEX

Explanation: IOAGATE failed to obtain a new linkage index from MVS. The first time IOAGATE starts with a specific ECAPARM configuration file, it requests a new linkage index from the operating system during initialization to perform cross memory communication with its partner application server address spaces. However, the attempt to obtain a linkage index failed.

The reason code rsn is an internal identifier that the operating system assigned to this specific problem.

IOAGATE shuts down.

Corrective Action: Call your system programmer for assistance.

ECAG07I SHUT DOWN UPON REQUEST FROM CONSOLE(console_id)

Explanation: This information message confirms that an operator issued the STOP command, which requests shutdown of the IOAGATE. The IEF404I message follows this message to indicate that shutdown is complete.

In this message, console_id is the identity of the console from which the STOP request was issued.

The value of console_id depends on whether this request was issued from a physical or virtual console. If it was a virtual console, the value of console_id may coincide with the user ID of the operator who issued this request, depending on your local configuration.

Corrective Action: No action is required.
ECAG08I  ***** LIST OF CURRENT ALLOCATIONS *****

**Explanation:** This information message indicates that IOAGATE allocated data sets to be used by IOAGATE or an application server manager in this run. It is a header for the full list of allocated data sets. Each occurrence of message ECAG09I that follows this message specifies a different allocated data set.

**Corrective Action:** No action is required.

ECAG09I  ddName type dsn

**Explanation:** This information message identifies a data set allocated by IOAGATE for use by IOAGATE or an application server manager in this run. It is issued separately for each data set allocated.

The variables in this message are:
- **ddName** - the name of the DD statement that allocates the data set
- **type** - the type of allocation Valid values are:
  - JCL - a DD statement specified permanently in JCL
  - DYN - a DD statement allocated dynamically
- **dsn** - the name of the data set allocated by the DD statement

**Corrective Action:** No action is required.

ECAG0AI  MODIFY COMMAND ISSUED FROM CONSOLE (console_id) ACCEPTED, COMMAND(cmd)

**Explanation:** This information message indicates that a valid modify command was issued.

The variables in this message are:
- **console_id** - the identity of the console from which the modify command was issued. The value of console_id depends on whether this request was issued from a physical or virtual console. If it was a virtual console, the value of console_id may coincide with the user ID of the operator who issued this request, depending on your local configuration.
- **cmd** - the command that was issued

**Corrective Action:** No action is required.

ECAG0BW  MODIFY COMMAND ISSUED FROM CONSOLE (console_id) REJECTED, COMMAND(cmd)

**Explanation:** The modify command that has been issued is invalid. The ECAG0CI and ECAG25I messages that follow this ECAG0BW message provide a list of valid modify commands.

The variables in this message are:
- **console_id** - the identity of the console from which the modify command was issued. The value of console_id depends on whether this request was issued from a physical or virtual console. If it was a virtual console, the value of console_id may coincide with the user ID of the operator who issued this request, depending on your local configuration.

- **cmd** - the command that was issued

The modify command is rejected. Normal processing continues.

**Corrective Action:** Issue a valid modify command.

**ECAG0CI VALID MODIFY COMMANDS ARE:**

**Explanation:** This information message introduces a list of valid modify commands after an invalid modify command was issued. Each of the ECAG25I messages that follows contains a valid modify command.

**Corrective Action:** No action is required.

**ECAG0DI *** FOLLOWING ECAPARM(suffix) CONFIGURATION FILE IS USED *****

**Explanation:** This information message is the header for the specified ECAPARM configuration file that IOAGATE or an application server will use in this run. ECAG0EI messages follow this message. Each ECAG0EI message displays a line of the ECAPARM configuration file.

In this message, suffix is a 1-character ID that specifies a unique ECAPARM configuration file.

**Corrective Action:** No action is required.

**ECAG0EI lineNum lineText**

**Explanation:** Each occurrence of this message is a line of an ECAPARM configuration file that IOAGATE or an application server is currently using.

The variables in this message are:

- **lineNum** - the sequential number of the current line of the ECAPARM configuration file
- **lineText** - the contents of the current line of the ECAPARM configuration file

**Corrective Action:** No action is required.

**ECAG0FI ISSUE "F monitorId,?" TO GET VALID COMMANDS**

**Explanation:** The message indicates that the command F IOAGATE,modifyCommand was issued, but the modifyCommand modify command is invalid.

**Corrective Action:** Issue the command F IOAGATE,modifyCommand with a valid modify command.

To obtain a list of available modify commands, issue the command F IOAGATE,?
ECAG0GW THERE IS NO ACTIVE APPLICATION SERVER, monitorId TERMINATING

**Explanation:** IOAGATE tried to launch an application server address space, but no such address space started, and STAYUP is not set to YES in the ECAPARM configuration file.

IOAGATE shuts down.

**Corrective Action:** No action is required.

ECAG0HI ENABLED FOR THE AUTOMATIC RESTART MANAGEMENT FUNCTION

**Explanation:** A valid ARMELEM parameter was specified in the ECAPARM configuration file, and was registered as an element of automatic restart management (ARM) for IOAGATE.

**Corrective Action:** No action is required.

ECAG0II AUTOMATIC RESTART IN PROGRESS AFTER UNEXPECTED FAILURE

**Explanation:** The message indicates that IOAGATE failed unexpectedly, but ARM support is enabled, and the operating system is automatically restarting IOAGATE.

IOAGATE restarts and normal processing continues.

**Corrective Action:** No action is required.

ECAG0JW AUTOMATIC RESTART MANAGEMENT REQUEST FAILED R15( rc) REASON ( rsn) short_explan

**Explanation:** The message indicates that when starting up, IOAGATE failed to activate automatic restart management (ARM).

The meaning of the variables in this message is shown in the following table:

<table>
<thead>
<tr>
<th>rc</th>
<th>rsn</th>
<th>short_explan</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>08</td>
<td>002C</td>
<td>ELEMENT NAME INVALID</td>
<td>An invalid element name was specified.</td>
</tr>
<tr>
<td>08</td>
<td>0150</td>
<td>ELEMENT NAME IN USE</td>
<td>The element name is registered in a different address space.</td>
</tr>
<tr>
<td>12</td>
<td>0004</td>
<td>NO ARM SUPPORT</td>
<td>The release of MVS or JES in use does not support the ARM function.</td>
</tr>
<tr>
<td>12</td>
<td>0104</td>
<td>MAX ARM USERS</td>
<td>The number of ARM users registered is the maximum permissible.</td>
</tr>
<tr>
<td>12</td>
<td>0160</td>
<td>NO ACCESS TO ARM CDS</td>
<td>This system provides no access to an ARM CDS.</td>
</tr>
</tbody>
</table>

ARM is not enabled. Normal processing continues.
Corrective Action: Correct the problem identified by the diagnostic information in this message, then restart IOAGATE.

**ECAG0KW MODIFY**(cmd) REJECTED, rsn

Explanation: The message indicates that an F IOAGATE, modifyCommand command was issued, and that the command was rejected for the reason specified in the message.

The variables in this message are:

- **cmd** - the modify command issued by the operator. Valid values are:
  - CLOSE
  - OPEN
- **rsn** - the reason for the rejection of the modify command.
  Possible reasons are:
  - NO PARAMETER SPECIFIED
  - INVALID CHANNEL SPECIFIED
  - SPECIFIED CHANNEL WAS NOT CLOSED

The command is ignored. Normal processing continues.

Corrective Action: Correct the command and if necessary reissue it.

**ECAG10I IOAGATE HAS BEEN INITIALIZED SUCCESSFULLY**

Explanation: This information message indicates that IOAGATE completed the initialization process successfully.

Corrective Action: No action is required.

**ECAG11S FUNCTION(func) STD(taskId.type) ECAGNRL OBTAINED ZERO STD ADDRESS**

Explanation: IOAGATE detected a severe internal error. An IOAGATE task tried to run the ECAGNRL internal service routine.

The variables in this message are:

- **func** - the internal numeric code of the function that IOAGATE tried to perform
- **taskId** - the internal identity of the IOAGATE task that tried to run the service routine
- **type** - the internal type of IOAGATE task that tried to run the service routine

IOAGATE shuts down.

Corrective Action: Contact BMC Software Customer Support.

**ECAG12S FUNCTION(func) STD(taskId.type) ECAGNRL OBTAINED ZERO STDID**

Explanation: IOAGATE detected a severe internal error. An IOAGATE task tried to run the ECAGNRL internal service routine.
The variables in this message are:

- `func` - the internal numeric code of the function that IOAGATE tried to perform
- `taskId` - the internal identity of the IOAGATE task that tried to run the service routine
- `type` - the internal type of IOAGATE task that tried to run the service routine

IOAGATE shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

**ECAG13W CHANNEL(channelId.TCP) CONNECTION REJECTED, MAXIMUM NUMBER OF LINKS REACHED**

**Explanation:** The maximum number of users is already connected to IOAGATE over the multiple connection TCP channel.

In this message, `channelId` is the identity of the channel over which communication was attempted.

The attempt to connect to IOAGATE over the specified multiple connection TCP channel fails, and normal processing continues.

**Corrective Action:** Try again later.

**ECAG14I task (taskId.type.channelId) STARTED**

**Explanation:** This information message indicates the normal start of an IOAGATE internal channel task.

The variables in this message are:

- `task` - the IOAGATE task
- `taskId` - the internal identity of the task
- `type` - the internal type of the task
- `channelId` - the identity of the channel to which the task belongs

**Corrective Action:** No action is required.

**ECAG15I task (taskId.type.channelId) SHUT DOWN**

**Explanation:** This information message indicates normal termination of an IOAGATE internal channel task.

The variables in this message are:

- `task` - the IOAGATE task
- `taskId` - the internal identity of the task
- `type` - the internal type of the task
- `channelId` - the identity of the channel to which the task belongs

**Corrective Action:** No action is required.
ECAG16S FUNCTION(func) STD(taskId.type) ECAGNRL OBTAINED INVALID MCT ADDRESS IN STD

**Explanation:** IOAGATE detected a severe internal error. An IOAGATE task tried to run the ECAGNRL internal service routine.

The variables in this message are:

- `func` - the internal numeric code of the function that IOAGATE tried to perform
- `taskId` - the internal identity of the IOAGATE task that tried to run the service routine
- `type` - the internal type of IOAGATE task that tried to run the service routine

IOAGATE shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

ECAG17S FUNCTION(func) ECAGNRL OBTAINED INVALID MCT

**Explanation:** IOAGATE detected a severe internal error. An IOAGATE task tried to run the ECAGNRL internal service routine.

In this message, `func` is the internal numeric code of the function that IOAGATE tried to perform.

IOAGATE shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

ECAG18S FUNCTION(func) STD(taskId.type) ECAGNRL OBTAINED ZERO FUNCTION ADDRESS

**Explanation:** IOAGATE detected a severe internal error. An IOAGATE task tried to run the ECAGNRL internal service routine.

The variables in this message are:

- `func` - the internal numeric code of the function that IOAGATE tried to perform
- `taskId` - the internal identity of the IOAGATE task that tried to run the service routine
- `type` - the internal type of IOAGATE task that tried to run the service routine

IOAGATE shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

ECAG19S FUNCTION(func) STD(taskId.type) ECAGNRL OBTAINED ZERO FUNCTION CODE

**Explanation:** IOAGATE detected a severe internal error. An IOAGATE task tried to run the ECAGNRL internal service routine.

The variables in this message are:
func - the internal numeric code of the function that IOAGATE tried to perform
taskId - the internal identity of the IOAGATE task that tried to run the service routine
type - the internal type of IOAGATE task that tried to run the service routine

IOAGATE shuts down.

Corrective Action: Contact BMC Software Customer Support.

**ECAG1AS FUNCTION(func) STD(taskId.type) ECAGNRL OBTAINED INVALID STDID**

Explanation: IOAGATE detected a severe internal error. An IOAGATE task tried to run the ECAGNRL internal service routine.

The variables in this message are:

- **func** - the internal numeric code of the function that IOAGATE tried to perform
- **taskId** - the internal ID of the IOAGATE task that tried to run the service routine
- **type** - the internal type of IOAGATE task that tried to run the service routine

IOAGATE shuts down.

Corrective Action: Contact BMC Software Customer Support.

**ECAG1BS FUNCTION(func) ECAGNRL FAILED TO LOCATE MCT TOKEN**

Explanation: IOAGATE detected a severe internal error. An IOAGATE task tried to run the ECAGNRL internal service routine.

In this message, **func** is the internal numeric code of the function that IOAGATE tried to perform.

IOAGATE shuts down.

Corrective Action: Contact BMC Software Customer Support.

**ECAG1CS FUNCTION(func) ECAGNRL OBTAINED ZERO MCT IN TOKEN**

Explanation: IOAGATE detected a severe internal error. An IOAGATE task tried to run the ECAGNRL internal service routine.

In this message, **func** is the internal numeric code of the function that IOAGATE tried to perform.

IOAGATE shuts down.

Corrective Action: Contact BMC Software Customer Support.

**ECAG1DS CHANNEL (channelId. TCP) FAILED, NO COMM. TASK IS AVAILABLE**

Explanation: A severe error has arisen in the IOAGATE TCP multiple connection channel **channelId**, and no active communication task is under the control of that channel.

The specified multiple connection channel (**channelId**) goes down. If it is the only channel configured in IOAGATE, IOAGATE shuts down.
**Corrective Action:** Contact BMC Software Customer Support.

**ECAG20I IOAGATE SHUTTING DOWN**

*Explanation:* This information message indicates that IOAGATE is shutting down, either as a result of a STOP command, or internal IOAGATE events.

IOAGATE shuts down.

*Corrective Action:* If the shutdown is not the result of an operator request, check the IOAGATE JES log, the DAIGLOG log and the DATRACE log for more information about the cause of the shutdown. If necessary, call your system programmer for assistance.

**ECAG21S IOAGATE HAS FAILED (rsn) TO INITIALIZE**

*Explanation:* IOAGATE failed to complete initialization. The reason code (rsn) is an internal ID that IOAGATE assigned to this specific problem.

IOAGATE shuts down.

*Corrective Action:* Check the IOAGATE JES log, the DAIGLOG log and the DATRACE log for more information about the cause of the failure. Try to restart the IOAGATE. If necessary, call your system programmer for assistance.

**ECAG24W task (taskId.type.channelId) DETACHED BY FORCE**

*Explanation:* IOAGATE forced a DETACH of an IOAGATE internal channel task. When this message is issued during IOAGATE termination, it indicates that an internal problem probably prevented the task from shutting down smoothly.

The message ECAG15I is issued after a smooth shutdown.

The variables in this message are:

- *task* - the IOAGATE task
- *taskId* - the internal identity of the task
- *type* - the internal type of the task
- *channelId* - the identity of the channel to which the task belongs

Termination continues.

*Corrective Action:* No action is required.

**ECAG25I modify_command**

*Explanation:* This information message usually follows messages ECAG0BW and ECAG0CI, which indicate that an invalid modify command was issued. This message might appear more than once. Each occurrence displays a valid modify command.

*Corrective Action:* No action is required.
ECAG29E ECAGNRL FAILED. STD(taskId.type) FUNCTION(func) RC(rsn)

Explanation: IOAGATE detected an internal error. The IOAGATE task tried to run the ECAGNRL internal service routine.

The variables in this message are:
- **taskId** - the internal identity of the IOAGATE task that tried to run the service routine
- **type** - the internal type of IOAGATE task that tried to run the service routine
- **func** - the internal numeric code of the function that IOAGATE tried to perform
- **rsn** - an internal identity that IOAGATE assigned to this specific problem

IOAGATE may shut down or continue, depending on the severity of the failure.

Corrective Action: If IOAGATE shuts down, contact BMC Software Customer Support.

ECAG2AE FILE OF KEYS IS UNAVAILABLE, ENCRYPTION DISABLED

Explanation: IOAGATE failed to allocate the file of encryption keys that is needed to initialize the encryption environment that is requested because ENCRYPT is set to YES in the ECAPARM configuration file.

The encryption environment is not established. Processing continues without encryption.

Corrective Action: Prepare a valid file of encryption keys of the type required for encryption to operate, both on IOAGATE and the workstation. For more information, see the description of the ENCRYPT parameter in the IOA chapter of the INCONTROL for z/OS Installation Guide.

ECAG2BE ENCRYPTION ROUTINE routineName IS UNAVAILABLE, ENCRYPTION DISABLED

Explanation: IOAGATE failed to load the encryption and decryption routine routineName when trying to initialize the encryption environment requested because ENCRYPT was set to YES in the ECAPARM configuration file.

The encryption environment is not established. Processing continues without encryption.

Corrective Action: Contact BMC Software Customer Support.

ECAG30E ECAPUT FAILED(rsn:text) CALLID (module.call_typ.call_id.queue_typ) TASK(taskId.type.channelId)

Explanation: IOAGATE detected an internal error. The IOAGATE task tried to run the ECAPUT internal service routine.

The variables in this message are:
IOAGATE continues processing or shuts down, depending on the failure severity.

Corrective Action: If IOAGATE shuts down, contact BMC Software Customer Support.

**ECAG31W IOAGATE(monitorId) WITH ECAPARM(suffix) ALREADY ACTIVE IN SYSTEM(systemId) LINDEX(linkageIndex)**

Explanation: Start of IOAGATE was attempted while IOAGATE was already active in the system. Two IOAGATEs with the same ECAPARM configuration file cannot run concurrently.

The variables in this message are:

- **monitorId** - the started task (STC) name of the IOAGATE
- **suffix** - a 1-character identity that specifies a unique ECAPARM configuration file used in this IOAGATE run
- **systemId** - the unique identity of the MVS system on which the IOAGATE is running
- **linkageIndex** - the MVS linkage index that enables cross-memory communication between IOAGATE and its partner application server address spaces

The newly started IOAGATE shuts down.

Corrective Action: If you must run a second IOAGATE in the same system concurrently, create and use an ECAPARM configuration file with a unique suffix.
ECAG32I IOAGATE(*monitorId*) WITH ECAPARM(*suffix*) RUNNING IN SYSTEM(*systemId*)

**Explanation:** This information message displays some main system attributes of the active IOAGATE. The ECAG33I message follows this message with more main system attributes.

The variables in this message are:
- *monitorId* - the started task (STC) name of the IOAGATE
- *suffix* - a unique 1-character suffix that specifies the ECAPARM configuration file used in this IOAGATE run
- *systemId* - the unique identity of the MVS system on which the IOAGATE is running

**Corrective Action:** No action is required.

ECAG33I LINDEX(*linkageIndex*) OBTAINED(*date*) QNAME(*qName*) RNAME(*rName*)

**Explanation:** This message displays some main system attributes of the active IOAGATE. During initialization, IOAGATE retrieves an MVS linkage index to perform cross memory communication with its partner application server address spaces. The linkage index obtained from MVS is kept by IOAGATE in an MVS name/token pair.

The ECAG32I message precedes this message and displays different system attributes.

The variables in this message are:
- *linkageIndex* - the MVS linkage index
- *date* - the date the MVS linkage index was obtained
- *qName* - the major name of the IOAGATE system resource
- *rName* - the minor name of the IOAGATE system resource

**Corrective Action:** No action is required.

ECAG34I SERVER TASK STATUS JOB/CHANNEL/SIID STEP/JOBID/MODULE UTILIZATION

**Explanation:** This information message indicates that an F IOAGATE,STATUS command was issued. It is a header for subsequent ECAG35I messages.

The STATUS command can be issued manually by the operator, or automatically by IOAGATE, as a result of internal problems.

**Corrective Action:** No action is required.

ECAG35I type taskId.addrSpaceId status channelId/siId step/jobId/mod utilization

**Explanation:** This information message specifies a server task of an application server address space that was issued.
The variables in this message are:

- **type** - the server task type. Valid values are:
  - CM - the manager of the address space of an application server
  - CS - application server
  - CD - detector server
  - CU - updater server

- **taskId** - the internal identity of the server task assigned by IOAGATE during initialization. The first character is a code that indicates the application. If this server task is busy handling a request for an alias application, this code indicates the alias. The next three digits form a unique sequential number of the task.

- **addrSpaceId** - the internal identity of the application server address space to which the specified task belongs.

- **status** - This variable has a primary status field (START, READY, UP, DOWN, BUSY, WAIT, SUSPEND, FAILED, PENDING or X'hexvalue'), and may include a secondary status field and additional information next to it. Each status field is described in the following table, in the order listed, with its secondary status fields and additional information that may overflow into fields that follow.

<table>
<thead>
<tr>
<th>Primary Status</th>
<th>Description, Secondary Status, and Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>START</td>
<td>The server task is starting. It may also show</td>
</tr>
<tr>
<td></td>
<td>- Time in seconds to handle a request, or be in a primary status.</td>
</tr>
<tr>
<td></td>
<td>- Startup timed out - The server did not startup within the required time.</td>
</tr>
<tr>
<td>READY</td>
<td>The server task started and is ready to handle requests. It may also show recovered to indicate that the server recovered successfully.</td>
</tr>
<tr>
<td>UP</td>
<td>Server task started, for a task that does not use cross-memory communication with the IOAGATE address space.</td>
</tr>
<tr>
<td>Primary Status</td>
<td>Description, Secondary Status, and Information</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------------------------</td>
</tr>
</tbody>
</table>
| DOWN          | The server task is down. It may also show one of the following to indicate an automatic recovery status or the reason for the DOWN status:  
  ▪ awaits recovery - Recovery was suspended for this server task because of internal temporary problems.  
  ▪ recovery disabled - Recovery was disabled for this server task because the MAXRECOV parameter of the ECAPARM configuration file is set to zero.  
  ▪ recovery timed out - The server failed to recover before maximum time elapsed.  
  ▪ recovery failed of threshold - Recovery was blocked for this server task because the MAXRECOV parameter of the ECAPARM configuration file is at its maximum value.  
  ▪ stopped - The DOWN status is the result of automatic recovery stopping.  
  ▪ failed - The DOWN status is the result of the failure of automatic recovery.  
  ▪ unknown - There is no known reason for the DOWN status.  
  ▪ timer on - The timer for the DOWN status is running. |
| BUSY          | The server task is busy handling a request. May also show the time in seconds to handle a request. |
| WAIT          | The non-CM server task is down and cannot be recovered until its CM server is ready. This may also show:  
  ▪ Time in seconds to handle a request or being in a WAIT state.  
  ▪ CM to be ready - Non CM server is waiting for its CM server to be ready. |
| SUSPEND       | The server task failed and cannot be recovered for the time being due to temporary internal problems. May also show the time in seconds to handle a request or be in a SUSPEND state. |
| FAILED        | The server task failed. May also show:  
  ▪ timer on  
  ▪ timer is running. |
| PENDING       | IOAGATE is waiting for this server task to send an internal acknowledgment to IOAGATE address space. May also show:  
  ▪ ACK pending - A server is in PENDING status.  
  ▪ Time in seconds to handle a request or be in a PENDING state. |
### Primary Status

<table>
<thead>
<tr>
<th>Description, Secondary Status, and Information</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X' hex_value'</strong></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

- **channelId**/**siId** - This field shows more status field information, or specifies the channel and service request in two parts, *channelId* and *siId*, where

  - **channelId** is the ID of the channel linked to the indicated server task in the ECAPARM configuration file. The first two characters specify the channel ID assigned in the ECAPARM configuration file. The rest of **channelId** is **MULTI** or **DUAL**, where **MULTI** is for a multiple connection (MC) model of a communication channel, and **DUAL** is for a dual connection (DC) model of a communication channel.

  - **siId** is a Service Instance ID (SIID) that specifies the service request being handled by a server task. The value is displayed only when the status of a server task is **BUSY**.

- **step** - the step name of a startup JCL procedure used to run the application server address space. This is displayed for a CM server task only.

- **jobId** - the STC JOBID of the application server assigned to its address space by JES. This is displayed for a CM server task only.

- **mod** - the name of the program that implements the server task. This is displayed for a CM server task only.

- **utilization** - the percent of time the server task was busy handling the request during the last 40 seconds.

**Corrective Action:** No action is required.

---

**ECAG36W APPL.SERVER(** *addrSpaceId* **) CANNOT BE STOPPED**

**Explanation:** An attempt to issue an F IOAGATE,STOPASID= *addrSpaceId* command failed. Either the specified address space ID is not ready or the server address space is already down.

In this message, *addrSpaceId* is the internal ID of the application server address space.

The modify command is rejected. Normal processing continues.

**Corrective Action:** Use the F IOAGATE,STATUS command to check the status of the server address space.

---

**ECAG37I STOP FOR APPL.SERVER (** *applServer*. *addrSpaceId*) INITIATED**

**Explanation:** This information message indicates that an F IOAGATE,STOPASID= *addrSpaceId* command was performed successfully. A STOPASID command shuts down a specific application server address space.

The variables in this message are:
INCONTROL for z/OS Messages Manual

- `applServer` - the full name of the application server
- `addrSpaceId` - the internal identity of the application server address space

**Corrective Action:** No action is required.

**ECAG38I** IOAGATE(`monitorId`) WITH ECAPARM(`suffix`) EXCLUSIVELY OWNS HEARTBEAT RESOURCE Q(`qName`) R(`rName`)

**Explanation:** This information message displays the name of the heartbeat resource of the running IOAGATE for a specific application server. When the application server is launched, IOAGATE issues a heartbeat ENQ request to acquire the specified resource exclusively as a heartbeat mechanism between the application server and IOAGATE. If the resource is available in the application server address space, it means that the IOAGATE stopped.

IOAGATE acquires a heartbeat resource for each application server it launches.

The variables in this message are:

- `monitorId` - the STC name of the IOAGATE
- `suffix` - a unique 1-character suffix identifying the ECAPARM configuration file that is used in this IOAGATE run
- `qName` - the major name of the heartbeat resource
- `rName` - the minor name of the heartbeat resource

An application server ID acts as the minor name.

**Corrective Action:** No action is required.

**ECAG39W** SERVER TASK(`taskId`) CURRENTLY CANNOT BE STOPPED

**Explanation:** An attempt to issue an `F IOAGATE,STOPTID=`taskId command to stop the specified server task failed. The specified server task is either not ready, or is already down.

In this message, `taskId` is the internal ID of a server task.

The modify command is rejected. Normal processing continues.

**Corrective Action:** Use the `F IOAGATE,STATUS` command to check the status of the server task, and reissue the command later.

**ECAG3AS** FAILURE(`rsn`) TO CREATE A NEW NAME/TOKEN PAIR ON SYSTEM LEVEL

**Explanation:** IOAGATE failed to create a new MVS name or token pair in which to keep a linkage index. During initialization, IOAGATE obtains a linkage index to perform cross memory communication with its partner application server address spaces. IOAGATE keeps the linkage index in an MVS name or token pair.

Possible values of `rsn` are:
INCONTROL for z/OS Messages Manual

- 04 - duplicated name used
- 16 - user not authorized
- 28 - parameter LEVEL invalid
- 32 - parameter NAME invalid
- 36 - parameter PERSIST invalid
- 64 - unexpected error

IOAGATE shuts down.

**Corrective Action:** Call your system programmer for assistance.

**ECAG3BW SERVER TASK( taskId) DOES NOT EXIST**

**Explanation:** An attempt to issue an `F IOAGATE,STOPTID=taskId` command to stop the specified server task failed, because the specified server task ID was incorrect. The variable `taskId` must be a correct internal ID of a server task.

The modify command is rejected. Normal processing continues.

**Corrective Action:** Use the `F IOAGATE,STATUS` command to identify the correct `taskId`, and reissue the command.

**ECAG3CI PUTTER( taskId.type) submitting controlMsg for Server( serverId)**

**Explanation:** This information message indicates that a PUTTER task of IOAGATE submitted the internal control message `controlMsg` for the application server `serverId`.

**Corrective Action:** No action is required.

**ECAG3DI GETTER( taskId.type) controlMsg confirmed for Server( serverId)**

**Explanation:** An IOAGATE GETTER task of IOAGATE received a confirmation for the internal control message `controlMsg` sent earlier by an IOAGATE PUTTER task. The confirmation control message `controlMsg` was sent by the application server `serverId`.

**Corrective Action:** No action is required.

**ECAG3EW PUTTER( taskId.type) Obsolete SIB thrown away, SIID=siId APPL=appl SID=serviceId Time difference=timeDiff**

**Explanation:** An IOAGATE PUTTER task discovered an irrelevant SIB internal control block with the attributes identified in this message. The problematic control block was created before the specified PUTTER task was started.

The variables in this message are:
InControl for z/OS Messages Manual

- **taskId** - the internal ID of this PUTTER task
- **type** - the type of this PUTTER task
- **siId** - the Service Instance ID
- **appl** - the application code
- **serviceId** - the identity of the Service
- **timeDiff** - The time difference between the time when the problematic SIB block was created and the time when the PUTTER task started.

The SIB control block is destroyed. Normal processing continues.

**Corrective Action:** No action is required.

**ECAG3FW FAILURE TO UNLOCK CHAIN OF SIBs:ALREADY UNLOCKED**

**UNLOCKER (taskId.type.callId):module**

**Explanation:** This warning message is issued if the chain of SIB control blocks is already unlocked when attempting to unlock it.

**Corrective Action:** No action is required.

**ECAG3GS FAILURE TO UNLOCK CHAIN OF SIBs:LOCKED BY (taskId)**

**UNLOCKER (taskId.type.callId):module**

**Explanation:** This severe error message is issued if the chain of SIB control blocks has been locked by some other task, indicated by LOCKED BY (taskId) when attempting to unlock it. In this case, the unrecoverable error indicator is set to ON, SVCDUMP is initiated, and IOAGATE goes down.

**Corrective Action:** No action is required.

**ECAG3HI IOAGATE Token: Name=tokenName LX=index Obtained=date System=systemName**

**Explanation:** This information message indicates that the F IOAGATE,SHOWTOKEN modify command was issued in the IOAGATE address space to display the MVS token of the current IOAGATE.

The variables in this message are:

- **tokenName** - the name of the MVS token of the current IOAGATE
- **index** - the Linkage Index used by this IOAGATE to establish cross-memory communication
- **date** - the date when the Linkage Index of IOAGATE was obtained from MVS
- **systemName** - the name of the MVS system on which the current IOAGATE is running

**Corrective Action:** No action is required.
ECAG3IW LAST READY CS SUBTASK IN (xxxx.yyyy) ASSIGNED. OCCURED (nnn) TIMES.

Explanation: The message is issued when IOAGATE assigns a transaction to the last ready CS server subtask in an application server address space that serves Control-D/Page ON Demand requests. This message will not be issued more than once per minute in order not to flood the console with such messages.

The variables in this message are:
- xxxx is the procedure name of the application server.
- yyyy is the qualifier (after the dot) of the specific application server address space. The qualifier allows distinguishing between the address spaces when multiple application server address spaces are started.
- nnn is the number of times the last ready CS has been assigned since the last time message ECAG3IW has been issued, including the current occurrence for which this ECAG3IW is issued.

For example, if the following messages appear:

10:05:00 ECAG3IW ...OCCURED (001) TIMES.
10:06:00 ECAG3IW ...OCCURED (005) TIMES.

This means that at 10:05:00 the last ready CS has been assigned and that in the following minute the last ready CS has been assigned 5 times.

When the last ready CS is assigned, it means that any new request must wait until a busy CS in the same address space finishes handling its request and becomes ready.

Corrective Action: In general, BMC Software recommends that you define enough CS subtasks and application server address spaces so that this situation rarely, if ever, occurs.

ECAG40W APPL.SERVER (applServer.addrSpaceId) CANNOT BE STARTED, CHANNEL(channelId) DISABLED

Explanation: The specified application server cannot be started. During initialization, IOAGATE detected errors in the indicated CHANNEL definition and disabled it. As a result, the application server that referenced this channel became unusable.

Variables in this message are:
- applServer - the full name of the application server
- addrSpaceId - the internal identity of an application server address space
- channelId - the channel identity referenced by the application server

Corrective Action: Check the IOAGATE DAIGLOG log and the DATRACE log for more information. Try to correct the CHANNEL definition, and restart IOAGATE.

ECAG41E SERVER TASK (applServer.type.taskId.addrSpaceId) FAILED WHEN HANDLING A REQUEST, USER(userId) SIID(serviceInstanceId)

Explanation: IOAGATE detected a server task failure. The server task was handling the specified user request when IOAGATE detected the failure.
Attributes of the failed server are:

- **applServer** - the name of the application server
- **type** - the server task type. Valid values are:
  - CM - the manager of the address space of an application server
  - CS - application server
  - CD - detector server
  - CU - updater server
- **taskId** - the internal identity of this server task
- **addrSpaceId** - the internal identity of the application server address space to which the specified server task belongs
- **userId** - the identity of the user whose request was in process
- **serviceInstanceId** - the service instance ID (SIID) that determines the service request being handled by the server task

**IOAGATE** does the following:

- clears resources allocated by cross memory communication with the failed server task
- initiates automatic recovery for the failed server task, if the option was not blocked by MAXRECOV parameter in the ECAPARM configuration file
- continues communication with other server tasks.

**Corrective Action:** Check the error messages of the application server address space to determine why the server task terminated. Fix the problem and try again.

**ECAG43W AN ATTEMPT TO CREATE A MESSAGE FOR appl REMOTE APPLICATION FAILED rsn**

**Explanation:** IOAGATE failed to create a notification message for a remote IOAGATE that supports the application *appl*. The reason for the failure is identified by the variable *rsn*.

This message is issued only when the IOAGATE is configured for IOAGATE-to-IOAGATE communication. Possible values for *rsn* are:

- No PDTs are available
- The proper PDT is not available
- The PLT table is not available
- No PLTs are available
- The proper PLT is not available

**Corrective Action:** Contact BMC Software Customer Support.
ECAG46W APPL.SERVER (applServer.type.taskId.addrSpaceId.channelId) ALREADY ACTIVE

Explanation: An F IOAGATE,STARTASID=addrSpaceId command failed. Either the specified ID is invalid, or this server address space is already up.

The variables in this message are:
- `applServer` - the name of the application server
- `type` - the CM server task type
- `taskId` - the internal identity of this server task
- `addrSpaceId` - the internal identity of this application server address space
- `channelId` - the identity of the channel to which the specified application server is linked

The modify command is rejected.

Corrective Action: Correct the application server address space ID, and reissue the command.

ECAG47I START FOR APPLICATION SERVER(applServer.addrSpaceId) INITIATED

Explanation: This information message indicates that an F IOAGATE,STARTASID=addrSpaceId command was performed successfully. The STARTASID command starts a specific application server address space.

The variables in this message are:
- `applServer` - the name of the application server
- `addrSpaceId` - the internal identity of the application server address space

Corrective Action: No action is required.

ECAG49I CHANNEL(channelId.SNA) USER(userId) LOGGED ON, CONVID(conversation_id) APPLID(applId)

Explanation: This information message indicates that the specified user successfully logged on to IOAGATE over a multiple connection (MC) SNA channel.

The variables in this message are:
- `channelId` - the identity of the channel over which the specified user logged on to IOAGATE
- `userId` - the identity of the user whose logon request was performed
- `conversation_id` - VTAM LU 6.2 (APPC) conversation identity
- `applId` - VTAM LU 6.2 (APPC) application identity of the partner

Corrective Action: No action is required.
ECAG4AI STOP FOR SERVER TASK (applServer.type.taskId.addrSpaceId) INITIATED

**Explanation:** This information message indicates that an `F IOAGATE,STOPASID=addrSpaceId` command was issued and performed successfully. The STOPASID command shuts down a specific application server address space.

The variables in this message are:
- `applServer` - the name of the application server shut down
- `type` - the CS server task type
- `taskId` - the internal identity of this server task
- `addrSpaceId` - the internal identity of the application server address space

**Corrective Action:** No action is required.

ECAG4BE SERVER TASK (applServer.type.taskId.addrSpaceId) FAILED WHEN BEING STARTED

**Explanation:** IOAGATE detected a server task failure before the task completed its startup.

The variables in this message are:
- `applServer` - the full name of the application server
- `type` - the server task type Valid values are:
  - CD - detector server
  - CS - application server
  - CU - updater server
- `taskId` - the internal identity of this server task
- `addrSpaceId` - the internal identity of the application server address space to which the failed server task is assigned

Automatic recovery is initiated for the failed server task if the option was not blocked by the MAXRECOV parameter in the ECAPARM configuration file, and processing continues.

**Corrective Action:** Check the error messages of the application server address space to determine why the server task failed, try to fix the problem, and try again.

ECAG4CE APPL.SERVER (applServer.type.task-id.addrSpaceId.channelId) FAILED WHEN BEING STARTED

**Explanation:** IOAGATE detected an application server failure before the server completed its startup.

The variables in this message are:
Automatic recovery is initiated for the failed application server if the option was not blocked by the MAXRECOV parameter in the ECAPARM configuration file. Processing continues.

**Corrective Action:** Check the error messages of the application server address space to determine why the application server failed, try to fix the problem, and restart IOAGATE.

**ECAG4DE SERVER TASK (applServerName.type.taskId.addrSpaceId) FAILED**

**Explanation:** IOAGATE detected a server task failure.

The variables in this message are:

- `applServer` - the name of the application server
- `type` - the server task type
- `taskId` - the internal identity of this server task
- `addrSpaceId` - the internal identity of the application server address space

IOAGATE does the following:

- clears resources allocated for cross memory communication with the failed server task
- initiates automatic recovery for the failed server task, if the option was not blocked by MAXRECOV parameter in the ECAPARM configuration file
- continues communication with other server tasks.

**Corrective Action:** Check the error messages of the application server address space to determine why the server task failed, try to fix the problem, and restart IOAGATE.

**ECAG4GI SERVER TASK (applServerName.type.taskId.addrSpaceId) HAS BEEN STOPPED BY OPERATOR**

**Explanation:** This information message indicates that the operator issued the command `FIOAGATE,STOPTID=taskId`, and that command was successfully performed. The STOPTID command shuts down a specific server task.

The variables in this message are:
**InControl for z/OS Messages Manual**

- **applServerName** - the name of the application supported by the server that was stopped
- **type** - the internal type of the server task that was stopped
- **taskId** - the internal identity of this server task
- **addrSpaceId** - the internal identity of the application server address space to which this server task is assigned

**Corrective Action:** No action is required.

**ECAG4HW APPL.SERVER( addrSpaceId ) DOES NOT EXIST**

**Explanation:** An `F IOAGATE,STARTASID=addrSpaceId` command was issued by the operator, and failed. The STARTASID command starts a specific application server address space that either was shut down or failed. The specified address space ID (`addrSpaceId`) is not a valid address space ID.

In this message, `addrSpaceId` is the invalid address space ID that was specified.

**Corrective Action:** Correct the address space ID and reissue the command.

**ECAG4IW APPL.SERVER( applServerName.type.taskId.addrSpaceId.channelId/jobId ) WENT DOWN BECAUSE OPERATOR STOPPED SERVER TASK( taskId )**

**Explanation:** The specified application server address space went down because an operator stopped the single or last active CS server task running under the control of the identified application server.

The variables in this message are:
- **applServer** - name of the application supported by the server that has gone down
- **type** - the internal type of the server task that has gone down
- **taskId** - the internal identity of the server task that has gone down
- **addrSpaceId** - the internal identity of the application server address space to which the server task that has gone down is assigned
- **channelId** - the identity of the channel to which the identified application server is linked
- **jobId** - STC JOBID of the application server assigned to its address space by JES

**Corrective Action:** No action is required.

**ECAG4JI TERMINATION FOR SERVER TASK( applServer.type.taskId.addrSpaceId ) INITIATED**

**Explanation:** An `F IOAGATE, CTID=taskId CANCEL TASK modify command has been issued by the user.

The variables in this message are:

- **applServer** - the name of the application supported by the server to which the modify command was issued
- **type** - the internal type of the server task which is to be terminated
- **taskId** - the internal identity of the server task which is to be terminated
- **addrSpaceId** - the internal identity of the application server address space to which the task **taskId** is assigned

IOAGATE issues an internal control message that causes the application server address space **addrSpaceId** to terminate the server task **taskId**. Normal processing continues.

**Corrective Action:** No action is required.

**ECAG4KW SERVER TASK( applServer.type.taskId.addrSpaceId) HAS BEEN TERMINATED BY IOAGATE, USER( userld) SIID( serviceInstanceId)**

**Explanation:** The specified server task has been terminated by IOAGATE.

The variables in this message are:
- **applServer** - the name of the application supported by the server on which the task was terminated
- **type** - the internal type of the server task that was terminated
- **taskId** - the internal identity of the server task that was terminated
- **addrSpaceId** - the internal identity of the application server address space to which the terminated server task **taskId** is assigned

**Corrective Action:** Analyze the IOAGATE outputs to identify the reason of the termination. If the problem persists, contact BMC Software Customer Support.

**ECAG4LE APPL.SERVER (applServerName.addrSpaceId.proc.stcId-channelId/jobId) FAILED**

**Explanation:** The specified application server address space failed.

The variables in this message are:
- **applServer** - name of the application supported by the server that has gone down
- **addrSpaceId** - the internal identity of the application server address space to which the server task that has gone down is assigned
- **proc** - the name of the procedure of the application server address space
- **stcId** - the name of the JCL procedure used to start the application server address space
- **channelId** - the identity of the channel to which the identified application server is linked
- **jobId** - STC JOBID of the application server assigned to its address space by JES

Normal processing continues, and, if recovery is not blocked for this application server, the IOAGATE tries to recover the server.
Corrective Action: No action is required.

ECAG50I CHANNEL(channelId.SNA) DEALLOCATE RECEIVED FROM PARTNER, APPL ID(applId) CONV ID(conversation_id)

Explanation: This information message indicates that a DEALLOCATE APPC command was received from a client or partner IOAGATE for the specified conversation ID.

The variables in this message are:
- channelId: the identity of the channel over which the conversation that was deallocated was established
- applId: VTAM LU 6.2 (APPC) application ID of the IOAGATE
- conversation_id: VTAM LU 6.2 (APPC) internal conversation identity

Corrective Action: No action is required.

ECAG55W CHANNEL(channelId.protocol) TASK(taskId.type) IS STARTING UP ALTHOUGH NO APPL.SERVER HAS COME UP YET

Explanation: A communication channel has waited for at least one application server linked to the channelId channel to become ready, but none has come up.

The variables in this message are:
- channelId: the identity of the channel to which the problematic application server is linked
- protocol: the communication protocol used by the current channel. Valid values are:
  - TCP - TCP/IP
  - SNA - SNA
- taskId: the internal identity of this channel task
- type: the internal type of this channel

IOAGATE discontinues waiting until at least one application server linked to the channelId channel is ready. The channelId channel continues initializing.

Corrective Action: This warning message may, but does not necessarily, indicate a real problem on the application server. Examine the JES logs of all application servers linked to the channelId channel and try to find the cause for the failure of the application server to start in time.

ECAG56I REJECTED:SID=serviceId SIID=serviceInstanceId SEQ=seqNumber APPLIC=appl ASID=addressSpaceId LAST=turn_around C/E=compression/encryption TYPE=t1/t2/t3 USER=userId

Explanation: This message follows the messages ECAC60E, ECAC61E, ECAC62E, ECAC64E, ECAC65E, ECAC66E, ECAC67E, ECAC68E, ECAC69E, ECAC6EE, ECAC6FE, ECAC6GE, ECAC6HE, ECAC6IE, ECAC6ME, ECAG58E, and provides details of the rejected transaction.

The variables in the message are:
- **serviceId** - the type of the transaction that was rejected
- **serviceInstanceId** - the service instance identity (SIID) of the transaction rejected by IOAGATE
- **seqNumber** - the sequential number of the rejected message in a given direction within the same transaction. These numbers start from 000001.
- **appl** - the short code of the application to which the rejected transaction was assigned
- **addressSpaceId** - the internal address space identity of the application server to which the rejected transaction was assigned
- **turn_around** - internal indication of the nature of the transaction. Valid values are:
  - T - Turn Around - This was the last message in this direction and a response was required
  - L - Last - The current message was the last in the service, meaning, the end of transaction.
  - ' ' (Blank) - the current message was not the last in the service, and more messages are expected
- **compression** - whether compression is in use. Valid values are:
  - A (Accept) - Used only by D applications, to indicate that the D client will accept compressed data from IOAGATE.
  - D (Compressed) - Used only by D applications, to indicate that this message contains compressed data.
  - Y - Compression is in use.
  - I (Ignore) - The compression indication field is used differently.
  - ' ' (Blank) - No compression is in use.
- **encryption** - whether encryption is in use. Valid values are:
  - Y (Yes) - DES or 3DES encryption is in use.
  - ' ' (Blank) - No encryption is in use.
- **t1** - whether the message is regular or extended. Valid values are:
  - R (Regular) - The message is regular.
  - E (Extended) - The message is extended.
- **t2** - indicates the message type. Valid values are:
  - B - Big message
  - C - Confirmation
  - D - Data
  - E - Error
  - F - End of download or upload
  - R - Request
  - S - Start of download or upload
  - ( - Start of file transfer
  - ) - End of file transfer
- *t3* - indicates the record type. Valid values are:
  - ! - Do not Process the message indication
  - A - Handshake CONNECT message
  - C - Handshake CONFIRM message
  - R - Handshake REJECT message
  - I - Handshake Information message
  - A - Active job file record
  - A - Attach request
  - B - Short database update
  - C - Condition
  - C - Communication update message
  - D - Cancel request
  - F - Modify server request
  - F - Force job
  - G - Synchronization record
  - H - Control resource
  - I - Initialization
  - J - Edit JCL
  - L - Log
  - M - Internal IOAGATE message
  - N - New job
  - O - Order job
  - Q - Quantitative resource
  - R - Control resource
  - S - Statistics record
  - T - Alert
  - V - View sysout file
  - Z - WS Synchronization record

- *userId* - the identity of the user associated with this transaction

**Corrective Action:** No action is required.
ECAG57W CHANNEL(channelId.protocol) TASK(taskId.type) IS STARTING UP ALTHOUGH APPL_SERVER(applServerId - addrSpaceId) HAS NOT COME UP YET

Explanation: The channelId communication channel has waited for the applServer application server that is linked to become ready, but applServer has not come up.

The variables in this message are:
- channelId - the identity of the channel to which the problematic application server is linked
- protocol - the communication protocol used by the current channel. Valid values are:
  - TCP - TCP/IP
  - SNA - SNA
- taskId - the internal identity of this channel task
- type - the internal type of the channelId channel
- applServerId - the internal identity of the application server linked to the channelId channel
- addrSpaceId - the internal identity of the application server address space linked to the channelId channel

IOAGATE discontinues waiting until at the application server linked to the channelId channel is ready. The channelId channel continues initializing.

Corrective Action: This warning message may, but does not necessarily, indicate a real problem on the application server. Examine the JES log of the applicId application server and try to find out why the application server failed to start in time.

ECAG58E CHANNEL(channelId.protocol) TASK(taskId.type) TIMEOUT OCCURRED WHILE WAITING FOR A MESSAGE FROM PARTNER

Explanation: This information message indicates that a request was canceled because an expected message did not arrive within a defined time-out interval.

The variables in this message are:
- channelId - the identity of the channel in which the specified time-out occurred
- protocol - the communication protocol used by the current channel. Valid values are:
  - TCP - TCP/IP communication protocol
  - SNA - SNA communication protocol
- taskId - the internal ID of this channel task
- type - the internal type of this channel

If the expected message is not critical, IOAGATE continues executing. If the expected message is critical, the corresponding SNA channel goes down.

Corrective Action: If the problem persists, call BMC Software Customer Support for assistance.
ECAG59W CHANNEL(\textit{channelId.protocol}) TASK(\textit{taskId.type}) "DO NOT PROCESS" INDICATION RECEIVED, MESSAGE DISCARDED

\textbf{Explanation:} This information message indicates that the specified channel received a request with a "Do not process (!)" indication.

The variables in this message are:

- \textit{channelId} - the identity of the channel in which the specified event occurred
- \textit{protocol} - the communication protocol used by the current channel. Valid values are:
  - TCP - TCP/IP communication protocol
  - SNA - SNA communication protocol
- \textit{taskId} - the internal ID of this channel task
- \textit{type} - the internal type of this channel

\textbf{Corrective Action:} No action is required.

ECAG5AI DISCARDED: \textit{msg}

\textbf{Explanation:} This message follows ECAG59W or ECAG5BW and displays the discarded transaction.

\textbf{Corrective Action:} No action is required.

ECAG5BW CHANNEL(\textit{channelId.protocol}) TASK(\textit{taskId.type}) HANDSHAKE MESSAGE REJECTED: THERE IS NO MAP SPECIFIED

\textbf{Explanation:} This message warns that the specified channel received a handshake used by IOAGATE-to-IOAGATE communication, but the local IOAGATE is not configured to be a partner IOAGATE.

The variables in this message are:

- \textit{channelId} - the identity of the channel that detected the event
- \textit{protocol} - the communication protocol used by the channel. Valid values are:
  - TCP - TCP/IP communication protocol
  - SNA - SNA communication protocol
- \textit{taskId} - the internal identity of the channel task that detected the event
- \textit{type} - the internal type of the channel task that detected the event

\textbf{Corrective Action:} No action is required.

ECAG5CI CHANNEL(\textit{channelId.protocol}) processed FOR INCOMING CONNECTIONS, APPLICATION(\textit{applId})

\textbf{Explanation:} This information message indicates that an F IOAGATE,\textless cmd\_modify\textgreater command was successfully performed.

The variables in this message are:
- `channelId` - the identity of the channel against which the modify command was performed
- `protocol` - the communication protocol used by `channelId`. Valid values are:
  - TCP - TCP/IP
  - SNA - SNA
- `processed` - the type of action. Valid values are:
  - CLOSED - `channelId` has been successfully closed for incoming connections
  - OPENED - `channelId` has been successfully opened for incoming connections
- `applicId` - the identity of the application that `channelId` serves

**Corrective Action:** No action is required.

**ECAG5DI** IOAGATE WILL BE SHUT DOWN AS SOON AS ALL CLIENTS HAVE DISCONNECTED

**Explanation:** This information message indicates that an F IOAGATE,CLOSE=ALL,SHUT modify command was successfully performed.

Processing continues. IOAGATE will be shut down as soon as all active clients have been disconnected.

**Corrective Action:** No action is required.

**ECAG5EW** SHUT SPECIFICATION REJECTED, THERE ARE OPEN CHANNELS

**Explanation:** An F IOAGATE,CLOSE=channelId,SHUT modify command was issued but the SHUT subcommand was rejected because a channel was found to be open and active.

**Corrective Action:** If required, close the open channels and re-issue the F IOAGATE,CLOSE=ALL,SHUT modify command.

**ECAG5FW** MODIFY(OPEN=ALL) IGNORED, ALL CHANNELS OPEN

**Explanation:** An F IOAGATE,OPEN=ALL modify command was issued, but was rejected because all active channels are already open.

**Corrective Action:** No action is required.

**ECAG5GI** SHUT COMMAND ISSUED EARLIER BY "CLOSE,SHUT" HAS BEEN CANCELED

**Explanation:** An F IOAGATE,OPEN=channelId modify command was issued, but the CLOSE=ALL,SHUT command had already been issued.

The action that was ordered by the SHUT subcommand has been canceled.

**Corrective Action:** No action is required.
ECAG5HI  IOAGATE GOES DOWN DUE TO COMMAND "CLOSE=.,SHUT" I ISSUED EARLIER

Explanation: An F IOAGATE,OPEN=ALL,SHUT modify command was issued some time ago, and all active clients have been disconnected. IOAGATE goes down.

Corrective Action: No action is required.

ECAG5II  CHANNEL(channelId.protocol) TASK(taskId.type) INCOMING CONNECTION REJECTED: CHANNEL CLOSED

Explanation: This information message indicates that an F IOAGATE,CLOSE=ALL/ channelId modify command was issued against the channelId channel, and this channel was closed.

The variables in this message are:
- channelId - the identity of the channel that was closed by the modify command
- protocol - the communication protocol used by channelId. Valid values are:
  - TCP - TCP/IP
  - SNA - SNA
- taskId - the internal identity of the channel task that detected the connection attempt
- type - the internal type of the taskId channel task

The attempt to connect to the channelId channel is rejected. Normal processing continues.

Corrective Action: No action is required.

ECAG5TE  LE PREINITIALIZATION FAILED, MOD=modname,FUNC=function,RC=return_code

Explanation: Language Environment Preinitialization services is used to create a persistent C environment for INCONTROL C programs. An error occurred while using this facility. The subtask involved will be abended with code U0186.

The variables are defined as follows:
- modname - name of the program that issued the call
- function - one of the following:
  - INIT - environment initialization
  - CSUB,TRM-CSUB - calling a C program
  - TERM - terminating the environment
- return_code (selection):
  - rc= 8: failure to load a C program. Program might be missing from STEPLIB.
  - rc=12: insufficient storage for the preinitialization environment
  - rc=16: An active environment already exists
• rc=32: Abend occurred in preinitialization services

**Corrective Action:**
1. For INIT return codes 8 or 12, check your environment. In other cases, notify BMC Customer Support.
2. For a Control-D PC transfer, a previous error (such as, an error reading the file during the transfer or an abend in the transmission program) might have caused this error. For immediate transfers, exit and enter the online session before trying more transfers.
3. For IOAGATE or Control-M monitor, if they shut down, restart them.

**ECAG5UE TCP/IP STACK stack UNAVAILABLE, ERRNO=errno. CHANNEL channell d DI SABLED.**

**Explanation:** An IOAGATE channel was defined with ESTACK=stack in ECAPARMx. The z/OS system has dual stack mode TCP/IP, but the specified stack is not running.

**Corrective Action:** Either bring up the started task specified in ESTACK parameter, or remove the ESTACK parameter. Then recycle IOAGATE.

**ECAG61S CHANNEL(channell d:SNA) IOAGATE INTERNAL COMMUNICATION ERROR, SEND INDICATION NOT RECEIVED**

**Explanation:** IOAGATE discovered a protocol violation. After the sending side of a dual connection (DC) SNA channel allocates a conversation with its partner or client, the partner application should reverse the conversation direction. Due to a protocol violation, the conversation direction was not reversed. This message can occur only for dual connection (DC) SNA channels.

IOAGATE shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

**ECAG62I CHANNEL(channell d:TCP) COMTASK(taskId) SOCKET(socket) USER(userId) LOGGED ON FROM ipAdd**

**Explanation:** This information message indicates that a user successfully logged on to IOAGATE over a multiple connection (MC) TCP channel.

The variables in this message are:
- `channelId` - the identity of the channel on which this user logged on to IOAGATE
- `taskId` - the identity of the TCP/IP communication task to which this user was assigned
- `socket` - TCP/IP socket number of this connection
- `userId` - the identity of the user who logged on
- `ipAdd` - IP address of the user that logged on

**Corrective Action:** No action is required.
ECAG63I CHANNEL(channelId.SNA) DEALLOCATE SENT TO PARTNER, APPLID(applId) LU(luName)

Explanation: This information message indicates that a DEALLOCATE APPC command was sent to a partner or client.

Conversation parameters:
- **channelId**: the identity of the channel this partner or client was using
- **applId**: VTAM LU 6.2 (APPC) application ID of the IOAGATE
- **luName**: VTAM LU 6.2 (APPC) LU name of the partner or client

Corrective Action: No action is required.

ECAG64I CHANNEL(channelId.SNA) CONVERSATION STARTED WITH PARTNER APPLID(applId) LU(luName) MODE(mode)

Explanation: This information message indicates that a conversation started between IOAGATE and its partner or client. The specified partner or client started a conversation with IOAGATE. The message can be issued for a dual connection (DC) SNA channel only.

Conversation parameters are:
- **channelId**: the identity of the channel on which the specified conversation started
- **applId**: VTAM LU 6.2 (APPC) application identity of the IOAGATE
- **luName**: VTAM LU 6.2 (APPC) LU name of the partner or client
- **mode**: the mode in use. Valid values are:
  - SENDER - the sender mode of the DC SNA channel conversation
  - RECEIVER - the receiver mode of the DC SNA channel conversation

Corrective Action: No action is required.

ECAG65I CHANNEL(channelId.SNA) DEALLOCATE RECEIVED FROM PARTNER APPLID(applId) LU(luName)

Explanation: This information message indicates that a DEALLOCATE APPC command was received from a partner or client. The partner deallocated the conversation with IOAGATE.

Conversation parameters are:
- **channelId**: the identity of the channel over which the specified conversation was occurring when it was terminated
- **applId**: VTAM LU 6.2 (APPC) application identity of the IOAGATE
- **luName**: VTAM LU 6.2 (APPC) LU name of the partner or client

Corrective Action: No action is required.
ECAG66W CHANNEL(channelId.SNA) TPEND EXIT INVOKED,
APPLID(applId) LU(luName) REASON(rsn)

Explanation: The VTAM operator broke the connection between the partner or client and the indicated SNA channel. This message indicates that the TPEND exit was invoked.

Attributes of the connection are:
- channelId - the identity of the SNA channel that was connected to the partner or client
- applId - VTAM LU 6.2 (APPC) application identity of the IOAGATE
- luName - VTAM LU 6.2 (APPC) LU name of the partner or client
- rsn - code indicating what happenedFor the explanation for each value of rsn, see the VTAM Programming for LU 6.2 Manual

Processing continues, and IOAGATE tries to recycle the specified SNA channel.

Corrective Action: For an explanation of TPEND reason codes, see the VTAM Programming for LU 6.2 Manual. Call your system programmer for assistance.

ECAG67W CHANNEL(channelId.SNA) ATTN LOSS EXIT INVOKED,
APPLID(applId) LU(luName)

Explanation: The partner or client and IOAGATE were disconnected. This message precedes the message ECAG68I, which contains VTAM diagnostic information.

The attributes of the broken connection are:
- channelId - the identity of the channel on which the disconnection occurred
- applId - VTAM LU 6.2 (APPC) application identity of the IOAGATE
- luName - VTAM LU 6.2 (APPC) LU name of the partner or client

IOAGATE attempts to recycle the indicated SNA channel.

Corrective Action: Read the message ECAG68I to identify and fix the problem, if possible. If you cannot resolve the problem, call your system programmer for assistance.

ECAG68I RPL6SNSI(rpl6sns_code) RPL6RC(rpl6rsn_code)
RPL6DETP(rpl6detp_code) RPLSONCD(rplsoncd_code)

Explanation: This information message displays VTAM diagnostic information for a network systems programmer. It follows message ECAG67W, which announces disconnection of IOAGATE from its partner or client.

RPL6 fields that are documented in the VTAM Programming for LU 6.2 are:
INCONTROL for z/OS Messages Manual

- \textit{rpl6sns\_code} - sense code returned by VTAM
- \textit{rpl6rsn\_code} - RPL6 reason code returned by VTAM
- \textit{rpl6detp\_code} - DETP reason code returned by VTAM
- \textit{rplsoncd\_code} - SONCD UNBIND type code returned by VTAM

\textbf{Corrective Action:} Try to determine the cause of the problem, and correct it. If you cannot resolve the problem, call your system programmer for assistance.

\textbf{ECAG69I CHANNEL(\textit{channelId}.SNA) READY FOR COMMUNICATIONS, APPL\textit{ID}(\textit{applId})}

\textbf{Explanation:} This information message indicates that the SNA channel of the IOAGATE is waiting for an ALLOCATE request from a partner or client. This message is issued during a multiple connection (MC) SNA channel startup.

Attributes of the SNA channel are:
- \textit{channelId} - the identity of the channel that is ready for communications
- \textit{applId} - VTAM LU 6.2 (APPC) application ID of the IOAGATE

\textbf{Corrective Action:} No action is required.

\textbf{ECAG70I PROBABLE CAUSE: TEMPORARY STORAGE SHORTAGE}

\textbf{Explanation:} This information message indicates that the probable reason for the failure of a VTAM request is a temporary shortage of main storage for VTAM. This message follows a message that announces failure of a VTAM request, such as an APPC command, or an OPEN or CLOSE ACB command, and precedes message ECAG81I, ECAG84I, or ECAG85I, which indicates the action that will be taken by IOAGATE. This message can be issued for an SNA channel only.

Processing continues, but the SNA channel fails.

\textbf{Corrective Action:} If the problem persists, consider tuning the VTAM buffer. Call your system programmer for assistance.

\textbf{ECAG71I PROBABLE CAUSE: VTAM IS HALTING}

\textbf{Explanation:} This information message indicates that VTAM is probably going down. This message follows a message that announces failure of a VTAM request, such as an APPC command, or an OPEN or CLOSE ACB command. It precedes message ECAG81I, ECAG84I, or ECAG85I, which indicates the action that will be taken by IOAGATE. This message can be issued for an SNA channel only.

SNA channel fails. Processing continues.

\textbf{Corrective Action:} If the problem persists, call your system programmer for assistance.
ECAG72I PROBABLE CAUSE: APPLID NOT DEFINED

Explanation: This information message indicates that the probable reason for the failure of a VTAM OPEN ACB command is that VTAM does not recognize the VTAM LU 6.2 (APPC) application ID specified in the OPEN ACB command. This message follows message ECAG91W, which announces the command failure, and precedes message ECAG83E, which specifies the action that will be taken by IOAGATE. This message can be issued for an SNA channel only.

Possible causes are:
- The Major node where APPLID is defined is not active.
- The APPLID defined to VTAM does not match the APPLID or APPLIDS defined to IOAGATE in the ECAPARM SNA channel declaration.

Processing continues, but the SNA channel fails.

Corrective Action: Activate the Major node, or correct the APPLID or APPLIDS specifications in the SNA channel declaration in the ECAPARM configuration file. If the problem persists, call your system programmer for assistance.

ECAG73I PROBABLE CAUSE: APPLID DEFINED IMPROPERLY

Explanation: This information message indicates that the probable reason for failure of a VTAM OPEN ACB command is that the VTAM LU 6.2 (APPC) application ID specified in the OPEN ACB command is probably not a valid application definition, although it is known to VTAM. This could happen, for instance, if the APPLID or APPLIDS defined to IOAGATE in the ECAPARM configuration file is incorrect, but happens to match the name of another resource known to VTAM.

This message follows a message that announces failure of the VTAM OPEN ACB command, and precedes message ECAG83E, which specifies the action that will be taken by the IOAGATE. This message can be issued for an SNA channel only.

Processing continues, but the SNA channel fails.

Corrective Action: Correct the APPLID or APPLIDS specifications in the SNA channel declaration in the ECAPARM configuration file. If the problem persists, call your system programmer for assistance.

ECAG74I PROBABLE CAUSE: ACB HAS ALREADY BEEN OPENED

Explanation: This information message indicates that the probable reason for the failure of a VTAM OPEN ACB command is that the VTAM LU 6.2 (APPC) application ID specified in the OPEN ACB command is already open and in use by another application.

Possible causes are:
- Another IOAGATE with the same APPLID is already up.
- The APPLID defined to the IOAGATE in the ECAPARM configuration file is incorrect, but matches the name of another resource known to VTAM.

This message precedes message ECAG85I, which specifies the action that will be taken by IOAGATE. This message can be issued for an SNA channel only.

Processing continues, but the SNA channel fails.
**Corrective Action:** Correct the APPLID specifications in the SNA declaration in the ECAPARM configuration file, or shut down the address space that uses the same APPLID. If the problem persists, call your system programmer for assistance.

**ECAG75I PROBABLE CAUSE: APPLID INACTIVATED**

**Explanation:** This information message indicates that the probable cause of the failure of a VTAM OPEN ACB command is that the VTAM LU 6.2 (APPC) application ID is inactive. This message precedes message ECAG81I, which specifies the action that will be taken by the IOAGATE. This message can be issued for an SNA channel only.

Processing continues, but the SNA channel fails.

**Corrective Action:** Activate the application defined by the APPLID. If the problem persists, call your system programmer for assistance.

**ECAG76I PROBABLE CAUSE: VTAM IS NOT ACTIVE**

**Explanation:** This information message indicates that the probable cause of the failure of a VTAM request, such as an APPC command, or an OPEN or CLOSE ACB command, is that VTAM is down. This message precedes message ECAG85I, which specifies the action that will be taken by the IOAGATE. This message can be issued for an SNA channel only.

Processing continues, but the SNA channel fails.

**Corrective Action:** Call your network systems programmer for assistance.

**ECAG77I PROBABLE CAUSE: PARTNER DISCONNECTED**

**Explanation:** This information message indicates that the probable cause of the failure of a VTAM APPC command is that the conversation was lost due to disconnection from the partner or client. This message follows message ECAG90E, which announces that an APPC command failed, and precedes message ECAG81I, which specifies the action that will be taken by the IOAGATE. This message can be issued for an SNA channel only.

Processing continues, but the SNA channel fails.

**Corrective Action:** Check the message issued by the partner or client and proceed accordingly. If the problem persists, call your system programmer for assistance.

**ECAG78I PROBABLE CAUSE: CONNECTION LOST**

**Explanation:** This information message indicates that the probable cause of failure of a VTAM APPC command is a communication disruption. This may be due to a resource failure on the route to or from the partner or client. This message precedes message ECAG81I, which specifies the action that will be taken by the IOAGATE. This message can be issued for an SNA channel only.

Processing continues, but the SNA channel fails.

**Corrective Action:** Try to determine the cause of the communication disruption and correct it. If the problem persists, call your system programmer for assistance.
ECAG79I PROBABLE CAUSE: SESSION TERMINATED

Explanation: This information message indicates that the probable cause of failure of a VTAM APPC command is the termination of a VTAM session, possibly because of a protocol error. This message precedes message ECAG81I, which indicates the action that will be taken by the IOAGATE. This message can be issued for an SNA channel only.

Processing continues, but the SNA channel fails.

Corrective Action: Call your system programmer for assistance. If the problem persists, contact BMC Software Customer Support.

ECAG81I CHANNEL(channelId.SNA) RE-START COMMUNICATION WILL BE ATTEMPTED

Explanation: This information message indicates that an attempt will be made to restart the specified SNA channel. Restarting an SNA channel involves preparing to receive a conversation allocation request from the partner or client LU, including opening the ACB if it is not already open. This message follows other messages that provide details about an error that occurred.

In this message, channelId is the identity of the problematic SNA channel.

IOAGATE attempts to restart the indicated channel.

Corrective Action: No action is required.

ECAG82I CHANNEL(channelId.SNA) RE-CYCLE COMMUNICATION WILL BE ATTEMPTED

Explanation: This information message indicates that an attempt will be made to recycle the SNA channel. Recycling communication for a SNA channel involves deallocating the conversation (if there is any), closing and re-opening the ACB, and preparing to receive a conversation allocation request from the partner or client LU. This message follows other messages that provide details about the error that occurred.

In this message, channelId is the identity of the problematic SNA channel.

IOAGATE attempts to recycle the indicated SNA channel.

Corrective Action: No action is required.

ECAG83E IOAGATE WILL BE SHUT DOWN

Explanation: IOAGATE will shut down because of an error that occurred. This message follows other messages that provide details about the error.

IOAGATE shuts down.

Corrective Action: If the shutdown is due to an error in the IOAGATE, contact BMC Software Customer Support.
ECAG84I  OPERATION WILL BE RE-ATTEMPTED

**Explanation:** This information message indicates that a failed operation will be retried. This message follows other messages that provide details about an error that occurred. This message can be issued for an SNA channel only.

Normal processing continues, and the failed operation is retried until it succeeds or until the retry limit is reached. When the retry limit is exceeded, an attempt is made to recycle the SNA channel.

**Corrective Action:** No action is required.

ECAG85I  OPERATION WILL BE RE-ATTEMPTED IN A MINUTE

**Explanation:** This information message indicates that a failed operation will be retried after one minute. This message follows other messages that provide details about an error that occurred. This message can be issued for a SNA channel only.

Normal processing continues, and the failed operation is retried after one minute.

**Corrective Action:** No action is required.

ECAG87I  CHANNEL(channelId.SNA) ESTABLISHED CNOS APPL ID(applId) LU(luName) LOGMODE(logmode) MINWNL(minwnl) MINWNR(minwnr) SESLIM(seslim_code)

**Explanation:** This information message indicates that a multiple connection (MC) SNA channel established CNOS connection with a partner IOAGATE.

Parameters of the established connection are:
- channelId - Channel ID of the local IOAGATE
- applId - VTAM LU 6.2 (APPC) application identity of the local IOAGATE
- luName - VTAM LU 6.2 (APPC) application identity of the partner IOAGATE
- logmode - LOGMODE used in this connection
- minwnl - Minimum contention winner sessions for the local IOAGATE
- minwnr - Minimum contention winner sessions for the partner IOAGATE
- seslim - Maximum number of sessions between the local and the partner IOAGATEs

**Corrective Action:** No action is required.

ECAG88I  CHANNEL(channelId.SNA) SESSION ALLOCATED LU(luName) CONVID(conversation_id) SID(session_id)

**Explanation:** This information message indicates that the sending conversation with a partner IOAGATE was allocated over a multiple connection (MC) SNA channel.

The variables in this message are:
ECAG89W CHANNEL(channelId.SNA) APPCCMD(appc_command) FAILED
APPLID(applId) R15(r15_rc) R0(r0_rsn) RPL6RC(rpl6_rsn) PARTNER LU(luName)

Explanation: An APPC command issued by a multiple connection (MC) SNA channel failed. This message precedes message ECAG84I, which specifies the action that will be taken by IOAGATE. This message may follow another message that provides more information about the error.

The variables in this message for the system programmer are:

- channelId: the identity of the channel that issued the APPC command
- appc_cmd: the failed APPC command
- applId: VTAM LU 6.2 (APPC) application identity of the local IOAGATE
- r15_rc: Return code returned by VTAM in R15
- r0_rsn: Reason code returned by VTAM in R0
- rpl6_rsn: RPL6 reason code returned by VTAM in RPL6
- luName: VTAM LU 6.2 (APPC) application ID of the partner IOAGATE

For more information on appc_cmd, r15_rc, r0_rsn, and rpl6_rsn, see the VTAM Programming for LU 6.2 Manual.

Corrective Action: If another message follows with a probable cause of the error, perform the user action recommended for that message. Otherwise, call your system programmer for assistance.

ECAG90E CHANNEL(channelId.SNA) APPCCMD(appc_cmd) FAILED
APPLID(applId) R15(r15_rc) R0(r0_rsn) RPL6RC(rpl6_rsn) PARTNER LU(luName)

Explanation: An APPC command issued by a multiple connection (MC) SNA channel failed. This message precedes message ECAG84I, which specifies the action that will be taken by IOAGATE. This message may follow another message that provides more information about the error.

The variables in this message for the system programmer are:
**channelId** - the identity of the channel that issued the APPC command

**appc_cmd** - the failed APPC command

**applId** - VTAM LU 6.2 (APPC) application identity of the local IOAGATE

**r15_rc** - return code returned by VTAM in R15

**r0_rsn** - reason code returned by VTAM in R0

**rpl6_rsn** - RPL6 reason code returned by VTAM in RPL6

**luName** - VTAM LU 6.2 (APPC) application identity of the partner IOAGATE

For more information on **appc_cmd**, **r15_rc**, **r0_rsn**, and **rpl6_rc**, see the VTAM Programming for LU 6.2 Manual.

**Corrective Action:** If another message follows with a probable cause of the error, perform the user action recommended for that message. Otherwise, call your system programmer for assistance.

**ECAG91W CHANNEL(channelId.SNA) OPEN ACB FAILED, APPLID(applId) ACBERFLG(acb_err_flag)**

**Explanation:** An OPEN ACB command issued by a multiple connection SNA channel failed. This message precedes a message that specifies the action that will be taken by IOAGATE. This message may follow another message that provides more information about the error.

The variables in this message for the system programmer are:

- **channelId** - the identity of the channel that issued the OPEN command
- **applId** - VTAM LU 6.2 (APPC) application identity of the local IOAGATE
- **acb_err_flag** - ACBERFLG flags returned by VTAM

**Corrective Action:** If another message follows with a probable cause of the error, perform the user action recommended for that message. Otherwise, call your system programmer for assistance.

**ECAG93W CHANNEL(channelId.SNA) CLOSE ACB FAILED, APPLID(applId) ACBERFLG(acb_err_flag)**

**Explanation:** A CLOSE ACB command issued by a multiple connection SNA channel failed. This message precedes a message that specifies the action that will be taken by IOAGATE. This message may follow another message that provides more information about the error.

The variables in this message for the system programmer are:

- **channelId** - the identity of the channel that issued the CLOSE command
- **applId** - VTAM LU 6.2 (APPC) application identity of the local IOAGATE
- **acb_err_flag** - ACBERFLG flags returned by VTAM

**Corrective Action:** If another message follows with a probable cause of the error, perform the action recommended for that message. Otherwise, call your system programmer for assistance.
ECAG94W CHANNEL(channelId.SNA) SETLOGON FAILED, APPLD(applId)
R15(r15_rc) R0(r0_rsn) RPLRTNCD(rplrtncd_code)
RPLFDBK2(rplfdbk2_code)

Explanation: A SETLOGON command issued by a multiple connection (MC) SNA channel failed. This message precedes a message that specifies the action that will be taken by IOAGATE. This message may follow another message that provides more information about the error.

The variables in this message for the system programmer are:

- **channelId** - the identity of the channel that issued the SETLOGON command
- **applId** - VTAM LU 6.2 (APPC) application identity of the local IOAGATE
- **r15_rc** - return code returned by VTAM in R15
- **r0_rsn** - reason code returned by VTAM in R0
- **rplrtncd_code** - RPLRTNCD returned by VTAM in RPL
- **rplfdbk2_code** - RPLFDBK2 returned by VTAM in RPL

For more information on **r15_rc**, **r0_rsn**, **rplrtncd_code**, and **rplfdbk2_code**, see the VTAM Programming for LU 6.2 Manual.

Corrective Action: If another message follows with a probable cause of the error, perform the user action recommended for that message. Otherwise, call your system programmer for assistance.

ECAG95E CHANNEL(channelId.SNA) APPCCMD(appc_cmd) FAILED AFTER num RETRIES APPLD(applId) PARTNER LU(luName)

Explanation: An APPC command issued by a multiple connection (MC) SNA channel failed after a number of retries. This message precedes a message that specifies the action that will be taken by the local IOAGATE. This message may follow another message that provides more information about the error.

The variables in this message for the system programmer are:

- **channelId** - the identity of the channel that issued the APPC command
- **appc_cmd** - the failed APPC command
- **num** - the number of retries before failure
- **applId** - VTAM LU 6.2 (APPC) application identity of the SNA channel
- **luName** - VTAM LU 6.2 (APPC) application identity of the partner IOAGATE

Corrective Action: For more information on **appc_cmd**, see the VTAM Programming for LU 6.2 Manual. The IOAGATE recycles the specified SNA channel.
If another message follows with a probable cause of the error, perform the user action recommended for that message. Otherwise, call your system programmer for assistance.

**ECAG96E CHANNEL(CHANNEL) APPCCMD SEND NOT COMPLETED WITHIN 10 MINUTES, APPLID(APPLID) PARTNER LU(LUName)**

**Explanation:** A SEND operation issued by a multiple connection (MC) SNA channel was not completed within the specified time interval. This message precedes a message that specifies the action that will be taken by the local IOAGATE. This message may follow another message that provides more information about the error.

The variables in this message are:
- `channelId` - the identity of the channel that issued the APPC command
- `applId` - VTAM LU 6.2 (APPC) application identity of the SNA channel
- `luName` - VTAM LU 6.2 (APPC) LU name of the partner IOAGATE

The IOAGATE recycles the specified SNA channel.

**Corrective Action:** If another message follows with a probable cause of the error, perform the user action recommended for that message. Otherwise, call your system programmer for assistance.

**ECAG97E CHANNEL(CHANNEL) GENCB FAILED, APPLID(APPLID) R15(r15_rc) R0(r0_rsn) RPLRTNCD(rplrtncd_code) RPLFDBK2(rplfdbk2_code)**

**Explanation:** A GENCB operation issued by a multiple connection SNA channel failed. This message precedes a message that specifies the action that will be taken by the local IOAGATE.

The variables in this message for the system programmer are:
- `channelId` - the identity of the SNA channel that issued the GENCB operation
- `applId` - VTAM LU 6.2 (APPC) application ID of the SNA channel
- `r15_rc` - return code returned by VTAM in R15
- `r0_rsn` - reason code returned by VTAM in R0
- `rplrtncd_code` - RPLRTNCD returned by VTAM in RPL
- `rplfdbk2_code` - RPLFDBK2 returned by VTAM in RPL

For more information on `r15_rc`, `r0_rsn`, `rplrtncd_code`, and `rplfdbk2_code`, see the VTAM Programming for LU 6.2 Manual.

The IOAGATE shuts down.

**Corrective Action:** Try to determine the cause of the failure using the diagnostic information in the message. If you cannot resolve the problem, call your system programmer for assistance.
ECAG98I CHANNEL(channelId.SNA) CONVERSATION STARTED, LU(luName) CONVID(conversation_id) SID(session_id) APPLID(applId)

**Explanation:** This information message indicates that the specified conversation started between the IOAGATE and its partner. A specific partner started a conversation with the IOAGATE.

The variables in this message are:
- channelId - the identity of the SNA channel on which the conversation was started
- luName - VTAM LU 6.2 (APPC) LU name of the partner IOAGATE
- conversation_id - VTAM LU 6.2 (APPC) conversation identity
- session_id - session identity
- applId - VTAM LU 6.2 (APPC) application identity of the IOAGATE

**Corrective Action:** No action is required.

ECAG99W CHANNEL(channelId.SNA) ATTN LOSS EXIT INVOKED, LU(luName) APPLID(applId) SID(session_id)

**Explanation:** A session between the specified LU and the local IOAGATE ended. A partner IOAGATE ended the connection to the local IOAGATE.

The variables in this message are:
- channelId - the identity of the SNA channel on which the connection was terminated
- luName - VTAM LU 6.2 (APPC) application identity of the partner IOAGATE
- applId - VTAM LU 6.2 (APPC) application identity of the local IOAGATE
- session_id - session identity

**Corrective Action:** No action is required.

Messages ECAH00 through ECAHxx

This group includes messages for the IOA (infrastructure) product.

ECAH01W APPL.SERVER(svr) SUSPECTED HANGING IN THE LAST num1 INTERVALS OF num2 seconds:

**Explanation:** The Hanging Detection mechanism in IOAGATE suspected a hanging transaction in the application server.

The variables in this message are:
- svr - the identity of the application server
- num1 - the duration in seconds of one time interval
- num2 - the number of time intervals that this hanging situation continues

This message is followed by message ECAH0AI.
Corrective Action: No action is required.

ECAH02W IOAGATE SUSPECTED HANGING IN THE LAST $num1$ INTERVALS OF $num2$ seconds:

Explanation: The Hanging Detection mechanism in IOAGATE suspected a hanging transaction in IOAGATE.

The variables in this message are:
- $num1$ - the duration in seconds of one time interval
- $num2$ - the number of time intervals that this hanging situation continues

This message is followed by message ECAH0BI.

Corrective Action: No action is required.

ECAH03W CHANNEL ($chan$) SUSPECTED HANGING IN THE LAST $num1$ INTERVALS OF $num2$ seconds:

Explanation: The Hanging Detection mechanism in IOAGATE suspected a hanging transaction in a communication channel.

The variables in this message are:
- $chan$ - the identity of the communication channel
- $num1$ - the duration in seconds of one time interval
- $num2$ - the number of time intervals that this hanging situation continues

This message is followed by message ECAH0CI.

Corrective Action: No action is required.

ECAH0AI MESSAGES HAVE BEEN ACCUMULATED FOR THE APPL.SERVER BUT IT HAS NOT BEEN READY TO PROCESS THEM

Explanation: This information message describes the result of the hanging transaction that was described in message ECAH01W.

Corrective Action: No action is required.

ECAH0BI ROUTING PROCESS DOES NOT TAKE PLACE

Explanation: This information message describes the result of the hanging transaction that was described in message ECAH02W.

Corrective Action: No action is required.

ECAH0CI MESSAGES HAVE BEEN ACCUMULATED FOR THE CHANNEL TO BE SENT, BUT NO MESSAGE HAS BEEN SENT

Explanation: This information message describes the result of the hanging transaction that was described in message ECAH03W.
Corrective Action: No action is required.

Messages ECAL00 through ECALxx
This group includes messages for the IOA (infrastructure) product.

ECAL00I Module Source Compilation date Change level Size CSECT of
Explanation: This information message provides header information about IOAGATE software level. ECAL01I messages that follow provide details for load modules of IOAGATE.
Corrective Action: No action is required.

ECAL01I module source compDate changeLevel size CSECT of
Explanation: This message follows the message ECAL00I, which provides header information. The set of ECAL01I information messages provides detailed software level information about a separate load module or CSECT of a load module.
The variables in this message are:
- module - the name of a load module or CSECT when SAS/C is the source
- source - the type of the source
- compDate - a compilation timestamp
- changeLevel - the last change identity applied to this module or CSECT
- size - the hexadecimal size of a load module
- CSECT of - the load module name that this CSECT is part of. If the load module name and the CSECT are the same, then this field is empty.
Corrective Action: No action is required.

ECAL02S MCT ADDRESS UNAVAILABLE
Explanation: A severe internal error occurred when trying to retrieve the detailed software level information of IOAGATE.
Level information about IOAGATE is not displayed. Processing continues.
Corrective Action: Contact BMC Software Customer Support.

ECAL03S NO PARAMETER SPECIFIED FOR ECASLVL
Explanation: A severe internal error occurred.
The ECAB0DI message ("ECAAPPL PROCESSOR CREATED...") is not displayed. Processing continues.
Corrective Action: Contact BMC Software Customer Support.

ECAL04S LOAD FAILED FOR MODULE(ECAAPL)
Explanation: A severe error occurred when trying to load the ECAAPPL processor.
IOAGATE shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

---

**ECAL05E** FAILURE TO RECOGNIZE LEVEL OF (ECAAPL)

**Explanation:** An internal error occurred.
The ECAB0DI message ("ECAAPPL PROCESSOR CREATED...") is not displayed. Processing continues.

**Corrective Action:** Contact BMC Software Customer Support.

---

**ECAL06I** Operating System Level(*lvl*) FMID(*fmid*)

**Explanation:** This information message displays the level of the Operating System under which control of IOAGATE is currently running.
The variables in this message are:
- *lvl* - the level identity of the operating system
- *fmid* - the FMID identity of the operating environment

**Corrective Action:** No action is required.

---

**ECAL07I** IOAGATE STARTED TO DISPLAY SOFTWARE LEVEL ONLY, RELEASE(*rel*) CCID(*lvl_id*)

**Explanation:** This information message indicates that IOAGATE was started with the A parameter set to L. This special mode serves to display the level information of the IOAGATE code only.
IOAGATE displays the requested level information, and goes down.

**Corrective Action:** No action is required.

---

**ECAL09E** FAILURE TO RECOGNIZE ECVTPNAM VALUE: val.

**Explanation:** An internal error occurred when trying to identify the operating system level.

**Corrective Action:** Contact BMC Software Customer Support.

---

**Messages ECAP00 through ECAPxx**

This group includes messages for the IOA (infrastructure) product.

**ECAP01S** READING FAILED WITH RC(*) REASON(*)

**Explanation:** An attempt to process a network map specified in the ECAPARM configuration file failed.
The message ECAP0XE precedes this message, and identifies the problematic network map.
If a network map is specified in the ECAPARM configuration file, IOAGATE reads the map during initialization, and builds internal tables of connections in the main storage. The same network map is processed by a Control-O monitor and by each Control-O application server that participates in the communication described by this network map. To get the name of the network map, the Control-O monitor loads the same ECAPARM configuration file.
INCONTROL for z/OS Messages Manual

The variables in this message are:

- \( rc \) - the return code

Valid values for \( rc \) are:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
<td>Member not found</td>
</tr>
<tr>
<td>16</td>
<td>Data set is not a library</td>
</tr>
<tr>
<td>24</td>
<td>LRECL is not 80</td>
</tr>
<tr>
<td>28</td>
<td>Data set in use</td>
</tr>
<tr>
<td>36</td>
<td>Data set not in the catalog</td>
</tr>
<tr>
<td>56</td>
<td>STAE detected an abend</td>
</tr>
</tbody>
</table>

- \( rsn \) - the system failure reason code

IOAGATE disables the Control-O application defined in the network map definitions, and processing continues.

Corrective Action: Correct the problem indicated by the reason code \( rsn \), and restart IOAGATE.

ECAP02E LUNAME= VALUE LONGER THAN 8 CHARACTERS

Explanation: The LUNAME parameter value in the specified line in the specified network map in the ECAPARM configuration file is too long.

If a network map is specified in the ECAPARM configuration file, IOAGATE reads the map during initialization and builds internal tables of connections in the main storage. The same network map is processed by a Control-O monitor and by each Control-O application server that participates in the communication described by this network map. To get the name of the network map, the Control-O monitor loads the same ECAPARM configuration file.

IOAGATE discards the line containing the problem, and processing continues. If the line is a part of a PARTNER statement that defines a connection for the current IOAGATE, processing of the map fails, and the application linked to the channel with this map is disabled.

Corrective Action: Change the value of LUNAME so that it complies with VTAM naming conventions, and restart IOAGATE.

ECAP03E NON-ALPHANUMERIC CHARACTER IN LUNAME= VALUE

Explanation: The LUNAME parameter value in the specified line in the specified network map in the ECAPARM configuration file contains a character that is not alphanumeric.
If a network map is specified in the ECAPARM configuration file, IOAGATE reads the map during initialization and builds internal tables of connections in the main storage. The same network map is processed by a Control-O monitor and by each Control-O application server that participates in the communication described by this network map. To get the network map name, the Control-O monitor loads the same ECAPARM configuration file.

IOAGATE discards the line containing the problem, and processing continues. If the line is a part of a PARTNER statement that defines a connection for the current IOAGATE, processing of the map fails, and the application linked to the channel with this map is disabled.

**Corrective Action:** Change the value of LUNAME so that it complies with VTAM naming conventions, and restart IOAGATE.

ECAP04E INVALID FIRST CHARACTER IN LUNAME= VALUE

**Explanation:** The first character of the LUNAME parameter value in the specified line in the specified network map in the ECAPARM configuration file is invalid.

If a network map is specified in the ECAPARM configuration file, IOAGATE reads the map during initialization and builds internal tables of connections in the main storage. The same network map is processed by a Control-O monitor and by each Control-O application server that participates in the communication described by this network map. To get the network map name, the Control-O monitor loads the same ECAPARM configuration file.

IOAGATE discards the line containing the problem, and processing continues. If the line is a part of a PARTNER statement that defines a connection for the current IOAGATE, processing of the map fails, and the application linked to the channel with this map is disabled.

**Corrective Action:** Change the value of LUNAME so that it complies with VTAM naming conventions, and restart IOAGATE.

ECAP05W THE STATEMENT IS OUT OF PLACE

**Explanation:** An invalid order of statements was discovered in the network map.

IOAGATE disables the channel that uses the indicated network map.

**Corrective Action:** Correct the IOAGATE-to-IOAGATE connection configuration in the network map, and restart IOAGATE.

ECAP06E port / host = REQUIRED IN TCP PARTNER IF CONNECTOR=LOCAL SPECIFIED

**Explanation:** Either the PORT or the HOST parameter in the TCP partner statement of the network map must be specified if the CONNECTOR parameter in that TCP partner is set to LOCAL.

IOAGATE disables the channel that uses the indicated network map.

**Corrective Action:** Correct the IOAGATE-to-IOAGATE connection configuration in the network map, and restart IOAGATE.

ECAP07E MAP DOES NOT BEGIN WITH LOCAL STATEMENT

**Explanation:** The network map must begin with a LOCAL statement.

IOAGATE disables the channel that uses the indicated network map.
Corrective Action: Correct the IOAGATE-to-IOAGATE connection configuration in the network map, and restart IOAGATE.

ECAP08W UNRECOGNIZED STATEMENT (*stmt*)

Explanation: The network map statement *stmt* was not recognized as valid.

IOAGATE disables the channel that uses the indicated network map.

Corrective Action: Correct the IOAGATE-to-IOAGATE connection configuration in the network map, and restart IOAGATE.

ECAP09E INVALID *stmt* STATEMENT

Explanation: The invalid statement *stmt* was discovered in the network map.

IOAGATE disables the channel that uses the indicated network map.

Corrective Action: Correct the IOAGATE-to-IOAGATE connection configuration in the network map, and restart IOAGATE.

ECAP0AW IMPROPER PARAMETER IN THE LOCAL STATEMENT

Explanation: An invalid parameter was discovered in the LOCAL statement of the network map.

IOAGATE disables the channel that uses the indicated network map.

Corrective Action: Correct the IOAGATE-to-IOAGATE connection configuration in the network map and restart IOAGATE.

ECAP0CE INVALID IP ADDRESS SPECIFIED IN HOST= PARAMETER

Explanation: An invalid IP address value was discovered in the HOST parameter of the network map.

IOAGATE changes the CONNECTOR value from LOCAL to PARTNER, and tries to continue processing the network map.

Corrective Action: Correct the IP address.

ECAP0DE NON-DIGIT CHARACTER IN PORT= PARAMETER

Explanation: A non-digit character was discovered in the PORT parameter of the network map.

IOAGATE changes the CONNECTOR value from LOCAL to PARTNER, and tries to continue processing the network map.

Corrective Action: Correct the PORT value.

ECAP0EE PORT= VALUE GREATER THAN 65534

Explanation: An invalid PORT parameter value was discovered.

The PORT parameter value must be in the range from 1024 through 65534.

IOAGATE changes the CONNECTOR value from LOCAL to PARTNER and tries to continue processing the network map.

Corrective Action: Correct the PORT value.
ECAP0FS NO LINE FOUND

Explanation: The network map is not valid because it contained no line.

IOAGATE disables the channel that uses the network map identified in the ECAP0XI message that precedes the ECAP0FS message.

Corrective Action: Specify the correct network map member.

ECAP0GE PORT= VALUE LESS THAN 1024

Explanation: The value of the PORT parameter is invalid. The value of the PORT parameter must be in the range from 1024 through 65534.

IOAGATE changes the CONNECTOR value from LOCAL to PARTNER, and tries to continue processing the network map.

Corrective Action: Correct the PORT value.

ECAP0HW NO VALUE SPECIFIED IN THE PORT= PARAMETER

Explanation: The PORT parameter has no value specified.

IOAGATE changes the CONNECTOR value from LOCAL to PARTNER, and tries to continue processing the network map.

Corrective Action: Set a value for the PORT parameter.

ECAP0IE LACK OF REQUIRED PARAMETERS IN protocol PARTNER STATEMENT

Explanation: Some required parameters were not found in the Partner statement of the network map.

In this message, protocol is the communication protocol to be used by the channel to which the network map is defined (the partner statement).

Valid values are:

- TCP - the partner statement uses the network map defined in TCP channel
- SNA - the partner statement uses to the network map defined in SNA channel

IOAGATE disables the channel that uses the indicated network map.

Corrective Action: Correct the IOAGATE-to-IOAGATE connection configuration in the network map and restart IOAGATE.

ECAP0KE INVALID APPL= PARAMETER SPECIFIED

Explanation: An invalid APPL parameter value was discovered in the SNA partner of the network map.

IOAGATE disables the channel that uses the indicated network map.

Corrective Action: Correct the IOAGATE-to-IOAGATE connection configuration in the network map and restart IOAGATE.
ECAP0LE NODE= PARAMETER REQUIRED IN THE PARTNER STATEMENT

**Explanation:** No NODE parameter was found in the PARTNER statement. The NODE parameter must be defined in the PARTNER statement of the network map.

IOAGATE disables the channel that uses the indicated network map.

**Corrective Action:** Correct the IOAGATE-to-IOAGATE connection configuration in the network map and restart IOAGATE.

ECAP0ME NO LOCAL STATEMENT REFERS TO THE CHANNEL NODE(*node*)

**Explanation:** The network map must have a LOCAL statement with a NODE parameter that matches the NODE value from the appropriate CHANNEL declaration.

In this message, *node* is the value of the NODE parameter in the CHANNEL declaration referring to the network map that is being analyzed.

IOAGATE disables the channel that uses the indicated network map.

**Corrective Action:** Correct the IOAGATE-to-IOAGATE connection configuration in the network map and restart IOAGATE.

ECAP0OW CONNECTOR=LOCAL ALTERED TO CONNECTOR=PARTNER

**Explanation:** This warning message is displayed by IOAGATE when the CONNECTOR value has changed from LOCAL to PARTNER.

IOAGATE tries to continue processing the network map.

**Corrective Action:** Correct the IOAGATE-to-IOAGATE connection configuration in the network map and restart IOAGATE.

ECAP0PW INVALID CONNECTOR= VALUE SPECIFIED, SET TO CONNECTOR=PARTNER

**Explanation:** The value of the CONNECTOR parameter is invalid.

IOAGATE changes the CONNECTOR value from LOCAL to PARTNER, and tries to continue processing the network map.

**Corrective Action:** Correct the IOAGATE-to-IOAGATE connection configuration in the network map and restart IOAGATE.

ECAP0QW INVALID LINE DROPPED

**Explanation:** IOAGATE could neither recognize the indicated line, nor detect any specific error in the line.

The line is ignored.

**Corrective Action:** Correct the network map and restart IOAGATE.

ECAP0RE LUNAME= SPECIFIED FOR TCP CHANNEL

**Explanation:** The SNA parameter LUNAME has been specified for a TCP channel.
IOAGATE disables the channel that uses the indicated network map, and tries to continue processing the network map.

**Corrective Action:** Correct the network map and restart IOAGATE.

**ECAP0SE parm = PARAMETER IS INVALID FOR SNA CHANNEL**

**Explanation:** The TCP parameter `parm` has been specified for a SNA channel.

IOAGATE disables the channel that uses the indicated network map, and tries to continue processing the network map.

**Corrective Action:** Correct the network map and restart IOAGATE.

**ECAP0TS INTERNAL ERROR OCCURRED WHEN DISABLING parm stmt**

**Explanation:** A severe internal error occurred when IOAGATE tried to disable the `parm` parameter or the `stmt` statement.

In this message, `parm/stmt` is the parameter or statement that IOAGATE tried to disable.

This message is only issued when IOAGATE is configured for IOAGATE-to-IOAGATE communication.

IOAGATE disables the channel that uses the indicated network map, and tries to continue processing the network map.

**Corrective Action:** Contact BMC Software Customer Support.

**ECAP0WE DUPLICATE NODE= SPECIFIED**

**Explanation:** The same NODE parameter value has been entered twice.

This message is only issued when IOAGATE is configured for IOAGATE-to-IOAGATE communication.

IOAGATE disables the channel that uses the indicated network map and tries to continue processing the network map.

**Corrective Action:** Correct the network map and restart IOAGATE.

**ECAP0XI ERROR DETECTED, MAP(mapId-channelId.protocol), LINE=lineNum**:

**Explanation:** This message is a header message, and is followed by another message that describes precisely an error discovered in line `lineNum`.

The variables in this message are:

- `mapId` - the identity of the network map in which IOAGATE discovered the error
- `channelId` - the identity of the channel that uses the indicated network map
- `protocol` - the current channel uses this communication protocol Valid values are:
  - TCP - TCP/IP communication protocol
  - SNA - SNA communication protocol
Corrective Action: Correct the network map and restart IOAGATE.

**ECAP0YE TCPVENDR PARAMETER MUST HAVE THE SAME VALUE IN ALL CHANNELS**

**Explanation:** An error occurred while IOAGATE was checking ECAPARM. The TCPVENDR parameter in the channels defined in ECAPARM had different values.

IOAGATE goes down.

**Corrective Action:** Ensure that the TCPVENDR parameter has the same value in all channels of ECAPARM, then restart IOAGATE.

**ECAP0ZE REQUESTED MAP NOT FOUND IN THE PARM LIBRARY**

**Explanation:** IOAGATE failed to load the network map specified in the channel.

IOAGATE disables the channel that uses the indicated network map and tries to continue processing.

**Corrective Action:** Correct the name of the network map and restart IOAGATE.

**ECAP10I IOAENV memName BUILT BY CCID(changeLevel) ON date is used**

**Explanation:** This information message displays level information for the memName IOAENV parameters member used by IOAGATE in the current run.

The variables in this message are:

- **memName** - the name of the parameters member Valid values are:
  - ECAAPPL - table of supported applications
  - ECAPDEF - table of defaults of numeric parameters
  - ECASRVT - table of services (transactions)

- **changeLevel** - the level of the change that was last applied to the indicated member

- **date** - the date this member was last changed

**Corrective Action:** No action is required.

**ECAP11S memName type PARAMETERS MEMBER UNAVAILABLE**

**Explanation:** A severe error occurred when IOAGATE tried to load the specified IOAENV parameters member.

The variables in this message are:

- **memName** - name of the parameters member
  Valid values are:
  - ECAPARM - configuration file
  - ECAAPPL - table of supported applications
  - ECAPDEF - table of defaults of numeric parameters
  - ECASRVT - table of services (transactions)
ECAP12S ECATMEM FAILED, rsn

Explanation: A severe internal error occurred when IOAGATE tried to verify an internal parameters member.

In this message, possible values for rsn are:

- RC= return_code REASON= reason_code
- INSUFFICIENT STORAGE
- DDNAME NOT PROVIDED
- MEMBER NAME NOT PROVIDED

IOAGATE shuts down.

Corrective Action: Contact BMC Software Customer Support.

ECAP13S memName type PARAMETERS MEMBER IS EMPTY

Explanation: A severe internal error occurred when IOAGATE tried to read the indicated IOAENV parameters member.

The variables in this message are:

- memName - name of the parameters member
  Valid values are:
  - ECAPARM - configuration file
  - ECAAPPL - table of supported applications
  - ECAPDEF - table of defaults of numeric parameters
  - ECASRVT - table of services (transactions)
- type - Name of the parameters member
  Valid values are:
  - SOURCE
  - IOAENV

IOAGATE shuts down.

Corrective Action: Contact BMC Software Customer Support.

ECAP16W NO IOAGATE-TO-IOAGATE CONNECTION WAS DEFINED

Explanation: The F IOAGATE,MAP modify command was issued, to display a network map, but failed because no IOAGATE-to-IOAGATE connection was configured in the current run of the local IOAGATE.
If a network map is specified in the ECAPARM configuration file, IOAGATE reads the map during initialization and builds internal tables of connections in the main storage. The NETWMAP parameter was not specified in the ECAPARM configuration file, or the multiple connection SNA channel was either disabled or not configured to function with a network map.

The F IOAGATE,MAP modify command is ignored. Normal processing continues.

**Corrective Action:** No action is required.

**ECAP17E MAP(mapId -channelId.protocol) PROCESSING FAILED, RC(rc)**

**Explanation:** An error was encountered in the network map identified by the variables in this message.

The variables in this message are:

- `mapId` - the name of a member in the IOPARM library that describes a map of network connections between IOAGATEs that allows one IOAGATE to communicate with another over a multiple connection (MC) channel
- `channelId` - the identity of the channel that uses the network map `mapId`
- `protocol` - the communication protocol used by the current channel. Valid values are:
  - TCP - TCP/IP communication protocol
  - SNA - SNA communication protocol
- `rc` - the return code

Valid values for `rc` are:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>&quot;Disable map&quot; error encountered</td>
</tr>
<tr>
<td>12</td>
<td>&quot;Stop processing&quot; error encountered</td>
</tr>
</tbody>
</table>

IOAGATE disables the channel that uses the indicated network map, and tries to continue processing.

**Corrective Action:** Correct the network map and restart IOAGATE.

**ECAP18W NETWORK MAP(mapId) HAS BEEN PROCESSED WITH RC(rc)**

**Explanation:** The network map `mapId` of IOAGATE connections was processed with a nonzero reason code (`rc`).

If a network map is specified in the ECAPARM configuration file, IOAGATE reads the map during initialization, and builds internal tables of connections in the main storage. The same network map is processed by a Control-O monitor and by each Control-O application server that participates in the communication described by this network map. To get the name of the network map, the Control-O monitor loads the same ECAPARM configuration file.

The variables in this message are:
- **mapId** - the name of the member in the IOA PARM library that determines the map of IOAGATE connections, and enables one IOAGATE to communicate with another over a multiple connection (MC) channel

- **rc** - the return code

Valid values for **rc** are:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>Minor errors were detected in the map, or errors were detected that do not relate to a PARTNER statement describing the connections of the current IOAGATE. The network map is enabled.</td>
</tr>
<tr>
<td>12</td>
<td>Severe errors were detected in the network map. Processing of the map failed.</td>
</tr>
</tbody>
</table>

**Corrective Action:** Do the following:

1. Check any error messages that precede this one.
2. Check the network map.
3. Correct the ECAPARM configuration file.
4. Restart IOAGATE.

**ECAP19I NETWORK MAP(mapId) HAS BEEN PROCESSED SUCCESSFULLY**

**Explanation:** This information message indicates that the **mapId** network map of IOAGATE connections was successfully processed.

If a network map is specified in the ECAPARM configuration file, IOAGATE reads the map during initialization and builds internal tables of connections in the main storage. The same network map is processed by a Control-O monitor and by each Control-O application server that participates in the communication described by this map.

To get the name of the network map, the Control-O monitor loads the same ECAPARM configuration file.

In this message, **mapId** identifies the member in the IOA PARM library that determines the map of IOAGATE connections, and enables one IOAGATE to communicate with another over a multiple connection (MC) channel.

**Corrective Action:** No action is required.

**ECAP1AW NETWORK MAP(mapName) WAS SPECIFIED BUT NOT PROCESSED**

**Explanation:** The network map **mapName** that is specified in the ECAPARM configuration file by the NETWMAP parameter has not been processed.

Other messages may clarify why the map has not been processed.

The Control-O monitor continues its startup, but without communication services through IOAGATE.

**Corrective Action:** If possible, determine from other messages why the map has not been processed. Correct the problem and restart IOAGATE and Control-O.
ECAP1BW NETWORK MAP (OR NODE) WAS NOT SPECIFIED IN ECAPARM(suffix)

Explanation: The ECAPARM configuration file with suffix suffix has been defined for Control-O, but either the NETWMAP (network map name) parameter or the NODE parameter or both have not been specified in this ECAPARM file.

The Control-O monitor continues its startup but without communication services through IOAGATE.

Corrective Action: Specify both parameters, and restart IOAGATE and Control-O.

ECAP1XE DUPLICATE NODE nodeId DETECTED IN CHANNEL(channelId), CHANNEL DISABLED

Explanation: A duplicate node has been detected in the channelId channel, and IOAGATE has disabled that channel.

The variables in this message are:
- nodeId - the identity of the node that is duplicated
- channelId - the identity of the problematic channel

IOAGATE disables the channel that uses the indicated network map, and tries to continue processing.

Corrective Action: Correct the problem, using the diagnostics issued by the message, and restart IOAGATE.

ECAP20I IOAGATE-TO-IOAGATE CONNECTIONS NODE=node MAP=mapId APPL=CONTROL-O

Explanation: This message is the response to the F IOAGATE,MAP modify command, and is the header for ECAP22I messages.

The variables in this message are:
- node - the identity of the current local node for which IOAGATE-to-IOAGATE connections are displayed
- mapId - the name of the member in the IOAPARM library that determines the map of IOAGATE connections, and enables one IOAGATE to communicate with another over a multiple connection (MC) channel

Corrective Action: No action is required.

ECAP21I CHAN LUNAME LOGMODE PARTNER CONVERSATION ID STATUS

Explanation: This information message follows an ECAP20I message, which identifies the current local node, and is a header for ECAP22I messages, which specify the SNA connections that are available for the current local node.

The ECAP23I and ECAP24I messages may also follow.

This group of messages is displayed as a result of an F IOAGATE,MAP command.

Corrective Action: No action is required.
ECAP22I  channelId luName logmode partner_id conversation_id status

Explanation: This information message specifies one of the available SNA IOAGATE-to-IOAGATE connections for the current local IOAGATE, using the network map specified in the last ECAP20I message. The ECAP20I message precedes and acts as a header for a single ECAP22I message, or a group of ECAP22I messages.

If a network map was specified in the ECAPARM configuration file, IOAGATE reads the map during initialization and builds internal tables of connections in the main storage. The same network map is processed by a Control-O monitor and by each Control-O application server that participates in the communication described by this map.

The variables in this message are:
- **channelId** - the identity of the channel that controls the connection
- **luName** - the Logical Unit name of the partner IOAGATE
- **logmode** - the LOGMODE used by this connection
- **partner_id** - the conversation ID of the outgoing conversation
- **conversation_id** - the conversation identity of the incoming conversation
- **status** - Status of the connection Valid values are:
  - NOTALLOC - the conversation is not allocated.
  - ALLOCTED - the conversation is allocated.
  - ALLOCSND - the Send channel is allocated.
  - ALLOCRCV - the Receive channel is allocated.

Corrective Action: No action is required.

ECAP23I  CHAN TASK PARTNER PORT CONNECTOR STATUS SOCKET HOST

Explanation: This information message is a response to the F IOAGATE,CHAN modify command. It follows an ECAP20I message, which identifies the current local node, and is a header for ECAP24I messages, which identify the available TCP connections for the current local node.

Corrective Action: No action is required.

ECAP24I  channelId taskId partner port connector status socket host

Explanation: This information message specifies one of the available TCP/IP connections for the current local IOAGATE using the network map specified in the last ECAP20I message. The ECAP23I message precedes and acts as a header for a single ECAP24I message, or a group of ECAP24I messages.

If a network map was specified in the ECAPARM configuration file, IOAGATE reads the map during initialization and builds internal tables of connections in the main storage. The same network map is processed by a Control-O monitor and by each Control-O application server that participates in the communication described by this network map.

The variables in this message are:
- **channelId** - the identity of the channel that controls this TCP/IP connection
- **taskId** - the identity of the communication task of the channel that controls this TCP/IP connection
- **partner** - the identity of the node on which the partner IOAGATE is running
- **port** - the TCP/IP port number used to connect to the partner IOAGATE
- **connector** - the mode of the current local IOAGATE specified by the CONNECTOR parameter in a network map. Valid values are:
  - **LOCAL** - the current IOAGATE is an initiator of the connection to the partner IOAGATE, that is, CONNECTOR is set to LOCAL
  - **PARTNER** - the current IOAGATE is not an initiator of the connection to the partner IOAGATE, that is, CONNECTOR is set to PARTNER
  The current IOAGATE can accept connection from its partner IOAGATE.
  
- **status** - Status of the connection. Valid values are:
  - **HNDSHAKE RCVD** - A handshake message has been received.
  - **HNDSHAKE SENT** - A handshake message has been sent.
  - **CONNECTED** - A connection was successfully established with the partner IOAGATE.
  - **TAKING SOCKET** - The connection is being taken by the recipient communication task.
  - **CONNECTED/TAKE** - Connection has been established. The taking-socket process is about to be completed.
  - **GIVING SOCKET** - Connection is being giving by the Listener task of the channel to the recipient communication task.
  - **CONNECTED/GIVE** - Connection has been established. The giving-socket process is about to begin.
  - **GIVE REQUIRED** - Connection has been established. The giving-socket process is being requested.
  - **GIVE FAILED** - Connection has been established. The giving-socket process failed.
  - **H-SHAKE FAILED** - The handshaking process has failed.
  - **RETRYING** - The attempt to connect to the partner IOAGATE failed. Another attempt will be made in the time interval specified in the ALLOCINT parameter in the ECAPARM configuration file.
  - **CONNECTION IN PROGRESS** - A Connect action has been initiated.
  - **CONNECTING** - The Connect action is being processed.
  - **DISABLED** - The IOAGATE-to-IOAGATE connection entry is disabled.
  - **READY TO CONNECT** - The local IOAGATE is ready to begin a Connect action.
  - **WAITING FOR CONNECTION** - The local IOAGATE is ready to accept connection from its partner IOAGATE.
  - **DISCONNECTED** - The connection to the partner IOAGATE has been disrupted.
  - **RECONNECTED** - The connection has been re-established.
socket - the TCP/IP socket number assigned to connect (CONNECT is set to YES), or to be connected (CONNECT is set to NO) to the partner IOAGATE

host - The host name or IP address of the partner IOAGATE. This data exactly reflects the specification in the network map.

Corrective Action: No action is required.

ECAP30E APSERVER ENTRY(entryId), INVALID ALIAS APPLICATION CODE(applicId) SPECIFIED, ALIAS DISABLED

Explanation: An invalid application code was specified as an alias in the APPL=(,) parameter of an APSERVER definition.

The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE. The APPL parameter of an APSERVER statement can be used to specify a list of alias codes. Each alias code specifies an application that can be served by the same application server as the others in the list, concurrently with the main application.

The variables in this message are:

entryId - a sequential number that identifies the APSERVER definition entry in the ECAPARM configuration file

applicId - the invalid application code that was specified as an alias

The specified alias application code is ignored, and processing continues.

Corrective Action: Check the ECAPARM configuration file, correct the file, and restart IOAGATE.

ECAP31E ECAPRM INTERNAL ERROR, APPLICATION ALIASES PROCESSING FAILED

Explanation: An internal error occurred during the processing of application aliases specified in an APPL parameter of an APSERVER statement.

Corrective Action: Contact BMC Software Customer Support.

ECAP32E NO RAW APSERVER ENTRIES FOUND

Explanation: An internal error occurred when IOAGATE was processing the ECAPARM configuration file. No APSERVER entry was found in the ECAPARM configuration file.

During initialization, IOAGATE reads and verifies the definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

IOAGATE shuts down.

Corrective Action: Correct the ECAPARM configuration file, and restart IOAGATE. If the problem persists, contact BMC Software Customer Support.
ECAP33S ECAPRM INTERNAL ERROR WORK AREA, SIZE(size) EXCEEDED ALLOWED MAXIMUM 64K

**Explanation:** A severe internal error occurred during checking of the ECAPARM configuration file. The size of the internal work area is invalid.

In this message, `size` is the size of the internal work area that exceeded the maximum.

IOAGATE shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

ECAP34E PARAMETER ARMELEM=arm_element_id INVALID, IMPROPER CHARACTER(chara) SPECIFIED

**Explanation:** While processing the ECAPARM configuration file, an invalid character was detected in the ARMELEM parameter.

The variables in this message are:
- `arm_element_id` - the IOAGATE automatic restart management (ARM) element name
- `chara` - the invalid character detected in the IOAGATE ARM element

The ARMELEM parameter is ignored. Normal processing continues.

**Corrective Action:** Using the diagnostics issued by the message, correct the problem, and restart IOAGATE.

ECAP35S ECAPRM INTERNAL ERROR, APSERVER ENTRY(entryId), SERVER= VALUE NOT SPECIFIED

**Explanation:** A severe internal error occurred in the ECAPARM configuration file because no value was specified for the SERVER parameter in the APSERVER definition.

During initialization, IOAGATE reads and verifies the definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

In this message, `entryId` is a sequential number that identifies the APSERVER definition entry in the ECAPARM configuration file.

The specified APSERVER definition is disabled, and processing continues.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

ECAP37E MORE THAN 99 APPLICATION SERVERS DEFINED

**Explanation:** The number of APSERVER statements specified in the ECAPARM configuration file exceeds the maximum permitted. A maximum of 99 APSERVER statements may be specified in the ECAPARM configuration file.

During initialization, IOAGATE reads and verifies definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

IOAGATE shuts down.
Corrective Action: Correct the ECAPARM configuration file and restart IOAGATE.

ECAP38E APSERVER ENTRY(entryId), UNKNOWN APPL(value) SPECIFIED, SERVER DISABLED

Explanation: An invalid application name was specified in an APPL parameter of an APSERVER definition in the ECAPARM configuration file. During initialization, IOAGATE reads and verifies definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

The identified APSERVER definition entryId is ignored. Processing continues.

Corrective Action: Correct the ECAPARM configuration file and restart IOAGATE.

ECAP39W CHANNEL(entryId), MAXIMUM NUMBER OF SERVERs PER CHANNEL(channelId) REACHED, APSERVER(server_id) DISABLED

Explanation: The number of APSERVER definitions linked to the identified channel exceeded the maximum number allowed, namely eight.

The identified APSERVER definition server_id is disabled. Processing continues.

Corrective Action: Correct the ECAPARM configuration file and restart IOAGATE.

ECAP3AE TOTAL NUMBER OF APPLICATION SERVER TASKS CANNOT EXCEED 500

Explanation: An internal error occurred because the number of application server tasks defined in the ECAPARM configuration file exceeds the maximum permitted. A maximum of 500 application server tasks may be defined in the ECAPARM configuration file.

Corrective Action: Contact BMC Software Customer Support.
ECAP3BE APSERVER ENTRY (entryId.entry_typ.model), IMPROPER CHANNEL(channel) SPECIFIED FOR THE APPL (applName), SERVER DISABLED

Explanation: The communication model in the ECAPARM configuration file in an APSERVER definition does not match the communication model of the referenced channel. During initialization, IOAGATE reads and verifies the definitions in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

The variables in this message are:

- **entryId**: a sequential number that identifies the APSERVER definition entry in the ECAPARM configuration file
- **entry_typ**: the type of application server defined by this APSERVER statement. Valid values are:
  - CM - manager of the address space of an application server
  - CS - application server
  - CD - detector server
  - CU - updater server
- **model**: the communication model of the channel required by the application
- **channel**: the identity of the channel referenced from the APSERVER definition
- **applName**: the identity of the application server

The indicated APSERVER definition is ignored, and processing continues.

Corrective Action: Correct the ECAPARM configuration file and restart IOAGATE.

ECAP3CS NO APPLICATION SERVER DEFINED IN ECAPARM

Explanation: A severe internal error occurred during initialization. No application server was defined in ECAPARM.

IOAGATE shuts down.

Corrective Action: Define at least one application server in ECAPARM.

ECAP3DE APSERVER ENTRY(entryId), UNKNOWN CHANNEL(value) SPECIFIED, SERVER DISABLED

Explanation: The server is disabled because a channel reference in an APSERVER definition does not exist in the ECAPARM configuration file.

During initialization, IOAGATE reads and verifies the definitions from the ECAPARM configuration file. IOAGATE, and each application server that communicates with this IOAGATE, process the same ECAPARM configuration file.

The variables in this message are:
- **entryId** - the sequential number that identifies the APSERVER definition entry in the ECAPARM configuration file

- **value** - the invalid value specified by the user as a channel reference

The specified APSERVER definition is disabled, and processing continues.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

**ECAP3EE APSERVER ENTRY(entryId), MANDATORY PARAMETER APPL=Was not specified, SERVER DISABLED**

**Explanation:** The server is disabled because no value was set for the APPL parameter in the APSERVER definition.

During initialization, IOAGATE reads and verifies the definitions specified in the ECAPARM configuration file. The IOAGATE, and each application server that communicates with this IOAGATE, process the same ECAPARM configuration file.

In this message, *entryId* is a sequential number that identifies the APSERVER definition entry in the ECAPARM configuration file.

The specified APSERVER definition is disabled. Normal processing continues.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

**ECAP3FS INTERNAL ERROR. EXPANDED AND RAW APPL ENTRIES DIFFER**

**Explanation:** A severe internal error occurred during the processing of the ECAPARM configuration file. Differences were found between the expanded and the raw application entries.

IOAGATE shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

**ECAP3GW APSERVER ENTRY(entryId), IMPROPER COMPRESS=SPECIFIED(code), CHANGED TO DEFAULT(default_code)**

**Explanation:** The value of the COMPRESS parameter in the ECAPARM configuration file is invalid. The COMPRESS parameter must be set to YES or NO.

During initialization, IOAGATE reads and verifies the definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

The variables in this message are:

- **entryId** - a sequential number that identifies the problematic APSERVER definition entry in the ECAPARM configuration file

- **code** - the current invalid value of the COMPRESS parameter

- **default_code** - the default value set by IOAGATE for the COMPRESS parameter for this application

The value specified for COMPRESS is replaced by the default value. Normal processing continues.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.
ECAP3HE APSERVER ENTRY(entryId), ENCRYPT= PARAMETER IS NOT SUPPORTED FOR applId

Explanation: A value cannot be set for the ENCRYPT parameter for the application applId.

The variables in this message are:

- entryId - a sequential number that identifies the problematic APSERVER definition entry in the ECAPARM configuration file
- applId - the identity of the application for which encryption is not supported

The value set for the ENCRYPT parameter is ignored. Processing continues.

Corrective Action: Correct the ECAPARM configuration file and restart IOAGATE.

ECAP41S NO CHANNEL ENTRY AVAILABLE

Explanation: A severe error occurred during checking of the ECAPARM configuration file. There is no valid CHANNEL definition in the ECAPARM configuration file.

During initialization, IOAGATE reads and verifies the definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

IOAGATE shuts down.

Corrective Action: Do the following:

1. Check any error messages that precede this one.
2. Correct the ECAPARM configuration file.
3. Restart IOAGATE.

ECAP42W CHANNEL ENTRY(entryId), MANDATORY PARAMETER ID= WAS NOT SPECIFIED, CHANNEL DISABLED

Explanation: The ID parameter is not specified for the indicated channel in the CHANNEL definition.

During initialization, IOAGATE reads and verifies the definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

In this message, entryId is a sequential number that identifies the problematic CHANNEL definition in the ECAPARM configuration file.

The specified CHANNEL definition is disabled, and normal processing continues.

Corrective Action: Correct the ECAPARM configuration file and restart IOAGATE.

ECAP43W CHANNEL ENTRY(entryId), MANDATORY PARAMETER MODEL= WAS NOT SPECIFIED, CHANNEL DISABLED

Explanation: The MODEL parameter is not specified for the indicated channel in the CHANNEL definition.
During initialization, IOAGATE reads and verifies the definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

In this message, entryId is a sequential number that identifies the problematic CHANNEL definition in the ECAPARM configuration file.

The specified CHANNEL definition is disabled, and normal processing continues.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

ECAP44W CHANNEL ENTRY(entryId), OPTIONAL PARAMETER SUBSYSTM= CAN BE USED WITH TCPVENDR=CA ONLY, PARAMETER IGNORED

**Explanation:** The optional SUBSYSTM parameter was specified in the ECAPARM configuration file with TCPVENDR set to IBM for an SNA channel or a TCP channel. The optional SUBSYSTM parameter is only valid for a TCP channel, and only with TCPVENDR set to CA.

During initialization, IOAGATE reads and verifies the definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

In this message, entryId is a sequential number that identifies the problematic CHANNEL definition in the ECAPARM configuration file.

The SUBSYSTM parameter is ignored, and normal processing continues.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

ECAP45W CHANNEL ENTRY(entryId), ID(channelId) NOT UNIQUE, CHANNEL DISABLED

**Explanation:** The same channel ID is used in more than one CHANNEL definition in the ECAPARM configuration file. The channel ID must be unique for each CHANNEL definition in the ECAPARM configuration file.

During initialization IOAGATE reads and verifies definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

The variables in this message are:

- **entryId** - a sequential number that identifies the problematic CHANNEL definition in the ECAPARM configuration file
- **channelId** - the channel identity assigned by the user in the ECAPARM configuration file

The specified CHANNEL definition is disabled, and normal processing continues.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

ECAP46W CHANNEL ENTRY(entryId), MANDATORY PARAMETER PORT= WAS NOT SPECIFIED, CHANNEL DISABLED

**Explanation:** The PORT parameter is not specified for the indicated TCP channel in the CHANNEL definition.
During initialization, IOAGATE reads and verifies the definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

In this message, entryId is a sequential number that identifies the problematic CHANNEL definition in the ECAPARM configuration file.

The specified CHANNEL definition is disabled, and normal processing continues.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

```
ECAP47W APPL.SERVER (applServer.addrSpaceId) DISABLED IN ECAPARM(suffix)
```

**Explanation:** During initialization, IOAGATE detected that the value of the SERVER parameter in the ECAPARM configuration file is DISABLE for the specified application server applServer. Therefore it will not be started.

The SERVER parameter can be specified manually in the APSERVER definition of the ECAPARM configuration file to enable or disable the definition. The default value is ENABLE.

The variables in this message are:
- `applServer` - the name of the application server with the SERVER parameter set to DISABLE
- `addrSpaceId` - the internal identity assigned to the application server address space
- `suffix` - unique 1-character suffix identifying the ECAPARM configuration file that contains the SERVER parameter set to DISABLE

The specified application server is disabled. Normal processing continues.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

```
ECAP48W CHANNEL ENTRY(entryId), PARAMETERS APPLID= OR APPLIDS=(,) REQUIRED WHEN PROTOCOL=SNA AND MODEL=DC, CHANNEL DISABLED
```

**Explanation:** Either the APPLID or APPLIDS parameters is missing for the SNA channel entry in the ECAPARM configuration file. When the PROTOCOL parameter is SNA and the MODEL parameter is DC, either the APPLID or the APPLIDS parameter must be specified in the ECAPARM configuration file.

During initialization, IOAGATE reads and verifies the definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

In this message, entryId is a sequential number that identifies the problematic CHANNEL definition in the ECAPARM configuration file.

The specified CHANNEL definition is disabled. Normal processing continues.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.
ECAP49E CHANNEL ENTRY(entryId), MANDATORY PARAMETER PROTOCOL= WAS NOT SPECIFIED, CHANNEL DISABLED

Explanation: The PROTOCOL parameter is not defined for the specified channel.

During initialization, IOAGATE reads and verifies the definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

In this message, entryId is a sequential number that identifies the problematic CHANNEL definition in the ECAPARM configuration file.

The specified CHANNEL definition is disabled. Normal processing continues.

Corrective Action: Set a value for the PROTOCOL parameter in the ECAPARM configuration file and restart IOAGATE.

ECAP4AS TASK-TO-ATTACH ENTRY(x) CHANNEL(channelId) INVALID STDTYPE(type) IN DESCRIPTOR

Explanation: A severe internal error occurred during processing of the ECAPARM configuration file. IOAGATE shuts down.

Corrective Action: Contact BMC Software Customer Support.

ECAP4BW CHANNEL(channelId) NUMBER OF SUPPORTED APPLICATIONS PER CHANNEL EXCEEDED MAXIMUM(num) APPLICATION(applicId) IGNORED

Explanation: Too many APSERVER definitions reference the same channel. During initialization, IOAGATE reads and checks the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

The variables in this message are:

- channelId - the identity of the problematic channel
- num - the maximum number of applications each channel can support
- applicId - the identity of the application that exceeded the maximum number of applications

The identified application is ignored. Processing continues.

Corrective Action: Reduce the number of applications that reference the same channel, and restart IOAGATE.

ECAP4CW CHANNEL ENTRY(entryId) APPLID= NOT SPECIFIED, SNA CHANNEL DISABLED

Explanation: No APPLID parameter is specified for an SNA communication channel in the ECAPARM configuration file. For an SNA channel, an APPLID parameter must be specified. It may be specified with or without a NETWMAP parameter.
During initialization, IOAGATE reads and verifies the definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

In this message, entryId is a sequential number that identifies the problematic CHANNEL definition in the ECAPARM configuration file.

The specified CHANNEL definition is disabled. Normal processing continues.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

**ECAP4DW CHANNEL ENTRY(entryId), PORT=** VALUE MUST BE IN THE RANGE FROM 1024 THROUGH 65534

**Explanation:** This warning message indicates that the PORT parameter value specified in the ECAPARM configuration file is invalid.

The PORT parameter value must be in the range from 1024 through 65534.

In this message, entryId is the identity of the channel for which the PORT parameter was defined.

The specified channel is disabled and processing continues.

**Corrective Action:** Correct the value of the PORT parameter in the ECAPARM configuration file and restart IOAGATE.

**ECAP4EW CHANNEL ENTRY(entryId), SUBPARAMETERS OF APPLIDS= PARAMETER ARE EQUAL, CHANNEL DISABLED**

**Explanation:** The same subparameter value is specified twice for the APPLIDS parameter for the specified channel in the ECAPARM configuration file.

During initialization, IOAGATE reads and verifies the definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

In this message, entryId is a sequential number that identifies the problematic CHANNEL definition in the ECAPARM configuration file.

The specified CHANNEL definition is disabled. Normal processing continues.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

**ECAP4FW CHANNEL ENTRY(entryId), SUBPARAMETER(subparm) OF APPLIDS= IS INVALID**

**Explanation:** An invalid subparameter is specified for the APPLIDS parameter for the channel entry in the ECAPARM configuration file.

During initialization, IOAGATE reads and verifies the definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

The variables in this message are:

- **entryId** - a sequential number that identifies the problematic CHANNEL definition in the ECAPARM configuration file
- **subparm** - the identity of the invalid subparameter

The specified CHANNEL definition is disabled and normal processing continues.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

---

**ECAP4GE NO APPLICATION SERVER AVAILABLE**

**Explanation:** There is no valid APSERVER definition in the ECAPARM configuration file. If there are any APSERVER definitions in the ECAPARM configuration file, they are invalid or disabled.

During initialization, IOAGATE reads and verifies the definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

IOAGATE shuts down.

**Corrective Action:** Do the following:

1. Check any other error messages that precede this one.
2. Correct the ECAPARM configuration file.
3. Restart IOAGATE.

---

**ECAP4HS PROCESSING TABLE OF DEFAULTS(ECAPDEF) FAILED**

**Explanation:** A severe internal error occurred during the processing of the ECAPDEF table of numeric parameters defaults.

IOAGATE shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

---

**ECAP4IE ECAPARM(suffix) VALIDITY CHECK FAILED, handler WAS THE LAST WORKED PROCESSOR**

**Explanation:** One or more errors occurred during the processing of the ECAPARM configuration file. This caused the file to fail a validity check, and processing of the file stopped.

During initialization, IOAGATE reads and verifies the definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

The variables in this message are:
- **suffix** - a 1-character suffix that identifies the ECAPARM configuration file
- **handler** - the subroutine that was last active during the processing of the ECAPARM configuration file

IOAGATE shuts down.

**Corrective Action:** Do the following:

1. Check other error messages that precede this one.
2. Correct the ECAPARM configuration file.
3. Restart IOAGATE.

ECAP4jW GATEWAY PARAMETER(parm) OUT OF RANGE(min-max), DEFAULT(defaultValue) SET

**Explanation:** When processing the GATEWAY section of the ECAPARM configuration file, IOAGATE detected that the value of the numeric parameter *parm* predefined in the ECAPDEF table of numeric defaults is invalid.

The variables in this message are:
- *parm* - the name of the parameter with the invalid value
- *min* - the minimum valid value of the *parm* parameter
- *max* - the maximum valid value of the *parm* parameter
- *defaultValue* - the default value of the *parm* parameter

The *parm* parameter is set to the default value *defaultValue*. Normal processing continues.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

ECAP4KW entryType ENTRY(entryId), PARAMETER(parm) OUT OF RANGE(min-max), VALUE(value) SET

**Explanation:** When processing the ECAPARM configuration file, IOAGATE found that the value of the numeric parameter *parm* was invalid.

The variables in this message are:
- *entryType* - the section of the ECAPARM configuration file that contains the invalid parameter. Valid values are:
  - CHANNEL - the channel definitions section
  - APSERVER - the application server definitions section
- *entryId* - a sequential number that identifies the definition entry in the ECAPARM configuration file that contains the invalid parameter
- *parm* - the name of the invalid parameter
- *min* - the minimum valid value of the *parm* parameter
- *max* - the maximum valid value of the *parm* parameter
- *value* - the value of the *parm* parameter that has been set

The *parm* parameter is set to the default value *value*. Normal processing continues.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.
ECAP4LE entryType ENTRY(entryId), MANDATORY PARAMETER(parm) OUT OF RANGE(min -max)

**Explanation:** When processing the ECAPARM configuration file, IOAGATE found that the value of the mandatory numeric parameter `parm` was invalid.

The variables in this message are:

- `entryType` - the section of the ECAPARM configuration file that contains the invalid mandatory numeric parameter `parm`. Valid values are:
  - CHANNEL - the channel definitions section
  - APSERVER - the application server definitions section
- `entryId` - a sequential number that identifies the definition entry in the ECAPARM configuration file that contains the invalid parameter
- `parm` - the name of the invalid parameter
- `min` - the minimum valid value of the `parm` parameter
- `max` - the maximum valid value of the `parm` parameter

The `parm` parameter is ignored. IOAGATE tries to continue processing.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

ECAP4ME entryType ENTRY(entryId), MANDATORY PARAMETER(parm) WAS NOT SPECIFIED

**Explanation:** When processing the ECAPARM configuration file, IOAGATE found that no value had been set for the mandatory parameter `parm`.

The variables in this message are:

- `entryType` - the section of the ECAPARM configuration file that contains the mandatory parameter `parm`. Valid values are:
  - CHANNEL - the channel definitions section
  - APSERVER - the application server definitions section
- `entryId` - a sequential number that identifies the definition entry in the ECAPARM configuration file that contains the parameter that lacks a value
- `parm` - the name of the mandatory parameter that lacks a value

The `parm` parameter is ignored. IOAGATE tries to continue processing.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

ECAP4NE GATEWAY MANDATORY PARAMETER(parm) OUT OF RANGE(min -max)

**Explanation:** When processing the GATEWAY section of the ECAPARM configuration file, IOAGATE detected that the value of the mandatory numeric parameter `parm` is invalid.
The variables in this message are:

- `parm` - the name of the invalid parameter
- `min` - the minimum valid value of the `parm` parameter
- `max` - the maximum valid value of the `parm` parameter

The `parm` parameter is ignored. IOAGATE tries to continue processing.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

**ECAP4OE GATEWAY MANDATORY PARAMETER(`parm`) WAS NOT SPECIFIED**

**Explanation:** When processing the GATEWAY section of the ECAPARM configuration file, IOAGATE detected that no value had been set for the mandatory parameter `parm`.

In this message, `parm` is the name of the mandatory parameter that lacks a value.

The `parm` parameter is ignored. IOAGATE tries to continue processing.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

**ECAP4PE CHANNEL(`channelId`) NETWORK MAP REQUIRED BY APSERVER, APPL.SERVER(`applicId`) DISABLED**

**Explanation:** The channel `channelId` does not contain any network map specification. A network map specification is required by the application server `applicId` linked to this channel.

The variables in this message are:

- `channelId` - the identity of the problematic channel
- `applicId` - the identity of the application server that requires network map specification

The channel `channelId` is disabled. Normal processing continues.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

**ECAP4QW CHANNEL(`channelId`) DISABLED**

**Explanation:** When trying to process a network map specified in the channel `channelId`, IOAGATE found the channel disabled.

In this message, `channelId` is the identity of the disabled channel.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

**ECAP4RW APPL.SERVER(`applicId`) -add_space_id. `channelId`) DISABLED**

**Explanation:** The application server identified in the message is disabled.

The variables in this message are:
The identity of the disabled application
- the identity of the application server address space of the disabled application
- the identity of the channel to which the problematic application server was linked

Corrective Action: Correct the ECAPARM configuration file and restart IOAGATE.

ECAP4SS ALL CHANNELS DISABLED, PROCESSING STOPPED
Explanation: IOAGATE monitor has shut down, because all channels were disabled during the processing of the ECAPARM configuration file.
IOAGATE has shut down.
Corrective Action: Correct the ECAPARM configuration file and restart IOAGATE.

ECAP4TE CHANNEL(channelId) DISABLED, PARAMETER BIND= CANNOT BE SPECIFIED FOR SNA CHANNEL
Explanation: The TCP parameter BIND has been specified for channelId, an SNA channel. This channel has been disabled. The TCP parameter BIND cannot be specified for a SNA channel.
In this message, channelId is the identity of the disabled channel.
The channel is disabled. Normal processing continues.
Corrective Action: Correct the ECAPARM configuration file and restart IOAGATE.

ECAP4UE CHANNEL(channelId) DISABLED, BAD IP ADDRESS SPECIFIED IN BIND= PARAMETER
Explanation: An invalid IP address was specified in the BIND parameter.
In this message, channelId is the identity of the TCP channel that detected the problem.
The channel is disabled. Processing continues.
Corrective Action: Correct the ECAPARM configuration file and restart IOAGATE.

ECAP4VS ALL CHANNELS DISABLED, monitorId IS GOING DOWN.
Explanation: IOAGATE monitor is shutting down because all channels have become disabled.
In this message, monitorId is the STC name of the IOAGATE started task.
IOAGATE shuts down.
Corrective Action: Correct the ECAPARM configuration file and restart IOAGATE.

ECAP4WS VALUE OF THE parm NUMERIC PARAMETER(val) EXCEEDS WORKABLE MAXIMUM
Explanation: When processing the ECAPARM configuration file, IOAGATE found that the value val set for the numeric parameter parm exceeds a workable maximum.
The variables in this message are:
- **parm** - the identity of the parameter in which the error was found
- **val** - the invalid value of the problematic parameter

The parm parameter is ignored. Normal processing continues.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

**ECAP4XS** `entry_typ NUMERIC PARAMETER(parm) NOT FOUND IN ECAPDEF`

**Explanation:** A severe internal error occurred during the processing of the ECAPDEF table of numeric parameter defaults. A numeric parameter was not found in the ECAPARM configuration file.

The variables in this message are:
- **entry_typ** - the name of the section of the ECAPARM configuration file that should contain the **parm** parameter. Valid values are:
  - GATEWAY - the global IOAGATE definitions section
  - CHANNEL - the channel definitions section
  - APSERVER - the application server definitions section
- **parm** - the identity of the problematic parameter

IOAGATE shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

**ECAP4YE** `CHANNEL(channelId) DISABLED, PARAMETER SHRDBIND= CANNOT BE SPECIFIED FOR SNA CHANNEL`

**Explanation:** The TCP parameter SHRDBIND was encountered in an SNA channel. The TCP parameter SHRDBIND cannot be specified for an SNA channel.

In this message, **channelId** is the identity of the TCP channel that detected the problem.

IOAGATE disables the specified channel and tries to continue normal processing.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

**ECAP4ZW** `CHANNEL ENTRY(channelId), LOGINMSG= CANNOT BE SPECIFIED FOR THE DC CHANNEL, PARAMETER IGNORED`

**Explanation:** The LOGINMSG parameter was specified for the **channelId** channel, but **channelId** is not an MC channel.

The LOGINMSG parameter can only be specified for an MC channel.

IOAGATE disables the LOGINMSG parameter. Normal processing continues.

**Corrective Action:** Correct the channel definition.

**ECAP50I** `ECAPARM(suffix) HAS BEEN PROCESSED SUCCESSFULLY`

**Explanation:** This information message indicates that processing of the ECAPARM configuration file has ended successfully.
During initialization, IOAGATE reads and verifies the definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

In this message, *suffix* is a 1-character suffix that identifies the ECAPARM configuration file.

**Corrective Action:** No action is required.

ECAP51S PROCESSING OF ECAAPPL(*suffix*) SUPPORTED APPLICATIONS TABLE HAS FAILED

**Explanation:** A severe error occurred during the processing of the internal table of applications supported by IOAGATE.

During initialization, IOAGATE reads and verifies the declarations specified in the internal table of applications supported by IOAGATE. The same table is processed by IOAGATE and by each application server that communicates with this IOAGATE.

In this message, *suffix* is a unique 1-character suffix that identifies an ECAAPPL table of supported applications.

IOAGATE shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

ECAP52I ECAAPPL(*suffix*) SUPPORTED APPLICATIONS TABLE HAS BEEN PROCESSED SUCCESSFULLY

**Explanation:** This information message indicates that processing of the internal table of the applications supported by the IOAGATE succeeded.

During initialization, IOAGATE reads and verifies the declarations specified in the internal table of applications supported by IOAGATE. The same table is processed by IOAGATE and by each application server that communicates with this IOAGATE.

In this message, *suffix* is a unique 1-character suffix that identifies an ECAAPPL table of supported applications.

**Corrective Action:** No action is required.

ECAP53S ECAPRM INTERNAL ERROR, DESCRIPTOR ADDRESS UNAVAILABLE

**Explanation:** A severe internal error occurred during the processing of the ECAPARM configuration file. A descriptor address was not found.

IOAGATE shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

ECAP54S ECAPRM INTERNAL ERROR, FAILURE TO LOCATE MCT TOKEN

**Explanation:** A severe internal error occurred during processing of the ECAPARM configuration file. An MCT token was not found.

IOAGATE shuts down.
Corrective Action: Contact BMC Software Customer Support.

ECAP55W APSERVER( applicId ), PARAMETER parm ( val ) CANNOT BE MODIFIED WITH VERSION( version )

Explanation: The specified parameter parm cannot be modified by the VERSION parameter, because the value of parm already has eight characters, which is the maximum. The VERSION parameter modifies a parameter by adding a 1-character version code to the existing value.

During initialization, IOAGATE reads and verifies the declarations specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

The variables in this message are:

- applicId - the identity of the application
- parm - the parameter to be modified
- val - the current value of the parameter
- version - the value of the VERSION parameter that cannot be used

The VERSION parameter is ignored and processing continues.

Corrective Action: Correct the value assigned to VERSION and restart IOAGATE.

ECAP56S THERE IS A SEVERE STRUCTURE ERROR IN ECAAPPL( suffix ) SUPPORTED APPLICATIONS TABLE

Explanation: A severe internal error occurred during ECAAPL processing. The structure of the internal table of applications supported by IOAGATE was found to be invalid.

During initialization, IOAGATE reads and verifies the declarations specified in the internal table of applications supported by IOAGATE. The same table is processed by IOAGATE and by each application server that communicates with this IOAGATE.

IOAGATE shuts down.

Corrective Action: Contact BMC Software Customer Support.

ECAP57W APPL APSERVER ENTRY( entryId ), ALIAS= VALUE CAN BE DEFINED IN CM ENTRY ONLY

Explanation: The value specified for the ALIAS parameter in the internal table of supported applications is valid only for a CM type application server.

During initialization, IOAGATE reads and verifies the declarations specified in the internal table of applications supported by IOAGATE. The same table is processed by IOAGATE and by each application server that communicates with this IOAGATE.

In this message, entryId is a sequential number that identifies the problematic APSERVER definition in the internal table of supported applications.

Initialization continues.

Corrective Action: Contact BMC Software Customer Support.
ECAP58S ECAPRM INTERNAL ERROR, BAD MCT ADDRESS OBTAINED

Explanation: A severe internal error occurred during the processing of the ECAPARM configuration file. The MCT address is not valid.

IOAGATE shuts down.

Corrective Action: Contact BMC Software Customer Support.

ECAP59E APPL APSERVER(applicId), CMPRSTYP= PARAMETER IS A MUST WHEN COMPRESS=YES SPECIFIED

Explanation: An internal error encountered during the processing of the ECAAPPL table of internal parameters. The CMPRSTYP parameter is not specified in the internal table of supported applications, but the COMPRESS parameter is set to YES.

During initialization, IOAGATE reads and verifies the declarations specified in the internal table of applications supported by the IOAGATE. The same table is processed by IOAGATE and by each application server that communicates with this IOAGATE.

In this message, applicId is the problematic APSERVER definition in the internal table of supported applications.

IOAGATE shuts down.

Corrective Action: Contact BMC Software Customer Support.

ECAP5AE ECAPARM (suffix) PROCESSING FAILED, RC=rc

Explanation: An internal error occurred during the processing of the ECAPARM configuration file.

The variables in this message are:

- suffix - a 1-character suffix that identifies a unique ECAPARM configuration file used in this IOAGATE run
- rc - a return code indicating the failure level

Valid values for rc are:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>08</td>
<td>An error occurred during ECAPARM processing. The ECAPARM processor is able to continue ECAPARM processing.</td>
</tr>
<tr>
<td>12</td>
<td>An error occurred during ECAPARM processing. The ECAPARM processor is NOT able to continue ECAPARM processing.</td>
</tr>
</tbody>
</table>

As indicated in the valid values for rc.

Corrective Action: Do the following:

1. Examine the IOAGATE logs, and try to determine the cause of the problem.
2. If possible, correct the problem and restart IOAGATE.
3. If the problem persists, contact BMC Software Customer Support.
ECAP5BS ECAAPL INTERNAL ERROR, ECAAPPL DESCRIPTOR ADDRESS UNAVAILABLE

Explanation: A severe internal error occurred during the processing of the specified table of internal parameters during initialization. The ECAAPL internal routine did not get the address of the ECAAPPL descriptor.

IOAGATE shuts down.

Corrective Action: Contact BMC Software Customer Support.

ECAP5CS ECAAPL INTERNAL ERROR, NO PARAMETERS OBTAINED

Explanation: A severe internal error occurred during the processing of the specified table of internal parameters during initialization. The ECAAPL internal routine did not get the parameters it needs to process the internal table of supported applications.

IOAGATE shuts down.

Corrective Action: Contact BMC Software Customer Support.

ECAP5DS ECAAPL INTERNAL ERROR, NO APPLICATION ENTRY OBTAINED

Explanation: A severe internal error occurred during the processing of the specified table of internal parameters during initialization. The ECAAPL internal routine did not get the application entry it needs to process the internal table of supported applications.

IOAGATE shuts down.

Corrective Action: Contact BMC Software Customer Support.

ECAP5EE IMPROPER CHANNEL(channelId.protocol) SPECIFIED FOR APPL.SERVER (applServer.addrSpaceId), APPL.SERVER DISABLED

Explanation: The channel specified by the CHANID parameter in an APSERVER definition in the ECAPARM configuration file is not appropriate for the application declared by the definition.

During initialization, IOAGATE reads and checks the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

The indicated application server applServer is disabled and processing continues.

Corrective Action: Correct the ECAPARM configuration file and restart IOAGATE.

The variables in this message are:

- channelId - the identity of the problematic channel
- protocol - the communication protocol of the problematic channel
- applServer - the identity of the problematic application server
- addrSpaceId - the internal identity of the problematic application server address space

The indicated application server applServer is disabled and processing continues.

Corrective Action: Correct the ECAPARM configuration file and restart IOAGATE.
ECAP5FS ECAAPL INTERNAL ERROR, FAILURE TO LOCATE MCT TOKEN

**Explanation:** A severe internal error occurred during the processing of the specified table of internal parameters during initialization. The ECAAPL internal routine did not find the MCT token. IOAGATE shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

ECAP5GI ECAPARM(suffix) CONFIGURATION FILE HAS BEEN PROCESSED WITH RC(04)

**Explanation:** This information message indicates that processing of the ECAPARM configuration file has ended with minor errors.

During initialization, IOAGATE reads and verifies the definitions specified in the ECAPARM configuration file. The same ECAPARM configuration file is processed by IOAGATE and by each application server that communicates with this IOAGATE.

In this message, `suffix` is a 1-character suffix that identifies the ECAPARM configuration file.

**Corrective Action:** Correct the ECAPARM configuration file and restart IOAGATE.

ECAP60I ECASRVT SERVICES TABLE HAS BEEN PROCESSED SUCCESSFULLY

**Explanation:** This information message indicates that processing of the ECASRVT internal table of services succeeded. During initialization, IOAGATE processes the ECASRVT internal table of services or request types supported by IOAGATE.

**Corrective Action:** No action is required.

ECAP61S PROCESSING OF ECASRVT SERVICES TABLE FAILED

**Explanation:** Processing of the ECASRVT internal table of services or types of transactions supported by IOAGATE failed. This is a severe internal error.

IOAGATE shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

ECAP6BS ECASRV INTERNAL ERROR, ECASRVT DESCRIPTOR ADDRESS UNAVAILABLE

**Explanation:** This is a severe internal error. The ECASRV internal routine did not get a descriptor address to process during processing of the ECASRVT internal table of services.

IOAGATE shuts down.

**Corrective Action:** Contact BMC Software Customer Support.

ECAP6CS ECASRV INTERNAL ERROR, NO PARAMETERS OBTAINED

**Explanation:** This is a severe internal error. The ECASRV internal routine did not get any parameters during processing of the ECASRVT internal table of services.
IOAGATE shuts down.

Corrective Action: Contact BMC Software Customer Support.

ECAP6DS ECASRV INTERNAL ERROR, NO SERVICE ENTRY OBTAINED

Explanation: This is a severe internal error. The ECASRV internal routine did not get any entry to process during processing of the ECASRVT internal table of services.

IOAGATE shuts down.

Corrective Action: Contact BMC Software Customer Support.

ECAP6FS ECASRV INTERNAL ERROR, FAILURE TO LOCATE MCT TOKEN

Explanation: This is a severe internal error. The ECASRV internal routine could not find an MCT token during processing of the ECASRVT internal table of services.

IOAGATE shuts down.

Corrective Action: Contact BMC Software Customer Support.

ECAP80S CHANNEL(channelId:TCP) HAS GONE DOWN DUE TO NO COMTASK AVAILABLE

Explanation: This is a severe error that can be issued for a multiple connection (MC) TCP communication channel only. All communication tasks that belong to the specified channel terminated.

In this message, channelId is the identity of the problematic channel.

This message follows ECAP88S. For more information, see messages ECAP86W, ECAP87W and ECAP88S. The multiple connection (MC) TCP channel goes down, and processing continues.

Corrective Action: Do the following:
1. Examine IOAGATE logs to try to determine why the communication tasks went down.
2. If possible, correct the problem and restart IOAGATE.
3. If the problem persists, contact BMC Software Customer Support.

ECAP82S CHANNEL(channelId:TCP) NO COMTASK INITIALIZED DURING LAST interval sec

Explanation: A severe error was encountered during initialization of the multiple connection TCP channel. No communication task launched by the channel started during the specified time interval.

The variables in this message are:

- channelId - the identity of the problematic TCP channel
- interval - the time interval (in seconds) during which no communication task succeeded in initializing

The specified TCP channel goes down. IOAGATE tries to continue processing.

Corrective Action: Do the following:
ECAP83W CHANNEL(channelId.TCP) DISABLED

**Explanation:** This message warns that the channelId MC TCP channel has been disabled because an EADDRINUSE error occurred while IOAGATE was trying to bind the port specified in the BIND parameter in ECAPARM.

**Corrective Action:** No action is required.

ECAP86W CHANNEL(channelId.TCP) COMTASK(taskId) CANNOT BE STARTED ANY MORE, THRESHOLD OF RESTARTS(threshold) REACHED

**Explanation:** A communication task of a multiple connection TCP channel has already shut down and restarted the maximum number of times. When an error prevents a TCP communication task from working normally, the TCP channel tries to resolve the problem by recycling the task. However, beyond a defined limit, the TCP channel assumes a severe problem, and prevents further recycling of the task.

This message can be issued for a multiple connection TCP channel only.

The variables in this message are:
- channelId - the identity of the channel that has the problematic task
- taskId - the internal identity of the problematic TCP communication task
- threshold - the internally defined maximum number of times to recycle a communication task

**Corrective Action:** Do the following:
1. Examine the IOAGATE logs to try to determine the cause of the failure.
2. If possible, correct the problem and restart IOAGATE.
3. If the problem persists, contact BMC Software Customer Support.

ECAP87W CHANNEL(channelId.TCP) num COMTASKS AMONG(channel_amount) DEFINED TO CHANNEL TERMINATED

**Explanation:** The specified number (num) of communication tasks became unavailable to a multiple connection (MC) TCP communication channel. A serious problem may be preventing the specified TCP channel from working properly. An ECAP86W message is issued before this message for each communication task that terminated.

This message can only be issued for a multiple connection (MC) TCP communication channel.

The variables in this message are:
- channelId - the identity of the problematic channel
- num - the number of communication tasks that terminated
- channel_amount - the number of communication tasks configured to the specified channel

**Corrective Action:** Do the following:
1. Examine the IOAGATE logs to try to determine the cause of the failure.
2. If possible, correct the problem and restart IOAGATE.
3. If the problem persists, contact BMC Software Customer Support.

**ECAP88S CHANNEL(\texttt{channelId}.TCP) ALL COMTASKS DEFINED TO CHANNEL(\texttt{num}) TERMINATED**

**Explanation:** No more active communication tasks are available for the specified channel. All communication tasks terminated, and none is allowed to restart. ECAP86W warning messages were previously issued for each communication task that went down. This message precedes message ECAP80S. For more information, see message ECAP86W.

This message can only be issued for a multiple connection (MC) TCP communication channel.

The variables in this message are:

- \texttt{channelId} - the identity of the problematic channel
- \texttt{num} - the number of communication tasks configured to the specified channel in the ECAPARM configuration file

The specified channel goes down and processing continues. If the indicated channel is the only one configured to IOAGATE, IOAGATE shuts down.

**Corrective Action:** Do the following:

1. Examine the IOAGATE logs to try to determine the cause of the failure.
2. If possible, correct the problem and restart IOAGATE.
3. If the problem persists, contact BMC Software Customer Support.

**ECAP90I ECAIPLS(\texttt{suffix}) IP LIST HAS BEEN \{PROCESSED | REFRESHED\} SUCCESSFULLY FOR CHANNEL(\texttt{channel})**

**Explanation:** This information message indicates that the IP list member was specified in the ECAPARM member for channel \texttt{channel} by means of the IPLIST parameter, and the IP list member was processed or refreshed (if the REFRESH command was issued) successfully.

The variables in this message are:

- \texttt{suffix} - one-character suffix used to specify the individual ECAIPLS x IP list member name
- \texttt{channel} - channel identity that the indicated ECAIPLS x IP list specified

**Corrective Action:** No action is required.

**ECAP91I CHANNEL(\texttt{channel}) ECAIPLS(\texttt{suffix}) IP LIST MEMBER IS BEING CHECKED**

**Explanation:** This information message indicates which specific IP list member is being processed. The message is issued in DAIGLOG output as a header for the group of ECAP93I messages issued for each line in the IP list member.

The variables in this message are:
channel - channel identity for which the indicated ECAIPLS x IP list was specified

suffix - one-character suffix used to specify the individual ECAIPLS x IP list member name

Corrective Action: No action is required.

**ECAP92I END OF ECAIPLS(suffix) IP LIST MEMBER**

Explanation: This information message indicates which specific IP list member was processed. The message is issued in DAIGLOG output as a footer after the group of ECAP93I messages issued for each line in the IP list member.

In this message, suffix is a one-character suffix used to specify the individual ECAIPLS x IP list member name.

Corrective Action: No action is required.

**ECAP93I indication number: IPListLine**

Explanation: This information message is issued in DAIGLOG output for each source IPListLine in the IP list member.

The variables in this message are:

- **indication** - a short string indicating the result of a source IPListLine processing

Valid values of indication are:

<table>
<thead>
<tr>
<th>indication</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>no indication</td>
<td>Indicates that no error was detected in an IP list source line.</td>
</tr>
<tr>
<td>ERROR code FOUND</td>
<td>Indicates that an error with hexadecimal code code was found in an IP list source line. When such an indication is issued, message ECAP94I follows message ECAP93I and specifies an approximate column where the error detected. Additionally, another error message follows message ECAP94I to specify the exact reason for the error.</td>
</tr>
<tr>
<td>RECORD IGNORED</td>
<td>Indicates that an IP list source line was ignored because another line in the IP list repeats the current line. Message ECAP98W that follows message ECAP93I specifies the sequential number of the duplicate line.</td>
</tr>
<tr>
<td>ALLOW IGNORED</td>
<td>Indicates that an IP list source line was ignored because there is a FORBID line in the IP list that was specified for the same IP address and a mask. Message ECAP9CE that follows message ECAP93I specifies the number of the FORBID line.</td>
</tr>
<tr>
<td>COMMENT LINE</td>
<td>Indicates that an IP list source line has an asterisk in the first column. The line is not processed.</td>
</tr>
<tr>
<td>BLANKED LINE</td>
<td>Indicates that an IP list source line contains no valid characters. The line is not processed.</td>
</tr>
</tbody>
</table>
- number - the sequential number of an IP list source line
- IPListLine - the contents of an IP list source line

**Corrective Action:** No action is required.

**ECAP94I** NEAR COLUMN NUM.column:

**Explanation:** This information message is issued in DAIGLOG output. It follows message ECAP93I when an error is detected in an IP list source line and indicates the approximate column where the error was detected. The message is issued for a source IP line when an error is detected in the line.

In this message, *column* is the approximate sequential number of the column in the IP list source line where the error was detected.

**Corrective Action:** No action is required.

**ECAP95E** EMPTY section SECTION

**Explanation:** No character was found between dots that form a section in a mask or IP address in the IP list source line indicated by message ECAP93I.

In this message, *section* is a portion of a mask or an IP address string between dots. Valid values are:

- ADDRESS
- MASK

The following system actions occur:

- The channel for which the IP list is defined is disabled.
- Processing continues.

**Corrective Action:** Correct the IP list member and try again.

**ECAP96E** VALUE IN SECTION EXCEEDS 255

**Explanation:** A value specified in a separate section of a mask or IP address exceeds 255 in the IP list source line indicated by message ECAP93I. The section is a portion of a mask or an IP address string between dots.

The following system actions occur:

- Processing continues.
- The channel for which the IP list is defined is disabled.

**Corrective Action:** Correct the IP list member and try again.

**ECAP97E** WRONG USAGE OF AN ASTERISK IN section

**Explanation:** An asterisk was improperly specified in a separate section of a mask or IP address in an IP list source line indicated by message ECAP93I. An asterisk can be specified in the first through fourth contiguous right-to-left sections of an IP address. An asterisk in a mask is not allowed.

In this message, *section* is a portion of a mask or an IP address string between dots. Valid values are:
ADDRESS

MASK

The following system actions occur:

- Processing continues.
- The channel for which the IP list is defined is disabled.

**Corrective Action:** Correct the IP list member and try again.

**ECAP98E WRONG NUMBER OF SECTIONS IN {ADDRESS | MASK}**

**Explanation:** The number of sections in a mask or IP address is not exactly four in the IP list source line indicated by message ECAP93I.

The following system actions occur:

- Processing continues.
- The channel for which the IP list is defined is disabled.

**Corrective Action:** Correct the IP list member and try again.

**ECAP99E NEITHER ALLOW NOR FORBID STATEMENT**

**Explanation:** A main keyword in the IP list source line indicated by message ECAP93I could not be identified. Each valid IP line must have either ALLOW or FORBID as a keyword.

The following system actions occur:

- Processing continues.
- The channel for which the IP list is defined is disabled.

**Corrective Action:** Correct the IP list member and try again.

**ECAP9AE INVALID CHARACTER DETECTED**

**Explanation:** An invalid character was detected in the IP list source line indicated by message ECAP93I. Message ECAP94I, which precedes message ECAP9AE, specifies the exact column where the invalid character was detected.

The following system actions occur:

- Processing continues.
- The channel for which the IP list is defined is disabled.

**Corrective Action:** Correct the IP list member and try again.

**ECAP9BW DUE TO DUPLICATE RECORD NUMBER: number**

**Explanation:** An IP list source line was ignored because there is a duplicate line in the IP list. In this message, `number` is the number of the duplicate IP list source line.

**Corrective Action:** Correct the IP list member and try again.
ECAP9CW DUE TO FORBID RECORD NUMBER: number SPECIFIED FOR THE SAME ADDRESS

Explanation: This warning indicates that the ALLOW IP list source line was ignored because the FORBID line in the IP list was specified for the same IP address and a mask as in the ignored line.

In this message, number is the number of the FORBID line in the IP list.

Corrective Action: Correct the IP list member and try again.

ECAP9DE WRONG MASK: INCONSECUTIVE (FROM LEFT TO RIGHT) BITS DETECTED

Explanation: Inconsecutive bits were detected in a mask specified in the IP list source line that was indicated by message ECAP93I. The mask should be built with consecutive, left-to-right bits only.

The following system actions occur:

- Processing continues.
- The channel for which the IP list is defined is disabled.

Corrective Action: Correct the IP list member and try again.

ECAP9ES SEVERE ERROR ENCOUNTERED; ROUTINE(routine) RC(rc) REASON(reason)

Explanation: A severe error, with an rc return code and reason reason, was detected by the routine internal routine.

The variables in this message are:

- routine - the name of the routine in which the indicated error case was detected. Valid values for routine are:
  - IOAPICV
  - IOAIPLS
  - IOAIPSH
- rc - a non-zero error return code
- reason - the hexadecimal error code specifying an exact error case.

The following system actions occur:

- Processing stops.
- The channel for which the IP list is defined is disabled.

Corrective Action: Contact BMC Software Customer Support.
ECAP9FS INTERNAL ERROR ENCOUNTERED; ROUTINE(*routine*) RC(*rc*) REASON(*reason*)

**Explanation:** A severe internal error, with an *rc* return code and *reason* reason, was detected by the *routine* internal routine.

The variables in this message are:

- **routine** - the name of the routine in which the indicated error case was detected. Valid values for routine are:
  - IOAIPCV
  - IOAIPLS
  - IOAI PSH
- **rc** - a non-zero error return code
- **reason** - the hexadecimal error code specifying an exact error case.

The following system actions occur:

- Processing stops.
- The channel for which the IP list is defined is disabled.

**Corrective Action:** Contact BMC Software Customer Support.

ECAP9GE IOAMEM SERVICE DETECTED AN ERROR; ROUTINE(*routine*) RC(*rc*) REASON(*reason*)

**Explanation:** The IOAMEM service detected an error when handling an IP list member. The IOAMEM routine is used when reading PDS members.

The variables in this message are:

- **routine** - the name of the routine in which the indicated error case was detected. Valid values for routine are:
  - IOAIPLS
  - IOAIPSH
- **rc** - a non-zero error return code
- **reason** - the hexadecimal error code specifying an exact error case.

The following system actions occur:

- IP list processing stops.
- The channel for which the IP list is defined is disabled.
- Processing continues.

**Corrective Action:** If it is not possible to locate the source of the error, contact BMC Software Customer Support.
ECAP9HW SYNTAX ERROR DETECTED IN ECAIPLS(suffix) IP LIST MEMBER, CHANNEL(channel)

**Explanation:** A syntax error was detected in an IP list member. Detailed messages specifying both the exact error and its location are issued in DAIGLOG output. See message ECAP93I.

The variables in this message are:
- `suffix` - the one-character suffix used to specify the individual ECAIPLS x IP list member name.
- `channel` - the channel identity for which the indicated ECAIPLS x IP list is specified.

The following system actions occur:
- Processing continues.
- The channel for which the IP list is defined is disabled.

**Corrective Action:** Correct the IP list member and try again.

ECAP9IS UNKNOWN ERROR ENCOUNTERED; ROUTINE(routine) RC(rc) REASON(reason)

**Explanation:** An unknown error, with an `rc` return code and `reason` reason, was detected by the `routine` internal routine.

The variables in this message are:
- `routine` - the name of the routine in which the indicated error case was detected. Valid values for `routine` are:
  - IOAI PCV
  - IOAIPLS
  - IOAIPSH
- `rc` - a non-zero error return code
- `reason` - the hexadecimal error code specifying an exact error case.

The following system actions occur:
- IP list processing stops.
- The channel for which the IP list is defined is disabled.

**Corrective Action:** Contact BMC Software Customer Support.

ECAP9JE FAILURE TO LOAD MODULE module

**Explanation:** The `module` module failed to load.

In this message, `module` is the name of the module that failed to load.

The following system actions occur:
IP list processing stops.
The channel for which the IP list is defined is disabled.

**Corrective Action:** Contact BMC Software Customer Support.

ECAP9KE SPECIFIED IP LIST MEMBER ECAIPLS(*suffix*) DOES NOT EXIST, CHANNEL(*channel*)

**Explanation:** The specified IP list member could not be located in a dataset allocated by DAPARM DD statement.

The variables in this message are:
- *suffix* - the one-character suffix used to specify the individual ECAIPLS x IP list member name.
- *channel* - the channel identity for which the indicated ECAIPLS x IP list is specified

The following system actions occur:
- IP list processing stops.
- The channel for which the IP list is defined is disabled.
- Processing continues.

**Corrective Action:** Correct the IP list member and try again.

ECAP9LE EMPTY IP LIST MEMBER ECAIPLS(*suffix*) SPECIFIED, CHANNEL(*channel*)

**Explanation:** The specified IP list member was found to be empty.

The variables in this message are:
- *suffix* - the one-character suffix used to specify the individual ECAIPLS x IP list member name.
- *channel* - the channel identity for which the indicated ECAIPLS x IP list is specified

The following system actions occur:
- IP list processing stops.
- The channel for which the IP list is defined is disabled.
- Processing continues.

**Corrective Action:** Correct the IP list member and try again.

ECAP9ME INVALID IP LIST MEMBER *member(*suffix*)* NAME SPECIFIED, CHANNEL(*channel*)

**Explanation:** This error message indicates that an invalid name was specified for the *channel* channel in ECAPARM as an IP list. A valid name should be ECAIPLS(*suffix*).

The variables in this message are:
The following system actions occur:
- IP list processing stops.
- The channel for which the IP list is defined is disabled.
- Processing continues.

**Corrective Action:** Correct the IP list member and try again.

ECAP9NE MORE THAN 999 RECORDS SPECIFIED IN IP LIST MEMBER ECAIPLS(suffix), CHANNEL(channel)

**Explanation:** The specified IP list member contains more than 999 lines.

The variables in this message are:
- `suffix` - the one-character suffix used to specify the individual ECAIPLS x IP list member name.
- `channel` - the channel identity for which the indicated ECAIPLS x IP list is specified

The following system actions occur:
- IP list processing stops.
- The channel for which the IP list is defined is disabled.
- Processing continues.

**Corrective Action:** Correct the IP list member and try again.

ECAP9OE THERE IS NO VALID RECORD IN SPECIFIED IP LIST MEMBER ECAIPLS(suffix), CHANNEL(channel)

**Explanation:** No valid lines were found in the specified IP list member.

The variables in this message are:
- `suffix` - the one-character suffix used to specify the individual ECAIPLS x IP list member name.
- `channel` - the channel identity for which the indicated ECAIPLS x IP list is specified

The following system actions occur:
- IP list processing stops.
- The channel for which the IP list is defined is disabled.
- Processing continues.

**Corrective Action:** Correct the IP list member and try again.
ECAP9PE HEADER RECORD NOT FOUND IN SPECIFIED IP LIST MEMBER ECAIPLS(suffix), CHANNEL(channel)

**Explanation:** No header record was found in the specified IP list member. The IP list member must have ALLOW * or FORBID* as its first valid record.

The variables in this message are:
- `suffix` - the one-character suffix used to specify the individual ECAIPLS x IP list member name.
- `channel` - the channel identity for which the indicated ECAIPLS x IP list is specified

The following system actions occur:
- IP list processing stops.
- The channel for which the IP list is defined is disabled.
- Processing continues.

**Corrective Action:** Correct the IP list member and try again.

ECAP9QW FAILURE TO REFRESH IP LIST MEMBER ECAIPLS(suffix) FOR CHANNEL(channel)

**Explanation:** The F monitor,REFRESH=IPListMember modify command was issued but was unsuccessful, probably due to syntax errors detected in the specified IP list member.

The variables in this message are:
- `suffix` - the one-character suffix used to specify the individual ECAIPLS x IP list member name.
- `channel` - the channel identity for which the indicated ECAIPLS x IP list is specified

The following system actions occur:
- No changes are performed.
- Normal processing continues.

**Corrective Action:** Correct the IP list member and try again.

ECAP9RW CANNOT REFRESH MEMBER member: NOT DEFINED IN A CHANNEL

**Explanation:** The F monitor,REFRESH=IPListMember modify command specified an IP list member name that is not defined in any channel.

In this message, `member` is the IP list (ECAIPLS x) member name.

No changes are performed. Normal processing continues.

**Corrective Action:** Correct the IP list member and try again.

ECAP9SE REFRESH FOR(member) FAILED WITH RC(rc) REASON(reason)

**Explanation:** The F monitor,REFRESH=IPListMember modify command was issued but was unsuccessful, probably due to internal errors encountered when processing the specified IP list member.
The variables in this message are:

- **member** - the IP list (ECAIPLS x) member name.
- **rc** - the return code value
- **reason** - the cause of the error

No changes are performed. Normal processing continues.

**Corrective Action:** Correct the IP list member and try again.

ECAP9TE WRONG OR NO VALID DATA

**Explanation:** Wrong or invalid data was detected in the IP list source line indicated by message ECAP93I.

No changes are performed. Normal processing continues.

**Corrective Action:** Correct the IP list member and try again.

ECAP9UE INVALID IPV6 RECORD

**Explanation:** A string in an IP source line contains the colon (:) character, but is not a syntactically valid IPv6 address.

The following system actions occur:

- If the error occurs during IOAGATE startup, the channel for which the IP list is defined is disabled. If it is the only channel, then IOAGATE will terminate.
- If the error occurs during a MODIFY REFRESH command, the refresh fails, but processing continues.

**Corrective Action:** Correct the IP list member and try again.

Use the following valid IPv6 address formats:

- full 39-character format, for example:
  - AA12:EF01:2345:FDD6:ABCD:EF01:2345:6789,
- zero-suppressed formats, for example:
  - 2001:DB8:0:0:8:800:200C:417A
  - 2001:DB8::8:800:200C:417A
  - ::1

Do not use ‘/’ to abbreviate addresses.

Do not use IPv4-mapped IPv6 addresses. For example:

- ::ffff:137.72.214.55 – incorrect
- 137.72.214.55 – correct representation of the above address

ECAP9VE INVALID IPV6 ADDRESS RANGE

**Explanation:** An IP source line contains a range of IPv6 addresses, but the second address is not higher than the first address.
If the range was specified in 2 lines:

- ALLOWTO or FORBIDTO was specified before ALLOWFR or FORBIDFR, respectively.
- ALLOWFR was not followed immediately by ALLOWTO, or FORBIDFR by FORBIDTO.

The following system actions might occur:

- If the error occurs during IOAGATE startup, the channel for which the IP list is defined is disabled. If it is the only channel, then IOAGATE will terminate.
- If the error occurs during a MODIFY REFRESH command, the refresh fails but processing continues.

**Corrective Action:** Correct the IP list member and try again.

ECAPA1E KEYRING PARAMETER IS A MUST IF SSL=YES SPECIFIED, CHANNEL( channelId ) DISABLED

**Explanation:** When SSL=YES is specified in the ECAPARM configuration file, the KEYRING parameter must also be specified.

In this message, `channelId` is the identity of the channel.

The channel is disabled. If there are no other enabled channels in IOAGATE, IOAGATE shuts down.

**Corrective Action:** Specify a KEYRING parameter.

ECAPA2E USERID/KEYRING PARAMETER INVALID, CHANNEL( channelId ) DISABLED

**Explanation:** The syntax of the KEYRING parameter is invalid.

In this message, `channelId` is the identity of the channel.

The channel is disabled. If there are no other enabled channels in IOAGATE, IOAGATE shuts down.

**Corrective Action:** Specify a proper KEYRING parameter. Refer to the chapter about installing IOA in the *INCONTROL for z/OS Installation Guide*.

ECAPA3E SSL NOT SUPPORTED BY IOAGATE IN z/OS LEVEL LOWER THAN z/OS 1.4, CHANNEL( channelId ) DISABLED

**Explanation:** SSL support in IOAGATE requires z/OS 1.4 or later.

In this message, `channelId` is the identity of the channel.

The channel is disabled. If there are no other enabled channels in IOAGATE, IOAGATE shuts down.

**Corrective Action:** Specify SSL=NO in the ECAPARM configuration file.

ECAPB1I PARAMETER xxxxxx SUCCESSFULLY | replaced in | retrieved from | MEMBER member_name

**Explanation:** A parameter in a IOA PARM library member was retrieved or updated by Control-M/Enterprise Manager.

**Corrective Action:** No action is required.
ECAPB2E RC=(04) REASON=(reason) PROCESSING FAILED

**Explanation:** An IOA PARM library parameter, which was needed to process a request from the Control-M/Enterprise Manager, could not be located.

**Corrective Action:** Review recent changes to the CTMAA section of the CTMPARM member in the IOA PARM library and to the member referred to by the ECAPARM parameter in the CTMAA section. Browse or edit the IOA PARM library, to ensure that it is not held exclusively by a TSO user or a job (for example, for compression). If no problem is found, save the IOAGATE and Application Server syouts and call BMC Software Customer Support.

ECAPB3E RC=(08) REASON=(reason) | INVALID PARAMETER (n) RECEIVED | additional_details

**Explanation:** The IOA PARM library editor program was called with invalid parameters. The invalid parameter is identified by \( n \), which is the parameter number in the ECAPMED parameter list.

**Corrective Action:** Review recent changes to the CTMAA section of the CTMPARM member in the IOA PARM library and to the member referred to by the ECAPARM parameter in the CTMAA section. If no problem is found, save the IOAGATE and Application Server syouts and call BMC Software Customer Support.

ECAPB4E RC=(12) REASON=(reason) FAILURE TO READ | WRITE | STOW MEMBER member_name

**Explanation:** A failure occurred while reading/writing/saving an IOA PARM library member.

**Corrective Action:** The failure might occur if the member is being edited in TSO, or the IOA PARM library needs to be compressed. If the problem persists, save the IOAGATE and Application Server syouts and call BMC Software Customer Support.

ECAPB5E RC=(24) REASON=(reason) INTERNAL ERROR OCCURRED

**Explanation:** The IOA PARM library editor program encountered a logical error.

**Corrective Action:** Save the Application Server syouts and call BMC Software Customer Support.

Messages ECAT00 through ECATxx

This group includes messages for the IOA (infrastructure) product.

ECAT00I CHANNEL (channelId:TCP) task (taskId.type) LISTENING ON PORT(port), IP(hostIpAdd/*), APPLICATION (appl)

**Explanation:** This information message displays the host IP address and TCP/IP communication port number on which IOAGATE is listening. The message indicates that the TCP channel has initialized and is waiting for the partner or client to initiate the connection.

The variables in this message are:
INCONTROL for z/OS Messages Manual

- `channelId` - the identity of the TCP channel that is listening to the specified port
- `task` - the name of the communication task of `channelId`. Valid values are:
  - `SENDER` - the sender side of the dual connection (DC) TCP channel
  - `RECEIVER` - the receiver side of the dual connection (DC) TCP channel
  - `LISTENER` - the manager task of the multiple connection (MC) TCP channel
- `taskId` - the internal identity of this communication task
- `type` - the internal type of this communication task
- `port` - the number of the TCP/IP communication port that the TCP channel is using to listen for connection
- `hostIpAdd` - the IP address on which IOAGATE is listening for incoming connections, which corresponds with the IP address specified in the `BIND` parameter in `ECAPARM`
- `*` (Asterisk) - IOAGATE is listening for incoming connections on all IP address (adapters) of the `z/OS`. Default.
- `appl` - the application supported by the specified channel

**Corrective Action:** No action is required.

ECAT01E PROBABLE CTM/EM SET UP ERROR: DATACENTER PLATFORM WRONGLY DEFINED AS 'DISTRIBUTED' INSTEAD OF AS 'Z/OS'

**Explanation:** IOAGATE received a synchronization message from Control-M/Enterprise Manager that is encoded for non z/OS platforms. The error is probably because the Control-M for z/OS is incorrectly defined in the Control-M Configuration Manager.

**Corrective Action:** Ensure that in the Platform field of the Control-M Definition dialog box, the Control-M is defined as 'z/OS', not as 'distributed'.

ECAT02I CHANNEL(`channelId.TCP`) task(`taskId.type`) ESTABLISHED CONNECTION WITH HOST(`hostIpAdd`), APPLICATION(`appl`)

**Explanation:** This information message indicates that a dual connection (DC) TCP communication channel succeeded in connecting to the specified partner or client.

The variables in this message are:
- `channelId` - the identity of the channel that established connection with a partner or client
- `task` - the communication task of the indicated TCP channel. Valid values are:
  - `SENDER` - the sender side of the dual connection TCP channel
  - `RECEIVER` - the receiver side of the dual connection TCP channel
**ECAT03I** CHANNEL(\textit{channelId}.TCP) \textit{task} (taskId.type) TERMINATED CONNECTION WITH HOST(\textit{hostIpAdd})

**Explanation:** This information message indicates that the communication task of the specified dual connection (DC) TCP communication channel terminated the connection with its partner or client.

The variables in this message are:

- \textit{channelId} - the identity of the channel that terminated connection with a partner or client
- \textit{taskId} - the internal identity of this communication task
- \textit{type} - the internal type of this communication task
- \textit{hostIpAdd} - the IP address of the host of the partner or client

Normal processing continues. The dual connection TCP channel will try to re-establish connection to the specified partner or client.

**Corrective Action:** No action is required.

**ECAT04W** CHANNEL(\textit{channelId}.TCP) \textit{task} (taskId.type) FAILED TO INITIALIZE, WILL RETRY IN A MINUTE

**Explanation:** This message warns that initialization failed during startup of the specified TCP channel. The ECAT05I or the ECAT09I message may accompany this message and explain the reason for the failure.

The variables in this message are:

- \textit{channelId} - the identity of the channel that failed to initialize
- \textit{taskId} - the internal identity of this communication task
- \textit{type} - the internal type of this communication task
- \textit{hostIpAdd} - the IP address of the host of the partner or client

Corrective Action: No action is required.
Normal processing continues. After one minute, initialization of the indicated TCP channel is attempted again.

**Corrective Action:** No action is required.

**ECAT05W CHANNEL(CHANNELID,TCP) task(taskId.type) DETECTED EVENT(errno.errno_id) STAGE(stage) API(api) ACTION(action)**

**Explanation:** This message warns that the dual connection (DC) TCP channel detected a TCP/IP internal errno event while trying to connect or during data exchange with a partner or client.

Internal TCP/IP errno events are network activities that are intercepted, identified, and processed by TCP/IP software. A unique name and a standard numeric code identify each event.

Internal TCP/IP events usually reflect normal network activity, including error recovery. Only codes that point to application program interface (API) errors indicate potential software defects.

This message ECAT05W is always followed by the ECAT0EI message, which explains the errno event.

The variables in this message are:

- **taskId** - the internal identity of this communication task
- **type** - the internal type of this communication task

Valid values are:
- **SENDER** - the sender side of the dual connection (DC) TCP channel
- **RECEIVER** - the receiver side of the dual connection (DC) TCP channel

- **taskId** - the internal identity of this communication task
- **type** - the internal type of this communication task

- **errno** - the name of the internal TCP/IP event

For a description of possible values of errno, refer to the ECAT0EI message that always follows this message.

- **errno_id** - the numeric identity of the internal TCP/IP event. For a description of possible values of errno_id, refer to the appropriate TCP/IP vendor documentation.

- **stage** - the internal ID of the processing stage at which the event was detected

- **api** - the TCP/IP socket API function that was active when the event was detected

- **action** - the internal action identity that describes how the dual connection (DC) TCP channel will handle the event. Valid values are:
  - **GO_DOWN** - shut down the specified communication task
  - **CLOSE_GO_DOWN** - disconnect, and shut down the specified communication task
  - **CLOSE_REINIT** - disconnect, reset, and initialize the specified communication task
  - **REINIT** - try to initialize the specified communication task again
  - **IGNORE** - ignore the event
DISABLE - disable the channel

Normal processing continues, and the specified TCP channel handles the event as described by the value of action.

Corrective Action: For information about the detected errno event, refer to the appropriate TCP/IP vendor documentation. If the problem persists, call your network systems programmer for assistance.

ECAT06I CHANNEL(channelId.TCP) task(taskId.type) PARTNER DISCONNECTED APPLICATION(appl)

Explanation: This information message indicates that the partner or client disconnected because the dual connection (DC) channel detected an End-Of-File TCP/IP internal errno event.

The variables in this message are:
- channelId - the identity of the channel to which the partner was connected
- task - the identity of the communication task of channelId. Valid values are:
  - SENDER - the sender side of the dual connection channel
  - RECEIVER - the receiver side of the dual connection TCP channel
- taskId - the internal identity of this communication task
- type - the internal type of this communication task
- appl - the identity of the application supported by channelId

Normal processing continues. The TCP channel channelId shuts down, is reset, and is initialized again.

Corrective Action: No action is required.

ECAT07I CHANNEL(channelId.TCP) task(taskId.type) READY, APPLICATIONS(appls)

Explanation: This information message indicates that a communication task of the specified multiple connection (MC) TCP channel initialized successfully. This information message is issued during multiple connection (MC) TCP channel initialization.

The variables in this message are:
- channelId - the identity of the multiple connection (MC) TCP channel that initialized successfully
- task - the communication task of the channelId channel. Valid values are:
  - LISTENER - the manager task of the multiple connection TCP channel
  - COMTASK - the communication task of the multiple connection TCP channel
- taskId - the internal identity of the task communication task
- type - the internal type of the task communication task
- appls - list of the applications supported by the channelId channel

Corrective Action: No action is required.
**ECAT08W CHANNEL(channelId.TCP) TASK(taskId) CONNECT FROM IP(IPAddress) FORBIDDEN**

**Explanation:** An attempt to connect to IOAGATE has been rejected because the incoming IP address is specified as forbidden in the IP validation list member that is defined for this channel.

The variables in this message are:
- channelId - the identity of the channel that received and rejected the connection request
- taskId - the internal identity of the channel task that received and rejected the connection request
- IPAddress - the IP address from which the connection has been initiated

The connection is closed and normal processing continues.

**Corrective Action:** No action is required.

**ECAT09W CHAN(channelId.TCP) task(taskId.type) EVENT(errno.errno_id) SOCK(socket) API(stage.api) ACT(action), RHOST(hostId)**

**Explanation:** This message warns that the multiple connection (MC) TCP channel detected a TCP/IP errno event while trying to connect or during data exchange with a partner or client.

Internal TCP/IP errno events are network activities that are intercepted, identified and processed by TCP/IP software. A unique name and a standard numeric code identify each event. Internal TCP/IP events usually reflect normal network activity, including error recovery. Only codes that point to application program interface (API) errors indicate potential software problems.

This message ECAT05W is always followed by the ECAT0EI message, which explains the errno event.

The variables in this message are:
- channelId - the identity of the channel that detected the event
- taskId - the name of the communication task of channelId. Valid values are:
  - LISTENER - the manager task of channelId
  - COMTASK - the communication task of channelId
- `taskId` - the internal identity of the communication task of `channelId`
- `type` - the internal type of the communication task of `channelId`
- `errno` - the name of the internal TCP/IP event. For a description of possible `errno` values, refer to the ECAT0EI message that always follows this message.
- `errno_id` - the numeric identifier of the internal TCP/IP event. For a description of possible values of `errno_id`, see the appropriate TCP/IP vendor documentation.
- `socket` - the TCP/IP socket number assigned to this connection within the indicated task.
- `stage` - the internal identity of the processing stage at which the event was detected.
- `api` - the TCP/IP socket API function that was active when the event was detected.
- `action` - the internal action identity that describes how the multiple connection TCP channel will handle the event. Valid values are:
  - `GO_DOWN` - Shut down the specified communication task.
  - `REINIT` - Try to establish the connection again.
  - `CLEAR` - Free resources assigned by the channel to handle this connection.
  - `DISABLE` - Disable the channel.
  - `IGNORE` - Ignore the event.
- `hostId` - the host IP address of the remote partner or client with which `channelId` is communicating.

Normal processing continues, and the specified TCP channel handles the event as described by the value of action.

**Corrective Action:** Refer to the appropriate TCP/IP vendor documentation for information about `errno_id`. If the problem persists, call your network systems programmer for assistance.

**ECATOAI CHANNEL**(`channelIdTCP`) **task**(`taskId.type`)** SETTING TCPACCESS SUBSYSTEM**(`subsystemName`)**

**Explanation:** This information message indicates that the `channelId` channel is setting up the TCPaccess subsystem name. This message is issued during startup, when the TCP communication channel is configured with the TCPaccess TCP/IP software of Computers Associates International, Inc.

The message is issued only when both the TCPVENDR=CA and SUBSYSTM parameters are specified in the ECAPARM configuration file.

The variables in this message are:
- `channelId` - the identity of the channel for which the TCPVENDR and SUBSYSTM parameters were specified.
- `task` - the communication task assigned to `channelId`. Valid values are:
  - `RECEIVER` - the receiver side of the dual connection (DC) TCP channel.
  - `LISTENER` - the manager task of the multiple connection (MC) TCP channel.
taskId - the internal identity of task

Corrective Action: No action is required.

ECAT0BI CHANNEL(channelId. TCP) task(taskId.type) PARTNER(node) CONNECTED, SOCKET(socket) HOST(host)

Explanation: The IOAGATE-to-IOAGATE connection has been established. This message is issued when the local IOAGATE has CONNECTOR set to LOCAL.

The variables in this message are:

- channelId - the identity of the TCP channel that established the connection
- task - the name of the communication task of the indicated TCP channel that established the connection
- taskId - the internal identity of task
- type - the internal type of task
- node - the node identity of the partner IOAGATE with which the connection has been established
- socket - the TCP/IP socket number assigned to this connection within the indicated task
- host - the identity of the remote host with which the connection has been established

Corrective Action: No action is required.

ECAT0CI CHANNEL(channelId.TCP) task(taskId.type) CONNECTION ACCEPTED FROM NODE(node), SOCKET(socket) HOST(host)

Explanation: The IOAGATE-to-IOAGATE connection has been established. This message is issued when the partner node has CONNECTOR set to local.

The variables in this message are:

- channelId - the identity of the TCP channel that established the connection
- task - the name of the communication task of channelId
- taskId - the internal identity of task
- type - the internal type of task
- node - the identity of the node of the partner IOAGATE with which the connection has been established
- socket - the TCP/IP socket number assigned to this connection within task
- host - the identity of the remote host with which the connection has been established

Corrective Action: No action is required.
ECAT0DW CHANNEL(channelId.TCP) task (taskId.type) PARTNER(node) DISCONNECTED(errno), SOCKET(socket)

**Explanation:** The IOAGATE-to-IOAGATE connection has been disrupted.

The variables in this message are:
- **channelId**: the identity of the TCP channel to which the partner IOAGATE was connected
- **task**: the name of the communication task of `channelId` to which the partner IOAGATE was connected
- **taskId**: the internal identity of `task`
- **type**: the internal type of `task`
- **node**: the identity of the node of the partner IOAGATE to which the partner IOAGATE was connected
- **errno**: the reason of the disconnection
  For a description of possible values of `errno`, see to the appropriate TCP/IP vendor documentation
- **socket**: the TCP/IP socket number assigned to this connection within `task`

Normal processing continues. IOAGATE tries to reestablish connection.

**Corrective Action:** No action is required.

ECAT0EI Event(errno : explan)

**Explanation:** This message always follows the ECAT05W and ECAT09W messages. It displays a short explanation of the `errno` event that is identified in the preceding ECAT05W or ECAT09W message.

The variables in this message are:
- **errno**: the name of the internal TCP/IP or IOAGATE channel event
- **explan**: short explanation of the `errno` event specified by the first variable

**Corrective Action:** No action is required.

ECAT0FS CHANNEL(channelId.TCP) task (taskId.type) BAD IP ADDRESS(ipAdd) SPECIFIED

**Explanation:** The specified IP address is invalid.

The variables in this message are:
- **channelId**: the identity of the TCP channel that detected the problem
- **task**: the name of the communication task of `channelId`
- **taskId**: the internal identity of `task`
- **type**: the internal type of `task`
- **ipAdd**: the invalid IP address value that caused the problem

The `channelId` TCP channel goes down.
Corrective Action: Correct the IP address and restart IOAGATE.

ECAT0GS CHANNEL(channelId.TCP) task(taskId.type) UNKNOWN HOST(hostId) SPECIFIED

Explanation: IOAGATE failed to resolve the specified Hostname.
The variables in this message are:
- channelId - the identity of the TCP channel that detected the problem
- task - the name of the communication task of channelId
- taskId - the internal identity of task
- type - Internal type of task
- hostId - the Hostname that caused the problem

The specified channel goes down.
Corrective Action: Correct the Hostname, or try specifying the IP address instead, and restart IOAGATE.

ECAT0HS CHANNEL(channelId.TCP) task(taskId.type) SOCKET GETTING FAILED

Explanation: A severe socket API error occurred while trying to get a socket.
The variables in this message are:
- channelId - the identity of the TCP channel that detected the problem
- task - the name of the communication task of channelId
- taskId - the internal identity of task
- type - the internal type of task

IOAGATE shuts down.
Corrective Action: Contact BMC Software Customer Support.

ECAT0IW CHANNEL(channelId.TCP) task(taskId.type) CONNECT TO PARTNER(node) WILL BE RETRIED IN nn sec

Explanation: An attempt to establish an IOAGATE-to-IOAGATE connection has failed. IOAGATE will retry the attempt after the time interval \( nn \). This message is issued only when the local IOAGATE has CONNECTOR set to LOCAL.
The variables in this message are:
- **channelId** - the identity of the TCP channel that attempted to connect
- **task** - the name of the communication task of **channelId**
- **taskId** - the internal identity of **task**
- **type** - the internal type of **task**
- **node** - the identity of the node of the partner IOAGATE with which connection was attempted
- **nn** - the time interval (in seconds) before another attempt is made to connect

IOAGATE will retry establishing the IOAGATE-to-IOAGATE connection after the time specified (nn seconds).

**Corrective Action:** No action is required.

```
ECAT0JE CHANNEL(channelId.TCP) task (taskId.type) HANDSHAKE SENDING TO PARTNER(node) FAILED(errno)
```

**Explanation:** An attempt to send a handshake message to a partner IOAGATE failed.

The variables in this message are:
- **channelId** - the identity of the TCP channel that performed a handshaking attempt
- **task** - the name of the communication task of **channelId**
- **taskId** - the internal identity of **task**
- **type** - the internal type of **task**
- **node** - the node identity of the partner with which IOAGATE was attempting a handshake
- **errno** - the reason for the disconnection

For a description of possible values of **errno**, see the appropriate TCP/IP vendor documentation

**Corrective Action:** Do the following:
1. Examine the IOAGATE logs to try to determine the cause of the failure.
2. If possible, correct the problem and restart IOAGATE.
3. If the problem persists, contact BMC Software Customer Support.

```
ECAT0KE CHANNEL(channelId.TCP) task (taskId.type) CONNECT TO PARTNER(node) FAILED, HOST(hostId) UNAVAILABLE
```

**Explanation:** IOAGATE is unable to establish IOAGATE-to-IOAGATE connection because the specified Hostname cannot be resolved by TCP/IP.

The variables in this message are:
- `channelId` - the identity of the TCP channel that attempted to connect
- `task` - the name of the communication task of `channelId`
- `taskId` - the internal identity of `task`
- `type` - the internal type of `task`
- `node` - the node identity of the partner to which IOAGATE attempted to connect
- `hostId` - the identity of the Host that caused the problem

IOAGATE disables the indicated channel, and tries to continue processing.

**Corrective Action:** Try to specify the IP address instead of a Hostname, and restart IOAGATE.

**Explanation:** The message warns that both sides of the IOAGATE-to-IOAGATE connection were configured with CONNECTOR set to LOCAL.

The variables in this message are:
- `channelId` - the identity of the TCP channel that detected the error
- `task` - the name of the communication task of `channelId`
- `taskId` - the internal identity of `task`
- `type` - the internal type of `task`
- `node` - the node identity of the partner IOAGATE

IOAGATE continues trying to establish an IOAGATE-to-IOAGATE connection.

**Corrective Action:** Correct the IOAGATE-to-IOAGATE connection configuration in the network map, by setting CONNECTOR to LOCAL on one side of the connection and to PARTNER on the other side, then restart the IOAGATEs.

**Explanation:** The specified IP address is invalid.

The variables in this message are:
channelId - the identity of the TCP channel that detected the problem

taskId - the internal identity of task

type - the internal type of task

parm - the name of the parameter that specifies the invalid Hostname

hostId - the invalid Hostname that caused the problem

IOAGATE disables the indicated channel and tries to continue processing.

Corrective Action: Correct the Hostname and restart IOAGATE.

Explanation: IOAGATE failed to resolve the specified Hostname. The variables in this message are:

channelId - the identity of the TCP channel that detected the problem

task - the name of the communication task of channelId

taskId - the internal identity of task

type - the internal type of task

parm - the name of the parameter that specifies the invalid Hostname

hostId - the invalid Hostname that caused the problem

IOAGATE disables the indicated channel, and tries to continue processing.

Corrective Action: Either correct the Hostname, or specify the IP address instead of a Hostname, then restart IOAGATE.

Explanation: This information message displays the socket implementation and client identity information that currently in use by IOAGATE. The variables in this message are:
- **channelId** - the identity of the TCP channel for which the socket and client ID information is issued
- **task** - the name of the communication task for which the socket and clientid information is issued
- **taskId** - the internal identity of **task**
- **type** - the internal type of **task**
- **socket_typ** - the type of socket implementation currently used by IOAGATE. Valid values are:
  - **OE** - integrated socket (OpenEdition socket)The value is explicitly specified in the ECAPARM configuration file.
  - **COM** - non-integrated socketThe value is explicitly specified in the ECAPARM configuration file.
  - **NONE** - no value assigned in the ECAPARM configuration file, default in use
- **client_id** - the internal identity of **task** assigned by TCP/IP

**Corrective Action:** No action is required.

**ECAT0PS BAD PARAMETERS RECEIVED(REASON: reason) WHEN VALIDATING INCOMING IP ADDRESS**

**Explanation:** An internal error encountered when performing validation of an incoming IP address. In this message, **reason** is the hexadecimal error code specifying an exact error case.

**Corrective Action:** Contact BMC Software Customer Support.

**ECAT0QE PROBABLE CTM/EM SET UP ERROR: CTM/CONFIGURATION MANAGER DISCOVERY PORT WRONGLY SET TO THE CTM/EM PORT**

**Explanation:** IOAGATE received a message from Control-M/Enterprise Manager that was intended for CTMCAS on the port assigned for CTMAS. The error is probably because the Control-M for z/OS is incorrectly defined in the Control-M Configuration Manager.

**Corrective Action:** Ensure that the Control-M for z/OS Configuration Agent Port is defined in the Control-M Definition dialog box with the value of the port assigned for CTMCAS, not with the value of the port assigned for CTMAS.

**ECAT0SI EVENT(event) OCCURRED ON PORT(port)**

**Explanation:** This information message indicates that the **event** error occurred on **port** port number. Details about the error are provided in message ECAT09W that precedes message ECAT0SI.

**Corrective Action:** No action is required.

**ECAT0TI IOAGATE(monitorId) RUNNING ON HOST (hostId,hostIpAdd)**

**Explanation:** This information message displays
- the STC name of IOAGATE
- the name and the IP address of the host on which IOAGATE is currently running

The variables in this message are:
```
• monitorId - the name of the IOAGATE started task
• hostId - the identity of the host on which the specified IOAGATE is running
• hostIpAdd - the IP address on which the specified IOAGATE is running

Corrective Action: No action is required.

ECAT0XI CHANNEL(CHANNELID.TCP) task(taskId.type) ADDITIONALLY LISTENING FOR CONNECTION ON PORT(port), IP(hostIpAdd)

Explanation: This information message displays the host IP address and the TCP/IP communication port number on which IOAGATE is listening because the SHRDBIND parameter has been specified in the ECAPARM configuration file for the indicated channel. This message is only issued when the SHRDBIND parameter is specified in the ECAPARM configuration file.

The message indicates that the indicated TCP channel has initialized and is waiting for the partner or client to initiate the connection.

The variables in this message are:
• channelId - the identity of the TCP channel that is listening to the specified port
• task - the name of the communication task of channelId. Valid values are:
  • SENDER - the sender side of the dual connection (DC) TCP channel
  • RECEIVER - the receiver side of the dual connection (DC) TCP channel
  • LISTENER - the manager task of the multiple connection (MC) TCP channel
• taskId - the internal ID of this communication task
• type - the internal type of this communication task
• port - the number of the TCP/IP communication port on which channelId is listening
• hostIpAdd - the address to which channelId is listening

Corrective Action: No action is required.

ECAT0YI codename (codeval)

Explanation: This message displays additional diagnostic information when an errno event occurs.

The variables in this message are:
• codename - the identity of the code of the problematic macro or service. Valid values are:
  • "Return Code of the failing service"
  • "Reason Code of the failing service"
  • "Information Code of the failing service"
  • "EVENT(EADDRINUSE) OCCURRED ON PORT"
  • "EVENT(EADDRNOTAVAIL) OCCURRED ON PORT"
```
INCONTROL for z/OS Messages Manual

- **codevalue** - the value of the code of the problematic macro or service, or port number

**Corrective Action:** Keep the DAIGLOG output for possible later analysis.

**ECAT0ZI Macro or Service that failed (mserv)**

**Explanation:** This message displays additional diagnostic information when an errno event occurs. In this message, *mserv* is the identity of the problematic macro or service.

**Corrective Action:** Keep the DAIGLOG output for possible later analysis.

**ECATS0E CHANNEL(channelId.TCP) TASK(taskId.type) SSL HANDSHAKE FAILED. RC(rc)**

**Explanation:** The SSL handshake with the client failed. The reason for the failure is described in message ECATS1E, which follows this message.

The variables in this message are:

- **channelId** - the identity of the TCP channel that is listening to the specified port
- **taskId** - the internal identity of this communication task
- **type** - the internal type of this communication task
- **rc** - System SSL return code value

Common values for **rc** are:

<table>
<thead>
<tr>
<th>rc</th>
<th>Meaning</th>
<th>Most Probable Cause</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>Key label is not found</td>
<td>A bad KEYLAB parameter was specified in the ECAPARM configuration file</td>
</tr>
<tr>
<td>406</td>
<td>Error while reading or writing data</td>
<td>A CTM/EM client attempted to communicate using TCP/IP without SSL</td>
</tr>
</tbody>
</table>

For a full explanation of the return codes, please refer to the IBM manual *SC24-5901-03, z/OS V1R4.0-V1R5.0 System SSL Programming*.

The connection is terminated. IOAGATE resumes listening for incoming connections on the DC channel.

**Corrective Action:** If the return code is 406 and after this failure the SSL handshake succeeds, no action is required. It is normal for CTM/EM to first attempt to connect using TCP/IP without SSL, and if this attempt fails, it retries with SSL.

If the return code is 406 and the error persists, the client side has probably not enabled SSL. Otherwise, refer to message ECATS1E and to the above-mentioned IBM publication.

**ECATS1E system_ssl_api_call rc(rc): textual_explanation_of_the_rc**

**Explanation:** This message is issued after messages ECATS0E, ECATS2E, ECATS4E, and ECATS5E. The message includes more details about the failure reported by the preceding message.

The variables in this message are:
system_ssl_api_call - the internal System SSL API call that failed
rc - the return code that appeared in the preceding message
textual_explanation_of_the_rc - textual explanation of the return code

For a full explanation of the return codes, please refer to the IBM manual SC24-5901-03, z/OS V1R4.0-V1R5.0 System SSL Programming.

Corrective Action: No action is required.

ECATS2E CHANNEL(channelId.TCP) TASK(taskId.type) SSL INIT FAILED. RC(rc)

Explanation: After connection is established and before the SSL handshake takes place, the SSL initialization fails. The subsequent message (message ECATS1E) includes more details about the failure.

The variables in this message are:
- channelId - the identity of the TCP channel that is listening to the specified port
- taskId - the internal identity of this communication task
- type - the internal type of this communication task
- rc - System SSL return code value

A common value for rc is:

<table>
<thead>
<tr>
<th>rc</th>
<th>Meaning</th>
<th>Most Probable Cause</th>
</tr>
</thead>
<tbody>
<tr>
<td>202</td>
<td>Error detected while opening the key database</td>
<td>A bad KEYRING parameter is specified in the ECAPARM configuration file.</td>
</tr>
</tbody>
</table>

For a full explanation of the return codes, please refer to the IBM manual SC24-5901-03, z/OS V1R4.0-V1R5.0 System SSL Programming.

The connection is terminated. The task resumes listening for new connections on the DC channel.

Corrective Action: Refer to message ECATS1E and to the above-mentioned IBM publication.

ECATS3I CHANNEL(channelId.TCP) TASK(taskId.type) SSL HANDSHAKE SUCCEEDED

Explanation: This information message indicates that an SSL handshake with the client succeeded.

The variables in this message are:
- channelId - the identity of the TCP channel that is listening to the specified port
- taskId - the internal identity of this communication task
- type - the internal type of this communication task

Corrective Action: No action is required.
ECATS4E CHANNEL(channelId:TCP) TASK(taskId:type) SSL READ FAILED.
RC(rc)

Explanation: An internal call to decrypt a received message failed. The subsequent message (message ECATS1E) includes more details about the failure.

The variables in this message are:
- channelId - the identity of the TCP channel that is listening to the specified port
- taskId - the internal identity of this communication task
- type - the internal type of this communication task
- rc - System SSL return code value

For a full explanation of the return codes, please refer to the IBM manual SC24-5901-03, z/OS V1R4.0-V1R5.0 System SSL Programming.

The connection is terminated. The task resumes listening for new connections on the DC channel.

Corrective Action: Refer to message ECATS1E and to the above-mentioned IBM publication.

ECATS5E CHANNEL(channelId:TCP) TASK(taskId:type) SSL SEND FAILED.
RC(rc)

Explanation: An internal call to encrypt a message before sending failed. The subsequent message (message ECATS1E) includes more details about the failure.

The variables in this message are:
- channelId - the identity of the TCP channel that is listening to the specified port
- taskId - the internal identity of this communication task
- type - the internal type of this communication task
- rc - System SSL return code value

For a full explanation of the return codes, please refer to the IBM manual SC24-5901-03, z/OS V1R4.0-V1R5.0 System SSL Programming.

The connection is terminated. The task resumes listening for new connections on the DC channel.

Corrective Action: Refer to message ECATS1E and to the above-mentioned IBM publication.

ECATS6E CHANNEL(channelId:TCP) TASK(taskId) SSL OPEN FAILED.
RC(rc)

Explanation: After an incoming TCP/IP connection was accepted for a channel with SSL=YES, IOAGATE attempted and failed to allocate and initialize a secure socket instance in the SSL subtask. The failure was in one of the following System SSL API calls:
- `gsk_secure_socket_open()`
- `gsk_attribute_set_buffer()`
- `gsk_attribute_set_numeric_value()`

The variables in this message are:
- `channelID` - the identity of the channel that detected the problem
- `taskID` - the internal identity of the channel task that detected the problem
- `rc` - the return code of the API call

The connection is closed.

**Corrective Action:** If the problem persists, contact BMC Software Customer Support.

**Explanation:** After an incoming TCP/IP connection was closed for a channel with SSL=YES, IOAGATE attempted and failed to close the corresponding secure socket instance in the SSL subtask. The failure was in the `gsk_secure_socket_close()` System SSL API call.

The variables in this message are:
- `channelID` - the identity of the channel that detected the problem
- `taskID` - the internal identity of the channel task that detected the problem
- `rc` - the return code of the API call

IOAGATE operations continue.

**Corrective Action:** If the problem persists, contact BMC Software Customer Support.

**Explanation:** An internal error occurred when an IOAGATE communications subtask attempted to get an internal message from the SSL subtask.

The variables in this message are:
- `channelID` - the identity of the channel that detected the problem
- `taskID` - the internal identity of the channel task that detected the problem
- `rc` - the return code of the API call

IOAGATE disables the channel, and goes down if there is no other active channel.

**Corrective Action:** Contact BMC Software Customer Support.
ECATS9E CHANNEL(channelID.TCP) TASK(taskID) INTERNAL ERROR IN ECAPCCB. RC(rc)

**Explanation:** An internal error occurred when an IOAGATE communications subtask attempted to put an internal message to the SSL subtask.

The variables in this message are:
- channelID - the identity of the channel that detected the problem
- taskID - the internal identity of the channel task that detected the problem
- rc - the return code of the API call

IOAGATE disables the channel, and goes down if there is no other active channel.

**Corrective Action:** Contact BMC Software Customer Support.

ECATSAE CHANNEL(channelID.TCP) TASK(taskID) ALLOCBUF FAILED. SOCK(socket)

**Explanation:** An internal error occurred when an IOAGATE communications subtask attempted to allocate an internal buffer for an SSL connection.

The variables in this message are:
- channelID - the identity of the channel that detected the problem
- taskID - the internal identity of the channel task that detected the problem
- socket - the socket for which the error occurred

IOAGATE disables the channel, and goes down if there is no other active channel.

**Corrective Action:** Contact BMC Software Customer Support.

ECATSBE CHANNEL(channelID.TCP) TASK(taskID) FREEBUF FAILED. SOCK(socket)

**Explanation:** An internal error occurred when an IOAGATE communications subtask attempted to free an internal buffer for an SSL connection.

The variables in this message are:
- channelID - the identity of the channel that detected the problem
- taskID - the internal identity of the channel task that detected the problem
- socket - the socket for which the error occurred

IOAGATE disables the channel, and goes down if there is no other active channel.

**Corrective Action:** Contact BMC Software Customer Support.
ECATSCE CHANNEL(channelID.TCP) TASK(taskID) INVALID REPLY(reply) FROM SSL SUBTASK. REQ(request)

**Explanation:** An internal error occurred when an IOAGATE communications subtask read an invalid internal reply from the SSL subtask.

The variables in this message are:
- `channelID` - the identity of the channel that detected the problem
- `taskID` - the internal identity of the channel task that detected the problem
- `reply` - the invalid reply
- `request` - the request for which the invalid reply was received

IOAGATE disables the channel, and goes down if there is no other active channel.

**Corrective Action:** Contact BMC Software Customer Support.

ECATSDE CHANNEL(channelID.TCP) TASK(taskID) INVALID REQUEST(request) IN CCB AFTER GET

**Explanation:** An internal error occurred when an IOAGATE communications subtask read an invalid internal request from the SSL subtask.

The variables in this message are:
- `channelID` - the identity of the channel that detected the problem
- `taskID` - the internal identity of the channel task that detected the problem
- `request` - the invalid request

IOAGATE disables the channel, and goes down if there is no other active channel.

**Corrective Action:** Contact BMC Software Customer Support.

ECATSEW CHANNEL(channelID.TCP) TASK(taskID) SSLPUT CALL WHILE SSLPUT IN PROCESS. SOCK(socket)

**Explanation:** An internal error (a previous internal put did not end) occurred when an IOAGATE communications subtask attempted to put an internal message to the SSL subtask.

The variables in this message are:
- `channelID` - the identity of the channel that detected the problem
- `taskID` - the internal identity of the channel task that detected the problem
- `socket` - the socket for which the error occurred

IOAGATE disables the channel, and goes down if there is no other active channel.

**Corrective Action:** Contact BMC Software Customer Support.
ECATSFE CHANNEL(channelID.TCP) TASK(taskID) MALLOC FAILED.
SIZE(size) SOCK(socket)

**Explanation:** An internal error occurred when an IOAGATE communications subtask attempted to allocate storage.

The variables in this message are:
- *channelID* - the identity of the channel that detected the problem
- *taskID* - the internal identity of the channel task that detected the problem
- *size* - the size of the storage request that failed
- *socket* - the socket for which the error occurred

IOAGATE disables the channel, and goes down if there is no other active channel.

**Corrective Action:** Contact BMC Software Customer Support.

**EDA messages**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**Messages EDAL00 through EDALxx**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**EDAL43I NEW DAY PROCEDURE COMPLETED SUCCESSFULLY**

**Explanation:** This information message indicates that the New Day procedure ended successfully. The CTMEDA program is executed as the last step in the New Day procedure to inform the Control-M monitor that the procedure ended successfully.

The Control-M monitor resumes execution.

**Corrective Action:** No action is required.

**EDAL44E NEW DAY PROCEDURE ENDED WITH ERRORS**

**Explanation:** *Highlighted, unrollable message.*

The last phase in the New Day procedure, the CTMEDA program, ended with errors. This message follows a message that describes the specific cause of the error.

The Control-M monitor remains in a suspended state.

**Corrective Action:** Correct the error according to the description in the previous message and rerun the New Day procedure to invoke the CTMEDA program.
EXO messages

This group includes messages for the Control-O CMEM product.

Messages EXO200 through EXO2xx

This group includes messages for the Control-O CMEM product.

EXO200I \{CONTROL-O | CTMCMEM\} EXECUTOR STARTED

Explanation: This information message is the normal start message of the Control-O or CMEM Executor task that handles tasks that cannot be executed by the Control-O or CMEM subsystem. Certain of these actions require communication with other IOA products.

Corrective Action: No action is required.

EXO201I \{CONTROL-O | CTMCMEM\} EXECUTOR ENDED

Explanation: This information message is the normal termination message of the CONTROL-O or CMEM Executor task that handles tasks that cannot be executed by the CONTROL-O or CMEM subsystem. Certain of these actions require communication with other IOA products.

Corrective Action: No action is required.

EXO202S ERROR ALLOCATING THE SUBSYSTEM-TO- MONITOR COMMUNICATION DATASET

Explanation: The CONTROL-O or CMEM monitor failed to allocate the subsystem-to-monitor communication file. The communication file links the CONTROL-O or CMEM and Control-M monitors. Possible causes are:

- The communication file is not cataloged on the correct disk.
- The communication file is cataloged in a catalog that cannot be accessed from the local CPU.
- The MVS allocation exit failed the allocation request.
- A security product failed the allocation request.
- The data set was not specified correctly in the Control-M CPU Installation Parameter in the IOACPRM member.
- The data set was never allocated. That is, the Control-M Console Subsystem was not installed in the current computer.

The Control-O or CMEM monitor shuts down.

Corrective Action: Check the potential reasons for the error listed above. Correct as necessary, and restart the Control-O or CMEM monitor.
EXO203S THE SUBSYSTEM-TO-MONITOR COMMUNICATION DATASET COULD NOT BE OPENED

**Explanation:** The Control-O monitor failed to open a subsystem-to-monitor communication file. The communication file links the Control-O or CMEM and Control-M monitors. Possible causes are:

- A communication file was incorrectly defined.
- The MVS DADSM exit failed the open request.
- A security product failed the open request.

The Control-O or CMEM monitor shuts down.

**Corrective Action:** Check the communication files that are in use, and make sure that they were properly defined, formatted, and cataloged. In addition, make sure that no restrictions are imposed, for example by MVS or a security package, and the like.

EXO204S I/O ERROR WHILE READING THE MONITOR-TO-SUBSYSTEM COMMUNICATION DATASET

**Explanation:** The Control-O monitor could not read a monitor-to-subsystem communication file due to an I/O error. The communication file links the Control-O or CMEM and Control-M monitors. The Control-O monitor-to-subsystem communication file may not have been formatted correctly during Control-M Installation Procedure, or may have been incorrectly modified.

The Control-O or CMEM monitor shuts down.

**Corrective Action:** For formatting information, see the section that describes how to install the Control-M Event Manager Subsystem (CMEM) in the Control-M chapter of the *INCONTROL for z/OS Installation Guide*. Reformat or restore as necessary, and restart the Control-O or CMEM monitor.

EXO205S ERROR_ALLOCATING THE MONITOR-TO-SUBSYSTEM COMMUNICATION DATASET

**Explanation:** The Control-O monitor failed to allocate the monitor-to-system communication file. The communication file links the Control-O or CMEM and Control-M monitors.

Possible causes are:

- The communication file is not cataloged on the correct disk.
- The communication file is cataloged in a catalog that cannot be accessed from the local CPU.
- The MVS allocation exit failed the allocation request.
- A security product failed the allocation request.
- The data set was not specified correctly in the Control-M CTM2SBS Installation Parameter in IOACPRM.

The Control-O or CMEM monitor shuts down.

**Corrective Action:** Check the potential reasons for the error listed above. Correct as necessary, and restart the Control-O or CMEM monitor.
EXO206S THE MONITOR-TO-SUBSYSTEM COMMUNICATION DATASET COULD NOT BE OPENED

Explanation: The Control-O or CMEM monitor failed to open a monitor-to-subsystem communication file. The communication file links the Control-O or CMEM and Control-M monitors. Possible causes are:

- A communication file was incorrectly defined.
- The MVS DADSM exit failed the open request.
- A security product failed the open request.

The Control-O or CMEM monitor shuts down.

Corrective Action: Check the communication files that are in use, and make sure that they were properly defined, formatted and cataloged. In addition, make sure that no restrictions are imposed by MVS, a security package, and so on.

EXO207S I/O ERROR WHILE READING THE SUBSYSTEM-TO-MONITOR COMMUNICATION DATASET

Explanation: The Control-O or CMEM monitor could not read a subsystem-to-monitor communication file due to an I/O error. The communication file links the Control-O or CMEM and Control-M monitors. The Control-O or CMEM subsystem-to-monitor communication file may not been formatted correctly during Control-M Installation procedure, or may have been incorrectly modified.

The Control-O or CMEM monitor shuts down.

Corrective Action: For formatting information, see the section that describes how to install the Control-M Event Manager Subsystem (CMEM) in the Control-M chapter of the INCONTROL for z/OS Installation Guide. Reformat or restore as necessary, and restart the Control-O or CMEM monitor.

EXO208S INVALID FORMAT OF THE SUBSYSTEM-TO-MONITOR COMMUNICATION DATASET

Explanation: The Control-O or CMEM subsystem-to-monitor communication file has not been formatted correctly during the Control-M Installation Procedure or may have been incorrectly modified.

The Control-O or CMEM monitor shuts down.

Corrective Action: For formatting information, see the section that describes how to install the Control-M Event Manager Subsystem (CMEM) in the Control-M chapter of the INCONTROL for z/OS Installation Guide. Reformat or restore as necessary, and restart the Control-O or CMEM monitor.

EXO209S OPEN OF THE CONTROL-O TRACE FILE FAILED. DDNAME DAACTLOG

Explanation: The Control-O monitor failed to open the trace file used when Control-O is operating in LOG and TEST modes.

The Control-O monitor shuts down.

Corrective Action: Make sure that DD name DAACTLOG is allocated to the Control-O monitor, or if no trace is required, to DUMMY.
EXO20AS SYSPLEX TABLE MISSING - SYSTEM LOGGER INTERFACE DISABLED

**Explanation:** CMEM attempted to read the Sysplex Table and could not find the table or encountered errors while reading the Sysplex Table. Possible causes are:

- Sysplex Table is not in the STEPLIB concatenation of load libraries.
- The Sysplex Table has an invalid internal format.
- The Sysplex Table has no valid, active table entries.

CMEM attempts to allocate, open, and use the subsystem-to-monitor (S2M) communication files to implement CMEM-Control-M communication.

**Corrective Action:** Determine if the Sysplex Table is not in the load library or has an invalid format. Correct the problem and recycle CMEM.

EXO20BE SYSTEM LOGGER REQUEST *req* FAILED: R15=*r15* RETURN=*rc* REASON=*rsn*

**Explanation:** One of the following System Logger requests failed:

- DEFCFS, IXMLNVNT - Define coupling facility structure.
- DEFLGS, IXMLNVNT - Define log stream.
- CONLGS, IXMLCONN - Connect to log stream.
- WRITEL, IXLWRITE - Write a log stream log block.
- BRWSEL, IXMLBRWSE - Browse a log stream log block.
- DELETL, IXMLDELET - Delete a log stream log block.
- DISLGS, IXMLCONN - Disconnect from log stream.
- DELLGS, IXMLNVNT - Delete log stream.
- DELCFS, IXMLNVNT - Delete coupling facility structure.

CMEM issues *r15*. Possible values of *r15* are:

- 08 - Minor System Logger request error.
- 12 - Intermediate System Logger request error.
- 16 - Major System Logger request error.
- 20 - Permanent System Logger request error.
- 24 - Internal CMEM error
- 28 - Operating system does not support System Logger interface.
- 32 - Internal CMEM error.

To determine the system action, check the descriptions of return and reason codes in the IBM manual *MVS Programming: Assembler Services Reference*, where they are described for each System Logger request separately.
Corrective Action: If you cannot correct the problem, call BMC Software Customer Support.

EXO20CI SYSTEM LOGGER INTERFACE ACTIVATED

Explanation: This information message indicates that CMEM has successfully initialized the System Logger interface. CMEM can now begin communicating with Control-M.

Corrective Action: No action is required.

EXO20CW IOACPRM NOT DEFINED. CMEM FUNCTION IS NOT SUPPORTED

Explanation: During Control-O or CMEM start up, the IOACPRM member was not found in the IOA PARM library, and therefore could not be loaded.

Initiation of CMEM fails. The CMEM functions DO FORCEJOB and DO RESOURCE cannot be executed by Control-M.

Corrective Action: Have the INCONTROL administrator check if the situation is valid. If not, create the IOACPRM member in the IOA PARM library, and restart the Control-O or CMEM monitor.

EXO20DW NO CPU ENTRY FOR THIS SYSTEM WAS DEFINED. CMEM FUNCTION IS NOT SUPPORTED

Explanation: During the start up of Control-O or CMEM, the IOACPRM member in the IOA PARM library does not contain the definition for the system where the Control-O or CMEM monitor is active.

Initiation of CMEM fails. CMEM functions DO FORCEJOB and DO RESOURCE cannot be executed by Control-M.

Corrective Action: Have the INCONTROL administrator check if the situation is valid. If not, add the definitions for the current system to the IOACPRM member in the IOA PARM library, and restart the Control-O or CMEM monitor.

EXO20EW S2M FILE WAS NOT DEFINED IN CPU ENTRY. CMEM FUNCTION NOT SUPPORTED

Explanation: During Control-O or CMEM start up, Control-O or CMEM could not allocate the Subsystem-to-Monitor file, because the name of the file is missing from the definition of the current system in the IOACPRM.

Initiation of CMEM fails. CMEM functions DO FORCEJOB and DO RESOURCE cannot be executed by Control-M.

Corrective Action: Call the INCONTROL administrator to check if the situation is valid. If not, add the name of the Subsystem-to-Monitor file and the definitions for the current system to the IOACPRM in the IOA PARM library, and restart the Control-O or CMEM monitor.

EXO20FE NO CMMPLEX MEMBER. CMEM FUNCTION NOT SUPPORTED

Explanation: During Control-O or CMEM start up, the CMEM Logger facility was required, but the CMMPLEX member containing the definition of the Logger was not found.

Initiation of CMEM fails. CMEM functions DO FORCEJOB and DO RESOURCE cannot be executed by Control-M.
Corrective Action: If the Logger should be used, create the CMMPLEX member in the IOA PARM library. If the Logger facility is not required, set the SYSLOGR parameter in the CMEMCOMM section of the IOACPRM member in the IOA PARM library to N. Once the member definitions are correct, restart the Control-O or CMEM monitor.

EXO210E INVALID DATE date IN A DO COND STATEMENT
Explanation: An invalid date reference format was used in a DO COND statement.
Valid date reference formats are:
- ODAT - Control-O or CMEM working date (default)
- DATE - Current Gregorian computer date
- PREV - Previously scheduled activation date for rule
- NEXT - Next scheduled activation date for rule
- mmdd - Month and day of the scheduling date
- ddmm - Day and month of the scheduling date
- %%%xx - An AutoEdit symbol
Corrective Action: Correct the date format, and reorder the rule table.

EXO212W CONTROL-O WAITING FOR SUBSYSTEM CONSOLE
Explanation: A Command-Response rule could not obtain a subsystem console because all valid subsystem consoles were in use by other Command-Response rules.
Command execution is delayed until the next Control-O interval, when a new attempt to obtain a subsystem console will be made.
Corrective Action: Check the Status screen for Command-Response rules which are executing. Verify that the number of Command-Response rules with a status of EXECUTING matches the number of subsystem consoles.
If this message is issued frequently, there may be an insufficient number of subsystem consoles to handle the Command-Response rules. In this case, increase the number of subsystem consoles in CTOPARM, and define new subsystem consoles to MVS accordingly. For information about defining subsystem consoles, see the Control-O chapter of the INCONTROL for z/OS Installation Guide.

EXO213E NO VALID SUBSYSTEM CONSOLE EXISTS
Explanation: A Command-Response rule could not obtain a subsystem console because no valid subsystem consoles were allocated by Control-O. The cause of the problem is probably in the subsystem console definition.
The command is not executed.
Corrective Action: Make sure that the NUMCONS parameter in CTOPARM is greater than zero, and that the correct number of subsystem consoles is defined in MVS. For information about defining subsystem consoles, see the Control-O chapter of the INCONTROL for z/OS Installation Guide.
If the console subsystem definition does not seem to be the cause of the problem, check for previous console allocation error messages, and contact BMC Software Customer Support.
EXO214E MAXIMUM NUMBER OF DO TSO/KSL REQUESTS WAS EXCEEDED. TSO/KSL PROCESSING IS ABORTED

Explanation: In the process of executing DO TSO or DO KSL requests, all of the TSP (TSO PARM) blocks in CSA or ECSA were used. Possible causes are:

- A JCL error in the TSO or KSL procedure.
- Started tasks in the system are not being processed due to system corrective measures, such as auxiliary storage shortage.

Further TSO or KSL requests are temporarily suspended until at least one TSP is available.

Corrective Action: If started tasks are not processed due to system corrective measures, wait until they run and their corresponding TSP blocks are freed.

If a started task failed due to a JCL error, perform the following recovery action:

1. Correct the JCL error.
2. Manually reissue the START command that Control-O previously issued, that is, S O2TTSOBCM,PARM=parm, where parm is in the console log or the Control-O JES log.

This action frees one TSP, and message EXO215I is issued when the next TSO or KSL request is processed. TSPs also become available when Control-O is brought down after a standard shutdown or an IPL.

EXO215I TSO/KSL PROCESSING IS RESUMED

Explanation: This information message indicates that normal TSO or KSL processing resumed. TSO or KSL processing was suspended as a result of a shortage of TSP blocks. For more details see message EXO214E.

Corrective Action: No action is required.

EXO216W REQUEST PROCESSING BYPASSED DUE TO CONTROL-O STANDALONE MODE

Explanation: A DO RESOURCE or DO FORCEJOB request was made when Control-M was not installed. These statements are not supported if Control-M is not installed.

The rule is not ordered.

Corrective Action: Correct the rule or install Control-M.

EXO217E COND name date NOT action BY CONTROL-O - SECURITY VIOLATION

Explanation: Control-O issued a DO COND request, but the prerequisite condition was not added or deleted. There is no authorization by the security exit to add or delete this condition in the IOA Conditions file.

The DO COND request is ignored and the rule continues execution.

Corrective Action: Contact your INCONTROL administrator.
EXO218E COMMAND cmdName NOT ISSUED BY CONTROL-O - SECURITY VIOLATION

Explanation: There is no authorization for the requested DO COMMAND statement. Security exit IOASE012 detected a violation. This exit is invoked for each command issued by a rule in which value OWNER or TRIGGER was specified for the RUNTSEC parameter.

The DO COMMAND statement is ignored and the rule continues execution.

Corrective Action: Contact your INCONTROL administrator.

EXO219E RUNTIME SECURITY CACHE INITIALIZATION ERROR - rsn

Explanation: This message indicates an internal error.

Control-O or CMEM continues to perform security checks without a security cache.

Corrective Action: Contact BMC Software Customer Support.

EXO21AE M2S FILE IS OF ANOTHER INSTALLATION QNAME qname1. IOA QNAME qName2 DSN dsn

Explanation: The Control-O or the CMEM monitor could not allocate the monitor to the Monitor to Subsystem (M2S) file of another IOA environment. During initialization the Control-O or the CMEM monitor compares the \texttt{qName} in the IOA environment with the \texttt{qName} in the M2S file. They should match.

CMEM stops. Control-O issues the CTO21FS and CTO21SE messages.

Corrective Action: Respond to the CTO21SE message. Then check the CTMPARM member and do one of the following:

- If it points to the wrong file, correct the name and start a new monitor.
- If there is no problem in the CTMPARM member, the M2S file was created in a different IOA environment. Delete the file and create a new M2S file using the correct IOA environment (IOAPARM).

EXO21BE S2M FILE FOR SMFID smfid IS OF ANOTHER INSTALLTION QNAME qName1. IOA QNAME qName2 DSN dsn

Explanation: The Control-O or the CMEM monitor could not allocate the subsystem to the Subsystem-to-Monitor (S2M) file of another IOA environment. During initialization the Control-O or the CMEM monitor compares the \texttt{qName1} in the IOA environment with the \texttt{qName2} in the S2M file. They should match.

CMEM stops. Control-O issues the CTO21FS and CTO21SE messages.

Corrective Action: Respond to the CTO21SE message. Then check the IOACPRM member and do one of the following:
If it points to the wrong file, correct the name, compile the member and start a new monitor.

If there is no problem in the IOACPRM member, the S2M file was created in a different IOA environment. Delete the file and create a new S2M file using the correct IOA environment.

EXO21CI M2S FILE FOR IOA QNAME qName. DSN=dsn

Explanation: This information message identifies the Monitor to Subsystem (M2S) file that the Control-O or the CMEM monitor allocated for communication with the Control-M monitor. QNAME is defined in the M2S file whose DSN is dsn.

Corrective Action: No action is required.

EXO21DI S2M FILE FOR SMFID smfid QNAME qName DSN=dsn

Explanation: This information message identifies the Subsystem-to-Monitor (S2M) file that the Control-O or the CMEM monitor allocated for communication with the Control-M monitor. QNAME is defined in the S2M file whose DSN is dsn.

Corrective Action: No action is required.

EXO21EE REPLY ABORT, CONTINUE OR TERMINATE

Explanation: The error described in message EXO21ES prevents communication between the Control-O monitor and Control-M. The response to this message determines the next action. The subtask is suspended until a response to this message is received.

Corrective Action: Select one the following responses:

- ABORT - Abend the Control-O monitor.
- CONTINUE - Disable communication with Control-M.
- TERMINATE - End Control-O monitoring with a return code of 8.

EXO21EI THE REPLY TO MESSAGE EX021EE WAS: reply

Explanation: The information message echoes the response to the message EXO21EE.

Corrective Action: No action is required.

EXO21ES SUBSYSTEM TO CONTROL-M MONITOR FUNCTION DISABLED

Explanation: An error occurred during initialization of Subsystem-to-Monitor (S2M) communication for the Control-O or the CMEM monitor. Initialization checks failed for the function that communicates with the Control-M monitor. For details, see earlier error messages in the JOBLOG or IOA Log file.

CMEM stops with a return code of 8. Control-O issues the message EXO21EE.

Corrective Action: Correct the problem and restart the CMEM monitor, or respond to the EXO21EE message.
EXO21FE SUPPORT FOR 'DO FORCEJOB' AND 'DO RESOURCE' IS DISABLED

Explanation: Either Control-O disabled communication with Control-M because of a CONTINUE response to the message EXO21EE, or a DO FORCEJOB or DO RESOURCE statement was encountered during execution of a Control-O rule with communication disabled.

DO FORCEJOB, DO RESOURCE and NEWCONLIST requests from Control-M are ignored.

Corrective Action: No action is required.

EXO250E RUNTIME SECURITY CLEANUP FAILED, RC=rc

Explanation: An error with the return code \textit{rc} occurred during interface with the locally used security product.

Control-O or CMEM continues working.

Corrective Action: Contact BMC Software Customer Support.

EXO251I RUNTIME SECURITY REFRESH ENDED OK

Explanation: This information message indicates a normal response to operator command \texttt{F CONTROLO,NEWSECDEF} or \texttt{F CTMCMEM,NEWSECDEF}. The runtime security cache containing previously handled security definitions was successfully refreshed.

If security definitions were changed, the new definitions are used.

Corrective Action: No action is required.

EXO252I SNMP REQUEST HOST=hostname PORT=portNumber SEVERITY=s TEXT=msgText

Explanation: This information message is an audit message that logs a DO SNMP request executed by Control-O.

Corrective Action: No action is required.

EXO253E SNMP REQUEST ERROR, RETURN CODE=rc, REASON CODE=rsn

Explanation: Control-O tried to send an SNMP request using a DO SNMP statement, but the request contained an error.

Possible return and associated reason codes are described in the following table:

<table>
<thead>
<tr>
<th>Return Code (rc)</th>
<th>Reason Code (rsn)</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>00</td>
<td>Successful completion, minor errors discovered.</td>
</tr>
<tr>
<td></td>
<td>04</td>
<td>SHL value exceeds 70, truncated.</td>
</tr>
<tr>
<td>08</td>
<td>04</td>
<td>Failed to get local IP address.</td>
</tr>
<tr>
<td></td>
<td>08</td>
<td>Failure to get storage for an SNMP trap.</td>
</tr>
<tr>
<td>Return Code ( rc )</td>
<td>Reason Code ( rsn )</td>
<td>Explanation</td>
</tr>
<tr>
<td>--------------------</td>
<td>--------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>12</td>
<td></td>
<td>Allocation storage has failed.</td>
</tr>
<tr>
<td>16</td>
<td></td>
<td>Hostname could not be resolved.</td>
</tr>
<tr>
<td>20</td>
<td></td>
<td>SNMP trap sending failed.</td>

</tr>
<tr>
<td>36</td>
<td></td>
<td>Specified Translation Table unavailable.</td>
</tr>
<tr>
<td>40</td>
<td></td>
<td>An invalid IP address was provided in HOST</td>
</tr>
<tr>
<td>20</td>
<td></td>
<td>Internal error.</td>
</tr>
</tbody>
</table>

The DO SNMP request is not sent, and fails.
Corrective Action: Notify the INCONTROL administrator.

EXO254E {CONTROL-O | CTMCMEM} SECURITY ENVIRONMENT CLEANUP FAILED BY USER EXIT RC=rc REASON=rsn

Explanation: The IOASECUR security module was unable to delete the security environment. This message indicates an internal error.

Corrective Action: Contact BMC Software Customer Support.

EXO255W CONTROL-O SERVER ERROR. SERVER id- rsn

Explanation: A server action cannot be performed because the server is not in the expected status. An action was attempted on a server that is either stuck or has disappeared. Server status is set to IN ERROR.

Corrective Action: Do the following:
1. Check the sysout of the server in error for the cause of the error.
2. Correct the detected errors, such as errors in the JCL.
3. Restart the server.

EXO256W DO request WAITING FOR id SERVER WAS REROUTED TO IMMEDIATE SERVER

Explanation: A DO KSL or TSO request waited for a server longer than the QWAIT time specified in the server definition in the CTOPARM member. The request is routed for execution in an Immediate server.

Corrective Action: To prevent this problem in the future, do one of the following:
- Define more servers.
- Increase the QWAIT time specification.

EXO257E DO request BY USER user WAS CANCELED - SECURITY VIOLATION

Explanation: A DO KSL or TSO request is not executed, because security exit CTOSE03 detected a security violation. Exit CTOSE03 is invoked for every DO KSL or TSO request issued by a rule in which value OWNER or TRIGGER is specified for the RUNTSEC parameter. The DO KSL or TSO request is not performed.

Corrective Action: Contact your IOA security administrator.

EXO258W DO request WAS DELAYED. NO IMMEDIATE SERVER AVAILABLE

Explanation: A DO KSL or TSO request designed for an Immediate server cannot be performed because all defined Immediate servers are busy. The request is executed in the next available Immediate server.
Corrective Action: Consider increasing the number of Immediate servers to be defined. The number of Immediate servers is specified in the SRVIMD# parameter in the CTOPARM member.

EXO259I VM/CP COMMAND EXECUTED, VMRC=rc, COMMAND=vm_cmnd

Explanation: This information message indicates that a DO COMMAND statement specifying the VM CP command `vm_cmnd` was successfully executed. This message also supplies the return code `rc` returned by the VM execution.

Corrective Action: No action is required.

EXO25AI TRAN transaction_id action_typ jobnam (jobId) STATUS=stat

Explanation: This information message provides information about a job request that either the Control-O or the CMEM monitor sent to Control-M in the communication file. It is output to the SYSPRINT SYSOUT file of the Control-O or the CMEM monitor. The next message provides more details about the request.

The variables in this message are:

- `action_typ` - Possible values are: FORCEJOB, RESOURCE, or COND (CMEM) monitor only
- `jobnam(jobId)` - The kind of job and the specific JES job ID that created the request.
- `stat` - Possible values are: S (Started), E (Ended), or O (Control-O event, On Spool job)

Corrective Action: Check the message that follows for more information about the job request.

EXO25BI TRAN transaction_id transaction_info

Explanation: This information message provides detailed information about a job request that either the Control-O or the CMEM monitor executed and sent to Control-M in the communication file (S2M). It is output to the SYSPRINT SYSOUT file of the Control-O or the CMEM monitor, and it always follows EXO25AI.

Corrective Action: No action is required.

EXO25CI CTD REQUEST MISSION date FORCE MISSION=missn CATEGORY=catgry

Explanation: This information message is an audit message that logs a DO CTD REQ executed by Control-O. It is always followed by EXO25GI.

Corrective Action: No action is required.

EXO25EE CTDCMI ERROR RETURN CODE=rc, CHECK CONTROL-O MONITOR SYSPRINT OR IOALOG FOR MORE INFORMATION

Explanation: Control-O tried to have Control-D force a mission using a DO CTD REQUEST statement, but the mission was not forced. The Control-D error message should appear on the SYSPRINT monitor or in the IOA log.

The DO CTD REQUEST fails. The mission is not forced.

Corrective Action: Notify the INCONTROL administrator.
EXO25FW MONITOR USE SYSPRINT SYSOUT INSTEAD OF ACTLOG SYSOUT

**Explanation:** Control-O monitor or CMEM monitor tries to write a message to ACTLOG sysout. The ACTLOG DD statement is missing from the Control-O or CMEM procedure.

The monitor writes the message to the SYSPRINT sysout. In the monitor address space this may cause ABEND S02A with a return code of 0C in some cases. Since the Monitor can recover itself from the abend, the monitor is not immediately terminated.

**Corrective Action:** Add the following DD statement to the Control-O procedure (CTOTROLO) and the CMEM procedure (CTMCMEM):

```
//ACTLOG DD OUTLIST,SYSOUT=OUT
```

EXO25GI CTD REQUEST MISSION *date* FORCE LIBRARY=*library*

**Explanation:** This information message is a continuation of message EXO25CI, and includes the library name.

**Corrective Action:** No action is required.

EXO260E EXECUTION OF VM/CP COMMAND ABORTED. RC=*rc*

**Explanation:** A DO COMMAND statement specifying a VM CP command failed. The return code *rc* indicates the cause of the error.

The specified command is ignored.

**Corrective Action:** The user response depends on the value of the return code (*rc*). The following table displays possible values for *rc*, together with their explanations and the appropriate user action.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
<th>User Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>MVS not running under VM.</td>
<td>Correct the rule containing this DO COMMAND statement.</td>
</tr>
<tr>
<td>8</td>
<td>Insufficient space (GETMAIN failed).</td>
<td>Increase the region size of the Control-O monitor.</td>
</tr>
<tr>
<td>12</td>
<td>IOAVMC not APF authorized.</td>
<td>Contact BMC Software Customer Support for assistance.</td>
</tr>
<tr>
<td>16</td>
<td>FREEMAIN error.</td>
<td>Contact BMC Software Customer Support for assistance.</td>
</tr>
</tbody>
</table>

EXO261I ATTEMPTING TO RECONNECT TO MVS SYSTEM LOGGER DUE TO ERROR *rsn*

**Explanation:** Control-O or CMEM has detected an MVS System Logger error, and is attempting to reconnect to the MVS System Logger.
In this message, rsn is a reason code that is documented in the IBM manual *MVS Programming: Assembler Services Reference*. Check that publication for the system action relevant to the reason code in the message. Each System Logger request is in a separate section of the guide. The reason codes are described in the topic “Return and Reason Codes” for the IXGWRITE System Logger request.

Control-O or CMEM tries several times to reconnect to the MVS System Logger.

**Corrective Action:** No action is required.

**EXO262E ATTEMPT TO RECONNECT TO MVS SYSTEM LOGGER FAILED**

**Explanation:** Control-O or CMEM detected an MVS System Logger error, and attempted several times to reconnect to the MVS System Logger, without success.

**Corrective Action:** No action is required.

**EXO263E MVS SYSTEM LOGGER ERROR - CMEM FEATURE DISABLED**

**Explanation:** Control-O or CMEM detected an MVS System Logger error. Either this error was so severe as not to be recoverable, or Control-O or CMEM attempted several times to reconnect to the MVS System Logger, without success.

Control-O or CMEM has stopped attempting to reconnect to the MVS System Logger. The CMEM facility is deactivated.

**Corrective Action:** If and when the MVS System Logger becomes operational, stop and restart the Control-O or CMEM monitor.

**EXO264E INCORRECT PORT PARAMETER portNumber WAS SPECIFIED. ONLY NUMERIC VALUE IS ALLOWED**

**Explanation:** Control-O tried to send an SNMP request using a port number parameter (portNumber) that was incorrect.

The DO SNMP request is not sent, and fails.

**Corrective Action:** Ensure that a correct port number is specified. Only numeric characters (from 0 through 9) are allowed.

**EXO281I user_message**

**Explanation:** This information message displays the message issued from a Control-O rule.

**Corrective Action:** No action is required.

**F34 messages**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.
Messages F34400 through F344xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

F34491S OPEN OF DDNAME "DA34F" FAILED

**Explanation:** Open of the file containing the operator commands failed (the DA34F DD statement). The CTM34F program is usually activated as part of the New Day procedure. Possible causes are:

- The DA34F DD statement missing.
- The data set described by the DA34F DD statement does not exist, or cannot be opened for sequential read, or record length is not 80.

Program execution stops with a condition code of 08.

**Corrective Action:** Correct the JCL of the job. For more information, see the *INCONTROL for z/OS Administrator Guide*.

F34492S OPEN OF IOA LOG FILE FAILED

**Explanation:** Open of IOA Log file failed at the DALOG DD statement. The CTM34F program is usually activated as part of the New Day procedure.

Possible causes are:

- The DALOG DD statement missing.
- The data set described by the DALOG DD statement is not the IOA Log file.
- The data set described by the DALOG DD statement is the IOA Log file but of another IOA monitor, or of a different IOA version.

Program execution stops with a condition code of 08.

**Corrective Action:** Correct the JCL of the job.

F34493I {IOA34F | CTM34F} STARTS EXECUTING COMMANDS

**Explanation:** This information message indicates that the IOA34F or CTM34F program is ready to execute the operator commands from the supplied list. This program is usually activated as part of the New Day procedure.

**Corrective Action:** No action is required.

F34494W EXECUTING COMMAND command

**Explanation:** The specified operator command was issued by the CTM34F Control-M utility, probably as part of the New Day procedure. Every operator command executed by the Daily Subsystem is written to the IOA Log for security reasons.

**Corrective Action:** No action is required.
F34495I {IOA34F | CTM34F} FINISHED EXECUTING COMMANDS

**Explanation:** This information message indicates that the IOA34F or CTM34F program finished executing the list of operator commands. This program is usually activated as part of the New Day procedure.

**Corrective Action:** No action is required.

F34496E PROGRAM {IOA34F | CTM34F} IS NOT APF-AUTHORIZED

**Explanation:** The MVS operating system rejected the operator commands issued by the CTM34F program. The CTM34F program should reside in an APF-authorized library and must be link edited with the AC=1 attribute in order to be able to issue operator commands.

The issued commands are rejected. The CTM34F program terminates with a condition code of 08.

**Corrective Action:** The CTM34F program already has the AC=1 attribute. The INCONTROL administrator should verify that the library in which CTM34F resides is APF-authorized.

F34497S VM HOST NOT AVAILABLE

**Explanation:** An attempt was made to issue a VM command while MVS was not running under VM. A command whose name starts with the prefix CP was passed to the IOAOPR utility. This prefix signals to Control-M that the command is intended for a host VM operating system, but the IOAOPR utility detected that no VM environment was available.

**Corrective Action:** Verify that a VM environment is running before issuing VM CP commands.

F34498S LOAD OF MODULE IOAVMC FAILED

**Explanation:** The IOAOPR utility could not load the IOAVMC module.

**Corrective Action:** Verify that the IOAVMC module resides in the STEPLIB library.

F34499E INVALID VALUE "value" FOR "RESPONSE" KEYWORD

**Explanation:** The user entered a value other than YES or NO for the Response keyword.

**Corrective Action:** Correct the entry to either YES or NO.

Messages F34500 through F345xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

F34500I EXECUTING VM COMMAND cmd

**Explanation:** This information message is issued by the IOAOPR utility to indicate execution of a VM CP command cmd.

**Corrective Action:** No action is required.

F34501I CTM501I REPLY: reply

**Explanation:** The IOAOPR utility issues this information message to display the reply received as a result of issuing a VM CP command.
Corrective Action: No action is required.

F34502E CONVCON INVALID RC=rc REASON =rsn CONSOLE ID=cons_id CONSOLE NAME=consName

Explanation: A command was issued to a console identified as cons_id or by the console name consName, and the CONVCON service return code rc is not 0. When a command is issued to a console, the CONVCON service is called to verify the console. The return code from the CONVCON service that validates the console response is rc.

The command may be rejected depending on the CONVCON action.

Corrective Action: Refer to the authorized Assembler services guide to determine the reason for the error. Correct the error, and reissue the command.

FLW messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages FLW0 through FLW0xx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

FLW001S OPEN OF DDNAME "DAFLOW" FAILED

Explanation: Open of jobs flow printout file failed in the DAFLOW DD statement of the CTMRFLW or CTMRAFL utility.

Possible causes are:
- The DAFLOW DD statement missing.
- The data set described by the DAFLOW DD statement cannot be accessed for sequential write.

The program stops executing with a condition code of 08.

Corrective Action: Correct the JCL for the job.

FLW002S OPEN OF DDNAME "DAJOB" FAILED

Explanation: Open of the scheduling tables file failed in the DAJOB DD statement of the CTMRFLW utility, or open of the Control-M Active Jobs file failed in the DACKPTIN DD statement of the CTMRAFL utility.

The DAJOB DD statement describes the production parameters tables on which a job flow report is requested. Many data sets or members can be concatenated to this DD statement. The DACKPTIN DD statement describes the Control-M Active Jobs file.

Possible causes are:
The DAJOB (DACKPTIN) DD statement missing.
The data set described by the DAJOB (DACKPTIN) DD statement cannot be opened for sequential read or record length is not 80 (600).
The program stops executing with a condition code of 08.
Corrective Action: Correct the JCL for the job.

FLW003E SCHEDULING TABLE(S) CONTAINS TOO MANY CARDS
Explanation: There are too many statements in the scheduling table or tables of the CTMRFLW utility. There are too many jobs to be analyzed in one run of the utility.
The program stops executing with a condition code of 08.
Corrective Action: Divide the scheduling tables list into two runs of the utility.

FLW004E SCHEDULING TABLE IS EMPTY
Explanation: The scheduling table does not contain any scheduling parameters for the CTMRFLW utility, or the Active Jobs file does not contain any job for the CTMRAFL utility. Scheduling tables described by the DAJOB DD statement do not contain any scheduling data for CTMRFLW.
The program stops executing with a condition code of 08.
Corrective Action: Correct the JCL for the job.

FLW005W A CYCLIC FLOW DETECTED IN GROUP grp, JOB FLOW MAY CONTAIN ERRORS
Explanation: A cyclic job flow detected in a group processed by the CTMRFLW or CTMRAFL utility. A cyclic flow detected inside a specific group may contain errors because there is no recognized parent to start a chain. The job flow of the specific group is terminated where the cyclic job flow is detected.
Corrective Action: Check the specified group using the Online Scheduling Definition Facility.

FLW006S OPEN OF DDNAME "SORTIN" FAILED
Explanation: Open of work file failed in the SORTIN DD statement of the CTMRFLW or CTMRAFL utility.
Possible causes are:
The SORTIN DD statement missing.
The data set described by the SORTIN DD statement cannot be opened for sequential write.
The program stops executing with a condition code of 08.
Corrective Action: Correct the JCL for the job.

FLW007S OPEN OF DDNAME "SORTOUT" FAILED
Explanation: Open of work file failed in DD statement SORTOUT of the CTMRFLW or CTMRAFL utility.
Possible causes are:
The DD statement SORTOUT is missing.

- The data set described by the DD statement SORTOUT cannot be opened for sequential read.

The program stops executing with a condition code of 08.

**Corrective Action:** Correct the JCL for the job.

**FLW008S** SORT FAILED RC = *code*

**Explanation:** Internal sort failed in the CTMRFLW or CTMRAFL utility. The CTMRFLW or CTMRAFL utility activates the regular sort program of the installation. The return code is specific to the sort program.

The program stops executing with a condition code of 08.

**Corrective Action:** Check the sort program literature for the meaning of the sort return code, and correct the JCL for the job accordingly.

**FLW009E** A JOB FLOW LOOP DETECTED. CHART CANNOT BE COMPLETED FOR GROUP *grp*

**Explanation:** Although the input is valid for the Job Flow Report, a cyclic job flow, or loop, was detected in the specified group. As a result, a Job Flow Chart cannot be generated. In a job flow loop, it is impossible to determine which job is first. Therefore, the Job Flow Report program breaks the loop at a job it selects arbitrarily, places an asterisk (*) to the left of the job selected, and issues this message.

Report generation continues, but the Job Flow Chart is not produced.

**Corrective Action:** No action is required.

**FLW010E** MAXIMUM NUMBER OF DEPENDENCIES FOR JOB *jobName* EXCEEDED. ONLY FIRST 50 ARE TAKEN

**Explanation:** At least one job in the input tables depends on more than 50 other jobs. The Job Flow Chart can analyze up to 50 dependencies per job.

The chart is produced, but only the 50 first dependencies of that job are included.

**Corrective Action:** No action is required.

**FLW011I** CHART CONSISTS OF *pg_count* VERTICAL PAGES AND *pg_count* HORIZONTAL PAGES

**Explanation:** This information message indicates the number of logical pages produced.

**Corrective Action:** No action is required.

**FLW012W** INTERNAL ERROR DETECTED. CHART MAY CONTAIN ERRORS, CODE=**errCode**

**Explanation:** An internal error occurred.

The program proceeds, but it may contain a logical error.

**Corrective Action:** Provide the INCONTROL administrator with the message code and the error code specified in the error message.
FLW013I **** MESSAGES OF JOB FLOW REPORT ****

**Explanation:** This information message is the title of the Messages List and indicates the beginning of the list.

**Corrective Action:** No action is required.

FLW014E INTERNAL ERROR (CODE=err_cod), PROCESSING STOPPED

**Explanation:** An internal error occurred.

Processing stops.

**Corrective Action:** Provide the INCONTROL administrator with the Control-M message code and the error code specified in the error message.

FLW015S NUMBER OF LINES PER PAGE MUST BE A MULTIPLE OF 4

**Explanation:** The value specified in the PAGESIZE parameter is not a multiple of 4. For additional information regarding the PAGESIZE parameter, see the job flow chart in the chapter that describes KSL and the Reporting facility in the Control-M for z/OS User Guide.

Reports and charts are not produced.

**Corrective Action:** Correct the PAGESIZE parameter.

FLW016S LINE SIZE MUST BE A MULTIPLE OF 16 CHARACTERS

**Explanation:** The subparameter specified in the LINESIZE parameter is not a multiple of 16. See the job flow chart in the chapter that describes KSL and the Reporting facility in the KeyStroke Language (KSL) User Guide for additional information regarding the LINESIZE parameter.

Reports and charts are not produced.

**Corrective Action:** Correct the LINESIZE parameter.

FLW017I PREPARING CHART FOR GROUP grp (job_count JOBS IN GROUP)

**Explanation:** This information message indicates that CTMRFLW began preparing a chart for the specified group.

**Corrective Action:** No action is required.

FLW018E MAXIMUM CHART SIZE FOR GROUP grp EXCEEDED

**Explanation:** There are too many jobs and dependencies in the specified group. Internal capacity exceeded.

Chart cannot be produced for that group.

**Corrective Action:** If this occurs when the GROUP UNITED parameter is specified in the CTMRFLW batch utility, avoid using the UNITED subparameter for these tables. If the GROUP UNITED parameter was not specified, separate this group into several groups.

If the error occurred while you were trying to see a graphic jobflow in the Graphic Jobflow online screen, the limit of 15 levels of dependencies has probably been exceeded. In such a case, use the CTMRFLW utility to display the graphic jobflow.
FLW019I \text{CHARS=(char\_set, char\_set)} \text{ IN DD STATEMENT ddName} \\
\text{Explanation:} This informative message indicates the character sets and DD name used for printing the chart. \\
\text{Corrective Action:} No action is required.

FLW01AE \text{PROCESSING OF AJF FILE TERMINATED rsn} \\
\text{Explanation:} A problem arose while the Active Jobs file (AJF) was being processed. \\
In this message, \text{rsn} identifies the problem that caused this message to be issued. The explanation, system action, and user response depend on the value of \text{rsn}. \\
If the value of \text{rsn} is \text{GETMAIN}, there is insufficient storage space and the processing of the AJF stops. \\
If the value of \text{rsn} is \text{nnnnnn/ mmmm/ jobName}, an invalid field format was detected in an entry in the AJF. The variables in this version of the message identify the problematic entry. They are: \\
\begin{itemize}
  \item \text{nnnnnn} - the Relative Block Address (RBA) 
  \item \text{mmmmm} - the order ID 
  \item \text{jobName} - the job name 
\end{itemize} \\
Processing of the AJF stops. \\
\text{Corrective Action:} The user response depends on the value of \text{rsn}: \\
\begin{itemize}
  \item If the value of \text{rsn} is \text{GETMAIN}, increase the REGION size. 
  \item If the value of \text{rsn} is \text{nnnnnn/ mmmm/ jobName}, do the following: 
    \begin{itemize}
        \item Use the Zoom facility (Screen 3.Z) to check the entry, and print the contents of Screen 3.Z. 
        \item Copy the Active Jobs file, for use (if necessary) by BMC Software Customer Support. 
        \item Run the CTMRFLW utility, and print the output. 
        \item Send the printed contents of Screen 3.Z and the printed output of the CTMRFLW utility to your local BMC Software representative. 
    \end{itemize}
\end{itemize}

FLW0A1W \text{SPECIFIED LINESIZE TOO LARGE FOR CHARACTER SETS} \\
\text{Explanation:} The specified LINESIZE is too large to be printed by the specified character sets. For example, standard English character set GS10 supports up to 132 characters per line while GS12 supports up to 160 characters per line. If GS10 was specified with a LINESIZE of 144, this warning message would be displayed. If GS12 was specified, this warning message would not be displayed. \\
\text{Corrective Action:} Either correct the specified LINESIZE or change the character sets which are specified in the JCL procedure.

FLW0A2E \text{TOO MANY GROUP PARAMETER CARDS ARE SPECIFIED} \\
\text{Explanation:} The number of GROUP parameter statements exceeded the maximum allowed. Do not specify more than 10 GROUP statements for CTMRFLW. \\
The utility terminates without processing.
**Corrective Action:** Decrease the number of GROUP statements.

**FLW0A3E SPECIFIED GROUPS WERE NOT FOUND IN THE TABLE(S)**

**Explanation:** None of the names specified in the GROUP parameter was found in the table or tables. No table contains a job whose group name matches the GROUP name parameters. It is also possible that the table is empty.

The utility terminates without processing.

**Corrective Action:** Delete or correct the GROUP parameter statements.

**FLW0A4W MEMBER memName DEPENDS ON "|" CONDITIONS. THE "|" SIGN WAS IGNORED**

**Explanation:** Normal message issued by the CTMRFLW utility, when the memName member depends on | (OR) conditions.

When processing OR conditions, the utility ignores the | sign. Conditions are displayed without the | sign.

**Corrective Action:** No action is required.

**FLW0A5S OPEN OF DDNAME "DACTO" FAILED**

**Explanation:** Open of the Control-O rule tables specified by the DACTO DD statement failed. Possible causes are:

- The DACTO DD statement is missing.
- The data set described by the DACTO DD statement cannot be opened for sequential processing.

The CTMRFLW utility ends with errors.

**Corrective Action:** Check the JCL for the job. Correct it, and rerun the utility.

**FLW0A6I MANUAL CONDITIONS PRECEDED BY "*" WERE DETECTED AS CONTROL-O "DO COND" CONDITIONS**

**Explanation:** This information message indicates that the CTMRFLW utility detected the addition of manual conditions by Control-O rules using DO COND statements.

Manual conditions added by DO COND statements are marked with an asterisk * by the utility.

**Corrective Action:** No action is required.

**FMG messages**

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.
Messages FMGI00 through FMGIxx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**FMGI50I BUILDING OF ECS COMMUNICATION DATASET STARTED**

**Explanation:** This information message indicates that the Enterprise Controlstation Communication Dataset formatting utility started allocating and formatting the Enterprise Controlstation Communication Dataset file.

**Corrective Action:** No action is required.

**FMGI51I BUILDING OF ECS COMMUNICATION DATASET ENDED**

**Explanation:** This information message indicates that the Enterprise Controlstation Communication Dataset formatting utility completed allocation and formatting of the Enterprise Controlstation Communication Dataset file normally.

**Corrective Action:** No action is required.

**FMGI52E BUILDING OF ECS COMMUNICATION DATASET FAILED**

**Explanation:** The Enterprise Controlstation Communication Dataset formatting utility failed.

**Corrective Action:** Look for an earlier error message that describes the type of error.

**FMGI53E OPEN OF DDNAME DAM2G FAILED**

**Explanation:** The Enterprise Controlstation Communication Dataset formatting utility failed to open the Enterprise Controlstation Communication Dataset file that is allocated to the DAM2G DD statement. Possible causes are:

- The DAM2G DD statement is missing.
- There is insufficient memory for the job.

The utility stops executing with a condition code of 08.

**Corrective Action:** Correct the JCL and rerun the job.

**FMGI54E I/O ERROR OCCURRED WHILE BUILDING THE ECS COMMUNICATION DATASET**

**Explanation:** An I/O error occurred in the Enterprise Controlstation Communication Dataset formatting utility while formatting the Enterprise Controlstation Communication Dataset file. The utility stops executing with a condition code of 08.

**Corrective Action:** Correct the file DCB parameters, and rerun the job. If necessary, contact BMC Software Customer Support.
FMGI55E THE SIZE OF SHOUT TO ECS COMMUNICATION DATASET IS NOT SET CORRECTLY

**Explanation:** An invalid value was specified on installation for the M2GSIZE parameter. The utility stops executing with a condition code of 08.

**Corrective Action:** Specify a valid value for the M2GSIZE parameter, and rerun the file creation process.

If this message was issued in a customized installation, do the following to set a valid value for the M2GSIZE parameter:

1. Open the IOA Installation and Customization Engine (ICE).
2. On the ICE Main Menu, select Installation.
3. On the IOA Installation screen, select Customized installation.
4. Set the Product ID to IOA, type 2 (INSTALL IOA) in the OPTION field, and press Enter.
5. Select Major Step 21 (Install Control-M Application Server), Minor Step 2 (Shout to Control-M/EM Parameters).
6. Change the value of the M2GSIZE parameter.

If this message was issued in a Default installation, save and exit the installation, change the value using the ICE Main Menu Customization option, run the job, and then return to the Default installation.

If this message was issued in a cloning installation, you first need to finish the cloning installation and then change the value using the ICE Main Menu Customization option. For more information, see the “Customizing INCONTROL products” section of the INCONTROL for z/OS Installation Guide.

FMGI56W SHOUT TO ECS COMMUNICATION DATASET OVERFLOWED. SOME MESSAGES MAY BE LOST

**Explanation:** The number of Shout messages written to the Enterprise Controlstation Communication Dataset file exceeded the available space. The Enterprise Controlstation Communication Dataset file contains a fixed number of blocks determined by the M2GSIZE parameter. Each block may contain one Shout message. Each time a Shout message is read from the file, a block is freed. Messages are being written to the file faster than they are read.

Old messages in the file are overwritten by newer Shout messages.

**Corrective Action:** If this condition occurs regularly, increase the size of the Enterprise Controlstation Communication Dataset file.

FOR messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages FORM00 through FORMxx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.
FORM20I CONTROL-D FOREIGN REPORT RESTORE ENDED O.K.

Explanation: This information message indicates that a foreign report was successfully restored as a Control-D report.
Corrective Action: No action is required.

FORM21E CONTROL-D FOREIGN REPORT RESTORE FAILED

Explanation: The CTDFOR utility failed to restore the foreign report file. The CTDFOR utility terminates. The foreign report is not restored.
Corrective Action: Examine other messages to determine the cause of the failure. Fix the problem, and rerun the CTDFOR utility.

FORM27E THE PARAMETER parm MUST BE SPECIFIED FOR CTDFOR UTILITY

Explanation: The parm parameter must be specified for the CTDFOR utility. The CTDFOR utility terminates.
Corrective Action: Add the missing parm parameter, and rerun the CTDFOR utility.

FORM28E INVALID PARAMETER:- parm

Explanation: An invalid parameter (parm) was provided to the CTDFOR utility. The CTDFOR utility terminates.
Corrective Action: Fix the invalid parm parameter, and rerun the CTDFOR utility.

FORM29E REDUNDANT PARAMETER:- parm

Explanation: The same parameter (parm) was specified twice for the CTDFOR utility. The CTDFOR utility terminates.
Corrective Action: Remove the redundant parm parameter, and rerun the CTDFOR utility.

FORM2AE INVALID DATE SPECIFIED:- dateVal

Explanation: The date value (dateVal) specified in the REPDATE input parameter is a non-numeric value. The CTDFOR utility terminates.
Corrective Action: Correct the invalid value in the REPDATE input parameter and rerun the utility.

FORM2BE GETPRM ROUTINE FAILED RC = rc

Explanation: An invalid parameter was specified for the CTDFOR utility. The parameter name, parameter content, or parameter syntax is invalid. The CTDFOR utility is terminated.
Corrective Action: Fix the parameters following the SYSIN DD statement, and rerun the CTDFOR utility.
FORM2CE SYSDATA RECORD ALREADY EXISTS IN ACTUSR. SKEY=key

Explanation: The CTDFOR utility tried to add a sysdata to the Active User Report List file (ACTUSR) but the sysdata already exists. The sysdata probably exists because the utility was previously run with the same input data.

The CTDFOR utility continues processing.

Corrective Action: No action is required.

FORM2DE USER RECORD ALREADY EXISTS IN ACTUSR. UKEY=key

Explanation: The CTDFOR utility tried to add a user record to the Active User Report List file (ACTUSR) but the record already exists. The user record probably exists because the utility was previously run with the same input data.

The CTDFOR utility continues processing.

Corrective Action: No action is required.

FORM2EI USER PARAMETERS FOR FOREIGN REPORT RESTORE: inputStmt

Explanation: This information message displays the input parameters provided by the user for the CTDFOR utility.

Corrective Action: No action is required.

FORM2FS UNKNOWN PRODUCT NAME PROVIDED IN PRODUCT= PARAMETER: parm

Explanation: A product name specified in the parm PRODUCT parameter is unknown to the CTDFOR utility. It is not the name of a product supported by the utility.

The CTDFOR utility terminates.

Corrective Action: Set the PRODUCT parameter to the name of a supported product.

FORM30E CONVERSION ROUTINE FAILED. RC = rc

Explanation: The conversion routine called by the CTDFOR utility failed to convert the report file to a CDAM file.

The CTDFOR utility terminates.

Corrective Action: Examine other messages to determine the cause for the conversion routine failure. Correct the problem and rerun the CTDFOR utility.

FRM messages

This group includes messages for the Control-M for z/OS and Control-D products.

Messages FRM400 through FRM4xx

This group includes messages for the Control-M for z/OS and Control-D products.
FRM450S OPEN OF WORK FILE FAILED - DDNAME "DAJ OBLST". PLEASE CHECK THE MESSAGES AND CODES MANUAL

**Explanation:** The New Day procedure was unable to open the file pointed to by the DAJ OBLST DD name for update.

After reading the list of CDAM files to be deleted from the file pointed to by DAJ OBLST, the New Day procedure empties the file and writes one record indicating that there are no more entries. Possible causes are:

- File not found on the disk.
- Incorrect security authorization.

**Corrective Action:** Determine the reason for the problem, and correct it. Reinstall Control-M/Rerstart.

FRM451I taskType taskName ODATE odate ORDERID orderId DELETED - MAXWAIT EXCEEDED

**Explanation:** This information message is issued during the New Day procedure. It indicates that a job or group entity has been deleted from the Active Jobs file because the MAXWAIT of the job or group entity was exceeded.

The MAXWAIT parameter sets a maximum limit to the time that a task can wait for execution. For more information, see the description of the MAXWAIT parameter in the *Control-M for z/OS User Guide*.

The variables in this message are:

- **taskType** - the type of task that was deleted

  Valid values are:

<table>
<thead>
<tr>
<th>taskType</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>JOB</td>
<td>The task was a job.</td>
</tr>
<tr>
<td>GRP ENTITY</td>
<td>The task was a group entity.</td>
</tr>
</tbody>
</table>

- **taskName** - the name of the job or group entity that was deleted
- **odate** - the ODATE of the job or group entity that was deleted
- **orderId** - the order ID of the job or group entity that was deleted

The **taskName** job or group entity is removed from the Active Jobs file.

**Corrective Action:** No action is required.

FRM452I FORMATTING OF activeFile STARTED

**Explanation:** This information message indicates that the Control-M Active Jobs file (AJF) or the Control-D Active Missions file (AMF) is currently being formatted.

**Corrective Action:** No action is required.
FRM453S OPEN OF DATES CONTROL RECORD FAILED. DDNAME "DACHK"

Explanation: Open of Control-M or Control-D Date Control record failed in the DACHK DD statement. This error message is issued by the CTMFRM (Control-M) or CTDFRM (Control-D) program as part of the New Day procedure.

Possible causes are:
- The DACHK DD statement is missing.
- The data set (member) described by the DACHK DD statement is not the Control-M or Control-D Date Control Record.

Corrective Action: Correct the JCL for the New Day procedure.

FRM454E FORMAT (format_pgm) ALREADY RUN TODAY

Explanation: An attempt was made to run the New Day procedure twice in the same day. The New Day procedure issues format_pgm. This program should not run more than once a day.

Possible values of format_pgm:
- CTMFRM - formats the Active Jobs file (AJF) in Control-M
- CTDFRM - formats the Active Missions file (AMF) in Control-D

The AJF or AMF is not formatted, but the New Day procedure continues to execute other programs in the program list.

Corrective Action: Check why the New Day procedure is being run twice, and whether jobs or missions were accidentally ordered twice because the General Date Control Record was erroneously modified.

FRM455S LAST FORMAT DATE GREATER THAN ORIGINAL SCHEDULING DATE IN DATES CONTROL RECORD

Explanation: The last format date is later than the original scheduling date in the Control-M Date Control record or the Control-D Date Control record. The New Day procedure issues this message. For more details refer to the appropriate user guide.

New Day processing stops.

Corrective Action: Correct the Control-M or Control-D Date Control record, and run the New Day procedure again.

FRM456S OPEN OF activeFile FAILED. DDNAME "ddName"

Explanation: Open of the Control-M Active Jobs file (AJF) or the Control-D Active Missions file (AMF) defined in the ddName DD statement failed. The New Day procedure calls the program that issues this message.

In Control-M, ddName is DACKPT and activeFile is the Active Jobs file (AJF).

In Control-D ddName is DAAMF and activeFile is the Active Missions file (AMF).

Possible causes of this message:
The _ddName_ DD statement is missing.

The data set described by the _ddName_ DD statement is not the AJF or the AMF.

The data set described by the _ddName_ DD statement is the AJF or the AMF, but of another Control-M or Control-D monitor, or of a different version of Control-M or Control-D.

Program execution stops with a condition code of 08.

**Corrective Action:** Correct the JCL for the New Day procedure, and rerun it.

**FRM457S OPEN OF BACKUP FILE FAILED. DDNAME “DABKUP”**

**Explanation:** Open of backup file for the Active Jobs file (AJF) or Active Missions file (AMF) defined in the DABKUP DD statement failed.

This error message is issued by the CTMFRM (Control-M) or CTDFRM (Control-D) program, which is usually activated as part of the New Day procedure.

Possible causes of this message are:

- The DABKUP DD statement is missing.
- The data set described by the DABKUP DD statement is not the Active Jobs Backup file or Active Missions Backup file.
- The data set described by the DABKUP DD statement is the Control-M Active Jobs Backup file or the Control-D Active Missions Backup file, but of another Control-M or Control-D monitor, or of a different version of Control-M or Control-D.

Program execution stops with a condition code of 08.

**Corrective Action:** Correct the JCL for the New Day procedure, and rerun it.

**FRM458S ERROR IN activeFile, RECORD 0. SHOULD BE FORMAT OR FREE**

**Explanation:** Record 0 of the _activeFile_ file contains incorrect data.

This error message is issued by the CTMFRM (Control-M) or CTDFRM (Control-D) program, which is usually activated as part of the New Day procedure.

In Control-M _activeFile_ is the Active Jobs file (AJF).

In Control-D _activeFile_ is the Active Missions file (AMF).

Possible causes of this message are:

- _activeFile_ is corrupt.
- The data set described by the DACKPT DD statement (Control-M) or the DAAMF DD statement (Control-D) is not _activeFile_ but is very similar to it.

Program execution stops with a condition code of 08.

**Corrective Action:** Check the validity of the data set described by the DACKPT or DDAMF DD statement. If necessary, correct the JCL, and rerun the New Day procedure.
If `activeFile` is corrupt, use a standard copy utility, like `IEBGENER`, to copy `activeFile`, and send it to BMC Software Customer Support. If necessary, run the FORMCKP utility to reformat the Active Jobs file or the CTFDRMF utility to reformat the Active Missions file. However, these utilities also erase all the jobs or missions in the respective files.

**FRM459I activeFile IS RESTORED FROM BACKUP**

**Explanation:** This information message indicates the beginning of a rerun of the New Day procedure after an earlier abend during the format of `activeFile`.

In Control-M, `activeFile` is the Active Jobs file (AJF).

In Control-D `activeFile` is the Active Missions file (AMF).

`activeFile` is restored from the appropriate backup file and processing continues normally.

**Corrective Action:** No action is required.

**FRM45AI taskType memName ODATE odate OID=orderId CYCLIC ATTRIBUTE REMOVED - MAXWAIT EXCEEDED**

**Explanation:** This information message indicates that the New Day procedure removed the cyclic attribute of the job to prevent further recycling. The cyclic job identified in the message was executing when the New Day procedure was being run. Therefore, it could not be removed from the Active Jobs file (AJF), although its MAXWAIT period had expired. To prevent further recycling of the job, its cyclic attribute is removed.

The job remains in the AJF with its changed `taskType`.

**Corrective Action:** No action is required.

**FRM45BI taskType memName ODATE odate CYCLIC ATTRIBUTE REMOVED - MAXWAIT EXCEEDED**

**Explanation:** This information message indicates that the New Day procedure removed the cyclic attribute of the job to prevent further recycling. The cyclic job identified in the message was executing when the New Day procedure was being run. Therefore, it could not be removed from the Active Jobs file (AJF), although its MAXWAIT period had expired. To prevent further recycling of the job, its cyclic attribute is removed.

The job remains in the AJF with its changed task type.

**Corrective Action:** No action is required.

**FRM45CE func OPERATION FOR "COM" FILE FAILED. RC=rc**

**Explanation:** An internal error occurred in the CTDCIO internal module while the Active Mission file was being formatted.

The Active Mission file is not formatted.

**Corrective Action:** Note the values of `func` and `rc` and contact BMC Software Customer Support.
FRM460S DATE CONTROL RECORD IS EMPTY

Explanation: The DACHKDD statement describes an empty data set or member.

For more information, see the descriptions of NEW DAY processing in the Control-M and Control-D chapters of the INCONTROL for z/OS Administrator Guide.

Program execution stops with a condition code of 08.

Corrective Action: Correct the Control-M or Control-D Date Control Record and run the New Day procedure again.

FRM461S ERROR WHILE FORMATTING IOA CONDITIONS FILE

Explanation: I/O error while formatting the IOA Conditions file. Possible causes are:

- The data set described by the DARESF DD statement is not the IOA Conditions file.
- An I/O error occurred while reading the IOA Conditions file.

Program execution stops with a condition code of 08.

Corrective Action: Correct and run the New Day procedure again. In case of an I/O error, you may need to recreate the IOA Conditions file. This erases all the conditions from the file.

FRM462S INVALID LAST FORMAT DATE IN DATE CONTROL RECORD

Explanation: Invalid format of last format date in the Date Control Record. This message is issued by the CTMFRM or CTDFRM program, which is activated as part of the New Day procedure. The valid format is ddmmyy or mmddyy.

Possible causes are:

- Someone has modified the contents of the Date Control Record incorrectly.
- The record described by the DACHK DD statement is not the Control-M Date Control Record or the Control-D Date Control Record.

For more information, see the sections that describe NEW DAY processing in the Control-M and Control-D chapters of the INCONTROL for z/OS Administrator Guide.

Program execution stops with a condition code of 08.

Corrective Action: Do one or both of the following, as necessary:

- Correct the JCL for the Daily Subsystem, and rerun it.
- Correct the format date in the Date Control Record, and rerun the New Day procedure.

FRM463S INVALID ORIGINAL SCHEDULING DATE IN DATE CONTROL RECORD

Explanation: Invalid original scheduling date in the Date Control Record. This message is issued by the CTMFRM (Control-M) or CTDFRM (Control-D) program, which is activated as part of the New Day procedure. The valid format is ddmmyy or mmddyy.

Possible causes are:
The record described by the DACHK DD statement is not the Control-M General Date Control Record or the Control-D General Date Control Record.

Someone modified the contents of the General Date Control Record incorrectly.

See the sections that describe NEW DAY processing in the Control-M and Control-D chapters of the INCONTROL for z/OS Administrator Guide for more information.

Program execution stops with a condition code of 08.

**Corrective Action:** Do one or both of the following, as necessary:

- Correct the JCL for the New Day procedure and rerun it.
- Correct the original scheduling date in the General Date Control Record and rerun the New Day procedure.

FRM464S FILE ALLOCATED TO DDNAME "ddName" IS NOT YOUR activeFile

**Explanation:** The data set described by the ddName DD statement is not the file specified by activeFile.

In Control-M, ddName is DACKPT and activeFile is the Active Jobs file (AJF).

In Control-D ddName is DAAMF and activeFile is the Active Missions file (AMF).

Possible causes are:

- The data set described by the ddName DD statement is not the AJF or the AMF.
- The data set described by the ddName DD statement is the AJF or the AMF, but of another Control-M or Control-D monitor, or of a different version of Control-M or Control-D.

Program execution stops with a condition code of 08.

**Corrective Action:** Correct the problem in the data set name indicated by the specified DD statement, and run the New Day procedure again.

FRM465S FILE ALLOCATED TO DDNAME "DABKUP" IS NOT A BACKUP OF THE activeFile

**Explanation:** The data set described by the DABKUP DD statement is not a backup of activeFile.

In Control-M, activeFile is the Active Jobs file (AJF).

In Control-D activeFile is the Active Missions file (AMF). Possible causes are:

- The data set described by the DABKUP DD statement is not the AJF or the AMF.
- The data set described by the DABKUP DD statement is the AJF or the AMF, but of another Control-M or Control-D monitor, or of a different version of Control-M or Control-D.

Program execution stops with a condition code of 08.

**Corrective Action:** Correct the Control-M Date Control Record and rerun the affected procedure.
FRM466S NEED MORE MEMORY TO FORMAT *activeFile*

**Explanation:** There is not enough memory to format *activeFile*.

In Control-M, *activeFile* is the Active Jobs file (AJF).

In Control-D *activeFile* is the Active Missions file (AMF).

Program execution stops with a condition code of 08. Control-M and Control-D monitors will not start after this error.

**Corrective Action:** To enable monitors to start, increase REGION size and rerun the affected procedure.

FRM467I taskType memName ODATE odate OID=orderId DISREGARDED - MAXWAIT EXCEEDED

**Explanation:** The New Day procedure issues this information message to indicate that the MAXWAIT of a task was exceeded. The maximum waiting time for a task or mission is specified in the MAXWAIT parameter.

For more information, see MAXWAIT in the *Control-M for z/OS User Guide* or the *Control-D and Control-V User Guide*.

The task or mission is erased from the AJF or AMF. In the case of a task, the *memName* member of the odate original date is removed from the AJF.

**Corrective Action:** No action is required.

FRM468I FORMATTING OF *activeFile* ENDED

**Explanation:** This information message indicates that the New Day procedure finished formatting *activeFile*. This message is issued by the CTMFRM (Control-M) or CTDFRM (Control-D) program, which is activated as part of the New Day procedure.

In Control-M, *activeFile* is the Active Jobs file (AJF).

In Control-D *activeFile* is the Active Missions file (AMF).

**Corrective Action:** No action is required.

FRM469S OPEN OF IOA LOG FILE FAILED

**Explanation:** Open of IOA Log file failed. The message is produced by the New Day procedure. Possible causes are:

- The DALOG DD statement is missing.
- The file allocated to the DALOG DD statement is not the IOA Log file.
- The file allocated to the DALOG DD statement is the IOA Log file, but it is of a different version or of a different IOA monitor.

Program execution stops with a condition code of 08.

**Corrective Action:** Correct the JCL and run the Daily again.
FRM46AI  memName ODATE  odate  DISREGARDED - MAXWAIT EXCEEDED

Explanation: This information message is issued by the Control-D New Day procedure. It indicates that the MAXWAIT of a job or mission has been exceeded.
The memName member is deleted from the Active Jobs file or Active Missions file.
Corrective Action: No action is required.

FRM470S ERROR WHILE FORMATTING THE activeFile, FILE WAS NOT FORMATTED

Explanation: An error occurred during formatting of activeFile. The New Day procedure issues this message.
In Control-M, activeFile is the Active Jobs file (AJF).
In Control-D activeFile is the Active Missions file (AMF).
Program execution stops with a condition code of 08.
Corrective Action: Look for a previous message that describes the type of error. Correct it and rerun the New Day procedure.

FRM481S OPEN OF WORK FILE FAILED - DDNAME "DAJ OBLST". DELETE OF ARCHIVED SYSOUTS FAILED

Explanation: Open for the DAJ OBLST file failed during the execution of the Control-M New Day procedure.
This error message is issued by the CTMDAS program, which is usually activated as part of the New Day procedure. The DAJ OBLST DD statement is probably missing.
Program execution stops with a condition code of 16.
Corrective Action: Make sure that CONTROLR is set to Y in CTMPARM.

FRM482S INIT OF RES FILE FAILED

Explanation: The New Day procedure failed to initialize the Control-M Resources file. An accompanying message identifies the reason for the failure.
The New Day procedure stops with an error, a return code of 12.
Corrective Action: Check the accompanying message to determine the reason for the problem, and correct the problem accordingly.

FRM484I FORMAT OF RESOURCE FILE HAS STARTED

Explanation: This information message indicates that the Control-M Resources file is currently being formatted. This procedure is usually part of the New Day procedure.
Corrective Action: No action is required.
FRM485I RESOURCE quantResource QUANTITY num WAS RELEASED BY CTMFRM

Explanation: This information message indicates that the CTMFRM format program cannot find the job that holds the specified quantity (num) of quantResource quantitative resources.

The system releases the quantitative resources for use by other jobs.

Corrective Action: No action is required.

FRM486E RESOURCE quantResource FOUND TO BE NOT BALANCED BY CTMFRM. CHECK AND ADJUST MANUALLY

Explanation: The number of quantResource quantitative resources currently in use exceeds the maximum defined for this resource. An error probably occurred during the monitor run on the previous day, since it is supposed to keep the resources balanced.

Corrective Action: Use the ADD, CHANGE and DELETE options on screen 4 to balance the Control-M Resources file.

FRM487I RESOURCE contResource IS HELD type - RELEASED BY FORMAT

Explanation: This information message indicates that the specified Control resource was released.

Valid values for type are:

<table>
<thead>
<tr>
<th>type</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>The resource is being used in Shared mode.</td>
</tr>
<tr>
<td>E</td>
<td>The resource is being used in Exclusive mode.</td>
</tr>
<tr>
<td>R</td>
<td>An unfulfilled critical path request for the resource.</td>
</tr>
</tbody>
</table>

The system releases the resource.

Corrective Action: No action is required.

FRM488I FORMAT OF RESOURCE FILE HAS ENDED

Explanation: This information message indicates that formatting of the new Control-M Resources file is complete and the resource is available.

Corrective Action: No action is required.

FRM489E OID=orderId FORMAT DETECTED MIT AND RESOURCE quantResource MISMATCH

Explanation: The quantResource Quantitative resource points to a job record (MIT) that is not its owner. Each resource in the Control-M Resources file points to the job record that owns it.

The system deletes the specified quantitative resource from the Control-M Resources file.

Corrective Action: No action is required.
FRM48AE FORMAT DETECTED MIT AND RESOURCE contResource MISMATCH

Explanation: The contResource Control resource points to a job record (MIT) that is not its owner. Each resource in the Control-M Resources file points to the job record that owns it. The system deletes the specified Control resource from the Control-M Resources file.

Corrective Action: No action is required.

Messages FRM600 through FRM6xx
This group includes messages for the Control-M for z/OS and Control-D products.

FRM617E INTERNAL ERROR - INVALID NAME OF THE ARCHIVED SYSOUT DATASET. DSNAME=dsn

Explanation: The name of Archived Sysout Data Set does not follow the Control-M/Restart naming conventions for this type of data set. This message is issued either by the Control-M New Day procedure, or by the CTMCOP utility during compress of the Control-M Active Jobs file.

Corrective Action: Contact BMC Software Customer Support for assistance.

FRM618E TOO MANY SYSOUT DATASETS SCHEDULED FOR DELETE - SOME WILL BE SKIPPED THIS TIME

Explanation: The number of Archived Sysout Data Sets scheduled for deletion exceeds the permitted number. This message is issued either by the Control-M New Day procedure or by the CTMCOP utility during compress of the Control-M Active Jobs file. The permitted value is one fifth of the Active Jobs file size.

Deletion of Archived Sysout Data Sets will be resumed during the next run of the New Day procedure or the CTMCOP utility.

Corrective Action: No action is required.

FRM637E THIS AUTOEDIT SYMBOL IS NOT ALLOWED HERE

Explanation: An AutoEdit symbol was specified in an environment in which it is not valid. Some AutoEdit symbols can be used in one environment only. For example, %%OYEAR cannot be used in utilities which are not submitted under Control-M.

The current process terminates.

Corrective Action: Specify an AutoEdit symbol that is valid for your environment.

FRM638S AUTOEDIT FAILED RC=rc

Explanation: An AutoEdit error occurred. An invalid AutoEdit statement or variable was encountered (with a return code of 12 or higher), or there was insufficient memory to perform the AutoEdit operation (a return code of 8).

The process terminates.
**Corrective Action:** If the return code was 8, increase memory. If the return code was 12 or higher, check the preceding message, and correct the erroneous statement or variable accordingly.

**FRM639S ACTIVE JOBS FILE (CKP) SIZE - PARM TABLE MISMATCH**

**Explanation:** The CKPSIZE parameter in CTMPARM is not the same as when the Active Jobs file (AJF) referenced by DD DACKPT was formatted. A change was made in the CKPSIZE parameter in CTMPARM after the Active Jobs file was formatted.

The job step or request terminates without performing the requested function.

**Corrective Action:** Adjust the CKPSIZE parameter according to the real size of the AJF, or reformat the AJF.

**FRM640I taskType taskName ODATE odate ORDERID orderId DELETED**

**Explanation:** This information message indicates that a job or group entity was deleted from the Active Jobs file.

The variables in this message are:
- **taskType** - the type of task that was deleted
- **taskName** - the name of the job or group entity that was deleted
- **odate** - the ODATE of the job or group entity that was deleted
- **orderId** - the order ID of the job or group entity that was deleted

The **taskName** job or group entity is deleted from the Active Jobs file.

**Corrective Action:** No action is required.

**FRM641S INVALID JOB RECORD DETECTED: jobName**

**Explanation:** A job record with an invalid format was detected during the New Day procedure. If the User Daily is run on a different computer without proper ENQ distribution software, such as GRS or MIM, a faulty record may be created in the Active Jobs file.

The faulty record is erased from the Active Jobs file.

**Corrective Action:** To avoid this problem, run all User Daily procedures on the CPU in which the Control-M monitor is running.

**Messages FRMB00 through FRMBxx**

This group includes messages for the Control-M for z/OS and Control-D products.
FRMB55E ERROR WHILE OPENING DD "DASCRLST". OLD PRINT PLAN FILES WILL NOT BE DELETED

Explanation: An error occurred while trying to write a print plan file name to the scratch list. The message is issued by the AMF formatting program. This program could not open the file referenced by DD DASCRLST. This could be because the entire corresponding DD statement is missing.

AMF formatting program continues processing.

Corrective Action: Verify that the DASCRLST DD statement exists in the JCL and that it references an existing file.

Messages FRML00 through FRMLxx

This group includes messages for the Control-M for z/OS and Control-D products.

FRML61E COPY TO HISTORY FILE FAILED: rsn REASON CODE: rc

Explanation: An error occurred while copying records from the Active Jobs file to the History Jobs file. The variables in this message are:
- rsn - the cause of the error
- rc - the reason code; this may contain additional information in certain cases

The Control-M New Day procedure terminates.

Corrective Action: Correct the cause of the error and rerun the Control-M New Day procedure. The enhanced checkpoint record can be used to continue the New Day procedure processing from the point at which the error occurred.

FRML63E HISTORY FILE PROCESSING MODULE NOT FOUND

Explanation: The attempt to load the CTMHCP or CTMFRH module failed. The name of the module that was not loaded appears in a previous error message. The load may have failed because the module does not exist in the IOA Load library.

The Control-M New Day procedure terminates.

Corrective Action: If History Jobs file processing is specified in the CTMPARM member, verify that the IOA Load library contains the required module.

FRML64I CTMFRM IS RUNNING IN HISTORY FILE CLEANUP MODE

Explanation: This information message indicates that the CTMFRM utility is currently cleaning the History Jobs file.

Corrective Action: No action is required.

FRML65W HISTORY FILE FREESPACE THRESHOLD REACHED

Explanation: This message is issued during New Day processing when there is insufficient free space in the History file to accommodate the entire Active Jobs file (AJF). The History file becomes full and New Day processing, processing stops.
New Day processing stops.

**Corrective Action:** Do the following:

1. Use the CTMHCLN utility to clean the History file.
2. If the error message is still displayed, use the CTMHCP utility to increase the size of the History file.

**FRML66S OPEN OF CONTROL-M HISTORY FILE FAILED. DDNAME "DAHIST"**

**Explanation:** The Control-M History Jobs file (HST) defined in the DAHIST DD statement could not be opened. The New Day procedure calls the program that issues this message.

A possible cause of this message is that the DAHIST DD statement is missing.

Program execution stops with a condition code of 08.

**Corrective Action:** Add the statement KEY=DAHIST to the ALCMDAS member in the IOA ENV library, and rerun the DELARCH step of the New Day procedure.

**FRML67S INTERNAL ERROR - ARCHIVED SYSOUT POINTER IS INVALID. ORDERID: jobId**

**Explanation:** During the New Day procedure, the Control-M Active Jobs file (AJF) was found to be corrupt, due to an internal error. The archived sysout of a job cannot be read.

In this message, `jobId` is the identity of the job that produced the archived sysout that cannot be read.

The New Day procedure does not delete the archived sysout for the `jobId` job.

**Corrective Action:** No action is required.

**FRS messages**

This group includes messages for the IOA (infrastructure) product.

**Messages FRS400 through FRS4xx**

This group includes messages for the IOA (infrastructure) product.

**FRS471S OPEN OF IOA CONDITIONS FILE FAILED. DDNAME "DARESC"**

**Explanation:** Open of IOA Conditions file failed (the DARESC DD statement).

This error message is issued by either the CTMFRM or the CTDFRM program, which is activated as part of the New Day Procedure.

Possible causes are:

- The DARESC DD statement is missing.
- The data set described by the DARESC DD statement is not the IOA Conditions file.

Program execution stops with a condition code of 08.
Corrective Action: Correct the JCL for the Daily Subsystem and rerun it.

FRS472S OPEN OF I OA SYNCHRONIZATION FILE FAILED. DDNAME "DASINC"

Explanation: Open of I OA Synchronization file failed in the DASINC DD statement. This error message is issued by either the CTMFRM or the CTDFRM program, which is activated as part of the New Day procedure.

Possible causes are:

- The DASINC DD statement is missing.
- The data set described by the DASINC DD statement is not the I OA Synchronization file.
- The data set described by the DASINC DD statement is an I OA Synchronization file, but it is of another Control-M or Control-D monitor, or of a different Control-M or Control-D version.

Program execution stops with a condition code of 08.

Corrective Action: Correct the JCL for the New Day procedure and rerun it.

FRS475S INVALID LAST FORMAT DATE IN DATE CONTROL RECORD

Explanation: Invalid format of last format date in the Date Control record. This message is issued by either the CTMFRM or the CTDFRM program, which is activated as part of the New Day procedure. The valid format is ddmmyy or mmddyy. Possible causes are:

- The record described by the DACHK DD statement is not the Control-M or Control-D Date Control record.
- Someone modified the contents of the Date Control Record incorrectly.

For more information, see the descriptions of NEW DAY processing in the Control-M and Control-D chapters of the INCONTROL for z/OS Administrator Guide.

Program execution stops with a condition code of 08.

Corrective Action: Do one or both of the following, as necessary:

- Correct the JCL for the New Day procedure, and rerun it.
- Correct the format date in the Date Control Record.

FRS476S LAST FORMAT DATE IN DATE CONTROL RECORD WAS MORE THAN 28 DAYS AGO

Explanation: The difference between the current working date (date-1) and the last format date in the Date Control Record is greater than 28 days. Possible causes are:

- Someone modified the contents of the Date Control Record incorrectly.
- The Control-M or Control-D monitor has not been used for more than 28 days. Correct the date to "yesterday."

Program execution stops with a condition code of 08.
**Corrective Action:** Correct the dates in the Date Control Record in the DACHK DD statement, and rerun the Daily Subsystem.

**FRS477S** FILE ALLOCATED TO DDNAME "DACNDF" IS NOT YOUR IOA CONDITION FILE

**Explanation:** The data set described by the DACNDF DD statement is not the required IOA Conditions file.

The CTMFRM or CTDFRM program issues this error message as part of the New Day procedure when one of the following occurs:

- The file allocated to the DACNDF DD statement is not the IOA Conditions file.
- The file allocated to the DACNDF DD statement is an IOA Conditions file, but for a different version, or for a different Control-M or Control-D monitor.

Program execution stops with a condition code of 08.

**Corrective Action:** Correct the JCL for the New Day procedure and rerun it.

**FRS478I** FORMATTING OF IOA CONDITIONS FILE STARTED

**Explanation:** This information message indicates that the formatting of the IOA Conditions file was started by the New Day procedure. The CTMFRM or CTDFRM program clears all the conditions from the day following the last formatting date until the next working date, that is, the first date in the General Date Control Record.

**Corrective Action:** No action is required.

**FRS479I** FORMATTING OF IOA CONDITIONS FILE ENDED

**Explanation:** This information message indicates that the New Day procedure formatted the IOA Conditions file. The CTMFRM or CTDFRM formatting program that the New Day procedure called ended.

**Corrective Action:** No action is required.

**FRS480S** ERROR WHILE FORMATTING IOA CONDITIONS FILE

**Explanation:** An error occurred while formatting the IOA Conditions file by the New Day procedure. An earlier error message describes the type of error.

Program execution stops with a condition code of 08.

**Corrective Action:** Check the IOA Log or the utility output for a previous message concerning the error.

**FRS481I** CORRUPTED CONDITION WAS ERASED FROM FILE

**Explanation:** This information message indicates that the New Day procedure detected a corrupted condition in the IOA Condition file, and deleted it from the file.

The New Day procedure runs to completion.

**Corrective Action:** Try to identify the condition involved, and consider whether to add it manually to the file. If necessary, have your INCONTROL administrator contact BMC Software Customer Support for a fix to the problem.
FST messages

This group includes messages for the Control-O product.

Messages FST700 through FST7xx

This group includes messages for the Control-O product.

FST720I FORMATTING OF STATISTICS FILE STARTED

**Explanation:** This informative message is issued when the CTOFST Statistics Formatting utility starts formatting the Statistics file.

**Corrective Action:** No action is required.

FST721S STATISTICS FILE DYNAMIC ALLOCATION ERROR \( rc/rsn/dsn \)

**Explanation:** Dynamic allocation of the Statistics file dsn failed with the return code \( rc \) and reason code \( rsn \).

The CTOFST Statistics Formatting utility terminates with the return code 08.

**Corrective Action:** See the IBM manual *MVS Programming: Authorized Assembler Services Guide* to determine the cause of the error, and correct the error accordingly. If not successful, contact BMC Software Customer Support.

FST722W STATISTICS FILE ALLOCATION ERROR - ACTIVE SMF ID DOES NOT MATCH PARAMETER SMF ID

**Explanation:** The SMF ID specified for the CTOFST Statistics Formatting utility does not match the active MVS SMF ID. The SMF ID for the CTOFST utility is specified in the input PARM string \( (parmSmfId) \). The current MVS SMF ID is specified in IEASMFxx of SYS1.PARMLIB \( (cpuSmfId) \). These SMF IDs must match.

No error is issued when the systems share the catalog, where the file is cataloged, and the disk, where the file was allocated.

A problem starting the Statistics task, in Control-O monitor, occurs when the systems do not share the catalogs or the disk. This usually occurs when the file should have been cataloged in the MASTER catalog of the target system \( (parmSmfId) \) and not the Master catalog of the system where the job was executed \( (cpuSmfId) \). In such a case, messages IKJ 56228I, CTO196S, and CTO185S will be issued and Control-O monitor will continue to work without collecting statistics.

The CTOFST utility terminates with a condition code of 04.

**Corrective Action:** Verify that the file was cataloged in the correct CATALOG. If it was not, DELETE the file and rerun the job on the correct system, where \( parmSmfId \) and \( cpuSmfId \) are the same. After reallocating the Statistics file start Control-O monitor or issue command ‘F control, STARTSTAT’ to start collecting the Control-O statistics.
FST723S STATISTICS FILE IN USE. FORMATTING CANNOT BE PERFORMED

**Explanation:** The CTOFST Statistics Formatting utility failed to format the Statistics file because the file is allocated to another user. The CTOFST Statistics Formatting utility attempts to allocate the Statistics file with DISP set to OLD.

The utility terminates with a return code of 08.

**Corrective Action:** Make sure that no user is allocated to the Statistics file, and rerun the job.

FST724E OPEN OF STATISTICS FILE FAILED

**Explanation:** The CTOFST Statistics Formatting utility could not successfully open the Statistics file.

The utility terminates with a return code of 08.

**Corrective Action:** Look for previous MVS error messages regarding the opening of the Statistics file. Correct the error and rerun the job.

FST725E OPEN OF MESSAGES FILE FAILED

**Explanation:** The CTOFST Statistics Formatting utility unsuccessfully attempted to open the Messages file specified in the SYSPRINT DD statement. An OPEN request was issued to the Messages file but was unsuccessful. A possible cause is that the SYSPRINT DD statement may not have been specified in the job stream.

The utility terminates with return code 08.

**Corrective Action:** Look for earlier MVS error messages regarding the opening of the Messages file. Correct the error, and rerun the job.

FST726S FORMATTING OF STATISTICS FILE ENDED WITH ERROR

**Explanation:** The formatting of the Statistics file was unsuccessful.

The CTOFST Statistics Formatting utility terminates with a return code of 08.

**Corrective Action:** Look for earlier error messages to determine the cause of the error. Correct the error and rerun the job.

FST729S WRITE OPERATION TO THE STATISTICS FILE FAILED

**Explanation:** A WRITE request failed during the formatting of the Statistics file.

The CTOFST Statistics Formatting utility terminates with a return code of 08.

**Corrective Action:** Delete the Statistics file. Then rerun the job, specifying the SMF ID volser and unit. Earlier MVS error messages regarding the Statistics file may indicate the cause of the error.

FST730I FORMATTING OF STATISTICS FILE ENDED SUCCESSFULLY

**Explanation:** This information message is issued when the CTOFST Statistics Formatting utility completes with no errors.

**Corrective Action:** No action is required.
FST731E INVALID PARAMETERS

Explanation: The DEFSTAT utility was called with incorrect parameters. The utility terminates with the return code 08.
Corrective Action: Correct the parameters and rerun the utility.

FTM messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages FTM100 through FTM1xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

FTM1T01 FILE TRANSFER STARTED

Explanation: This information message indicates that the File Transfer monitor was started.
Corrective Action: No action is required.

FTM1T3E INVALID MODIFY PARAMETER. VALID PARAMETERS ARE:

Explanation: An invalid parameter was passed to the File Transfer monitor by an operator modify command. A list of valid modify parameters is displayed on the operator console following this message. The modify command is rejected.
Corrective Action: Enter an operator modify command with valid parameters.

FTM1T4S BLDL/ATTACH FAILED FOR TASK taskName

Explanation: Initialization of a File Transfer monitor internal task failed. The reason, system code, is on the computer log. Possible causes are:
- The task is not in the IOA Load library.
- There is insufficient memory for File Transfer monitor.
The File Transfer monitor shuts down.
Corrective Action: Refer to your system programmer for assistance. If necessary, increase the monitor REGION size.

FTM1T5S UNRECOVERABLE ERROR ENCOUNTERED

Explanation: An unrecoverable error occurred during operation of the File Transfer monitor, while trying to access to the Active Transfer file.
The File Transfer monitor shuts down.
Corrective Action: Examine relevant CTD9B1S-CTD9B9S messages, and take appropriate corrective action. If the problem is not resolved, send the IOA log and the CTDFTM file transfer monitor print-out to BMC Customer Support.

Messages FTM200 through FTM2xx
This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

FTM2T0I FILE TRANSFER MONITOR SHUTTING DOWN
Explanation: Highlighted, unrollable message.
This information message indicates that the File Transfer monitor is shutting down.
Corrective Action: No action is required.

FTM2T1S FILE TRANSFER MONITOR ENDED WITH ERROR
Explanation: This information message indicates that the File Transfer monitor ended with an error.
Corrective Action: In the printout of the File Transfer monitor, check the messages which preceded this FTM121S message for an indication of the cause of the error, and take appropriate corrective action.

FTM2T2W FILE TRANSFER MONITOR IS ACTIVE. QNAME "qName"
Explanation: Highlighted, unrollable message.
The user attempted to activate the File Transfer monitor when it was already active. More than one File Transfer monitor cannot be active at the same time.
The new File Transfer monitor is not activated.
Corrective Action: No action is required.

FTM2T5I validModifyParm
Explanation: This information message displays a valid modify parameter that can be used in File Transfer monitor operator commands. It is issued together with the FTM103E message.
Corrective Action: No action is required.

FTM2T8S RECIPIENT TREE WAS NOT LOADED BECAUSE OF ERROR - MONITOR IS TERMINATING
Explanation: The attempt to load the Recipient Tree failed. As part of the initialization process, the File Transfer monitor attempts to load the Recipient Tree.
The File Transfer monitor shuts down.
Corrective Action: Check other messages in the IOA log and JES log to determine why the Recipient Tree could not be loaded. Fix the Recipient Tree. Then try again to start the File Transfer monitor.
FTM2T9S NO RECIPIENTS WERE FOUND WITH IP ADDRESS. MONITOR IS TERMINATING

Explanation: The File Transfer monitor was unable to find a recipient with an IP address. The File Transfer monitor terminates.

Corrective Action: Contact BMC Software Customer Support.

FTM2TAS SUBTASK IS TERMINATED BY TIMEOUT FOR IPA = ipAdd.'

Explanation: The subtask has timed out and been terminated.

The monitor main task periodically checks the status of all its subtasks. When the CPU of a subtask has not changed since the last check, the subtask is considered to be inactive ("hanging"), and the main task of the monitor interrupts the subtask. The subtask is terminated.

Corrective Action: In the printout of the File Transfer monitor, and in the log of your PC session manager, check the messages which preceded this FTM121S message for an indication of the reason why the subtask was left inactive, and take appropriate corrective action.

FTM2TBS SUBTASK IS TERMINATED BY CANCEL REQUEST FOR IPA = ipAdd. PORT = portNumber.

Explanation: The File Transfer monitor subtask with the IP address identified in this message has been terminated by an operator modify CANCEL command.

The identified subtask is terminated.

Corrective Action: No action is required.

FTM2TCS THERE ARE NO ACTIVE SUBTASKS

Explanation: This information message indicates that the File Transfer monitor has no active subtasks.

Corrective Action: No action is required.

FTM2TDS FORMAT OF THE MODIFY COMMAND IS NOT CORRECT

Explanation: An invalid operator modify command has been entered.

The command is rejected.

Corrective Action: Correct and reissue the operator modify command.

For more information, see the File Transfer Monitor section in the Control-D chapter in the INCONTROL for z/OS Administrator Guide.

FTM2TES THE SUBTASK NUMBER IS NOT DIGITAL

Explanation: An invalid subtask number has been specified in an operator modify CANCEL command.

The command is rejected.

Corrective Action: Enter a valid subtask number and reissue the command.
FTM2TFS THE SUBTASK NUMBER EXCEEDS THE TOTAL NUMBER OF THE ACTIVE SUBTASKS

**Explanation:** The subtask number entered in an operator modify CANCEL command is invalid, because it is greater than the total number of active subtasks.

For more information, see the File Transfer Monitor section in the Control-D chapter in the *INCONTROL for z/OS Administrator Guide*.

The command is rejected.

**Corrective Action:** Enter a valid subtask number in the operator modify CANCEL command and reissue the command.

FTM2TGS SUBTASK IS ALREADY NOT ACTIVE FOR IPA = ipAdd PORT = portNumber

**Explanation:** The File Transfer monitor subtask with the IP address and port number identified in this message is already inactive.

The command is rejected.

**Corrective Action:** No action is required.

FTM2THS SUBTASK IS TERMINATED BY SUSPEND FOR IPA = ipAdd PORT = portNumber

**Explanation:** The File Transfer monitor subtask with the IP address and port number identified in this message has been terminated by an operator modify SUSPEND command.

The subtask is terminated.

**Corrective Action:** No action is required.

FTM2TIS IPA SPECIFIED IN THE CANCEL COMMAND IS NOT CORRECT.

**Explanation:** An invalid IP address was specified in an operator modify CANCEL command.

The command is rejected.

**Corrective Action:** Enter a correct IP address in the CANCEL command and reissue the command.

FTM2TJS THE INTERVAL PARAMETER VALUE IS NOT DIGITAL.

**Explanation:** An invalid File Transfer monitor sleeping interval has been specified in an operator modify command.

The File Transfer monitor sleeping interval must be a 3-digit number from 1 through 999 seconds.

For more information, see the File Transfer Monitor section in the Control-D chapter in the *INCONTROL for z/OS Administrator Guide*.

The operator modify command is rejected.

**Corrective Action:** Enter a valid value for the File Transfer monitor sleeping interval and reissue the command.
FTM2TKI THE MODIFY COMMAND cmdText IS ACCEPTED

**Explanation:** This information message indicates that the `cmdText` modify command has been accepted by the File Transfer monitor.

**Corrective Action:** No action is required.

FTO messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages FTOT00 through FTOTxx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

FTOT01I TRANSFER START GROUP groupId REPORT repId

**Explanation:** This information message indicates that the transfer of the `repId` report in the `groupId` group from the Control-D Session Agent started.

**Corrective Action:** No action is required.

FTOT02I TRANSFER ENDED OK GROUP groupId, BYTES numBytes (trfr_rate BYTES/SEC), REPORT repId

**Explanation:** This information message indicates that the transfer of the `repId` report in the `groupId` group from the Control-D Session Agent ended successfully.

The variables in this message are:

- `groupId` - the identity of the group that contains `repId`
- `repId` - the identity of the report that was transferred
- `numBytes` - the number of bytes transferred
- `trfr_rate` - the transfer rate, in bytes per second

**Corrective Action:** No action is required.

FTOT04E FUNCTION func WAS SUPRESSED BY CTDSE27/CTDX027 EXIT GROUP groupId REPORT repId

**Explanation:** A File Transfer option function has been suppressed, either by Control-D Security Exit 27, or by Control-D User Exit 27.

The variables in this message are:
func - the File Transfer option function that was suppressed
groupId - the identity of the group that contains repId
repId - the identity of the report that was to be transferred

The repId report is not transferred.

**Corrective Action:** If you use Control-D Security Exit 27 to perform some special function instead of or in addition to the standard function, no intervention is required.
Otherwise, correct Control-D Security Exit 27 or Control-D User Exit 27.

FTOT05E UNEXPECTED RETURN CODE rc FOR FUNCTION func FROM CTDSE27/CTDX027 EXIT GROUP groupId REPORT repId

**Explanation:** An unexpected return code was returned by either Control-D User Exit 27 or Control-D Security Exit 27.

The variables in this message are:
- rc - the return code
- func - the function that was being performed when rc was returned
- groupId - the identity of the group that contains repId
- repId - the identity of the report on which the function was being performed

The transfer of repId from the Control-D Session Agent is terminated.

**Corrective Action:** Correct Control-D Security Exit 27 or Control-D User Exit 27.

FTOT06E ERROR IN FTOPARM errorText

**Explanation:** An error was found in the text of a member in the Control-D FTOPARM library.
The transfer of the current message from the Control-D Session Agent is terminated.

**Corrective Action:** Correct the problematic text in the Control-D FTOPARM library.

FTOT07E TRANSFER HAS BEEN TERMINATED GROUP groupId, BYTES numBytes (trfr_rate BYTES/SEC), REPORT repId

**Explanation:** The transfer of a report has been terminated.
The variables in this message are:
- groupId - the identity of the group that contains repId
- numBytes - the number of bytes transferred
- trfr_rate - the transfer rate, in bytes per second
- repId - the identity of the report that was being transferred

The transfer of repId is terminated.
Corrective Action: Examine accompanying messages that explain the reason for the termination of this transfer.

FTOT08E TRANSFER ENDED NOT OK GROUP groupId, BYTES numBytes (trfr_rate BYTES/SEC), REPORT repId

Explanation: The transfer of a report ended unsuccessfully (NOT OK).

The variables in this message are:

- groupId - the identity of the group that contains repId
- numBytes - the number of bytes transferred
- trfr_rate - the transfer rate, in bytes per second
- repId - the identity of the report that was being transferred

Corrective Action: Examine accompanying messages that explain the reason for the transfer ending NOT OK.
G - J

This group includes messages for the Control-M for z/OS (including Control-M/Assist, Control-M/Links for z/OS and Control-M/Restart), Control-D, Control-V and IOA products.

GIX messages

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

Messages GIX0 through GIX0xx

This group includes messages for the Control-D, Control-D/Image, and Control-D/Page on Demand products.

GIX000I CONTROL-V GLOBAL INDEX utilityName STARTED

Explanation: This information message indicates that the utilityName Global Index utility started.

Corrective Action: No action is required.

GIX001I CONTROL-V GLOBAL INDEX utilityName ENDED OK

Explanation: This information message indicates that the utilityName Global Index utility finished successfully.

Corrective Action: No action is required.

GIX003I USER PARAMETERS: parm_1. . . parm_n

Explanation: This information message identifies the input parameters for the CTVUPGDB or CTDDBPRT utility.

Corrective Action: No action is required.

GIX004E INVALID DO= FUNCTION SPECIFIED

Explanation: The function specified in a DO statement is not valid.

The current utility stops.

Corrective Action: Correct the function name in the DO statement and rerun the job.

GIX005E INVALID PARAMETER: parm

Explanation: The parm input parameter for the CTVUPGDB or CTDDBPRT utility is not valid.

The utility stops.
Corrective Action: Correct the invalid input parameter and rerun the job.

GI X006E REDUNDANT PARAMETER: parm
Explanation: The parm input parameter for the CTVUPGDB or CTDDBPRT utility has already been specified. The same parameter is specified twice.
The utility stops.
Corrective Action: Delete the extra input parameter from the JCL and rerun the job.

GI X007E ERROR IN PARAMETERS: FODATE IS HIGHER THAN TODATE
Explanation: The specified starting order date (FODATE) is later than the specified ending order date (TODATE).
The utility stops.
Corrective Action: Correct the value of either FODATE or TODATE in the JCL and rerun the job.

GI X008E INVALID DATE SPECIFIED: date
Explanation: Either the starting order date (FODATE) or the ending order date (TODATE) is invalid. The correct format is DD/MM/YY.
In this message, date is the problematic FODATE or TODATE date.
The utility stops.
Corrective Action: Correct the value of the incorrect ODATE parameter and rerun the job.

GI X00BE INVALID PARAMETERS
Explanation: A parameter in the SYSIN stream for the CTVUPGDB utility is invalid. The error was detected during analysis of input parameters.
The CTVUPGDB utility stops.
Corrective Action: Examine other messages relating to the CTVUPGDB utility to identify and fix the problem, and rerun the utility.

GI X00CE THE PARAMETER parm MUST BE SPECIFIED
Explanation: The parm input parameter for the CTVUPGDB utility is missing. The CTVUPGDB utility requires the parm parameter.
The CTVUPGDB utility stops.
Corrective Action: Insert the missing parameter in the JCL and rerun the job.

GI X00DE ERROR OPENING GLOBAL INDEX DATABASE. RC=rc
Explanation: The current utility or IOA application server could not open the Global Index database.
Global Index processing stops.
Corrective Action: Do the following:
If `rc` is 0 (meaning OK), examine the file names for the DAGIR and DAGIRI DD statements. Correct them, if necessary, and rerun the job.

If `rc` is not 0, for possible return code values and their meanings, see:

- if the Global Index is an IOA Access Method file, the GI XO10E message
- if the Global Index is a DB2 database, the CTDGI0S message

Examine the IOA log for messages clarifying the error. Correct the problem, and rerun the job.

If the problem persists, contact your INCONTROL administrator.

GI XO10E SET PATH FAILED. RC=`rc`

Explanation: The Global Index function could not establish a path for retrieving values. The required path does not exist in the Global Index database.

In this message, `rc` is the internal return code from the Global Index interface routine.

The explanations of the possible values of `rc` depend on whether the Global Index database is an IOA Access Method file or a DB2 database. These explanations appear in the following tables.

<table>
<thead>
<tr>
<th><code>rc</code></th>
<th>IOA Access Method Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>OK</td>
</tr>
<tr>
<td>04</td>
<td>End of file. Key not found.</td>

</tr>
</tbody>
</table>

The current utility stops.

**Corrective Action:** Do the following:

1. Examine the return code to identify the problem.
2. Examine the IOA log for messages clarifying the error.
3. Correct the problem.
4. Rerun the current utility or restart the IOA Application server.
5. If necessary, contact your INCONTROL administrator.

**GI X014E ERROR OPENING \{SORTIN | SORTOUT\} FILE**

**Explanation:** The current utility could not open the SORTIN or SORTOUT temporary sorting file. The current utility ends with a return code of 08.
**Corrective Action:** Examine the SYSPRINT and system log for other messages that describe the error, and correct the problem accordingly.

**GI0X015E ERROR ALLOCATING STORAGE FOR utilityName**

**Explanation:** While executing the utilityName utility, the GETMAIN request failed. The GETMAIN request fails when there is not enough storage.

The utilityName utility ends with a return code of 08.

**Corrective Action:** Increase the region size in the appropriate JCL JOB or EXEC statement and rerun the utility.

**GI0X016E ERROR FREEING STORAGE FOR utilityName RC=rc**

**Explanation:** While executing the utilityName utility, the FREEMAIN request failed. FREEMAIN failed to free storage that GETMAIN allocated.

For an explanation of the return code (rc) in this message, see the IBM manual MVS Programming: Authorized Assembler Services Guide.

The utilityName utility ends with a return code of 08.

**Corrective Action:** No action is required.

**GI0X017E DYNAMIC ALLOCATION OF fileName FAILED, RC=rc, REASON CODE=rsn**

**Explanation:** Dynamic allocation failed. This error occurred when the CTVUPGDB utility tried to allocate the fileName file.

For an explanation of the internal return code (rc) and the reason code (rsn) in this message, see the IBM manual MVS Programming: Authorized Assembler Services Guide.

The CTVUPGDB utility ends with a return code of 08.

**Corrective Action:** Use the information provided by the return and reason codes to correct the problem. If necessary, contact your system programmer.

**GI0X018E DYNAMIC DEALLOCATION OF fileName FAILED, RC=rc, REASON CODE=rsn**

**Explanation:** Dynamic deallocation failed. This error occurred when the CTVUPGDB utility tried to deallocate the fileName file.

For an explanation of the return code (rc) and the reason code (rsn) in this message, see the IBM manual MVS Programming: Authorized Assembler Services Guide.

The CTVUPGDB utility ends with a return code of 08.

**Corrective Action:** No action is required.

**GI0X019E INTERNAL ERROR - PATH TREE NOT FOUND**

**Explanation:** The internal routine of the CTVUPGDB utility that scans the index tree encountered an empty path.
The CTVUPGDB utility ends with a return code of 08.

**Corrective Action:** Contact your INCONTROL administrator.

**GIX020E INTERNAL ERROR - ORPHAN SUBINDEX**

**Explanation:** The internal routine of the CTVUPGDB utility that scans lower level index trees encountered an empty parent path.

The CTVUPGDB utility ends with a return code of 08.

**Corrective Action:** Contact your INCONTROL administrator.

**GIX022E SORT FAILED RC=rc**

**Explanation:** The sort routine invoked by the CTVUPGDB utility ended with errors. The CTVUPGDB utility issues this message whenever the sort routine it invokes ends with a return code other than 0.

For an explanation of the return code value `rc`, refer to the documentation for your SORT utility.

The CTVUPGDB utility ends with a return code of 08.

**Corrective Action:** Do the following:

1. Examine the return code `rc` to identify the problem.
2. Correct the problem.
3. Rerun the current utility or restart the IOA Application server.
4. If necessary, contact your system programmer for assistance.

**GIX023E CTVGDB FAILED RC=rc**

**Explanation:** The CTVGDB routine invoked by the CTVUPGDB utility ended with errors. The CTVUPGDB utility issues this message whenever the CTVGDB routine it invokes ends with a return code other than 0.

Possible values for the internal return code from CTVGDB (`rc`) are explained in the following table:

<table>
<thead>
<tr>
<th>rc</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>No values for subindex.</td>
</tr>
<tr>
<td>08</td>
<td>Error during open.</td>
</tr>
<tr>
<td>12</td>
<td>Error during close.</td>
</tr>
<tr>
<td>16</td>
<td>Error during GETMAIN operation.</td>
</tr>
<tr>
<td>20</td>
<td>Error during FREEMAIN operation.</td>
</tr>
<tr>
<td>24</td>
<td>Error during dynamic allocation.</td>
</tr>
<tr>
<td>28</td>
<td>Error during dynamic deallocation.</td>
</tr>
</tbody>
</table>

1741
The CTVUPGDB utility ends with a return code of 08.

**Corrective Action:** Do the following:

1. Examine the IOA Log file and the relevant job log for messages clarifying the source of the error.
2. Correct the error and rerun the CTVUPGDB utility.
3. If necessary, contact your INCONTROL administrator.

**GI X024E parm PARAMETER INVALID. ONLY YES OR NO IS VALID**

**Explanation:** The value of the `parm` input parameter is invalid. The value of the `parm` parameter must be YES or NO.

The current utility stops.

**Corrective Action:** Correct `parm` in the JCL and rerun the utility.

**GI X025W MAXIMUM NUMBER OF PROCESSED INDEXES procIndex REACHED. PROCESSING STOPPED**

**Explanation:** The CTVUPGDB utility tried to add another main index to the Global Index database when it had already added the maximum number for this run. The MAXINDX parameter defines the maximum number of indexes that may be added to the Global Index database in each run of the CTVUPGDB utility.
The utility adds MAXINDX main indexes and ends with a return code of 04. Other indexes will be added during the next run of the CTVUPGDB utility.

**Corrective Action:** Increase the value of the MAXINDX parameter and run the CTVUPGDB utility again.

**GI026E parm PARAMETER INVALID. ONLY YES, NO OR ALL IS VALID**

**Explanation:** The value of the parm input parameter is invalid.

Valid values for the parm parameter are:

- YES
- NO
- ALL

The current utility stops.

**Corrective Action:** Correct the parm input parameter in the JCL, and rerun the utility.

**GI027E JOBID PARAMETER INVALID. SHOULD BE Jnnnnn or Jnnnnnnn**

**Explanation:** The JOBID input parameter is invalid. The format of the parameter name must be the character J followed by five or seven digits, depending on how your system is set up.

The utility stops.

**Corrective Action:** Correct the JOBID input parameter in the JCL, and rerun the utility.

**GI028W INDEX EXISTS IN GLOBAL INDEX DATABASE, USE FORCE PARAMETER TO ADD IT AGAIN**

**Explanation:** The CTVUPGDB utility is trying to add an index that is already in the Global Index database. The GI029I message, which follows the current message, provides details about the index that caused the error.

The index is not processed.

**Corrective Action:** To replace values in an existing index, run the CTVUPGDB utility with the FORCE input parameter set to YES.

**GI029I USER userName, REPORT reportName, JOBNAME jobName, JOBID jobId, ODATE orderDate**

**Explanation:** This information message provides detailed information about the situation that caused the GI028W message to be issued.

**Corrective Action:** No action is required.

**GI02AI INDEX: index DSNAME: dsn**

**Explanation:** This information message is issued by the CTVUPGDB utility before the GI017E error message and displays the index name and data set name of the index file for which the dynamic allocation error occurs.

The variables in this message are:
- **index** - the index name of the problematic index file
- **dsn** - the data set name of the problematic index file

The CTVUPGDB utility ends with a return code of 08.

**Corrective Action:** See the description of the GI017E message.

**GI02BE CHKPTID MEMBER memName IS IN USE**

**Explanation:** The *memName* CHECKPOINT member is in use by the CTVUPGDB utility, which has been invoked by another user.

The CTVUPGDB utility ends with a return code of 00.

**Corrective Action:** Try to run the utility again later.

**GI02CI WAITING FOR GLOBAL INDEX DATABASE index**

**Explanation:** The *index* Global Index file is being used by another task for writing data.

The CTVUPGDB utility checks the Global Index file every 30 seconds until its use by the other task ends and the file is released. The CTVUPGDB utility then starts.

**Corrective Action:** No action is required.

**GI02DE LIST=DB2 OR LIST=ONLY SHOULD BE SPECIFIED**

**Explanation:** The required LIST parameter is not specified or an incorrect value is specified.

The utility stops.

**Corrective Action:** Add the missing LIST parameter or set it to a valid value then rerun the job.

**GI02EW PATH NOT FOUND IN CTDGI DB2: pathName**

**Explanation:** The *pathName* Index path was not found in the CTDGI DB2 member, which contains a list of index path names.

This message is only issued if the LIST input parameter of the CTVUPGDB utility is set to DB2.

The CTVUPGDB utility does not unload the values of the *pathName* Index path into the sequential file from which they can be copied into the DB2 table.

**Corrective Action:** No action is required.

**GI02FE RECORD KEY vsaKey**

**Explanation:** This information message follows the CTD908S message. The GI02FE message identifies the VSA key of the record that was being accessed when the error occurred that caused the CTD908S message to be issued.

In this message, *vsaKey* is the VSA key of the problematic record.

The CTVUPGDB utility ends with a return code of 08.

**Corrective Action:** No action is required.
GI0031I  TO GLOBAL INDEX DATABASE WERE ADDED: reportsQuantity REPORTS, indexQuantity INDEXES, indexValueNum INDEX VALUES

Explanation: This information message identifies the data that was added to the Global Index database.
Corrective Action: No action is required.

GI0034S  INTERNAL ERROR CREATING TABLE tableName

Explanation: An internal error occurred in the CTVUPGDB utility. CTVUPGDB did not find the SYSDATA entry in the internal table.
The CTVUPGDB utility ends with a return code of 8.
Corrective Action: Contact your INCONTROL administrator.

GI0035E  INDEX tableName HAS INCORRECT LENGTH

Explanation: The CTVUPGDB utility tried to add a path that was already in the Global Index database with different length parameters. This message occurs during an attempt to change the length of the index value in the definition of the decollation mission for a path that is already in the Global Index database.
The CTVUPGDB utility continues without adding the values in the indicated path to the Global Index database.
Corrective Action: Either change the length of the index value in the definition of the decollation mission that is causing the incorrect path or delete the old path from the Global Index database.

GI0036I  GLOBAL INDEX HOUSEKEEPING UTILITY STARTED

Explanation: This information message indicates that the CTVGI CL Global Index housekeeping utility started.
Corrective Action: No action is required.

GI0037I  GLOBAL INDEX HOUSEKEEPING UTILITY ENDED

Explanation: This information message indicates that the CTVGI CL Global Index housekeeping utility ended.
Corrective Action: No action is required.

GI0038I  SEARCHING THE ACTIVE AND MIGRATED USER FILES

Explanation: This information message indicates that the CTVGI CL Global Index housekeeping utility started searching ACTIVE and MIGRATED user files. This message makes it easier to calculate how long it takes to run each stage of the housekeeping utility.
Corrective Action: No action is required.
GI039I DELETING VSA ENTRIES

**Explanation:** This information message indicates that the CTVGICL Global Index housekeeping utility started deleting VSA entries from the Global Index database. This message makes it easier to calculate how long it takes to run each stage of the housekeeping utility.

**Corrective Action:** No action is required.

GI03CE ERROR IN PARAMETERS

**Explanation:** The CTVGICL Global Index housekeeping utility detected one or more invalid parameters. CTVGICL detected the error while it was analyzing parameters.

The CTVGICL utility stops.

**Corrective Action:** Examine other messages relating to the job to identify and correct any errors, and rerun the utility.

GI03DE IOAMEM ERROR func memName, RC rc, REASON CODE rsn

**Explanation:** The CTVUPGDB Global Index utility could not read the specified library member of the CTD PARM library. CTVUPGDB was trying to read GLOBIDB or the member specified by the CHKPTID input parameter to see if the member needed to be restarted from the checkpoint as a result of an earlier abnormal ending.

The CTVUPGDB utility starts from the beginning to try to write the member.

**Corrective Action:** If there are no other messages, and the utility ended normally, no action is required. This message may be triggered by the first run of the CTVUPGDB utility. Otherwise, examine the other error messages and respond accordingly.

If the problem persists, report the information returned in the message to your INCONTROL administrator.

GI03EI INDEX PATH: pathName

**Explanation:** This information message is issued for each loaded Index Path by loading the Global Index immediately during decollation mission run.

In this message, `pathName` is the name of the loaded Index Path.

**Corrective Action:** No action is required.

GI03FE DELRPT FUNCTION FAILED. RC=rc

**Explanation:** The CTVGICL Global Index utility could not finish processing the DELRPT function. The CTVGICL utility invokes the DELRPT function to delete reports.

In this message, `rc` is the internal return code from the Global Index interface routine.

The explanations of the possible values of `rc` depend on whether the Global Index database is an IOA Access Method file or a DB2 database. These explanations appear in the following tables.

<table>
<thead>
<tr>
<th>rc</th>
<th>IOA Access Method Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>OK</td>
</tr>
</tbody>
</table>
### IOA Access Method Explanation

</table>
The CTVGICL utility stops.

**Corrective Action:** Do the following:
1. Examine the IOA Log file and the relevant job log for messages clarifying the source of the error.
2. Correct the error.
3. Rerun the CTVGICL utility.
4. If necessary contact your INCONTROL administrator.

**GI03GI reportsQuantity REPORTS WERE SELECTED FROM file USER FILE**

**Explanation:** This information message indicates the number of reports selected for checking from the ACTIVE or MIGRATED user file by the CTVGICHK utility.

The variables in the message are:
- `reportsQuantity` - the number of selected reports.
- `file` - the type of Control-D user file. Can be ACTIVE or MIGRATED.

**Corrective Action:** No action is required.

**GI03HW NO REPORTS WERE SELECTED**

**Explanation:** No reports were selected by the CTVGICHK utility for checking.

The CTVGICHK utility ends with a return code of 4.

**Corrective Action:** Correct the input selection parameters in the JCL member and rerun the utility.

**GI040E DELPATH FUNCTION FAILED. RC=rc**

**Explanation:** The CTVGICL Global Index housekeeping utility could not finish processing the DELPATH function. The CTVGICL utility invokes the DELPATH function to delete paths.

In this message, `rc` is the internal return code from the Global Index interface routine. Possible values are explained in the following table.

<table>
<thead>
<tr>
<th>rc</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>OK</td>
</tr>
</tbody>
</table>

</tbody>
</table>

The CTVGICL utility stops.

**Corrective Action:** Do the following:

1. Examine the IOA Log file and the relevant job log for messages clarifying the source of the error.
2. Correct the error.
3. Rerun the CTVGICL utility.
4. If necessary contact your INCONTROL administrator.

**GI X041I** USER PARAMETERS FOR GLOBAL INDEX CLEAR *parmList*

**Explanation:** This information message displays the parameters specified for the CTVGICL Global Index housekeeping utility.

**Corrective Action:** No action is required.

**GI X042I** PATH DELETED: *pathName*

**Explanation:** This information message indicates that the CTVGICL Global Index utility deleted the *pathName* path from the Global Index database.

**Corrective Action:** No action is required.
GI043E ERROR IN DELPATH FOR pathName RC rc

Explanation: The DELPATH Global Index function could not delete the pathName path. The CTVGICL utility invokes the DELPATH function to delete paths. A possible cause for this error is that the PATH to be deleted was in use when DELPATH tried to delete it.

The variables in this message are:

- pathName - the problematic path
- rc - the return code

Valid values are shown in the following table:

<table>
<thead>
<tr>
<th>rc</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>OK</td>
</tr>
<tr>
<td>04</td>
<td>End of file. Key not found.</td>
</tr>
<tr>
<td>12</td>
<td>Invalid function.</td>
</tr>
<tr>
<td>20</td>
<td>Not enough storage.</td>
</tr>
<tr>
<td>24</td>
<td>Not enough storage in GIR file.</td>
</tr>
<tr>
<td>28</td>
<td>Not enough storage in GIRI file.</td>
</tr>
<tr>
<td>32</td>
<td>There is no DBO block.</td>
</tr>
<tr>
<td>40</td>
<td>Invalid LRECL or KEYLEN in data or index file. Invalid input parameter.</td>
</tr>
<tr>
<td>48</td>
<td>SETPATH was not issued.</td>
</tr>
<tr>
<td>100 through 199</td>
<td>DBS error codes.</td>
</tr>
<tr>
<td>200 through 299</td>
<td>DBI error codes.</td>
</tr>
</tbody>
</table>

DELPATH skips the path that caused the error and continues to delete the next path.

Corrective Action: Do the following:

1. Examine the IOA Log file and the relevant job log for messages clarifying the source of the error.
2. Correct the error.
3. Rerun the CTVGICL utility.
4. If necessary contact your INCONTROL administrator.
GI0X044E parm PARAMETER INVALID. SHOULD BE AFTER PATH PARAMETER

**Explanation:** The parm input parameter for the CTVUPGDB Global Index housekeeping utility is in the wrong position. The ALT and BASELEN parameters may be specified only once each and must appear after the PATH parameter because they refer to a specific path.

The CTVUPGDB utility stops.

**Corrective Action:** Correct the input parameters in the JCL and rerun the job.

GI0X045W NO RECORDS WERE ADDED TO THE GLOBAL INDEX DATABASE

**Explanation:** The CTVUPGDB Global Index housekeeping utility did not add any records to the Global Index database.

The CTVUPGDB utility continues processing.

**Corrective Action:** To add records to the Global Index database, correct the input parameters in the JCL for the CTVUPGDB utility and rerun it.

GI0X046I LIST OF DELETED REPORTS:

**Explanation:** This information message is the header for a list of reports that the DELRPT function of the CTVGICL Global Index housekeeping utility deleted. The GI0X046I message is followed by one or more instances of the GI0X047I message.

**Corrective Action:** No action is required.

GI0X047I USER userName JOBNAME jobName KEY vsaKey - entryNum ENTRIES

**Explanation:** This information message identifies a report that was deleted by the CTVGICL utility. The first GI0X047I message in a series is preceded by either the GI0X046I or the GI0X041I message.

The variables in this message are:
- **userName** - the identity of the user of the report
- **jobName** - the identity of the job
- **vsaKey** - the identity of the VSA record
- **entryNum** - the number of deleted Global Index entries related to the specified report

**Corrective Action:** No action is required.

GI0X048I FROM GLOBAL INDEX DATABASE WERE DELETED: nr REPORTS, ne ENTRIES.

**Explanation:** This information message provides the number of reports and Global Index entries deleted by the current run of the CTVGICL utility.

The variables in this message are:
nr - the number of reports deleted
ne - the number of index entries deleted

Corrective Action: No action is required.

GIX049E file_typ USER FILE READ ERROR, RC=rc

Explanation: An error occurred while reading the User report list file.

The variables in this message are:

- file_typ - the type of User report list file, that is, ACTIVE or MIGRATED
- rc - the internal return code from the IOA Access Method interface routine

Valid values for rc are:

<table>

### GIX04AE GLOBAL INDEX READ ERROR, RC=rc

**Explanation:** An error occurred while reading data from the Global Index database.

In this message, rc is the return code from the Global Index interface routine.

The explanations of the possible values of rc depend on whether the Global Index database is an IOA Access Method file or a DB2 database. These explanations appear in the following tables.

<table>
<thead>
<tr>
<th>rc</th>
<th>IOA Access Method Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>OK</td>
</tr>
<tr>
<td>04</td>
<td>End of file. Key not found.</td>
</tr>
</tbody>
</table>

The CTVGI CL utility ends with a return code of 16.

**Corrective Action:** Do the following:

1. Examine the IOA Log file and the relevant job log for messages clarifying the source of the error.
2. Correct the error and rerun the CTVGI CL utility.
3. If necessary contact your INCONTROL administrator.

1756
The Global Index request is not performed.

**Corrective Action:** Do the following:

1. Examine the IOA Log file and the relevant job log for messages clarifying the source of the error.
2. Correct the error.
3. Restart the IOA application server or rerun the job.
4. If necessary contact your INCONTROL administrator.

**GI X04BE DELETE REPORT FROM DB2 TABLE tableName FAILED, RC=rc**

**Explanation:** An attempt to delete report entries from a DB2 table failed.

The variables in this message are:
- `tableName` - the identity of the DB2 table
- `rc` - the internal return code from the DB2 Global Index interface routine

Possible values for `rc` are:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
<td>Invalid function</td>
</tr>
<tr>
<td>20</td>
<td>Not enough storage</td>
</tr>
<tr>

</tr>
<tr>
<td>68</td>
<td>Duplicate parameter found in the CTDGI DB2 member</td>
</tr>
</tbody>
</table>
Return Code | Explanation
--- | ---
72 | More than 10 fields found in a PATH description in the CTDGIDB2 member.
76 | DB2 open error
80 | Accessing path not present in the CTDGIDB2 member
84 | SQL error
85 | SQL error if time-out occurs
88 | Error in loading the DB2 interface module

The CTVGICL utility ends with a return code of 16.

**Corrective Action:** Do the following:
1. Examine the IOA Log file and the relevant job log for messages clarifying the source of the error.
2. Correct the error.
3. Rerun the CTVGICL utility.
4. If necessary contact your INCONTROL administrator.

**GIX04CW REQUEST IS REJECTED. PLEASE TRY AGAIN LATER**

**Explanation:** A request to retrieve data from the Global Index DB2 database is rejected because the corresponding DB2 table is in use by another job that is loading or deleting data. This message is directed to the WebAccess user who issued the request.

The Global Index request is not performed.

**Corrective Action:** Reissue the request later.

**GIX04DE DELVAL FUNCTION FAILED, RC=rc**

**Explanation:** An error occurred while deleting an index value from the Global Index IOA Access Method database file.

In this message, rc is the internal return code from the Global Index interface routine. Possible values are explained in the following table.

<table>
<thead>
<tr>
<th>rc</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>OK</td>
</tr>
<tr>
<td>04</td>
<td>End of file. Key not found.</td>
</tr>
<tr>
<td>12</td>
<td>Invalid function.</td>
</tr>
</tbody>
</table>
### INCONTROL for z/OS Messages Manual

</tr>
</tbody>
</table>

The CTVGICL utility ends with a return code of 08.

**Corrective Action:** Do the following:

1. Search the IOA Log file and the relevant job log for messages clarifying the source of the error.
2. Correct the error.
3. Rerun the CTVGICL utility.
4. If necessary contact your INCONTROL administrator.

**GI0X04EE PARAMETER DELPATH IS MISSING FOR DELVAL FUNCTION**

**Explanation:** The CTVGICL utility detected that the DO Control-D input parameter was set to DELVAL, but the DELPATH input parameter that is mandatory in this case was not found.

The CTVGICL utility ends with a return code of 08.

**Corrective Action:** Insert the DELPATH parameter in the JCL and rerun the job.

**GI0X04FE ERROR DELETING VALUE: indexValue, RC=rc**

**Explanation:** An error occurred while deleting an index value from the Global Index IOA Access Method database file.

The variables in this message are:
indexValue - the problematic index value
rc - the internal return code from the Global Index interface routine.

Possible values for rc are:

<table>
<thead>
<tr>
<th>rc</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>OK</td>
</tr>
<tr>
<td>04</td>
<td>End of file. Key not found.</td>

<tr>
<td>100  through 199</td>
<td>DBS error codes.</td>
</tr>
<tr>
<td>200  through 299</td>
<td>DBI error codes.</td>
</tr>
</tbody>
</table>

The CTVGICL utility ends with a return code of 08.

Corrective Action: Do the following:
1. Examine the IOA Log file and the relevant job log for messages clarifying the source of the error.
2. Correct the error.
3. Rerun the CTVGICL utility.
4. If necessary contact your INCONTROL administrator.

GI X04GI VALUE DELETED: indexValue

Explanation: This information message identifies the index value which is being deleted when you invoke the DO=DELVAL function of the CTVGICL utility.

In this message, indexValue is the identity of the index value that is being deleted.
Corrective Action: No action is required.

GI X041I FROM DB2TABLE tableName

Explanation: This information message identifies the DB2 table name from which the reports were deleted. This message is followed by one or several instances of messages GI X047I.

Corrective Action: No action is required.

GI X04J E REQUEST REJECTED. INDEX NAME/VALUE CANNOT BE SPECIFIED AS A MASK

Explanation: The index name or index value specified in the Control-D Web/Access Filter window contains a mask character (* or ?).

The request is rejected.

Corrective Action: Specify the index name or index value in the Filter in full, without any mask character, and reissue the request.

GI X04KE DB2 TABLE tableName READ ERROR, RC=rc

Explanation: An attempt to read data from a DB2 table failed.

The variables in this message are:

- tableName - the identity of the DB2 table
- rc - the internal return code from the DB2 Global Index interface routine

Possible values for rc are:

<table>
<thead>
<tr>
<th>rc</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>76</td>
<td>DB2 open error</td>
</tr>
<tr>
<td>84</td>
<td>SQL error</td>
</tr>
<tr>
<td>85</td>
<td>SQL error if timeout occurred</td>
</tr>
</tbody>
</table>

The CTVGICL utility skips this DB2 table and continues to work with other tables specified in the parameters.

Corrective Action: Do the following:

1. Examine the IOA Log file for messages clarifying the source of the error.
2. Correct the error and if the specified DB2 table should be cleaned, rerun the utility

GI X04LI FROM DB2 TABLE tableName WERE DELETED number ENTRIES

Explanation: This information message provides the number of entries deleted from the tableName DB2 table.

The variables in this message are:
**INCONTROL for z/OS Messages Manual**

- **tableName** - the name of the DB2 table
- **number** - the number of deleted entries

**Corrective Action:** No action is required.

**GI X04NI** USER *userName* JOBNAME *jobName* KEY *key* - entry

**Explanation:** This information message identifies a report that was deleted by the CTVGICL utility. The variables in this message are:

- **userName** - the identity of the user of the deleted report
- **jobName** - the identity of the job that created the deleted report
- **key - entry** - the identity of the VSA record key of the deleted report

**Corrective Action:** No action is required.

**GTM messages**

This group includes messages for the IOA (infrastructure) product.

**Messages GTM0 through GTM0xx**

This group includes messages for the IOA (infrastructure) product.

**GTM001W** *taskName*: COMMUNICATION IS NOT ACTIVE

**Explanation:** Communication with the Enterprise Manager gateway was disconnected. IOAGATE reported the disconnection to the application server of Control-M. The *taskName* task of the application server issues this message.

The application server waits until communication is connected again.

**Corrective Action:** Check IOAGATE messages to identify and fix the communication problem.

**GTM002W** *taskName*: NO RESPONSE RECEIVED WITHIN EXPECTED TIME INTERVAL

**Explanation:** The Enterprise Manager gateway did not respond to an IOAGATE transmission within the time allowed.

The Control-M application server waits for a message from the Enterprise Controlstation gateway.

**Corrective Action:** Check the Enterprise Manager gateway to find out why it is not responding.

**GTM003E** *taskName*: COMMUNICATION SLOWDOWN ENCOUNTERED

**Explanation:** IOAGATE buffers are full. IOAGATE can not accept any new messages from the Control-M application server. IOAGATE informs the application server. The *taskName* task of the application server tries to transmit again several times and, if it does not succeed, issues this message.
The Control-M application server stops.

**Corrective Action:** Check IOAGATE messages to try to identify and fix the problem. If necessary, contact BMC Software Customer Support.

GTM004E taskName : MBX INTERNAL ERROR ENCOUNTERED. FUNCTION: funcName RC=rc

**Explanation:** An internal error occurred in the MBX API.

The Control-M application server terminates.

**Corrective Action:** Contact BMC Software Customer Support.

GTW messages

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

Messages GTWG00 through GTWGxx

This group includes messages for the Control-M for z/OS, Control-M/Assist, Control-M/Links for z/OS, and Control-M/Restart products.

**GTWG00I** ENTERPRISE/CS MAINFRAME GATEWAY STARTED

**Explanation:** This information message indicates a normal start of MVS Gateway for Enterprise Controlstation.

**Corrective Action:** No action is required.

**GTWG01I** ENTERPRISE/CS MAINFRAME GATEWAY TRACE LEVEL IS SET TO debugLevel

**Explanation:** This information message indicates that the Enterprise Controlstation Mainframe Gateway DEBUG level was set by an operator modify command (F).

The TRACE level is set to a new level. Each TRACE level activates the trace option on different components of the Enterprise Controlstation Mainframe Gateway.

**Corrective Action:** No action is required.

**GTWG02E** ENTERPRISE/CS MAINFRAME GATEWAY NOT APF-AUTHORIZED

**Explanation:** The Enterprise Controlstation Mainframe Gateway is not APF-authorized. The CTWGTW module is not in an APF-authorized library or does not have the AC=1 attribute.

The Enterprise Controlstation Mainframe Gateway shuts down.

**Corrective Action:** Either add the library name in which CTWGTW resides to the IEAAPF00 member in SYS1.PARMLIB, or relink the module with the AC=1 attribute.
GTWG03E INVALID MODIFY PARAMETER. VALID PARAMETERS ARE:

**Explanation:** An operator modify command (F) passed an erroneous parameter to the Enterprise Controlstation Mainframe Gateway. One or more GTWG25I messages are displayed on the operator console after this message, each containing a valid modify parameter.

The modify command is rejected.

**Corrective Action:** Enter a valid modify parameter.

GTWG04E BLDL/ATTACH FAILED FOR TASK `modName`

**Explanation:** Initialization of an IOAGATE internal task failed. The system code indicating the exact reason can be found in the system log. Possible causes are:

- The `modName` module is not in the IOAGATE Load library.
- Insufficient storage is available for the IOAGATE.

The IOAGATE shuts down.

**Corrective Action:** Call your system programmer for assistance. If necessary, increase the IOAGATE REGION size.

GTWG05E UNRECOVERABLE ERROR ENCOUNTERED

**Explanation:** An unrecoverable error occurred in the operation of the Enterprise Controlstation Mainframe Gateway. The IOA Log, or the Enterprise Controlstation Mainframe Gateway JES messages file or SYSPRINT file, should contain a message with more details about the error. See also, GTWA01W.

The Enterprise Controlstation Mainframe Gateway shuts down.

**Corrective Action:** Call your system programmer for assistance. If the problem is not resolved, call BMC Software Customer Support for assistance.

GTWG06E ONE OF THE SUBTASKS HAS ABENDED

**Explanation:** One of MVS Gateway for Enterprise Controlstation's internal subtasks has abended.

MVS Gateway for Enterprise Controlstation shuts down with user abend 0006. A dump of the abending task is included in the SYSABEND output file.

**Corrective Action:** Call your system programmer for assistance. If the problem is not resolved, contact BMC Software Customer Support.

GTWG07I SHUT DOWN UPON REQUEST FROM OPERATOR

**Explanation:** This information message confirms that an operator command (P) was issued, requesting shutdown of MVS Gateway for Enterprise Controlstation. This message is followed by message GTWG20I, indicating completion of the shutdown.

MVS Gateway for Enterprise Controlstation starts to shut down.

**Corrective Action:** No action is required.
GTWG10E TRACE LEVEL MUST BE A NUMBER BETWEEN 0 AND 255

**Explanation:** An invalid TRACE level was entered, either in the operator modify command (F) or in the operator start command (S). When activating the Enterprise Controlstation trace facilities, specify a number from 0 through 255, inclusive, for the TRACE level. 0 specifies no tracing.

**Corrective Action:** Issue the command again with the correct TRACE level. The required TRACE level should be supplied by BMC Software Customer Support.

IOAGATE continues executing

GTWG11I SERVICE ID "id" IS {ENABLED | DISABLED}

**Explanation:** This information message confirms the current enable or disable status of service ID, after the operator has issued an operator modify command (F) that enables or disables it.

**Corrective Action:** No action is required.

GTWG20I CONTROL-M NJE GATEWAY SHUTTING DOWN

**Explanation:** This information message is issued when the Control-M NJE Gateway shuts down, either as a result of an operator command (P), or due to internal Control-M NJE Gateway events. The Control-M NJE Gateway log, the Control-M NJE Gateway JES messages file, or the SYSPRINT file usually contain additional messages concerning the reason for the shutdown.

The Control-M NJE Gateway shuts down.

**Corrective Action:** No action is required.

GTWG21S CONTROL-M NJE GATEWAY ENDED WITH ERRORS

**Explanation:** The Control-M NJE Gateway ended with an error. The Control-M NJE Gateway log, the Control-M NJE Gateway messages file, or the SYSPRINT file usually contain additional messages about the specific error.

The Control-M NJE Gateway shuts down.

**Corrective Action:** Check the Control-M NJE Gateway log or the system log for the reason. Call your system programmer for assistance if needed. Try to restart the Control-M NJE Gateway.

GTWG23I CONTROL-M NJE GATEWAY INTERVAL IS SET TO nn SECONDS

**Explanation:** This information message displays the current NJE Gateway sleeping interval after it is set by an operator Modify command (F).

The NJE Gateway wakes up every nn seconds to check what it must do.

**Corrective Action:** No action is required.

GTWG24E INTERVAL MUST BE A TWO-DIGIT NUMBER BETWEEN 03 AND 99 SECONDS

**Explanation:** Invalid Enterprise Controlstation Mainframe Gateway sleeping interval specified in an operator modify command (F). The Enterprise Controlstation Mainframe Gateway sleeping interval must be a 2-digit number from 03 to 99 seconds.
The modify command is rejected.

**Corrective Action:** Enter a valid sleeping interval.

**GTWG25I validParm**

**Explanation:** This information message accompanies message GTWG03E, which indicates that an invalid modify parameter was specified. This message contains a valid modify parameter. This message may appear more than once. Each occurrence lists another valid modify parameter.

**Corrective Action:** No action is required.

**GTWG30E CTGPUT FAILED. TASKID=taskId PUTID=putId RC=rc**

**Explanation:** Control-M NJE Gateway detected an internal error. Internal CTWPUT operation that was issued by PUTID putId, under subtask number taskId, failed with return code rc. If the return code was 20, a GETMAIN failure occurred above the 16M line.

For some errors, Control-M NJE Gateway shuts down. For other errors, operation continues.

**Corrective Action:** If Control-M NJE Gateway shuts down, contact BMC Software Customer Support. If rc was 20, increase the region size.

**GTWG31W YOUR IOA GATEWAY IS ALREADY ACTIVE. QNAME qName**

**Explanation:** Highlighted, unrollable message.

An attempt was made to start an Control-M NJE Gateway that was already active. Two Control-M NJE Gateways with the same QNAME cannot run at the same time in the same MVS. If resources are shared by more than one MVS, this restriction applies to every MVS that shares these resources.

The newly started Control-M NJE Gateway shuts down.

**Corrective Action:** No action is required.

**GTWG34E UNABLE TO OPEN DACONN PARAMETER FILE**

**Explanation:** The Control-M NJE Gateway main task failed to open the DACONN DD statement at startup. The DD statement is probably missing.

The started NJE Gateway task stops.

**Corrective Action:** Correct the problem, and restart the job.

**GTWG35E EMPTY PARAMETER FILE**

**Explanation:** The Control-M NJE Gateway main task read an empty parameter file at startup.

The started NJE Gateway task stops.

**Corrective Action:** Correct the problem, and restart the job.

**GTWG36E INVALID CARD nnnn. DATA=data**

**Explanation:** At startup, the specified statement in the parameter file was not valid.

The started Control-M NJE Gateway task stops.
**Corrective Action:** Correct the problem, and restart the job.

GTWG37E DUPLICATE CARD \textit{nnnn}. DATA=\textit{data}

**Explanation:** At startup, the specified statement in the parameter file occurred twice. The started Control-M NJE Gateway task stops.

**Corrective Action:** Correct the problem, and restart the job.

GTWG38E INCOMPLETE MFCONNECTION. THREE CARDS MUST BE PROVIDED

**Explanation:** At startup, the MFCONNECTION was defined incorrectly. The MFCONNECTION description must include one MFCONNECTION statement, and two HOST descriptor statements. The started Control-M NJE Gateway task stops.

**Corrective Action:** Review installation instructions, correct the problem, and restart the job.

GTWG39E INVALID HOST DESCRIPTOR CARD \textit{nnnn}. DATA=\textit{data}

**Explanation:** At startup, the MFCONNECTION definition was not valid. Either the syntax of one of the two statements following MFCONNECTION is not valid, or the definition names a host system that was not specified. The started Control-M NJE Gateway task stops.

**Corrective Action:** Review installation instructions, correct the problem, and restart the job.

GTWG40E INVALID MFCONNECTION CARD \textit{nnnn}. DATA=\textit{data}

**Explanation:** At startup, the syntax of the MFCONNECTION statement was not valid. The started Control-M NJE Gateway task stops.

**Corrective Action:** Review installation instructions, correct the problem, and restart the job.

GTWG41E DUPLICATE MFCONNECTION CARD \textit{nnnn}. DATA=\textit{data}

**Explanation:** At startup, the MFCONNECTION statement in the specified statement was already defined earlier. During comparison of MFCONNECTION statements, the order of the host arguments on the statement is not significant. The started Control-M NJE Gateway task stops.

**Corrective Action:** Correct the problem, and restart the job.

GTWG42E MAINFRAME OR WORKSTATION CONNECTION MISSING

**Explanation:** At startup, there was no MFCONNECTION definition in the parameter file. The parameter file must contain at least one MFCONNECTION definition. The started Control-M NJE Gateway task stops.

**Corrective Action:** Correct the problem, and restart the job.
GTWG43E INVALID EXEC PARM

**Explanation:** At startup, the EXEC PGM parameter specified in the started task of the NJE Gateway was not valid.

The started Control-M NJE Gateway task stops.

**Corrective Action:** Review installation instructions, correct the problem, and restart the job.

GTWG44E HOST AND PARTNER NAMES CANNOT BE THE SAME

**Explanation:** At startup, the HOST and CONNECT initialization parameters were identical. The HOST parameter identifies the local host, and the CONNECT parameter identifies a partner host. They cannot be the same.

The main Control-M NJE Gateway task stops.

**Corrective Action:** Correct the HOST and CONNECT parameters, and restart the job.

GTWG45E ECAGATE INTERNAL ERROR. CODE=rc, USER=userId

**Explanation:** Due to an internal error, an internal call (ECAPUT) failed with return code rc. In this message, userId identifies the user from whom the message was received.

The message causing the error is ignored.

**Corrective Action:** Contact BMC Software Customer Support.

**ILY messages**

This group includes messages for the Control-M for z/OS and Control-D products.

**Messages ILY400 through ILY4xx**

This group includes messages for the Control-M for z/OS and Control-D products.

ILY411S OPEN OF DDNAME "DAPROG" FAILED.

**Explanation:** This message is issued by the New Day procedure. The data set described by the DAPROG DD statement contains a list of programs to be activated by the New Day procedure. Possible causes are:

- The DAPROG DD statement is missing.
- The data set described by the DAPROG DD statement cannot be opened for sequential read.

For more details, see the chapter that discusses implementation issues in the appropriate user guide.

The New Day procedure stops executing.

**Corrective Action:** Correct the JCL for the job and rerun it.
ILY413E PROGRAM pgm WAS NOT FOUND

Explanation: The pgm program was not in the load list of the Daily subsystem. The DAPROG DD statement describes a data set that contains a list of programs to be activated as part of the Daily subsystem.

The Daily subsystem terminates with errors.

Corrective Action: Check whether IOA Load library is concatenated as STEPLIB to the Daily subsystem. Correct the JCL and consult your system programmer about running the Daily subsystem again.

ILY414E INVALID CONDITION CODE FOR PROGRAM pgm

Explanation: The pgm Control-M or Control-D internal program that was activated by New Day processing finished with a return code higher than the maximum allowed in the program list. Positions 10-11 in the program list indicate the highest return code that is still considered OK for this program.

Corrective Action: No action is required.

ILY415I PROGRAM pgm IS BEING INVOKED

Explanation: This information message indicates that the pgm internal Control-M or Control-D program was activated by New Day processing.

Corrective Action: No action is required.

ILY416I {CTMILY | CTDILY} ENDED

Explanation: This information message indicates that New Day processing is finished.

Corrective Action: No action is required.

ILY417E UNRECOGNIZED PARAMETER ON EXEC STATEMENT: expression

Explanation: The CTMTDAY procedure was executed with an unsupported or invalid NEWDAY parameter value expression. (For more information on the Control-M CTMTDAY procedure, see the INCONTROL for z/OS Administrator Guide, “CTM,” “New Day Procedure Flow.”)

The CTMTDAY procedure is not executed.

Corrective Action: Correct and re-execute the CTMTDAY procedure.

ILY418E UNRECOGNIZED PARAMETER ON EXEC STATEMENT: expression

Explanation: The CTMTDAY procedure was executed with the following NEWDAY parameter: date. However, the date format or contents are invalid. For more information regarding the Control-M CTMTDAY procedure, see the INCONTROL for z/OS Administrator Guide, “CTM,” “New Day Procedure Flow.”

The CTMTDAY procedure is not executed.

Corrective Action: Correct and re-execute the CTMTDAY procedure.

ILY419I PROCESSING MODE IS mode

Explanation: The CTMTDAY procedure was executed with one the following NEWDAY mode parameters:
ORDERONLY[, date ]

FORMATONLY

Special NEWDAY processing will be performed according to the mode (FORMATONLY or ORDERONLY) specified in the procedure. (For more information regarding the Control-M CTMTDAY procedure, see the INCONTROL for z/OS Administrator Guide, “CTM,” “New Day Procedure Flow.”)

Corrective Action: No response is required.

ILY41AW DATE IGNORED IN 'FORMATONLY' REQUEST: xxxxxxx

Explanation: The CTMTDAY procedure is executed with the following NEWDAY parameter:

FORMATONLY, xxxxxxx

where the operator probably intended xxxxxxx as a date value. (A date is not valid with the FORMATONLY mode.)

Special NEWDAY processing is performed according to the FORMATONLY mode, ignoring xxxxxxx. (For more information regarding the Control-M CTMTDAY procedure, see the INCONTROL for z/OS Administrator Guide, “CTM,” “New Day Procedure Flow.”)

Corrective Action: No response is required.

IOA messages

This group includes messages for the IOA (infrastructure) product.

Messages IOA0 through IOA0xx

This group includes messages for the IOA (infrastructure) product.

IOA001E INVALID PARAMETER

Explanation: An invalid parameter was passed to IOAZAP on the EXEC statement. The PARM parameter in the JCL EXEC statement was manually modified incorrectly.

The program stops execution with a condition code of 08. All the zaps that follow will be bypassed.

Corrective Action: Restore the original JCL job stream as follows:

1. Using the documentation provided as part of the IOA Monthly Maintenance Upgrade System, transfer the JCL job stream from the diskette to the mainframe.
2. Modify the JCL as specified in the documentation.
3. Submit the job.

Note:
You may run the JCL job stream as often as necessary. If a zap is already applied, it is bypassed.
IOA003I dd/mm/yy IOAZAP PROCESSING STARTED FOR CONTROL- x release VERSION version

Explanation: This information message is the normal start message produced by the IOA automatic zap application program.

Corrective Action: No action is required.

IOA004I dd/mm/yy IOAZAP PROCESSING COMPLETED FOR CONTROL- x rel/VERSION ver

Explanation: This information message is the normal termination message produced by the IOA automatic zap application program.

Corrective Action: No action is required.

IOA005S OPEN OF DDNAME ddName FAILED

Explanation: The automatic zap application program failed to open the ddName DD statement. Possible causes are:

- The ddName DD statement is missing.
- The data set described by the ddName DD statement does not exist.

The program stops execution with a condition code of 08.

Corrective Action: The JCL was probably modified incorrectly. Restore the original JCL job stream, as follows:

1. Using the documentation provided as part of the IOA Monthly Maintenance Upgrade system, transfer the JCL job stream from the diskette to the mainframe.
2. Modify the JCL as specified in the documentation.
3. Submit the job.

Note:
You may run the JCL job stream as often as necessary. If a zap is already applied, it is bypassed.

IOA007S AMASPZAP REPORTED ERROR IN STEP stepName FOR ZAP desc

Explanation: The AMASPZAP utility reported that an error occurred in the zap.

The program stops execution with a condition code of 08. All zaps that follow are bypassed.

Corrective Action: Check the report produced by the AMASPZAP utility to determine the cause of the problem. The zap was probably modified incorrectly. Restore the original JCL job stream, as follows:

1. Using the documentation provided as part of the IOA Monthly Maintenance Upgrade system, transfer the JCL job stream from the diskette to the mainframe.
2. Modify the JCL as specified in the documentation.
3. Submit the job.

Note:
You may run the JCL job stream as often as necessary. If a zap is already applied, it is bypassed.

If the problem is not due to a user modification of the zap, contact BMC Software Customer Support for assistance. Your representative will need the report produced by the AMASPZAP utility to resolve the problem.

IOA008S SYNTAX ERROR ON LINE lineNum IN STEP stepName FOR ZAP desc

Explanation: The automatic zap application program found that statement number lineNum in JCL step stepName is not valid. The problem is caused by an incorrect manual modification of the zap.

This message is followed by message IOA015S, which displays the statement in error in the damaged JCL job stream.

The program stops execution with a condition code of 08. All zaps that follow will be bypassed.

Corrective Action: Restore the original JCL job stream as follows:

1. Using the documentation provided as part of the IOA Monthly Maintenance Upgrade system, transfer the JCL job stream from the diskette to the mainframe. The job stream contains both the JCL and zaps.

2. Modify the JCL job stream as specified in the documentation.

3. Submit the job.

Note: You may run the JCL job stream as often as necessary. If a zap is already applied, it is bypassed.

IOA009S INVALID REP ON LINE lineNum IN STEP stepName FOR ZAP desc

Explanation: The automatic zap application program found that statement number lineNum in JCL step stepName is not valid. The problem is caused by incorrect manual modification of the zap.

This message is followed by message IOA015S, which displays the statement in error in the damaged JCL job stream.

The program stops execution with a condition code of 08. All the zaps that follow will be bypassed.

Corrective Action: Restore the original JCL job stream, as follows:

1. Using the documentation provided as part of the IOA Monthly Maintenance Upgrade system, transfer the JCL job stream from the diskette to the mainframe. The job stream contains both the JCL and zaps.

2. Modify the JCL job stream as specified in the documentation.

3. Submit the job.

Note: You may run the JCL job stream as often as necessary. If a zap is already applied, it is bypassed.

IOA010S TOO MANY INPUT CARDS FOR ONE ZAP

Explanation: Too many statements were added to the zap. Message IOA013I can be used to determine which zap caused the problem.
The program stops execution with a condition code of 08. All zaps that follow will be bypassed.

**Corrective Action:** Restore the original JCL job stream, as follows:
1. Using the documentation provided as part of the IOA Monthly Maintenance Upgrade system, transfer the JCL job stream from the diskette to the mainframe. The job stream contains both the JCL and zaps.
2. Modify the JCL job stream as specified in the documentation.
3. Submit the job.

**Note:**
You may run the JCL job stream as often as necessary. If a zap is already applied, it is bypassed.

**IOA011I** ZAP ALREADY APPLIED - PROCESSING CONTINUES

*Explanation:* This information message indicates that the zap was previously applied, and is being bypassed by the IOA automatic zap application program. This message is preceded by message IOA013I, which can be used to determine which zap was bypassed.

The processing of the rest of the zaps continues.

**Corrective Action:** No action is required.

**IOA011S** LINKAGE FAILED ON STEP *step*

*Explanation:* An attempt to relink a module during maintenance failed at the step indicated in the message.

The job stops processing at the failed step. The cause of the problem is indicated in the job output.

**Corrective Action:** Check the job output for the cause of the problem, and correct accordingly; then rerun the job. If you cannot correct the problem, notify BMC Software Customer Support.

**IOA012I** SUCCESSFUL APPLICATION OF ZAP *desc*

*Explanation:* This information message indicates that the Zap *desc* was successfully applied.

The processing of the rest of the zaps continues.

**Corrective Action:** No action is required.

**IOA013I** IOAZAP STEP *stepName* PROCESSING STARTED

*Explanation:* This information message indicates that the IOA automatic zap application program, which is executing at step *stepName*, started to process the zap.

**Corrective Action:** No action is required.

**IOA014I** IOAZAP STEP *stepName* PROCESSING COMPLETED SUCCESSFULLY

*Explanation:* This information message indicates that the IOA automatic zap application program, which is executing at the *stepName* step, finished successfully.

The processing of the rest of the zaps continues.
Corrective Action: No action is required.

IOA015S LINE IN ERROR: stmt
Explanation: Incorrect manual modification of a zap.
In this message, stmt is the statement that was incorrectly modified.
The IOA automatic zap application program ends with errors.
Corrective Action: Refer to previous messages, which describe the type of error.

IOA017I date FORMAT OF database
Explanation: This information message indicates that one of the IOA databases was formatted. The format procedure writes an audit trail message to the IOA maintenance log.
Corrective Action: No action is required.

IOA018I SUCCESSFUL LINKAGE EXECUTION "zapText"
Explanation: This information message indicates that the IOAZAP utility successfully relinked a module. Occasionally, it is necessary to relink a module for maintenance purposes.
Corrective Action: No action is required.

IOA019W ZAP IS NOT REQUIRED - PROCESSING BYPASSED
Explanation: This message indicates that the zap is not required by this installation. IOA maintenance can support various configurations, including enhancement tapes. For this reason, not all zaps supplied are required by your installation.
Corrective Action: No action is required.

IOA020E IOAZAP STEP stepName PROCESSING COMPLETED WITH ERROR
Explanation: This error message indicates that IOAZAP maintenance step stepName failed to complete. Possible causes are:
- There is an error in the zap, possibly a typing error.
- The load library needs to be compressed.
- You do not have the necessary security authorization to apply zaps.
Corrective Action: If possible, correct the error and rerun the step. Otherwise, contact BMC Software Customer Support.

IOA046S BLDL/LOAD FAILED FOR THE MODULE modName
Explanation: Loading of the modName module failed.
Possible causes are:
The IOA Load library is not in the load modules search list (STEPLIB + Linklist).
- There is insufficient memory.
- There is some other system-oriented reason, which may be found in the syslog.

Execution might stop.

**Corrective Action:** Prepare the Control-M monitor full output and contact BMC Customer Support.

**Messages IOA100 through IOA1xx**

This group includes messages for the IOA (infrastructure) product.

**IOA100I srvr - IOA ARCHIVE SERVER INITIALIZATION STARTED**

**Explanation:** This information message indicates that the IOA Archive Server has started and is currently building the required internal environment.

**Corrective Action:** No action is required.

**IOA101E srvr - IOA ARCHIVE SERVER INITIALIZATION FAILED RC rc IN STEP step**

**Explanation:** The IOA Archive Server encountered an internal error.

The cross-memory environment could not be established.

The IOA Archive Server shuts down.

**Corrective Action:** Activate the Control-D subsystem. If it is already active, deactivate then reactivate it. Try to reactivate the IOA Archive server. If this does not help, check for other system messages that might clarify the cause of the problem and precede accordingly. If these measures are of no avail, record the return code, step name and all other related messages and contact BMC Software Customer Support.

**IOA102E srvr - IOA ARCHIVE SERVER NOT APF-AUTHORIZED**

**Explanation:** The IOA Archive Server is not APF (Authorized Programming Facility) authorized. The IOASSRV module is not in an APF authorized library or does not have attribute AC=1.

The IOA Archive Server terminates with a return code of 8.

**Corrective Action:** Add the name of the library in which the IOASSRV module resides to the IEAAPF00 member in the SYS1.PARMLIB library.

**IOA103E srvr - COMMAND FAILED - cmdText**

**Explanation:** An invalid command or parameter was passed to the IOA Archive Server by an operator MODIFY command. This message is accompanied by another message that indicates why the command failed.

The MODIFY command is not executed.

**Corrective Action:** See the accompanying message, which indicates why the command failed.
IOA104S srvr - BDL/LOAD FAILED FOR THE MODULE modName

Explanation: Loading of the modName module failed. Possible causes are:

- Insufficient memory.
- Another system-oriented cause may be found in the system log.

The IOA Archive Server terminates with a return code of 8.

Corrective Action: Check the system job log for more information. If the problem persists, contact BMC Software Customer Support.

IOA105S srvr - UNRECOVERABLE ERROR ENCOUNTERED

Explanation: An unrecoverable error occurred in the operation of the IOA Archive Server.

The IOA Log file should contain a previous message about the error.

The IOA Archive Server shuts down.

Corrective Action: Check the accompanying message in the IOA Log file. Contact your system programmer for assistance. If the problem is not resolved, contact BMC Software Customer Support.

IOA106S srvr - MEDIA mediaName HAS ABENDED

Explanation: An IOA Archive Server internal subtask abended.

The IOA Log file and system log should contain previous messages about this error.

The IOA Archive Server issues an implicit START command for this media. Attempts are made to initialize media mediaName and continue normal processing. If these attempts fail, the IOA Archive Server sets the status of the abended media to never active and this media becomes unavailable for use by the IOA Archive Server.

Corrective Action: Check the IOA Log file and system log for additional messages which may indicate why media mediaName abended. If the problem is not resolved, contact BMC Software Customer Support.

IOA107I srvr - SHUT DOWN UPON REQUEST FROM OPERATOR

Explanation: This information message indicates that the IOA Archive Server is shutting down upon operator’s request.

Corrective Action: No action is required.

IOA108E srvr - REASON: COMMAND IS INVALID

Explanation: An invalid command was passed to the IOA Archive Server. This message follows message IOA103E or SRV103E, which contains the text of the failed command.

The MODIFY command is not executed.

Corrective Action: For more information, refer to the section that describes the IOA Archive Server in the Control-D and Control-V User Guide. Enter a valid MODIFY command.
IOA109S srvr - MEDIAL TYPE \textit{media\_type} IS INVALID OR NOT SUPPORTED

\textbf{Explanation:} The IOA Archive Server encountered an invalid or unsupported media type specified in the IOASPRM member (IOA Archive Server Installation Parameters).

The media type specified in the IOASPRM member should match one of the supported media types specified in the IOA Archive Server Program List (the IOASPROG member).

The IOA Archive Server terminates with a return code of 8.

\textbf{Corrective Action:} For more information about currently supported media types, refer to the section on how to set IOA Archive Server Installation Parameters in the \textit{INCONTROL for z/OS Installation Guide}. Correct the media\_type in the IOASPRM member (IOA Archive Server Installation Parameters). Start the IOA Archive Server again. If the problem is not resolved, contact BMC Software Customer Support.

IOA10AS srvr - SERVER NAME IS NOT EQUAL TO THE PROCNAME SPECIFIED IN IOASPRM

\textbf{Explanation:} Highlighted, unrollable message.

The name of IOA Archive Server does not match the value of the PROCNAME parameter in the IOASPRM member. The name of the IOA Archive Server must be the same as the value of the PROCNAME IOA Archive Server Installation Parameter in the IOASPRM member.

The IOA Archive Server terminates with a return code of 8.

\textbf{Corrective Action:} Use the correct IOA Archive Server name or correct the value of the PROCNAME parameter. Restart the IOA Archive Server.

IOA10BI srvr - IOA ARCHIVE SERVER SHUTTING DOWN

\textbf{Explanation:} Highlighted, unrollable message.

This information message indicates that the IOA Archive Server is shutting down due to operator command or due to internal events.

The IOA Log file should contain additional messages about the reason for shutting down the IOA Archive Server.

The IOA Archive Server shuts down.

\textbf{Corrective Action:} No action is required.

IOA10CS srvr - IOA ARCHIVE SERVER ENDED WITH ERROR

\textbf{Explanation:} An error caused the IOA Archive Server to terminate. The IOA Log file and system log file should contain additional messages identifying the specific error.

The IOA Archive Server shuts down.

\textbf{Corrective Action:} Check the IOA Log file and the system log for the reason. Contact your system programmer for assistance if needed.

IOA10DW srvr - YOUR IOA ARCHIVE SERVER IS ALREADY ACTIVE. QNAME qName

\textbf{Explanation:} Highlighted, unrollable message.
An attempt was made to start an IOA Archive Server which is already active. It is impossible to run two IOA Archive Servers with the same qName at the same time.

The newly-started IOA Archive Server with the same qName shuts down.

**Corrective Action:** No action is required.

**IOA10EE srvr - REASON: PARAMETER IS INVALID**

**Explanation:** An invalid parameter was passed to the IOA Archive Server by operator command MODIFY. This message follows the IOA103E or SRV103E message, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

**Corrective Action:** For more details, refer to the section that describes the IOA Archive Server in the Control-D and Control-V User Guide. Reissue the MODIFY command with valid parameters.

**IOA110E srvr - INSUFFICIENT STORAGE FOR INITIALIZATION RC=rc**

**Explanation:** There is insufficient memory to initiate or operate the IOA Archive Server.

The IOA Archive Server shuts down.

**Corrective Action:** Increase the IOA Archive Server REGION size. If the problem persists, record the return code and contact BMC Software Customer Support.

**IOA114S srvr - BLDL/ATTACH FAILED FOR MODULE modName**

**Explanation:** Initialization of an IOA Archive Server internal task failed.

Possible causes are:
- Insufficient memory to attach the task.
- The modName module does not exist in the LOAD library.

The IOA Archive Server terminates.

**Corrective Action:** Check the system log for additional messages which clarify the situation. Try one of the following:
- If the attach failed because of lack of memory, increase the REGION size in the IOA Archive Server procedure.
- If the IOA LOAD library does not contain the modName module, contact BMC Software Customer Support.

**IOA115E srvr - OPEN OF DDNAME ddName FAILED**

**Explanation:** Open of the ddName DD statement failed.

Possible causes are:
- The ddName DD statement is missing.
- The data set referenced by the ddName DD statement does not exist.

The IOA Archive Server terminates with a return code of 8.
Corrective Action: Correct the JCL and rerun the job.

IOA116W srvr - ALL MEDIA ARE INACTIVE

Explanation: Highlighted, unrollable message.
The IOA Archive Server issues this message when it determines that no active media are allocated to it.
Every media was terminated due to operator request or internal error. This message disappears when a
START command is issued for any media.
The IOA Archive Server continues processing.
Corrective Action: If information about the status of a media is needed, issue a DISPLAY command.

IOA117I srvr - IOA ARCHIVE SERVER INITIALIZATION COMPLETE

Explanation: This information message indicates that the IOA Archive Server was successfully initialized.
Corrective Action: No action is required.

IOA118E srvr - REASON: MEDIA mediaName IS INCORRECT

Explanation: The media was specified in a MODIFY operator command, but was not defined in the
IOASPRM member, which defines the IOA Archive Server Installation Parameters. This message follows
message IOA103E or SRV103E, which indicates that operator command MODIFY failed and contains the
text of the failed command.
The MODIFY command is not executed.
Corrective Action: For more details, refer the section that describes the IOA Archive Server in the
Control-D and Control-V User Guide. Reissue the MODIFY command with the correct media name.

IOA11AE srvr - REASON: MEDIA mediaName ALREADY INACTIVE

Explanation: An attempt was made to stop media mediaName which was already inactive. This
message follows message IOA103E or SRV103E, which indicates that operator command MODIFY failed
and contains the text of the failed command.
The MODIFY command is not executed.
Corrective Action: No action is required.

IOA11BE srvr - REASON: MEDIA mediaName ALREADY ACTIVE

Explanation: An attempt was made to start media mediaName which was already active. This
message follows message IOA103E or SRV103E, which indicates that operator command MODIFY failed
and contains the text of the failed command.
The MODIFY command is not executed.
Corrective Action: No action is required.

IOA11CE srvr - INITIALIZATION OF ALL MEDIA FAILED

Explanation: During initialization, the IOA Archive Server determined that initialization failed for all
media specified in the IOASPRM member (IOA Archive Server Installation Parameters).
Every media was terminated due to an unrecoverable error. The IOA Log file should contain additional messages concerning specific errors.

The IOA Archive Server terminates with a return code of 8.

**Corrective Action:** Check the IOA Log file and the system log for messages describing the error. Contact the system programmer for assistance if needed. Start the IOA Archive Server again. If the problem is not resolved, contact BMC Software Customer Support.

**IOA11DW srvr - nn CYCLES PERFORMED WHILE WAITING FOR MEDIA INITIALIZATION TO BE COMPLETED**

**Explanation:** Highlighted, unrollable message.

The IOA Archive Server cannot complete the initialization phase. During IOA Archive Server initialization, a period of time equal to nn cycles elapsed before any media specified for use by the IOA Archive Server completed the initialization process. Each cycle is one IOA Archive Server sleeping interval, whose value in hundredths of a second is defined in the INTERVAL parameter in the IOASPRM member in the IOA Archive Server Installation Parameters.

The initialization of the IOA Archive Server is not completed.

**Corrective Action:** Check the IOA Log file and the system log for the cause of the problem. If the IOA Archive Server waits a long time for media to complete initialization, and the reason for the delay cannot be determined, issue the CANCEL command to stop the IOA Archive Server. Restart the IOA Archive Server. If the problem is not resolved, contact BMC Software Customer Support.

**IOA11EW srvr - nn CYCLES PERFORMED WHILE WAITING FOR MEDIA TO TERMINATE**

**Explanation:** The IOA Archive Server cannot complete the termination phase. During IOA Archive Server termination, a period of time equal to nn cycles elapsed before the media specified for use by the IOA Archive Server completed the termination process. Each cycle is one IOA Archive Server sleeping interval, whose value in hundredths of a second is defined in the INTERVAL parameter in the IOASPRM member in the IOA Archive Server Installation Parameters.

The termination of the IOA Archive Server is not completed.

**Corrective Action:** Check the IOA Log file and the system log for the cause of the problem. If the IOA Archive Server waits a long time for media to complete termination, and the reason for the delay cannot be determined, issue operator command CANCEL to stop the IOA Archive Server. If the problem is not resolved, contact BMC Software Customer Support.

**IOA11FW srvr - REASON: MEDIA mediaName IS BUSY**

**Explanation:** A command cannot be passed to media mediaName for execution because the media has not finished executing a previous command. This message follows message IOA103E or SRV103E, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

**Corrective Action:** Reissue the MODIFY command later.
IOA120S srvr - INTERNAL ERROR RC=rc

**Explanation:** The IOA Archive Server encountered an internal error.
The IOA Archive Server terminates with abend code 0006. The output includes a dump of the abend.

**Corrective Action:** Report the message ID and return code to BMC Software Customer Support.

IOA121E srvr - REASON: MEDIA mediaName INACTIVE

**Explanation:** An attempt was made to start a device assigned to media *mediaName* while that media was inactive. Media *mediaName* must be started before issuing a START command for a device assigned to it. This message follows message IOA103E or SRV103E, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

**Corrective Action:** Issue an operator command to start media *mediaName*, as follows:

```
F IOASMON,START MEDIA=mediaName
```

After media *mediaName* is initialized successfully, issue the MODIFY command to start a device. For more details, refer to the section that describes the IOA Archive Server in the Control-D and Control-V User Guide.

IOA122W srvr - IOA ARCHIVE SERVER PARAMETERS CONTAIN NO MEDIA OR ONLY MEDIA TYPE DASD

**Explanation:** During the initialization phase, the IOA Archive Server determined that the IOASPRM member does not include a definition for any media or only includes definitions for media of the DASD type. Possible causes are:

- The IOASPRM member in the IOA PARM library does not define any media.
- The IOASPRM member in the IOA PARM library has definitions for only DASD media.

Do not activate the IOA Archive Server unless a media type other than DASD is defined in the IOASPRM member.

The IOA Archive Server shuts down.

**Corrective Action:** If the services of the IOA Archive Server are required, add appropriate media to the IOASPRM member in the IOA Archive Server Installation Parameters, and restart the IOA Archive Server.

IOA123W cdam_srvr_name - GETMAIN FAILED DURING SESSION OPENING OF USER userId

**Explanation:** An attempt to access a migrated index failed because there is insufficient memory in the IOA Archive server to open a session. A session is opened in the IOA Archive server when accessing a migrated index. This error occurs when there is not enough memory in the IOA Archive server to hold the RBA range table of the user, and the index record for that index.

The session is not opened and the migrated index cannot be viewed.

**Corrective Action:** Increase the region of the IOA Archive server.
IOA124W cdam_srvr_name - OSE TYPE PASSED TO SERVER BY USERID userd1 IS INVALID

Explanation: An internal error occurred when accessing a migrated index. A session is opened in the IOA Archive Server when accessing a migrated index.

The session is not opened and the migrated index cannot be viewed.

Corrective Action: Print the user record and index records of the report. Record the last actions of the user before the error occurred. Supply this information to BMC Software Customer Support.

IOA127E srvr - DEBUG LEVEL MUST BE A NUMBER BETWEEN 0-255

Explanation: The MODIFY operator command to activate the IOA Archive Server debug facility contains an invalid DEBUG level. Valid DEBUG levels are between 0 and 255. Zero specifies no debugging.

The MODIFY command is not executed. The DEBUG facility is not activated.

Corrective Action: Reissue the operator command with the correct debug level. The required debugging level should be supplied by BMC Software Customer Support.

IOA128I srvr - DEBUG LEVEL IS SET TO /d

Explanation: This information message indicates that the IOA Archive Server debug level has been set to nnn by a MODIFY operator command.

Each debug level activates the trace option on different components of the IOA Archive Server.

The DEBUG level is set to level nnn.

Corrective Action: No action is required.

IOA130E mediaName - REASON: DEVICE deviceId IS NOT ASSIGNED TO THIS MEDIA

Explanation: An attempt was made to reference device deviceId, which currently is not assigned to media mediaName. This message follows message IOA137E or MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

Corrective Action: For more details, refer to the section that describes the IOA Archive Server in the Control-D and Control-V User Guide. Issue a DISPLAY command to obtain information about each media and its resources that are known to the IOA Archive Server. Reissue the MODIFY operator command with the correct deviceId number.

IOA131E mediaName - REASON: DEVICE deviceId ALREADY INACTIVE

Explanation: An attempt was made to stop device deviceId, which is currently inactive. This message follows message IOA137E or MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

Corrective Action: No action is required.
IOA132E mediaName - REASON: DEVICE deviceId ALREADY ACTIVE

Explanation: An attempt was made to start device deviceId, which is currently active. This message follows message IOA137E or MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

Corrective Action: No action is required.

IOA133W mediaName - nn CYCLES PERFORMED WHILE WAITING FOR MEDIA INITIALIZATION TO BE COMPLETED

Explanation: Highlighted, unrollable message.

Media mediaName cannot complete the initialization phase.

During initialization, the media waits for devices which have been started to complete their initialization process. No responses were received from these devices. Each “cycle” is one IOA Archive Server sleeping interval whose value (in hundredths of a second) is defined in the INTERVAL parameter in the IOASPRM member in the IOA Archive Server Installation Parameters.

The initialization of media mediaName is not completed.

Corrective Action: Check the IOA Log file and the system log for the cause of the problem. If media mediaName waits a long time for devices to complete initialization and the reason for the delay cannot be determined, issue a CANCEL operator command to stop the IOA Archive Server. Start the IOA Archive Server again. If the problem is not resolved, contact BMC Software Customer Support.

IOA134E mediaName - MEDIA SHUT DOWN - INITIALIZATION OF ALL DEVICES FAILED

Explanation: The initialization process for all devices assigned to media mediaName failed.

Media mediaName is terminated and becomes unavailable for use by the IOA Archive Server.

Corrective Action: Check the IOA Log file and system log for messages about the initialization failure. Issue an operator command to restart media mediaName. If the problem is not resolved, contact BMC Software Customer Support.

IOA135W mediaName - nn CYCLES PERFORMED WHILE WAITING FOR DEVICE TO TERMINATE

Explanation: Highlighted, unrollable message.

Media mediaName cannot complete the termination phase.

During termination, media mediaName waits for devices to terminate. Each “cycle” is one IOA Archive Server sleeping interval whose value (in hundredths of a second) is defined in the INTERVAL parameter in the IOASPRM member in the IOA Archive Server Installation Parameters.

The termination of media mediaName is not completed.
**Corrective Action:** Check the IOA Log file and the system log for the cause of the problem. If media `mediaName` waits a long time for devices to complete termination and the reason for the delay cannot be determined, issue a CANCEL operator command stop the IOA Archive Server. If the problem is not resolved, contact BMC Software Customer Support.

**IOA136E mediaName - REASON: LENGTH OF DEVICE NUMBER IN DEVICE= deviceId IS INCORRECT**

**Explanation:** The DEVICE parameter was specified with an invalid length. The length of the DEVICE parameter in the MODIFY operator command should be four digits.

This message follows message IOA137E or MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

**Corrective Action:** Reissue the MODIFY command with a correct DEVICE parameter.

**IOA137E mediaName - COMMAND FAILED cmdText**

**Explanation:** An invalid command or parameter was passed to media `mediaName` by a MODIFY operator command. This message is followed by other messages that clarify why the operator command failed.

The MODIFY command is not executed.

**Corrective Action:** Check the system log for a message that indicates why the command failed. Correct the problem, and reissue the MODIFY operator command.

**IOA138E mediaName - REASON: PARAMETER IS INVALID**

**Explanation:** An invalid parameter was passed to media `mediaName` by the MODIFY operator command. This message follows message IOA137E or MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

**Corrective Action:** For more information, refer to the section on the IOA Archive Server in the *Control-D and Control-V User Guide*. Enter a MODIFY command with valid parameters.

**IOA139I mediaName - MEDIA SHUT DOWN UPON REQUEST FROM OPERATOR**

**Explanation:** This information message indicates that media `mediaName` is shutting down upon the operator's request.

**Corrective Action:** No action is required.

**IOA13AI mediaName - MEDIA SHUT DOWN UPON REQUEST OF MAIN TASK**

**Explanation:** This information message indicates that media `mediaName` is shutting down upon the IOA Archive Server's request.
Possible causes are:

- The IOA Archive Server is shutting down due to operator request.
- The IOA Archive Server encountered an unrecoverable error.

The IOA Archive Server shuts down the media before it shuts down. The IOA Log file and system log should contain additional messages concerning the situation.

**Media** `mediaName` **shuts down.**

**Corrective Action:** Check the IOA Log file and system log for messages explaining the situation. Contact the system programmer for assistance, if needed.

**IOA13BE mediaName - REASON: VALUE SPECIFIED IN DEVICE= PARAMETER IS INVALID**

**Explanation:** The DEVICE parameter was specified in a modify operator command without specifying its value. This message follows message IOA137E or MDT137E, which indicates that the modify operator command failed, and contains the text of the failed command.

MODIFY is not executed.

**Corrective Action:** For more information, refer to the section on the IOA Archive Server in the *Control-D and Control-V User Guide*. Reissue the MODIFY command with a valid DEVICE parameter.

**IOA13DE mediaName - REASON: DEVICE= PARAMETER IS INVALID FOR DYNAMIC DEVICES**

**Explanation:** An attempt to start a specific device by operator command failed because the devices used by the IOA Archive Server are allocated dynamically. This message follows message IOA137E/MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command.

MODIFY is not executed.

**Corrective Action:** For more information about how to control the device, refer to the section on media and resource management in the *Control-D and Control-V User Guide*. Reissue the MODIFY command with appropriate parameters.

**IOA13FW mediaName - REASON: ALL DEVICES ARE ALREADY ACTIVE**

**Explanation:** An attempt to start one or more devices by issuing a MODIFY operator command failed, because all devices were already active.

This message follows message IOA137E or MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command. The operator cannot increase the number of devices the IOA Archive Server can use to more than the maximum quantity defined in the IOASPRM member in the IOA Archive Server Installation Parameters.

The MODIFY command is not executed.

**Corrective Action:** Issue a DISPLAY command to get information about each media and its resources that are allocated to the IOA Archive Server. For more information about how to control devices, refer to the section on media and resource management in the *Control-D and Control-V User Guide*. 
IOA140S mediaName - BLDL/ATTACH/LOAD FAILED FOR THE MODULE modName

**Explanation:** Initialization of the mediaName media failed.

Possible causes are:

- The Control-V LOAD library is not in the load modules search list (STEPLIB + LinkList).
- Insufficient memory is available to attach the task.
- The modName module is not in the LOAD library.

The IOA Archive Server shuts down.

**Corrective Action:** Check the system log for additional messages which clarify the situation. Try one of the following:

- If the attach failed because of lack of memory, increase the REGION size in the IOA Archive Server procedure.
- If the modName module does not exist in the IOA LOAD library, contact BMC Software Customer Support.

IOA141I mediaName - INITIALIZATION STARTED

**Explanation:** This information message indicates that media mediaName has started and is building the required internal environment.

**Corrective Action:** No action is required.

IOA142I mediaName - INITIALIZATION SUCCESSFULLY COMPLETED

**Explanation:** This information message indicates that media mediaName was successfully initialized.

**Corrective Action:** No action is required.

IOA143W mediaName - REASON: ALL DEVICES ARE ALREADY INACTIVE

**Explanation:** An attempt to stop one or more devices by issuing a MODIFY operator command failed, because all the devices were already inactive. This message follows message IOA137E, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

**Corrective Action:** For more information, refer to the section on the IOA Archive Server in the Control-D and Control-V User Guide. Issue a DISPLAY command to get information about each media and its resources that are allocated to the IOA Archive Server.

IOA144S mediaName - INSUFFICIENT STORAGE FOR INITIALIZATION

**Explanation:** Highlighted, unrollable message.

Insufficient memory is available to initiate media mediaName.

Media mediaName shuts down. The IOA Archive Server shuts down.

**Corrective Action:** Increase the IOA Archive Server REGION size.
IOA145E mediaName - FREEMAIN ERROR ENCOUNTERED

**Explanation:** Highlighted, unrollable message.

Media mediaName encountered an internal error.

The media mediaName task terminates with User Abend 0007. The IOA Archive Server terminates with User Abend code 0006. The output includes a dump of the abend.

**Corrective Action:** Contact your system programmer for assistance. If the problem is not resolved, contact BMC Software Customer Support.

IOA146E mediaName - MEDIA INITIALIZATION FAILED

**Explanation:** Highlighted, unrollable message.

Media mediaName encountered an internal error.

This message is preceded by other messages which clarify the situation.

Media mediaName shuts down.

**Corrective Action:** Check the IOA Log file and the system log for messages describing the error. Contact your system programmer for assistance, if needed. If the problem is not resolved, contact BMC Software Customer Support.

IOA147S mediaName - INTERNAL ERROR DURING INITIALIZATION - MEDIA INITIALIZATION FAILED

**Explanation:** Highlighted, unrollable message.

The mediaName media encountered an internal error.

The mediaName media abends with User Abend 0007. The IOA Archive Server shuts down with User Abend 0006. The output includes a dump of the abend.

**Corrective Action:** Contact your system programmer for assistance. If the problem is not resolved, contact BMC Software Customer Support.

IOA148S mediaName - INTERNAL ERROR RC=rc

**Explanation:** Media mediaName encountered an internal error.

One of the following actions occurs, depending on severity of the internal error:

- Media mediaName terminates and IOA Archive Server continues processing.
- Media mediaName abends with User Abend 0007. The IOA Archive Server terminates with User Abend 0006. The output includes a dump of the abend.

**Corrective Action:** Check the IOA Log file and system log for messages describing the error. Contact your system programmer for assistance. If the problem is not resolved, report the rc to BMC Software Customer Support.
IOA149E mediaName - REASON: COMMAND IS INVALID

**Explanation:** An invalid command was passed to media `mediaName` by the MODIFY operator command. This message follows message IOA137E or MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command.

The MODIFY command is not executed.

**Corrective Action:** For more information, refer to the section on the IOA Archive Server in the *Control-D and Control-V User Guide*. Enter a valid MODIFY command.

---

IOA14AE mediaName - REASON: VALUE SPECIFIED IN DEVQTY= PARAMETER IS INVALID

**Explanation:** An invalid value was specified for the DEVQTY parameter. This message follows message IOA137E or MDT137E, which indicates that operator command MODIFY failed and contains the text of the failed command. Possible causes are:

- The value for the DEVQTY parameter is missing in the MODIFY operator command.
- The length of the DEVQTY parameter exceeds the maximum allowable length.
- The value of the DEVQTY parameter is invalid. Valid values are numeric or the character string ALL.
- The value of the DEVQTY parameter is greater than the maximum quantity defined in the IOASPRM member in the IOA Archive Server Installation Parameters.
- The value of the DEVQTY parameter is greater than the number of active devices allocated to the IOA Archive Server.

The MODIFY command is not executed.

**Corrective Action:** For more information, refer to the section on the IOA Archive Server in the *Control-D and Control-V User Guide*. Issue a DISPLAY command to get information about each media and its resources that are allocated the IOA Archive Server. Reissue the MODIFY command with a valid DEVQTY parameter.

---

IOA14BE mediaName - LOCATE ERROR FOR dsn RC=rc

**Explanation:** A CDAM data set cannot be found in the catalog.

The user requested a report which resides on a CDAM file which is uncataloged or does not exist.

The request is ignored.

**Corrective Action:** Catalog the file or take other corrective action and try again.

---

IOA14CI mediaName - MEDIA SHUTTING DOWN

**Explanation:** This information message indicates that media `mediaName` is shutting down.

**Corrective Action:** No action is required.

---

IOA14DS mediaName - DEVICE device_id ABENDED

**Explanation:** A media internal subtask abended.
Media $mediaName$ issues an implicit start command for device $deviceId$. Attempts are made to initialize this device and continue normal processing. If these attempts fail, media $mediaName$ sets the status of the designated device to NEVER ACTIVE and this device becomes unavailable for use by the IOA Archive Server.

**Corrective Action:** Check the IOA Log file and system log for additional messages which indicate why device $deviceId$ abended.

**IOA14ES** $mediaName$ - PARAMETER DEVADDR NUMBER $nnnn$ DEFINED IN IOASPRM INSTALLATION PARAMETERS IS INVALID

**Explanation:** The DEVADDR parameter contains an invalid value.

The format of the device number specified in the DEVADDR parameter in the IOASPRM member (IOA Archive Server Installation Parameters) must be four digits.

Initialization of media $mediaName$ fails. The IOA Archive Server shuts down with a return code of 08.

**Corrective Action:** Set the DEVADDR parameter to a valid numeric value and restart the IOA Archive Server.

**IOA14FI** $mediaName$ - ALL DEVICES WERE DEFINED AS INACTIVE IN IOASPRM INSTALLATION PARAMETERS

**Explanation:** This information message indicates that $mediaName$ is inactive because all devices which belong to it are defined as inactive in the IOASPRM member (IOA Archive Server Installation Parameters).

**Corrective Action:** If necessary, issue operator MODIFY commands to start the media and the devices.

**IOA150E** $mediaName$ - DYNAMIC ALLOCATION ERROR FOR DDNAME=SORTIN RC=$rc$, REASON CODE=$rsn$

**Explanation:** An error occurred while trying to allocate an OSS Extract Database file.

This error causes the dynamic allocation of the SORTIN DD statement to fail.

For information on the return code ($rc$), see the IBM manual *MVS Programming: Authorized Assembler Services Guide*.

Media $mediaName$ is terminated.

**Corrective Action:** Use the return code ($rc$) and reason code ($rsn$) to determine the problem and correct it. If you cannot resolve the problem, record the DD statement, return code, and reason code, and contact BMC Software Customer Support.

**IOA151S** $sort\_prog$ - SORT OF OSS EXTRACT DATABASE FILE FAILED, RC=$rc$

**Explanation:** The internal sort of the OSS Extract Database file failed.

In this message, $sort\_prog$ activates the regular sort program at the site.

The system log usually contains additional messages about specific errors.

$sort\_prog$ is terminated.
**Corrective Action:** Check the system log for messages describing the error. Contact the system programmer for assistance, if needed. If the problem is not resolved, contact BMC Software Customer Support.

**IOA170I** mediaName - DEVICE deviceId - IS STARTING

**Explanation:** This information message indicates that IOA Archive Server deviceId device allocated to the mediaName media started.

**Corrective Action:** No action is required.

**IOA171I** mediaName - DEVICE deviceId - SHUT DOWN UPON REQUEST OF MAIN TASK

**Explanation:** This information message indicates that the main task requested shutting down the IOA Archive Server deviceId device allocated to the mediaName media.

**Corrective Action:** No action is required.

**IOA17AI** mediaName - DEVICE deviceId - UNABLE TO ALLOCATE DEDICATED DEVICE

**Explanation:** This information message indicates that the IOA Archive Server could not allocate device deviceId even though it is dedicated to the Server explicitly by means of the DEVADDR parameter or implicitly by a quantity of a unit name in the DEVQTY parameter.

If dedicated explicitly, the device possibly is disconnected.

If dedicated implicitly, probably no device in the device group specified in the IOASPRM member for mediaName media is available.

See messages DVT190E or IOA190E and DVT192E or IOA192E in the IOA Log file for the error code and info code.

The Server tries to allocate the device at 3-minute intervals until stopped by a MODIFY command.

**Corrective Action:** Use the error code and information code to determine why the allocation failed. For a description of the return code, see the IBM manual MVS Programming: Authorized Assembler Services Guide. Ask the operator to correct the problem and restart the device.

**IOA17BI** mediaName - DEVICE deviceId - UNABLE TO ALLOCATE DEVICE DYNAMICALLY

**Explanation:** This information message indicates that the IOA Archive Server could not allocate the deviceId device which should be allocated dynamically. Probably none of the devices in the device group specified in the IOASPRM member for the mediaName media is available.

For the error code and information code, see the DVT190E or IOA190E and DVT192E or IOA192E messages in the IOA Log file. For a description of the return code, see the IBM manual MVS Programming: Authorized Assembler Services Guide.

The Archive Server tries to allocate the device five times, at 2-minute intervals. If it does not succeed, device deviceId is terminated.
**Corrective Action:** Use the error code and information code to determine why the allocation failed. Ask the operator to correct the problem and restart the device.

**IOA17CI mediaName - DEVICE deviceId - SHUT DOWN BECAUSE OF INTERNAL ERROR**

**Explanation:** Highlighted, unrollable message.

This message indicates that an internal error occurred while accessing device `deviceId`. The cache request that generated the error is ignored. The activity that used this device is restarted.

**Corrective Action:** Notify your INCONTROL administrator.

**IOA17DI mediaName - DEVICE deviceId - SHUT DOWN BECAUSE OF ABEND Snnn**

**Explanation:** Highlighted, unrollable message.

This message indicates that an abend occurred while accessing the `deviceId` device. The cache request which caused the abend is ignored. The activity which used this device will be restarted.

**Corrective Action:** Notify your INCONTROL administrator.

**IOA180S mediaName - DEVICE deviceId - UNABLE TO ACQUIRE STORAGE FOR blockId, RC IS rc**

**Explanation:** IOA Archive Server device `deviceId` is unable to acquire storage space for a BLKLST, FDB, CMP, CACHE or RDBUF block. See accompanying message DVT178I or IOA178I for the name of the requested file.

Execution of the task on device `deviceId` is terminated.

**Corrective Action:** Restart the IOA Archive Server. Re-IPL if necessary. Notify your INCONTROL administrator.

**IOA181S mediaName - DEVICE deviceId - UNABLE TO xxQ ON vol / platter / device, RC IS rc**

**Explanation:** The IOA Archive Server for device `deviceId` was unable to ENQ or DEQ on a key volume, platter, or device.

Execution of the task on device `deviceId` is terminated.

**Corrective Action:** Restart the IOA Archive Server. Re-IPL if necessary. Notify your INCONTROL administrator.

**IOA190E mediaName - DEVICE deviceId - UNABLE TO ALLOCATE UNIT unit**

**Explanation:** A file could not be dynamically allocated on `mediaName` media by the `deviceId` IOA Archive Server device.
For the error code and info code, see message DVT192E or IOA192E. For information on these codes, see the IBM manual *MVS Programming: Authorized Assembler Services Guide*.

The request is ignored.

**Corrective Action:** Use the error code and info code to determine why the allocation failed. Correct the problem. Restart the IOA Archive Server.

**IOA191E mediaName - DEVICE deviceId - UNABLE TO DEALLOCATE**

**Explanation:** The specified file could not be deallocated on the specified media when switching to another file in the IOA Archive Server device task.

For the error code and info code, see message DVT192E or IOA192E.

The next request and all future requests are ignored until deallocation succeeds.

**Corrective Action:** Use the error code and info code to determine why deallocation failed. Correct the problem. Restart the IOA Archive Server.

**IOA192E mediaName - DEVICE deviceId - ERR + INFO CODE IS err+info_code**

**Explanation:** This message accompanies messages IOA190E or DVT190E and IOA191E or DVT191E. It provides the error code and info code for a failed dynamic allocation or deallocation.

**Corrective Action:** Use the error code and info code to determine the problem and correct it.

**IOA193E mediaName - DEVICE deviceId - I/O ERROR error**

**Explanation:** The I/O error identified in this message occurred.

The request that caused the I/O error is ignored.

**Corrective Action:** Correct the problem in the file. Retry.

**IOA194E mediaName - DEVICE deviceId - UNABLE TO OPEN FILE dsn**

**Explanation:** The `deviceId` IOA Archive Server device could not open the `dsn` file.

The request is ignored.

**Corrective Action:** Verify that the `dsn` file exists and can be accessed.

**IOA195I mediaName - DEVICE deviceId - PLEASE MOUNT REQUIRED VOLUME, OR ANSWER NO**

**Explanation:** This information message indicates that a request was issued to mount a tape volume on the `deviceId` device, and that the requested tape volume was not mounted. The previous tape mount message was issued after an attempt to open a file on a tape volume that was not mounted on the device.

If this WTO is answered NO, the mount request is canceled and the user request is ignored.

**Corrective Action:** If the requested volume cannot be mounted, or to cancel the mount request for any reason, reply NO to this WTO. Otherwise, mount the requested volume.
IOA1A0I  \textit{mediaName} - NUMBER OF DEVICES = \textit{num1} NUMBER OF ACTIVE DEVICES = \textit{num2}

\textbf{Explanation:} This information message is sent by the IOA Archive Server to the console in response to a DISPLAY command to indicate the following:

- \textit{num1} devices are assigned to \textit{mediaName} media.
- \textit{num2} active devices are assigned to \textit{mediaName} media.

This message is preceded by message IOA1A1I or DSP1A1I, which supplies the IOA Archive Server name and media name for which the DISPLAY message was issued.

\textbf{Corrective Action:} No action is required.

IOA1A1I  \textit{srvr} - MEDIA \textit{mediaName} STATUS DISPLAY:

\textbf{Explanation:} This information message is sent by the IOA Archive Server to the console in response to a DISPLAY command. This message is the header for messages that provide information about the status of \textit{mediaName} media.

\textbf{Corrective Action:} No action is required.

IOA1A2I  \textit{mediaName} - MEDIA TYPE = \textit{media_type} SYSTEM UNIT NAME = \textit{name}

\textbf{Explanation:} This information message is sent by the IOA Archive Server to the console in response to a DISPLAY command. This message identifies the media type and system unit name defined in the IOASPRM member in the IOA Archive Server Installation Parameters.

\textbf{Corrective Action:} No action is required.

IOA1A3I  \textit{mediaName} - STATUS = \textit{status}

\textbf{Explanation:} This information message is sent by the IOA Archive Server to the console in response to a DISPLAY command to provide information about the current status of \textit{mediaName}.

\textbf{Corrective Action:} No action is required.

IOA1A4I  \textit{mediaName} - NUMBER OF PENDING REQUESTS = \textit{num}

\textbf{Explanation:} This information message is sent by the IOA Archive Server to the console in response to a DISPLAY command to provide information about the number of pending requests for \textit{mediaName}.

\textbf{Corrective Action:} No action is required.

IOA1A5I  \textit{mediaName} - DEVICE STATUS PLATTER VOLSER DSN

\textbf{Explanation:} This information message is sent by the IOA Archive Server to the console in response to a DISPLAY command. It is the header for IOA1A6I or DSP1A6I messages, which provide information about the status of each device assigned to \textit{mediaName}.

\textbf{Corrective Action:} No action is required.
IOA1A6I mediaName - device status platter volser dsn

Explanation: This information message is sent by the IOA Archive Server to the console in response to a DISPLAY command. Each message describes a device assigned to mediaName media. This message follows message IOA1A5I or DSP1A5I, which provides the header for each field. The variables in this message are:

- device - the name of the assigned device
- status - Active, Inactive or Idle
- platter - <<FIX>>
- volser - the serial number of the volume on which the data set is found
- dsn - the data set name

Corrective Action: No action is required.

IOA1A7I mediaName - DEVICE USE STATUS VOLSER DSN

Explanation: This information message is sent by the IOA Archive Server to the console in response to a DISPLAY command. It is the header for IOA1A8I or DSP1A8I messages, which provide information about the status of each device assigned to mediaName media.

Corrective Action: No action is required.

IOA1A8I mediaName - device use status userId volser dsn

Explanation: This information message is sent by the IOA Archive server to the console in response to a DISPLAY command. It follows message IOA1A7I, which provides the header for each field. Each occurrence of this message describes a device assigned to mediaName media. The variables in this message are:

- device - the name of the assigned device
- use - Dedicated or Dynamic
- status - Active, Inactive or Idle
- userId - the user ID of the owner of the data set being retrieved by the device
- volser - the serial number of the volume on which the data set is found
- dsn - the data set name

Note:
The userId, vol, and dsn fields contain values only when the device is active.

Corrective Action: No action is required.
IOA1A9I mediaName - DEVICE STATUS USER-ID DSN

**Explanation:** This information message is sent by the IOA Archive Server to the console in response to a DISPLAY command. This message is the header for message IOA1AAI, which provides information about the status of each device assigned to the media identified in the message.

**Corrective Action:** No action is required.

IOA1AAI mediaName - deviceStatus userId dsn

**Explanation:** This information message is sent by the IOA Archive Server to the console in response to a DISPLAY command. Each message provides information about a device assigned to the mediaName media. A message is issued for each device defined in the MAXCONN parameter in IOASPRM. These messages are preceded by message IOA1A9I, which provides the header for each field.

Possible values of deviceStatus are:

<table>
<thead>
<tr>
<th>deviceStatus</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INACTIVE</td>
<td>The device is not yet activated.</td>
</tr>
<tr>
<td>ACTIVE</td>
<td>The device is retrieving data requested by the userId user from the dsn data set.</td>
</tr>
<tr>
<td>IDLE</td>
<td>The device is ACTIVE, but currently not working on any request.</td>
</tr>
</tbody>
</table>

**Corrective Action:** No action is required.

IOA1AEI mediaName - TVL: OWNER-ID deviceStatus, NUM OF REQUESTS - num DSN dsn

**Explanation:** This information message is sent by the IOA Archive Server to the console in response to a DISPLAY command to provide information about the current status of media mediaName.

**Corrective Action:** No action is required.

Messages IOA200 through IOA2xx

This group includes messages for the IOA (infrastructure) product.

IOA282I text (userId)

**Explanation:** Highlighted, unrollable message.

This information message is activated by the SHOUT facility. The user ID is for the job order requesting the SHOUT.

**Corrective Action:** No action is required.
Messages IOA400 through IOA4xx

This group includes messages for the IOA (infrastructure) product.

IOA41AW MAXCOMMAND 0 OR UNLIMIT SPECIFIED. LOOP DETECTION INACTIVATED

Explanation: This message is issued by KSL when it executes one of the following commands:
- MAXCOMMAND 0
- COMMAND UNLIMIT

These commands specify that KSL should not limit the number of commands executed by a script. By default, the maximum number of commands that can be executed by a KSL script is 400, in order to intercept runaway scripts. This number can be increased by using the MAXCOMMAND limit command.

If a KSL script expects to execute an unlimited number of commands because it runs in an endless loop until requested to stop, then the MAXCOMMAND 0 or UNLIMIT command can be specified in the script. The script is not limited (loop detection is inactivated).

Corrective Action: Verify that the loop detection has been intentionally inactivated.

IOA482S OPEN OF USER DATE CONTROL-RECORD FAILED. DDNAME "DACHK"

Explanation: Opening of the file containing the User Dates Control record failed (the DACHK DD statement). This message is issued by the New Day procedure.

This is due to one of the following:
- The DACHK DD statement is missing.
- The data set (member) described by the DACHK DD statement does not exist.

The New Day procedure stops executing.

Corrective Action: Correct the JCL for the job/CLIST.

IOA484I POST DAILY CHECKPOINT WRITTEN

Explanation: This information message indicates that Post-daily checkpoint was written.

Corrective Action: Indicates that the New Day procedure ended normally.

Messages IOA500 through IOA5xx

This group includes messages for the IOA (infrastructure) product.

IOA555S OID=orderid INSUFFICIENT STORAGE. INCREASE THE REGION SIZE

Explanation: There was insufficient memory to perform a task.
The action that could not be performed accompanies this message. It may vary depending on the environment in which the message was issued.

**Corrective Action:** For jobs, increase the REGION size. For TSO, log on again using a larger SIZE parameter or exit one of the screens.

IOA5A0W mediaName - DEVICE num - CONNECT ERROR. STORAGE MACHINE: st.maName, SUBSYSTEM: smName, RC: rc

**Explanation:** The IOASMON monitor, migration job, or the CTVCLMIG utility failed to connect to the Filetek storage machine because the CONNECT function failed.

The probable cause for this failure is that the maximum number of connections to the storage machine was reached.

The variables in this message are:
- `mediaName` - Name of the Filetek storage machine media as defined in IOASPRM.
- `num` - Number of the IOASMON device in which the error occurred.
- `st.maName` - Name of the Filetek storage machine. When it does not appear in the message, the name used is that of the storage machine as defined in the storage machine configuration member.
- `smName` - SM subsystem name.
- `rc` - Return code from the CONNECT function.

If an IOASMON monitor fails, the monitor continually retries to connect until it succeeds, or until the device task is brought down. If a migration job or CTVCLMIG failed, it terminates with errors.

**Corrective Action:** Check the return code of the CONNECT function against the Filetek documentation, and correct the problem accordingly. This might require reducing the number of active device tasks to reduce the number of connections to the storage machine. If a migration job or CTVCLMIG failed, rerun the job or utility.

IOA5A1E mediaName - DEVICE num - ERROR ALLOCATING FILE fileName, RC: rc

**Explanation:** The migration job failed to allocate a file in the Filetek storage machine because the CREATOPEN function failed.

The variables in this message are:
- `mediaName` - Name of Filetek storage machine media defined in IOASPRM.
- `num` - Presently not in use.
- `fileName` - Name of the file that the migration job failed to allocate.
- `rc` - Return code from the CREATOPEN function.

The migration job skips the bad file, and processes the next file.

**Corrective Action:** Check the return code of the CREATEOPEN function against the Filetek documentation, and correct the problem accordingly.
IOA5A2E mediaName - DEVICE num - ERROR IN CLOSE. FILE fileName, RC: rc

Explanation: The migration job failed to close a file in the Filetek storage machine because the CLOSE function failed.

The variables in this message are:
- mediaName - Name of Filetek storage machine media defined in IOASPRM.
- num - Presently not in use.
- fileName - Name of the file that the migration job fails to close.
- rc - Return code from the CLOSE function.

The migration job skips the bad file, and processes the next file.

Corrective Action: Check the return code of the CLOSE function against the Filetek documentation, and correct the problem accordingly.

IOA5A3I mediaName - DEVICE num - EMSG msgText, RC: rc

Explanation: This information message is issued when a message is received from the Filetek storage machine subsystem.

The variables in this message are:
- mediaName - Name of Filetek storage machine media defined in IOASPRM.
- num - Presently not in use.
- msgText - Message received from the storage machine.
- rc - Return code from the function.

Corrective Action: No action is required.

IOA5A4E mediaName - DEVICE num - EMSG FAILED. RC: rc

Explanation: The IOASMON monitor, migration job, or the CTVCLMIG utility failed to receive a message from the Filetek storage machine because the EMSG function failed.

The variables in this message are:
- mediaName - Name of Filetek storage machine media defined in IOASPRM.
- num - Number of the IOASMON device in which the error occurred.
- rc - Return code from the EMSG function.

The IOASMON monitor, migration job, or the CTVCLMIG utility continues processing.

Corrective Action: Check the return code of the EMSG function against the Filetek documentation, and correct the problem accordingly.
IOA5A5E mediaName - DEVICE num - ERROR IN DISCONNECT TO STORAGE MACHINE: st.ma.-name, SUB SYSTEM smName, RC: rc

**Explanation:** The IOASMON monitor, migration job, or the CTVCLMIG utility failed to disconnect from the Filetek storage machine because the DISCONNECT function failed.

The variables in this message are:

- **mediaName** - Name of the Filetek storage machine media as defined in IOASPRM.
- **num** - Number of the IOASMON device in which the error occurred.
- **st.ma.-name** - The Filetek storage machine name. When it is omitted, the name of the storage machine defined in the storage machine configuration member is used.
- **smName** - SM subsystem name.
- **rc** - Return code from the DISCONNECT function.

The connection remains active. In the case of a migration job, or the CTVCLMIG utility failure to disconnect, the job or utility terminate with errors.

**Corrective Action:** Check the return code of the DISCONNECT function against the Filetek documentation, and correct the problem accordingly. In the case of failure of a migration job or the CTVCLMIG utility, rerun the job or utility correspondingly.

IOA5AIE MEDIANM mediaName - DEVICE device_num - ERROR READING FILE fileName, RC: rc

**Explanation:** The migration job failed to read from a FileTek storage machine because the READ-RECORD function failed.

The variables in this message are:

- **mediaName** - FileTek storage machine media defined in the IOASPRM member.
- **device_num** - Number of the IOASMON device in which the error occurred.
- **fileName** - Name of the file for which the error occurred.
- **rc** - Return code from the READ-RECORD function.

The migration job skips the bad file, and processes the next file.

**Corrective Action:** Check the return code from the READ-RECORD function in the FileTek documentation. Correct the problem accordingly.

IOA5D0E mediaName - DEVICE deviceName - ERROR IN ACCESS TO OAM. RC = rc REASON CODE = rsn

**Explanation:** IBM macro OSREQ was unable to carry out ACCESS for the specified OAM.

The variables in this message are:
mediaName - the OAM media name as defined in IOASPRM. Blanks are indicated if issued by means of a migration process.

deviceName - The task ID that issued the message. Blanks are indicated if the ID was issued by means of a migration process.

rc - the return code

rsn - the reason code

The system terminates any activity with OAM.

**Corrective Action:** Refer to IBM documentation. Consult either the OAM Programmer’s Reference or the DFSMSdfp Diagnosis Reference.

**Explanation:** IBM macro OSREQ was unable to carry out UNACCESS for the specified OAM.

The variables in this message are:

- mediaName - the OAM media name defined in IOASPRM. Blanks indicated that it was issued by a migration process.
- deviceName - the ID of the task that issued the message. Blanks indicate that the ID was issued by a migration process.
- rc - the OSREQ return code
- rsn - the OSREQ reason code

**Corrective Action:** Refer to OAM programmer reference material, or DFSMSdfp diagnosis reference material for an explanation of the return and reason codes.

**Explanation:** IBM macro OSREQ requested a RETRIEVE of the first object in collection collName. OSREQ returned a warning.

The variables in this message are:

- collName - Transformed name of the CDAM file being migrated.
- rc - Return code issued by OAM.
- rsn - Reason code issued by OAM.

**Corrective Action:** Refer to OAM programmer reference material, or DFSMSdfp diagnosis reference material for an explanation of the return and reason codes.
IOA5D3E ERROR DURING READ OF 1ST BLOCK - collName RC=rc REASON CODE=rsn

Explanation: IBM macro OSREQ was unable to carry out a RETRIEVE of the 1st object in the collection collName.

The variables in this message are:

- **collName**: Transformed name of the CDAM file being migrated.
- **rc**: Return code issued by OAM.
- **reason**: Reason code issued by OAM.

Migration stops.

Corrective Action: Refer to OAM programmer reference material, or DFSMSdfp diagnosis reference material for an explanation of the return and reason codes.

IOA5D4W WARNING IN QUERY - objName collName RC=rc REASON CODE=rsn

Explanation: IBM macro OSREQ requested QUERY on object objName in collection collName and issued a warning.

The variables in this message are:

- **objName**: the object requested by OSREQ (and in collection collName)
- **collName**: the transformed name of the CDAM file being migrated
- **rc**: the return code issued by OAM
- **rsn**: the reason code issued by OAM

Corrective Action: Refer to OAM programmer reference material, or DFSMSdfp diagnosis reference material for an explanation of the return and reason codes.

IOA5D5E ERROR DURING QUERY - objName collName RC=rc REASON CODE=rsn

Explanation: IBM macro OSREQ was unable to QUERY object objName in collection collName.

The variables in this message are:

- **objName**: Object requested by OSREQ (and in collection collName).
- **collName**: Transformed name of the CDAM file being migrated.
- **rc**: Return code issued by OAM.
- **rsn**: Reason code issued by OAM.

The system action depends on who issued the message, as follows:
If the migration job issues the message, LOCATE for `collName` fails, and `collName` does not migrate.

If IOMSMON issues the message, `collName` is not retrieved for viewing or printing.

**Corrective Action:** Refer to OAM programmer reference material, or DFSMSdfp diagnosis reference material for an explanation of the return and reason codes.

**IOA5D6E INCOMPLETE OAM FILE - `oamfil`**

**Explanation:** A migration job detected an incomplete OAM file. During most multistage migrations, OAM file `oamfil` migrates from OAM to another media. However, the migration job detected that `oamfil` was incomplete.

In this message, `oamfil` is the name of the incomplete OAM file.

The file does not migrate.

**Corrective Action:** Check `oamfil` in OAM, and attempt to determine the cause.

**IOA5D7W WARNING IN DELETE - `objName `**

**Explanation:** IBM macro OSREQ requested DELETE for object `objName` in collection `collName`, and produced a warning return code.

The variables in this message are:

- `objName` - the object requested by OSREQ and in collection `collName`
- `collName` - the transformed name of the CDAM file being migrated
- `rc` - the return code issued by OAM
- `rsn` - the reason code issued by OAM

**Corrective Action:** Refer to OAM programmer reference material, or DFSMSdfp diagnosis reference material for an explanation of the return and reason codes.

**IOA5D8E ERROR IN DELETE - `objName `**

**Explanation:** IBM macro OSREQ was unable to DELETE object `objName` in collection `collName`.

The variables in this message are:

- `objName` - the object requested by OSREQ and in collection `collName`
- `collName` - the transformed name of the CDAM file being migrated
- `rc` - the return code issued by OAM
- `rsn` - the reason code issued by OAM

The system terminates any activity associated with file `collName`. If this error occurs during migration, the `collName` is not migrated.
Corrective Action: Refer to OAM programmer reference material, or DFSMSdfp diagnosis reference material for an explanation of the return and reason codes.

IOA5D9E ERROR FROM DB2 SYNC . RC=rc REASON CODE=rsn

Explanation: DB2 SYNC service generated an error during processing, after updating OAM data. If the update of OAM was successful, DB2 performs a DB2 SYNC after each action that updates the OAM data. ABORT is performed if the update fails.

The variables in this message are:
- $rc$ - the DB2 return code
- $rsn$ - the DB2 reason code

Current activity stops.

Corrective Action: Refer to DB2 documentation for an explanation of the return code and the reason code in the message. Determine the status of files in OAM after the migration. Verify that all updates were correctly performed in OAM.

IOA5DBW WARNING IN STORE - objName collName RC=rc REASON CODE=rsn

Explanation: The message relays a warning message returned from IBM macro OSREQ. IBM macro OSREQ was called with a request to STORE object objName in collection collName.

The variables in this message are:
- objName - the name of the object to be stored in collection collName
- collName - the name of the collection where the object name resides
- rc - the OSREQ return code
- rsn - the OSREQ reason code

Corrective Action: See IBM documentation for an explanation of the return and reason codes in this message. Use OAM programmer reference material, or DFSMSdfp diagnosis reference material.

IOA5DCE ERROR IN STORE - objName collName RC=rc REASON CODE=rsn

Explanation: There was a request to STORE object objName in collection collName. However, IBM macro OSREQ returned an invalid return code.

The variables in this message are:
- objName - the name of the specified object
- collName - the name of the collection indicated as containing the specified object
- rc - the OSREQ return code
- rsn - the OSREQ reason code

Migration for file collName halts. In the next migration run, when the migration program discovers that the collection was not completed, all migrated objects are deleted, and the migration for this file is retried.
**Corrective Action:** Refer to IBM documentation for an explanation of the return and reason codes in this message. Use OAM programmer reference material, or DFSMSdfp diagnosis reference material.

**IOA5DDW** WARNING IN RETRIEVE - `objName collName RC = rc REASON CODE = rsn`

**Explanation:** The user requested that IBM macro OSREQ RETRIEVE object `objName` in collection `collName`. A warning code was returned by the macro.

The variables in this message are:
- `objName` - the name of the specified object
- `collName` - the name of collection indicated as containing the specified object
- `rc` - the OSREQ return code
- `rsn` - the OSREQ reason code

**Corrective Action:** Refer to IBM documentation for an explanation of the return code and the reason code specified in this message. Use OAM programmer reference material, or DFSMSdfp diagnosis reference material.

**IOA5DEE** MEDIANM - DEVICE `taskId` - ERROR IN RETRIEVE - `objName collName RC=rc REASON CODE = rsn`

**Explanation:** IBM macro OSREQ was unable to RETRIEVE object `objName` in collection `collName`.

The variables in this message are:
- `mediaName` - the OAM media name defined in IOASPRM Blank if issued from a migration process.
- `taskId` - the ID of the task that issued the message Blank if issued from a migration process.
- `objName` - the name of the specified object
- `collName` - the name of collection specified as containing `objName`
- `rc` - the OSREQ return code
- `rsn` - the OSREQ reason code

The system action depends on who issued the message, as follows:
- If this message is issued by IOASMON, the read from the OAM migrated file fails, and this message is displayed on the user screen.
- If this message is issued by a Multistage migration job, the migration of file `collName` stops, and a migration failure message is issued.

**Corrective Action:** Record the return code and reason code and refer to IBM documentation. Refer to OAM programmer reference material, or DFSMSdfp diagnosis reference material.

**IOA5DFI** MEDIANM DEVICE `deviceName` - DB2 MSG RECEIVED - `db2msg`

**Explanation:** This information message relays a message returned from DB2 while processing IBM macro OSREQ.
The variables in this message are:

- **deviceName** - the ID of the media device
- **db2msg** - the message returned from DB2 by means of OSREQ

**Corrective Action:** Refer to IBM documentation for an explanation of DB2 messages.

**IOA5DGS OAM IS NOT ACTIVE IN SYSTEM**

**Explanation:** IBM OAM software was not active. Control-V attempted to initiate a connection to OAM. The system terminates the action attempted by Control-V.

**Corrective Action:** Activate OAM.

**IOA5DJ E DB2 TABLES CORRUPTED - COLLECTION MATCHED AN OLD OBJECT objName collName**

**Explanation:** An IBM OAM utility attempted to store an object over a different object with the same name. During migration to OAM, an OAM utility detected an object with the same name but different content. OAM DB2 tables may have been deleted by the user, and objects in the deleted tables may be connected to new collections. Message MIG5CUE immediately follows this message.

The variables in this message are:

- **objName** - the object name that caused the error
- **collName** - the name of the collection where the original **objName** resides

The system stops migration for **objName collName**. DB2 undoes migration actions performed for this collection. A LOCATE Failed Error message is issued for the OAM migrated file.

**Corrective Action:** Consult your DB2 administrator. Check and fix the DB2 tables.

**IOA5E3I CLIP_ID=clipId**

**Explanation:** This information message is issued for each Centera clip created during Control-V migration to the EMC Centera storage system.

The variable in this message is:

- **clipId** - the name of the clip

**Corrective Action:** No action is required.

**IOA5E4E CENTERA INIT ERROR: RC=rc, REASON CODE=rsn**

**Explanation:** Connection to EMC Centera cannot be established. This message is followed by message **IOA5E9I**, which issues the Centera pool value used for connection.

The variables in this message are:
 IOA Archive Server skips the reading of data from Centera and continues processing with reading data from other media.

**Corrective Action:** Refer to EMC Centera documentation for a description of the received reason code. Check the pool value printed in the accompanying MIG5E9I message. If the IP addresses are not correct, update them in parameters POOL1-POOL4 in the IOASPRM member. Restart the IOA Archive Server after the reason for the problem is eliminated.

**IOA5E6E CENTERA READ ERROR: RC=rc,REASON CODE=rsn,DSN=dsn,BLN=blk,L=len**

**Explanation:** An error was detected while reading a block from the EMC Centera clip. This message is followed by message IOA5E31, which issues the problematic Centera clip name.

The variables in this message are:
- **rc** - return code from the EMC Centera API
- **rsn** - reason code from the EMC Centera API
- **dsn** - the name of the migrated dataset
- **blk** - error block number
- **len** - returned block length

The migrated **dsn** dataset is not read.

**Corrective Action:** Refer to the EMC Centera documentation for a description of the received reason code. If you cannot resolve the problem, contact the EMC Centera experts.

**IOA5E8E CENTERA TERMINATE ERROR- RC=rc, REASON CODE=rsn**

**Explanation:** An error was detected during termination of the EMC Centera device.

The variables in this message are:
- **rc** - return code from the EMC Centera API
- **rsn** - reason code from the EMC Centera API

The EMC Centera connection is not terminated.

**Corrective Action:** Refer to the EMC Centera documentation for a description of the received reason code. If you cannot resolve the problem, contact the EMC Centera experts.

**IOA5E9I POOL=pool**

**Explanation:** This information message follows message IOA5E4E.

In this message, **pool** represents the pool value specified in parameters POOL1-POOL4 in the IOASPRM member.
Corrective Action: No action is required.

Messages IOA600 through IOA6xx

This group includes messages for the IOA (infrastructure) product.

IOA631S INVALID FORMAT OF INPUT PARAMETERS

Explanation: While the IOA Online facility was being initialized, a severe syntax error was found in one of the keywords in one of the ALC members. ALC members contain keywords that reference data sets to be allocated during initialization. The line in which the erroneous keyword appears is displayed in the IOAD81I message that follows this message. IOA Online facility terminates with errors.

Corrective Action: Correct the erroneous keyword displayed in message IOAD81I, and reactivate the IOA Online facility.

IOA684E DSN dsn IN USE (DISP=OLD)

Explanation: The dsn data set is held exclusively by another user.

Possible causes are:

- Control-M AutoEdit facility - failure to read a symbols member (%GLOBAL statement, or %LIBSYM %MEMSYM statement).
- IOA Online facility - schedule, calendar or rule definition.
- Control-O initialization.
- CMEM initialization.

The system action depends on the cause, as follows:

- AutoEdit facility - job submission stops.
- IOA Online facility - reading or updating of the table, calendar or rule is not performed.
- Control-O is not started.
- CMEM is not started.

Corrective Action: Try again.

IOA686E DSN dsn NOT IN CATALOG

Explanation: The requested data set name is not in the catalog.

Possible causes are:
Control-M AutoEdit facility - failure to read a symbols member (%%GLOBAL statement, or
%%LIBSYM %%MEMSYM statement).

IOA Online facility - schedule, calendar or rule definition.

New Day procedure - failure to read a calendar from the data set described by the DACAL DD
statement.

The system action depends on the cause, as follows:

- AutoEdit facility - job submission stops.
- IOA Online facility - reading or updating of the table, calendar or rule is not performed.
- New Day procedure ends with errors.

**Corrective Action:** The appropriate response depends on the cause, as follows:

1. AutoEdit facility - correct the JCL for the job and rerun it.
2. Online facility - correct the library name and retry.
3. New Day procedure - correct the New Day procedure and retry.

Messages IOA700 through IOA7xx

This group includes messages for the IOA (infrastructure) product.

**IOA704E** MISSING/INVALID PARAMETER IN THE PARM FIELD. VALID
PARAMETERS ARE: IOA, CTM, CTD, CTR, CTO, CTB, ECS

**Explanation:** Only one subsystem parameter should be specified in the PARM field of the IOAINS
program. The IOAINS installation program can install only one of the above products at a time. The
product code should be specified in the PARM field of the IOAINS EXEC statement.

The IOAINS installation program terminates with a condition code of 08.

**Corrective Action:** Correct the PARM field and resubmit the job.

**IOA705I** {START | END} MODIFYING OF LINES FOR MEM=memName,
LIB=lib

**Explanation:** This information message indicates that statements contained in the specified library or
member will be (START) or were (END) modified depending on the operation. This message is issued at
the start and after modification of each member by IOAINS.

**Corrective Action:** No action is required.

**IOA706I** LINE BEFORE CHANGE: stmt

**Explanation:** This information message displays each statement before it is modified.

**Corrective Action:** No action is required.

**IOA707I** LINE AFTER CHANGE: stmt

**Explanation:** This information message displays each statement after it is modified.
Corrective Action: No action is required.

IOA708E OPEN OF DDNAME ddName FAILED

Explanation: The specified DD name could not be opened. This message is issued when errors occur during an attempt to open the mandatory DD names of the IOAINS and IOAIN1 installation programs. The IOAINS or IOAIN1 installation program terminates with a condition code of 08.

Corrective Action: Correct the error and resubmit the job.

IOA709E INVALID PARMS IN stmt

Explanation: In the IOAINS program, this message is issued as a result of an unrecognized parameter in the DEFPARMx member, where x represents the IOA product. In the IOAIN1 program, this message is issued as a result of an unrecognized parameter in the member pointed to by the DAINS DD statement. In both cases, the statement content follows.

The DEFPARMx member or the DAINS DD statement contains installation variables to replace constants throughout the product libraries. However one of the variables was not recognized by IOAINS or IOAIN1. The IOAINS or IOAIN1 installation program terminates with a condition code of 08.

Corrective Action: Check the statement content. Do not modify the text between the percent signs. If needed, restore the relevant library from the original tape to determine the original variable value.

IOA70AE ERROR ALLOCATING MEM=memName LIB= lib

Explanation: The specified library or member could not be allocated. The DALIBS DD name contains a list of libraries and members in which modification of the product Installation Parameters takes place. If the member is blank, the entire library can not be allocated.

The IOAINS installation program continues with the next library and member as specified under the DD name DALIBS.

Corrective Action: Determine the reason the library or member could not be allocated. Then resubmit IOAINS while DALIBS contains only the problematic library and member specifications.

IOA70BE MISSING PARAMETERS IN THE PARM FIELD

Explanation: Incorrect or missing PARM value in the IOAIN1 installation program. The PARM field of the IOAIN1 installation program should contain the type of run (1, 2, 3, 4, 5, or 6), followed by the product suffix, and a series of variables to be modified by the program. However, this PARM value was missing or incorrect.

The IOAIN1 installation program terminates with a condition code of 08.

Corrective Action: Check the PARM field in the IOAIN1 installation program, correct the error, and resubmit the job.

IOA70CE INVALID "OS" PARAMETER. EXPECTED VALUES: MVS, MSP

Explanation: An invalid OS parameter was passed to the IOAIN1 installation program, with run type 4. When running the IOAIN1 installation program with run type 4, the OS parameter should be MVS or MSP.
The IOAIN1 installation program terminates with a condition code of 08.

Corrective Action: Check the PARM field in the IOAIN1 installation program, correct the error, and resubmit the job.

IOA70DE MODIFYING OF LINES ENDED, DD=ddName

Explanation: This information message indicates that the IOAIN1 installation program successfully completed modification of the lines in the member pointed to by the ddName DD statement. This message is issued for each DD statement of the format DAINS xxx.

Corrective Action: No action is required.

IOA70EE "parm" PARAMETER VALUE EXCEEDS 44 CHARACTERS. PROGRAM TERMINATED

Explanation: The value assigned to the parm parameter, which was coded in the DEFPARMx member and should be substituted by the IOAINS installation program, exceeded 44 characters. Since the maximum length for a parameter value is 44, the program cannot perform variable substitution.

The program stops executing with a return code of 08. No substitution is performed by this step of IOAINS.

Corrective Action: Correct the value of parm and rerun the job.

IOA712E INVALID PARAMETER IN SYSIN FILE RSN:05

Explanation: The IOAFTR installation program is used for tailoring members during the copying process from one library to another. This message is issued by IOAFTR if the SYSIN statement includes the same input and output libraries pointed to by the INDD and OUTDD statements and the same member name for input and output.

The IOAFTR installation program terminates with a reason code of 05.

Corrective Action: Check the settings or change the name of one of the members to: xxxxxxx1 and rerun the process.

IOA717E CALENDAR CONTAINS INVALID DATA

Explanation: The IOACL utility displays this message if a calendar contains invalid data. For example, a regular calendar can have a value of Y/N/+/-/blank in the months. If another value is present, this error message will be displayed. Note that the previous message identifies the calendar that contains the error. The XML output file will not contain this calendar.

Corrective Action: Check the calendar, correct the values that are invalid, and rerun the IOACL utility.

IOA71EI PROCESSING CALENDAR calendar name

Explanation: This message is produced for each calendar that is processed by the IOACL utility.

Corrective Action: No action is required.
IOA720I UTILITY *util* STARTED

**Explanation:** This information message is issued by CTMAPI, and indicates that the utility identified in the message has started.

CTMAPI issues this message before calling the application that handles the appropriate action code.

**Corrective Action:** No action is required.

IOA721I UTILITY *util* ENDED SUCCESSFULLY

**Explanation:** This information message is issued by CTMAPI, and indicates that the utility identified in the message has ended with a return code of 0.

**Corrective Action:** No action is required.

IOA722I UTILITY *util* ENDED UNSUCCESSFULLY REASON *rc*

**Explanation:** This information message indicates that the specified utility identified in the message has ended with a return code other than 0.

In this message, *rc* is the return code.

**Corrective Action:** Use the contents of any messages issued by the utility, together with the return code, to determine the cause of the problem and take appropriate corrective action.

IOA723I API ENDED UNSUCCESSFULLY REASON *rc*

**Explanation:** This message is issued whenever CTMAPI fails to perform an action, for example, failing to load an application.

In this message, *rc* is the reason code, the meaning of which is identical to the reason codes issued by the CTMBAPI DSECT, which can be found in the CTMBAPI member in the IOA MAC library.

The reason codes are listed below:

<table>

</table>

**Corrective Action:** No action is required.

**IOA724E NO KEYWORD FOUND**

**Explanation:** A valid action code was specified, but no other mandatory keywords were supplied. Therefore CTMAPI cannot perform the action that was requested.

For further information on mandatory keywords, see the CTMAPI appendix in the *Control-M for z/OS User Guide*.

The action is not performed.

**Corrective Action:** Correct the request by inserting the mandatory keywords.

**IOA725E DUPLICATE KEYWORD**

**Explanation:** The same keyword was specified more than once.

The action that was requested is rejected.

**Corrective Action:** Correct the request by removing the duplicate keyword specifications, and resubmit the request.

**IOA726E EXPECTED VALUE FOR TOKEN**

**Explanation:** In an action request, a keyword was specified that requires a value, but no value was found.

For example, the keyword DSNAME was specified, but no data set name was specified.

The request is rejected.

**Corrective Action:** Correct the syntax of the command, and reissue the request.

**IOA727E ILLEGAL VALUE LENGTH**

**Explanation:** A parameter was set to a value that exceeds the maximum valid length.

The request is rejected.

**Corrective Action:** Correct the command to ensure that the lengths of the values of all parameters are valid.

**IOA728I inputText**

**Explanation:** This information message serves as an echo line, showing the input to CTMAPI.

**Corrective Action:** No action is required.
IOA729E I LLEGAL COMMAND

Explanation: A CTMAPI request was issued, but the action requested is not one defined by CTMAPI. The request is rejected.

Corrective Action: Correct the command so as to ensure that only valid actions are requested.

IOA72AI action SUCCESSFUL

Explanation: This information message indicates that CTMAPI successfully performed a SEARCH or IF action.

Corrective Action: No action is required.

IOA72BI action NOT SUCCESSFUL

Explanation: This information message indicates that CTMAPI was unsuccessful in performing a SEARCH or IF action.

Corrective Action: No action is required.

IOA72CE SYNTAX ERROR

Explanation: CTMAPI could not perform the action that was requested because of a syntax error in the request.

This message is usually accompanied by other messages that clarify the nature of the error. The request is rejected.

Corrective Action: Examine the request and correct the error.

IOA72DE UNRECOVERABLE ERROR OCCURRED DURING SEARCH

Explanation: An internal error occurred while CTMAPI was performing the SEARCH AJF command. Possible causes are such problems as failure to get memory, failure to find the AJF that was specified, and so on.

Usually this message is accompanied by other messages issued by CTMAPI or CTMAPQ. The command is rejected.

Corrective Action: Examine any accompanying messages, and take appropriate corrective action.

IOA72JE AJF ACTION NOT PERFORMED

Explanation: An AJF action that was requested was not performed. Usually, this message is accompanied by other messages that explain the reason.

The AJF action is not performed.

Corrective Action: Examine the accompanying messages to ascertain the nature of the problem, and take appropriate corrective action.
**IOA72KE NEWDAY IN PROCESS**

**Explanation:** An AJF action that was requested could not be performed, because the New Day procedure is holding the AJF. No action can be performed on the AJF until the New Day procedure releases it.

The AJF action is not performed.

**Corrective Action:** Wait for a time, until the New Day procedure ends, and reissue the request.

**IOA72LE MISSING ON PGMST LINE DEFINITION**

**Explanation:** This message is issued when a user edited a job definition in the Job Scheduling Definition screen (Screen 2), and

- defined two ON PGMST statements connected by a Boolean connector (AND or OR)
- failed to complete the details of the second ON PGMST statement
- attempted to save the job

**Corrective Action:** Correct the problematic ON PGMST statement.

**IOA72MI ACTION action ON JOB jobId ORDERID orderId**

**Explanation:** This message describes the action taken by CTMAPI on a job in the Active Jobs file.

The variables in this message are:

- `action` - the action that was taken
- `jobId` - the identity of the relevant job
- `orderId` - the order ID of the job

CTMAPI performs the action and issues this message. This message is followed by one of the following messages:

- IOA72AI - issued when the return code resulting from the action signifies successful completion of the action
- IOA72BI - issued when the return code resulting from the action signifies unsuccessful completion of the action

**Corrective Action:** Verify that the action identified in this message was performed on the correct job.

**IOA72QE ACTION FAILED rsn: action ON JOB jobName ORDERID orderId**

**Explanation:** The CTMAPI utility failed to perform the requested action on the `jobName` job, whose order ID is `orderId`. The reason for the failure is described by the following `rsn` codes:

<table>

**Corrective Action:** No action is required.

**IOA72SW** ERROR IN TIMEZONE: DUPLICATE TIME ZONE NAME . LINE IGNORED

**Explanation:** A duplicate time zone designation was detected in the TIMEZONE member of the CTM PARM library. The time zone in question is listed in message IOA72ZI, which follows message IOA72SW.

**Corrective Action:** Correct the TIMEZONE member.

The duplicate entry is ignored.

**IOA72UI** JOB jobName ORDERID orderId EXCLUDED FROM EM DOWNLOAD

**Explanation:** This information message indicates that the jobName job, whose order ID is orderId, is marked to be excluded from the next downloading of jobs from the AJF to Control-M/EM. This is a response to the CTMAPI command EMDOWNLD EXCLUDE LIST, which lists the jobs currently excluded from the download process.

**Corrective Action:** No action is required.

**IOA72VI** NO JOBS EXCLUDED FROM EM DOWNLOAD

**Explanation:** This information message appears in response to the CTMAPI command EMDOWNLD EXCLUDE LIST, which lists the jobs currently excluded from the download process. No jobs with such a status were found on the AJF.

**Corrective Action:** No action is required.
IOA72XI JOB jobName IS A GROUP ENTITY -- ALL JOBS IN GROUP WILL BE PROCESSED

Explanation: This information message indicates that a request to exclude the jobName job from downloading is being processed, and the job was found to be a group entity. As a result, all jobs in the group are marked as excluded from downloading.
Corrective Action: No action is required.

IOA72ZI text

Explanation: This information message contains the timezone entry and description text.
Corrective Action: See message IOA72SW.

IOA740E MEMBER MemName IS IN USE, PLEASE TRY LATER

Explanation: The MemName member is in use and cannot be overwritten.
Corrective Action: Release the MemName member.

IOA741E PROBLEMS WITH BASE LIBRARY basepref.INSTALL error

Explanation: The install library specified in the message does not exist, or has an invalid DSNNAME.
The variables in this message are:
- basepref - the base prefix of the missing install library
- error - a description of the error
A prompt is issued for the base prefix.
Corrective Action: Check if the library was installed, or if the prefix was misspelled, and correct accordingly.

IOA742E PROBABLY NOT A BASE LIBRARY IOAIC00A error

Explanation: The basepref.INSTALL parameter points to a data set that is not a base library. A base library must contain the IOAIC00A member.
A prompt is issued for a base prefix.
Corrective Action: Specify the correct base library prefix.

IOA743E ENVIRONMENT TABLE PROBLEMS[. APPLICATION TERMINATED]

Explanation: The Environment table was not found in the specified install library.
The ICE application terminates.
Corrective Action: Reload the required install library from the installation tape.
IOA744E UNABLE TO ALLOCATE THE ENVIRONMENT \textit{lib} LIBRARY DATASET NAME: \textit{dsn}

\textbf{Explanation:} The application failed to allocate the \textit{dsn} dataset name in the environment's \textit{lib} library.

\textbf{Corrective Action:} Consult your system administrator to check for an MVS allocation problem.

IOA746I NO ENVIRONMENT EXISTS OR SELECTED [FOR CLONING]

\textbf{Explanation:} This information message indicates that no environment exists or is selected. Either this is the first time ICE was activated, or no current environment exits. The system cannot proceed with any activity other than ENVIRONMENTS.

\textbf{Corrective Action:} In the ICE Main Menu, select Installation and then select the ENVIRONMENTS activity. If needed, define an environment; select a defined environment.

IOA747E UNKNOWN OR MISSING PRODUCT ID

\textbf{Explanation:} An invalid product ID was specified. Product ID is a three letter abbreviation of an IOA product, for example, CTM for Control-M.

\textbf{Corrective Action:} Specify a valid product ID.

IOA748E ENFORCE STEP ORDER MUST BE YES OR NO

\textbf{Explanation:} A value other than YES or NO was specified in the Enforce step order parameter.

\textbf{Corrective Action:} Specify YES or NO.

IOA749E THIS ACTIVITY CANNOT BE PERFORMED FOR THIS PRODUCT ID

\textbf{Explanation:} The user specified a product and an activity that cannot be specified together. Certain activities are valid only when installing certain products. For example, activities INSTALL, COPY IOA, and MAINTENANCE are valid only for product ID IOA.

\textbf{Corrective Action:} Specify another activity (or change the product ID).

IOA74AE THIS ACTIVITY CANNOT BE SELECTED FOR \textit{product}

\textbf{Explanation:} The user selected an activity that is not valid when installing a product which is not \textit{product}.

\textbf{Corrective Action:} Change the activity or the product ID.

IOA74BE THIS ACTIVITY IS NOT SUPPORTED FOR A CLONED ENVIRONMENT

\textbf{Explanation:} The message is displayed when one of the following SMP/E processes is attempted on a cloned environment:
applying a maintenance upgrade (ICE Main Menu=>Maintain your Environment=>Maintenance)
applying ad hoc PTFs (ICE Main Menu=>Maintain your Environment=>APPLY PTFs)

These processes cannot be performed since cloned environments do not include the SMP/E installation utilities.

**Corrective Action:** Avoid selecting the above ICE options on cloned environments.

**IOA74CE** THIS ACTIVITY IS NOT VALID FOR AN ENVIRONMENT CREATED FROM TAPE

**Explanation:** The user requested activity COPY IOA for an environment created from the product tape. This is not permitted.

**Corrective Action:** If this message was issued in a Default or an IOA cloned installation, see the INCONTROL for z/OS Installation Guide, “Customizing INCONTROL Products.”

If this message was issued in a customized installation, select the ENVIRONMENTS activity and then select an environment whose CREATE FROM parameter is an environment ID.

**IOA74DE** PFMSMF: Value PFMSMF MUST BE ZERO OR BETWEEN 128 AND 255

**Explanation:** This error message indicates that the value of the parameter PFMSMF is incorrect.

**Corrective Action:** Set the value of the parameter PFMSMF to 0 or a number between 128 and 255.

**IOA750E** THE ENVIRONMENT NAME MUST BEGIN WITH A LETTER

**Explanation:** The first position of the environment name is not an alphabetic character.

A prompt is issued for the environment name parameter.

**Corrective Action:** Specify a value in the environment name parameter with an alphabetic character in the first position.

**IOA751E** PREFIX MUST BE DIFFERENT FROM THE BASE PREFIX

**Explanation:** The same prefix is specified for the base and for the environment. The same prefix cannot be used for both the environment data sets and for the base data sets.

A prompt is issued for the environment prefix parameter.

**Corrective Action:** Specify an environment prefix different from the base prefix.

**IOA752E** NOT A VALID DSNAME SYNTAX OR EMPTY

**Explanation:** A DSNAME that does not conform to DSNAME syntax rules is specified or the field was left blank. The DSNAME must conform to DSNAME syntax rules and cannot be empty.

A prompt is issued for the DSNAME.

**Corrective Action:** No action is required.
IOA753E EITHER DEFINE BOTH UNIT AND VOLSER OR LEAVE BOTH OF THEM BLANK

Explanation: The unit or volume names are missing. Both the unit and volume names must be supplied. A prompt requests the missing parameter.

Corrective Action: Specify the missing name.

IOA754E ENVIRONMENT ID CANNOT BE TAPE or EPD

Explanation: The environment ID is specified as TAPE or EPD. The environment ID can be any string, up to eight characters, except the strings TAPE or EPD. A prompt is issued for the environment ID parameter.

Corrective Action: Specify an environment ID other than TAPE or EPD.

IOA755E DUPLICATION IS NOT ALLOWED

Explanation: An attempt to define a new environment uses the name/installation prefix of a previously defined environment. The name of an environment/installation prefix must be unique. A prompt is issued for the environment name/installation prefix parameter.

Corrective Action: Specify a name for the environment/installation prefix which does not match the name/installation prefix of another environment.

IOA756I ENVIRONMENT environmentID DELETED

Explanation: This information message indicates that the specified environment was deleted as required. The entry in the environment table was deleted. The libraries were not deleted.

Corrective Action: No action is required.

IOA757E THE COPY FROM ENVIRONMENT environmentID DOES NOT EXIST

Explanation: There was an attempt to create a new environment from an existing environment, but the environmentID source environment does not exist. A prompt is issued for the environment ID parameter.

Corrective Action: Change the source environment ID to one that already exists.

IOA758E ONLY ONE ENVIRONMENT CAN BE INSTALLED FROM TAPE

Explanation: An attempt to install, in a single base, more than one environment from the product tape failed. Only one environment, per base library, can be installed from the same product tape.

Corrective Action: Select another environment from which to install the new environment.
IOA760E COULD NOT LOAD ISPLNK MODULE

Explanation: The installation application failed to load the ISPLINK module. ICE requires the use of the ISPF ISPLINK module, and therefore loads the module during installation.

Corrective Action: Consult your system administrator who should check the ISPF installation.

IOA761E MEMBER memName NOT FOUND

Explanation: The memName member does not exist.

Corrective Action: Check that the member name and library are specified correctly.

IOA762E INVALID ACTION

Explanation: An invalid action code was specified. The valid action codes appear on each screen.

Corrective Action: Specify a valid action.

IOA763E CANNOT SELECT STEP. PRIOR STEP NOT COMPLETED

Explanation: A major or a minor step was selected, but previous steps were optional, excluded, or not completed. If ENFORCE STEP ORDER is specified as YES, the application checks the prior steps.

Corrective Action: Complete prior steps, or specify ENFORCE STEP ORDER=NO.

IOA764I BROWSE MODE - VIEW ONLY

Explanation: This information message indicates that the current screen is in browse mode.

Corrective Action: No action is required.

IOA765E CANNOT MARK STEP AS COMPLETE. SOME MINOR STEPS ARE NOT COMPLETED

Explanation: An attempt to mark a major step as completed when at least one mandatory minor step was not completed failed. A major step can be marked as completed only when all mandatory minor steps have been completed.

Corrective Action: Complete the mandatory minor steps.

IOA766E CANNOT ALLOCATE HELP FILE

Explanation: The online help file cannot be allocated. The online help file is allocated when the help is requested, or EXTERNAL STEP is selected.

Corrective Action: Check that the IOAIMxxx member, where xxx is the Product ID, appears in the basepref.INSTALL library.
IOA767E KEYWORD *keyName* WAS NOT FOUND IN MEMBER *memName*

**Explanation:** The keyword *keyName* in Special Edit (Data * type step) does not appear in the specified member. The Special Edit process searches for the keyword in the target member and, if requested, in the reference member. If the keyword is not found in either one of these members, this message is issued.

**Corrective Action:** If the identified member is the reference member, choose another member, or specify N to relinquish the use of a reference. If the specified member is the target member, copy it from the base library into the target member.

IOA768E TARGET AND DISTRIBUTION ZONE NAMES CANNOT BE GLOBAL

**Explanation:** An attempt to specify the name of a target or distribution zone as GLOBAL failed. In SMP/E, GLOBAL is reserved for the name of the global zone.

A prompt is issued for the target or distribution zone parameter.

**Corrective Action:** Specify another name for the zone in question.

IOA769E TARGET AND DISTRIBUTION ZONE NAMES MUST BE DIFFERENT

**Explanation:** Identical names were specified for the target and distribution zones. Target and distribution zone names must be unique.

A prompt is issued for the target or distribution zone parameter.

**Corrective Action:** Change either the target or distribution zone name.

IOA76AE TARGET PREFIX MUST BE DIFFERENT FROM GLOBAL PREFIX

**Explanation:** Identical prefixes were specified for the target and global prefixes. Target and global prefixes must be unique.

A prompt is issued for the target or prefix parameter.

**Corrective Action:** Change the target prefix.

IOA76BE DISTRIBUTION PREFIX MUST BE DIFFERENT FROM GLOBAL PREFIX

**Explanation:** Identical prefixes were specified for the distribution and global prefixes. Distribution and global prefixes must be unique.

A prompt is issued for the distribution prefix parameter.

**Corrective Action:** Change the distribution prefix.

IOA76CE DISTRIBUTION AND TARGET PREFIXES MUST BE DIFFERENT

**Explanation:** Identical prefixes were specified for the distribution and target prefixes. Distribution and target prefixes must be unique.

**Corrective Action:** Change either the distribution or target prefix.
IOA76DE The step can be marked as COMPLETE only after being selected

Explanation: This step can be marked as COMPLETE only after being selected at least once.
Corrective Action: Select this member, and then mark it as COMPLETE.

IOA76EE Step can not be marked as COMPLETE, the process did not finish ok

Explanation: The step can be marked as COMPLETE only after the process finishes OK.
Corrective Action: Make sure that the process finishes OK, and then mark it as COMPLETE.

IOA770E MISSING VALUES FOR: parms

Explanation: There was an attempt to mark the Data Type minor step as completed, but at least one of its mandatory parameter values was not specified. The names of the problematic parameters are listed in the message.

The step is not marked as completed.
Corrective Action: Select the step again and specify the missing values.

IOA771E varName MUST BE NUMERIC AND WHOLE NUMBER ONLY

Explanation: A non-numeric or non-integer value was specified for the varName variable.
A prompt is issued for the variable.
Corrective Action: Specify a numeric value for the variable.

IOA772E ParmName MUST BE ALPHANUMERIC [AND FIRST CANNOT BE NUMERIC]

Explanation: An invalid value was specified for the ParmName parameter.
The word "Parameters" is a valid value for the ParmName parameter.
Corrective Action: Specify a valid value for the parameter.

IOA773E varName MUST BE AT LEAST charNum CHARACTERS LONG

Explanation: The input value for the variable identified in the message was too short.
A prompt is issued for the variable.
Corrective Action: Specify a character string for the variable that contains at least the minimum number of characters indicated in the message.

IOA774E varName MUST BE AT MOST charNum {CHARACTERS | DIGITS} LONG

Explanation: The input value for the variable identified in the message was too long.
A prompt is issued for the variable.
Corrective Action: Specify a character string for the variable that does not exceed the maximum length indicated in the message.

IOA775E varName MUST BE val OR LESS

Explanation: The input value for the variable identified in the message was too large.
A prompt is issued for the variable.

Corrective Action: Specify a number for the variable that is less than the value indicated in the message.

IOA776E varName MUST BE val OR GREATER

Explanation: The input value for the variable identified in the message was too small.
A prompt is issued for the variable.

Corrective Action: Specify a number for the variable that exceeds the value indicated in the message.

IOA777E varName VALUE SHOULD BE BETWEEN val1 AND val2

Explanation: The input value for the variable identified in the message was not in the indicated range.
A prompt is issued for the variable.

Corrective Action: Specify a number for the variable within the range specified in the message.

IOA778E varName VALUE IS ONE OF: val1 val2 ... val6

Explanation: The input value for the variable identified in the message was not one of a number of valid values.
A prompt is issued for the variable.

Corrective Action: Specify for the variable one of the valid codes indicated in the message.

IOA779E varName IS MANDATORY

Explanation: A mandatory variable has no value.
A prompt is issued for the variable.

Corrective Action: Specify a value for the variable.

IOA77AE varName HAS INVALID DSNAME SYNTAX OR EMPTY

Explanation: The DSNAME for the variable does not conform to DSNAME syntax rules or is empty. The DSNAME must conform to DSNAME syntax rules.
A prompt is issued for the variable.

Corrective Action: Correct the DSNAME.
IOA77BE \textit{varName} FAILED VALIDITY CHECKS. PLEASE CONSULT THE INSTALLATION MANUAL

\textbf{Explanation:} The value of the specified variable is invalid.
A prompt is issued for the variable.

\textbf{Corrective Action:} Refer to the \textit{INCONTROL for z/OS Installation Guide} for the valid format and values of the variable.

IOA77CE SIGN OF \textit{varName} MUST BE - OR +

\textbf{Explanation:} There is no minus sign - or plus sign + before the identified field.
A prompt is issued for the variable.

\textbf{Corrective Action:} Insert a minus sign - or a plus sign + at the beginning of the field.

IOA77DE HOUR MUST BE BETWEEN 00 AND 23

\textbf{Explanation:} An invalid value specifies the hour of the day. The hour value must be between 00 and 23.
A prompt is issued for the variable.

\textbf{Corrective Action:} Specify an hour value between 00 and 23.

IOA77EE MINUTE MUST BE BETWEEN 00 AND 59

\textbf{Explanation:} An invalid value specifies the minute of the day. The minute value must be between 00 and 59.
A prompt is issued for the variable.

\textbf{Corrective Action:} Specify a minute value between 00 and 59.

IOA77FE \textit{varName} MUST BE IN HEXADECIMAL DIGITS

\textbf{Explanation:} A non-hexadecimal value was specified for the specified variable. The value must be either 0 to 9, or A to F.
A prompt is issued for the variable.

\textbf{Corrective Action:} Specify a hexadecimal value.

IOA780W DO NOT PROCEED. CANNOT INSTALL \textit{prod1} WHEN \textit{prod2} IS NOT INSTALLED

\textbf{Explanation:} An attempt to install product \textit{prod1} before concluding the installation of the prerequisite product \textit{prod2} failed.
Some products can be installed only after other products have been installed. For example, IOA must be installed before all other IOA products.

\textbf{Corrective Action:} Complete all the installation steps of the prerequisite product.
IOA781E varName1: val1 MUST BE DIFFERENT FROM varName2 [in xxxPARM]

**Explanation:** The values for variable 1 and variable 2 in xxxPARM are identical. If in xxxPARM is missing variable 1 and variable 2 are in the same member.

**Corrective Action:** Choose another value for one of the variables.

IOA782W CTM: val1 CTD: val2 CTD OR CTM MUST BE "Y"

**Explanation:** The values of the CTM or CTD parameter were not specified as Y.

**Corrective Action:** Specify CTM or CTD as Y.

IOA783E var: MAX. TWO QUALIFIERS ALLOWED

**Explanation:** The var variable can contain only two qualifiers (only one dot is allowed).

**Corrective Action:** Correct the var variable to contain only two qualifiers (with only one dot).

IOA784E SMF: valSMF = NO, OR SMF BETWEEN 128 AND 255

**Explanation:** An invalid value is specified for SMF. Valid values for SMF are either NO, or a numeric value in the range 128-255.

**Corrective Action:** Change the value of the SMF parameter to NO, or a number between 128 and 255.

**Corrective Action:** Correct the var variable to contain only two qualifiers (with only one dot).

IOA785W DUALVOL: volser

**Explanation:** When installing IOA, installation of a dual database was requested by specifying Y in the DUALDB parameter. For improved performance and recovery capability, place the dual file on a different disk and (preferably) on a different disk controller than the rest of the IOA Core:

- DBVOLA — the volume serial number for IOA Core
- DUALVOL — the volume on which the dual database is to be allocated

**Corrective Action:** Specify different volumes for the IOA Core and dual files.
IOA786E DUALUNIT: NONE

IF DUALDB IS "Y" THEN DUALUNIT CANNOT BE NONE

DUALVOL: NONE

IF DUALDB IS "Y" THEN DUALVOL CANNOT BE NONE

Explanation: When installing IOA, installation of a dual database was requested by specifying Y in the DUALDB parameter. However, one or both of the following parameters were specified NONE (rather than a valid value):

- DUALUNIT— the unit on which the dual database is to be allocated
- DUALVOL— the volume on which the dual database is to be allocated

Corrective Action: Either change the DUALDB field to N or make sure that both a valid unit number is specified for DUALUNIT and a valid volume is specified for DUALVOL.

IOA787E MAXDAYS MAXRUNS CANNOT BE BOTH NULLS

Explanation: No value is specified for either MAXDAYS or MAXRUNS. A value must be specified for at least one of these parameters.

Corrective Action: Specify a value in the MAXDAYS parameter, or the MAXRUNS parameter, or both.

IOA788E COMM: {SNA | TCP}{APPLID= | PORT=} MUST BE SUPPLIED IF COMM = {SNA | TCP}

Explanation: No value is specified for the APPLID parameter when COMM is set to SNA, or there is no value specified for the PORT parameter when COMM is set to TCP.

Corrective Action: Specify a valid value in the APPLID or PORT accordingly.

IOA789E PROCPRFA: procprfa_val, PROCLIB: DONTCOPY SITEPROC: DONTCOPY. WHEN BOTH PROCLIB AND SITEPROC ARE DONTCOPY THEN PROCPRFA MUST BE IOA

Explanation: This is one of two messages with the same ID, but different text.

DONTCOPY is specified in the PROCLIB and SITEPROC parameters but an invalid value is specified in the PROCPRFA parameter.

Corrective Action: Change the value of the PROCPRFA parameter to IOA as indicated in the message.

IOA789E CLISTNMJ: clistnmj_val, SYSPROCA: DONTCOPY. WHEN SYSPROCA IS DONTCOPY THEN CLISTNMJ MUST BE CTJ XVER

Explanation: This is one of two messages with the same ID, but different text.

DONTCOPY is specified in the SYSPROCA parameter, but an invalid value is specified in the CLISTNMJ parameter.
Corrective Action: Change the value of the CLISTNMJ parameter to CTJXVER as indicated in the message.

IOA78AW varName: val DATASET NOT FOUND

Explanation: The supplied non-IOA data set name does not exist or is not cataloged. A data set name was specified to which an IOA data set is to be copied.

Corrective Action: Check that the specified data set name is correct.

IOA78BE IF IOAID 1 THEN SHRQNM MUST BE DIFFERENT FROM QNAME AND NOT NULL

Explanation: The SHRQNM field is blank or has the same value as the QNAME field, when the value of the IOAID field is greater than one. When the IOAID is greater than one, a unique name must be specified for the shared queue.

Corrective Action: Specify a unique name in the SHRQNM field.

IOA78CE CTO DAYTIME: val1 CTM DAYTIME: val2. CTO DAYTIME MUST BE EQUAL TO CTM DAYTIME

Explanation: A DAYTIME value is specified for Control-O that is different from the DAYTIME value of Control-M, which was installed earlier.

Corrective Action: Change Control-O DAYTIME to match that of Control-M.

IOA78DE HSTSIZE: val1 AJFSIZE: val2. HSTSIZE CANNOT BE LESS THAN AJFSIZE

Explanation: The HSTSIZE value cannot be less than the AJFSIZE value.

Corrective Action: Change the Control-M HSTSIZE parameter or the AJFSIZE parameter values.

IOA78EE PARALLEL: val1 MODET: val2. FOR PARALLEL=S, MODET MUST BE "TEST"

Explanation: When the Control-M/Tape PARALLEL parameter is specified as "S", the MODET parameter must be "TEST".

Corrective Action: Change the Control-M/Tape PARALLEL parameter or the MODET parameter values.

IOA78FE DYNDS: val1 DYNVOL: val2. WHEN DYNDS=N, DYNVOL CANNOT CONTAIN "Y"

Explanation: When the Control-M/Tape DYNDS parameter is specified as "N", the DYNVOL parameter cannot be "Y".

Corrective Action: Change the Control-M/Tape DYNDS parameter or the DYNVOL parameter values.
IOA78GE JS3CHRS: val1 text

**Explanation:** The *val1* value entered for the JS3CHRS parameter is invalid. The *text* field contains the explanation.

**Corrective Action:** Change parameter JS3CHRS as required.

IOA790E COULD NOT FIND OR OPEN FILE: dsn MEMBER: memName

**Explanation:** The installation application could not find or open the specified file.

**Corrective Action:** Check that the DSNAME and library name are specified correctly.

IOA791E NUMBER OF JOBS SPECIFIED IS NOT NUMERIC

**Explanation:** The user specified a non-numeric value for the number of jobs.

**Corrective Action:** Specify a numeric value for the number of jobs.

IOA792E NUMBER OF RULES SPECIFIED IS NOT NUMERIC

**Explanation:** A non-numeric value is specified for the number of rules.

**Corrective Action:** Specify a numeric value for the number of rules.

IOA793E NUMBER OF RETENTION DAYS IS NOT NUMERIC OR OUT OF RANGE

**Explanation:** A non-numeric value or a number that exceeds the maximum is specified for the number of retention days.

**Corrective Action:** In the case of a non-numeric value, specify a numeric value for the number of retention days. If the number of retention days is too large, reduce it.

IOA794E AT LEAST ONE INPUT VALUE HAS TO BE ENTERED

**Explanation:** No values are specified.

**Corrective Action:** Specify at least one value.

IOA795E RESPONSE SHOULD BE Y OR N

**Explanation:** The specified value is neither Y (Yes) nor N (No).

**Corrective Action:** Specify either Y or N.

IOA796E INPUT CHANGED. CHECK AND RE-ENTER Y OR N

**Explanation:** After value was changed in the screen, there was an attempt to exit without confirmation.

**Corrective Action:** Specify Y to save the changes, or N to cancel the changes.

IOA797E INPUT IS NOT NUMERIC OR EXCEEDS - max_vol_num

**Explanation:** Either a non-numeric value for the number of volumes or a number that exceeded the maximum was specified.
Corrective Action: Specify a numeric value that does not exceed the limit.

IOA798E FIELD MUST BE NON-EMPTY AND NUMERIC ONLY
Explanation: A non-numeric value was specified or the field was left empty.
Corrective Action: Specify a numeric value only.

IOA799E BLOCK SIZE MUST BE NUMERIC AND MUST BE IN RANGE
Explanation: A non-numeric block size or a number that was outside the range was specified.
Corrective Action: Specify a numeric value that is within the specified range.

IOA79AE CANNOT CALCULATE SPACE BECAUSE OF HUGE NUMBERS
Explanation: The quantities are too large to be handled by the space calculation program.
Corrective Action: Reduce one or more quantities.

IOA79BE FIELD MUST BE NON-EMPTY AND NUMERIC ONLY
Explanation: A non-numeric value was specified or the field was left empty.
Corrective Action: Specify a numeric value only.

IOA79CE VALID VALUE FOR EXTEND IS A OR M
Explanation: A value other than A (Automatic) or M (Manual) was specified for EXTEND. Only A or M is a valid value in the EXTEND parameter.
Corrective Action: Specify either A or M for EXTEND.

IOA79DE PERCENT MUST NOT BE BLANK AND HAS TO BE NUMERIC
Explanation: No numeric value is specified for the PERCENT parameter.
Corrective Action: Specify a numeric value in the PERCENT parameter.

IOA79EE DEVICE TYPE IS NOT ONE OF 3350,3380,3390,9345
Explanation: The specified device type is not supported.
Corrective Action: Specify one of the listed device types in the DEVICE TYPE parameter.

IOA79FE VOLUME PARAMETERS INCORRECTLY ENTERED
Explanation: One or more volume parameters is specified incorrectly. One VOLUME parameter is mandatory. It must be specified in the first VOLUME field. Any additional VOLUME parameters must be specified consecutively in the subsequent fields, without leaving gaps between them.
Corrective Action: Specify the VOLUME parameters as described above.

IOA7A0E NUMBER OF BLOCKS EXCEEDED 65535. INCREASE BLOCK SIZE
Explanation: The specified number of blocks exceeds the maximum allowed.
Corrective Action: Decrease the number of blocks or enlarge the block size.

IOA7A1E INPUT MUST CONFORM TO VOLUME SERIAL NUMBER RULES

Explanation: The specified volume serial number contains an invalid character or the field was left blank.
Corrective Action: Correct the volume serial number specified for invalid characters or make sure that the field is not empty.

IOA7A2E WHEN SPECIFYING DUAL=N THIS FIELD MUST BE BLANK OR N

Explanation: DUAL=N is specified, but the field on which the cursor is positioned is neither blank nor N. When DUAL=N is specified by the user, the field in question must either be left empty, or be filled in with an N.
Corrective Action: Either blank out the field or specify N.

IOA7B0E dsn(memName) DATASET OR MEMBER NOT FOUND

Explanation: The specified member was not found in the specified library.
Corrective Action: Check the member and library name, and correct if necessary.

IOA7B1I DATA INSERTED INTO col

Explanation: This information message indicates that the data specified was successfully incorporated into the specified column.
Corrective Action: No action is required.

IOA7B2I varName IN TABLE tableName CLEARED

Explanation: This information message indicates that the specified variable in the identified table was reset as required.
Corrective Action: No action is required.

IOA7B3E RESPONSE SHOULD BE YES OR NO

Explanation: The specified value is invalid.
Corrective Action: Specify either YES or NO.

IOA7B4W NO CONFIRMATION TO OVERRIDE

Explanation: This warning message requests confirmation for copying parameter values from a previous IOA installation to a new installation. The message “Confirm erasing and replacing all entered data” appears on the screen with a default of NO to prevent accidental override of new installation values with old ones.
Corrective Action: To override the parameter values in the new installation with those of the previous installation, specify YES in the “Confirm erasing and replacing all entered data” field.
IOA7B5E NO REFERENCE INSERTED. RETURN CODE rc

Explanation: An internal error occurred. As a result no reference value was inserted into the table. In this message, rc is the return code issued by ISPF. Valid values are:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
<td>Table is not open</td>
</tr>
<tr>
<td>16</td>
<td>Truncation occurred when reading a table</td>
</tr>
<tr>
<td>20</td>
<td>A severe error occurred when reading a table</td>
</tr>
<tr>
<td>24</td>
<td>Dynamic allocation of a library and member failed</td>
</tr>
</tbody>
</table>

Corrective Action: Check the return code specified in the message in ISPF documentation, and correct accordingly. Rerun the activity or step.

IOA7B6E ACTION NOT PERFORMED. RETURN CODE rc

Explanation: An internal error occurred, and as a result the requested action was not performed. In this message, rc is the return code issued by ISPF. Valid values are:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
<td>Table is not open</td>
</tr>
<tr>
<td>16</td>
<td>Truncation occurred when reading a table</td>
</tr>
<tr>
<td>20</td>
<td>A severe error occurred when reading a table</td>
</tr>
<tr>
<td>24</td>
<td>Dynamic allocation of a library and member failed</td>
</tr>
</tbody>
</table>

Corrective Action: Check the return code specified in the message in ISPF documentation, and correct accordingly. Rerun the activity or step.

IOA7B7I REFERENCE AND VALUE REMAIN UNCHANGED

Explanation: This information message indicates that there is no reference data in either of the columns in the screen.

Corrective Action: No action is required.

IOA7B8I ICE TABLES REPLACED

Explanation: This information message indicates that the existing ICE tables were replaced by a new set. The values and the step status were copied from the old table to the new.
**Corrective Action:** No action is required.

**IOA7B9E MULTIPLE SELECTIONS IS NOT ALLOWED WHEN "A" IS SELECTED**

**Explanation:** You cannot select more than one row when selecting a row with "A".

**Corrective Action:** Make sure that only one row is selected. Clear all but one selected row.

**IOA7B9I tableName colName CLEARED**

**Explanation:** This information message indicates that all the values in the specified column of the ICE table were cleared in response to a clear request.

**Corrective Action:** No action is required.

**IOA7BAE THE IOA RELEASE, release, IS NOT SUPPORTED FOR ADAPTATION**

**Explanation:** The IOA release, release, is not supported for adaptation.

**Corrective Action:** Consider upgrading to IOA release release.

**IOA7BBE SAME LIBRARIES USED FOR INPUT AND OUTPUT**

**Explanation:** The same names were used for the input and output libraries.

**Corrective Action:** Change the names so that they are different.

**IOA7BCE REFERENCE LIBRARIES PREFIX MUST BE SET TO PERFORM THE ADAPTATION**

**Explanation:** The Reference Libraries Prefix is missing.

**Corrective Action:** Provide the Reference Libraries Prefix to continue with the Express Upgrade process.

**IOA7BEE REFERENCE LIBRARY CAN NOT BE EMPTY**

**Explanation:** In the environment definition panel of ICE, the user asked that the values of the referenced environment will be used in the new environment being referenced. However, the user left the References Libraries Prefix field, which points to the referenced environment, empty.

ICE displays the environment definition panel again.

**Corrective Action:** Specify a valid prefix in the References Libraries Prefix field and point to the referenced environment. Alternatively, you can set the Insert references into current values field in the panel to No. This means that the values will not be inserted in the current environment.

**IOA7E0I text**

**Explanation:** The text describes the step that was performed during the Express installation.

**Corrective Action:** No action is required.
IOA7E1E IOA: This IOA environment already exists.

**Explanation:** The given prefixes for installation, operation, SMP/E, or databases for the IOA environment already exist. The installation stops and the IOA7E0I message is displayed.

**Corrective Action:** Return to the long parameters panel and change the prefixes.

IOA7E2E product_name: The Product is already installed, please deselect it.

**Explanation:** The given prefixes for installation, operation, or databases for the product are already allocated. The installation stops and the IOA7E0I message is displayed.

**Corrective Action:** Either return to the long parameters panel and change the prefixes or deselect this product from the Products and Sizes panel.

IOA7E3E product_name: text

**Explanation:** This is a verification error. First the step where the error occurred is indicated and then the error itself is described. The installation stops.

**Corrective Action:** Fix the parameter and resume the installation.

IOA7E4E product_name: text

**Explanation:** This is an installation error. First the step where the error occurred is indicated and then the error itself is described. The installation stops.

**Corrective Action:** Analyze the problem to determine if it is a job or a process failure.

IOA7E5I The Installation ended with ==> Success

**Explanation:** The installation ended successfully.

**Corrective Action:** Proceed to the post installation steps.

IOA7U01 text

**Explanation:** The text describes an action that was performed during the Express Upgrade process.

**Corrective Action:** No action is required.

IOA7U0E Express Upgrade error message

**Explanation:** This tracking error message can contain one of the following messages:
The ExecName exec terminated with Rc Rc

The job JobName(JobId) failed. Analyze the job and, after correcting the problem, rerun the step.

The Product product has an existing prefix in the DataSetName library.

The Product product has an existing procedure in the DataSetName library.

Error at: Copy new started tasks

The Switch step has FAILED

Error at: Updating QNAMEs in repositories of new products

The FALLBACK process has FAILED

Error at: Backup the site libraries

Reference values from release prior to 6.0.00 is not supported.

Error at step analyze. Check the ICELOG and, after correcting the problem, rerun the step.

Error during LMINIT Lib Rc Rc

Failed to Save Parameters Save Product Parameters into Installation Library ended NOT-OK. Check the ICELOG and, after correcting the problem, rerun the step.

The OLD environment has at least one installed product that is missing in the NEW environment. Please refer to the Limitations in the Express Upgrade section of the Installation Guide.

ICE failed to check availability to copy stc/proc to system library. Check that the Lib library is available for processing.

The Environment Prefix Pref doesn't exist in the table DataSetName (IOAITENV)

ICE of the OLD environment is in use. Exit the ICE of the old environment and try to rerun current step of the Express Upgrade again.

The OLD environment with this ILPREFA is already being upgraded to the NEW environment EnvironmentName. The same OLD environment cannot be simultaneously upgraded to more than one NEW environment.

Error at: Adjust xxxSET members in the PROCLIB library.

Error at: Adjust started tasks in the site library.

Corrective Action: Analyze the failure, correct the cause of the problem, and then continue with the Express Upgrade process.

IOA7U0W Express Upgrade warning message

Explanation: This tracking warning message can contain one of the following messages:

- Adaptation process was canceled by the user
- Changing parameters has been canceled by the user
- Differences were found between the OLD and NEW environments. Either correct the differences and rerun the step, or confirm the differences.

Corrective Action: No action is required.
Messages IOA800 through IOA8xx
This group includes messages for the IOA (infrastructure) product.

IOA830S PASSWORD CHECK FAILED
Explanation: The CTTINIT procedure discovered an error in the Control-M/Tape password. This messages follows other messages that detail the error and password. The CTTINIT procedure stops.
Corrective Action: Check the job log of CTTINIT for previous messages that refer to this failure, and proceed accordingly.

Messages IOA900 through IOA9xx
This group includes messages for the IOA (infrastructure) product.

IOA913S OPEN OF DDNAME "SYSPRINT" FAILED
Explanation: The opening of a print file failed. Possible causes are:
- The SYSPRINT DD statement is missing.
- The data set described by the SYSPRINT DD statement cannot be accessed for sequential write.
The program stops executing.
Corrective Action: Correct the JCL and submit again.

IOA915S ERROR OPENING SYSPRINT
Explanation: An error was detected during an attempt to open the file referenced by the SYSPRINT DD statement.
The file referenced by the SYSPRINT DD statement is not opened.
Corrective Action: Check the system job log, and correct the problem accordingly. Rerun the job.

IOA946S ERROR OPENING SYSPRINT
Explanation: The IOADII utility detected an error when opening the file referenced by the SYSPRINT DD statement.
The file referenced by the SYSPRINT DD statement is not opened.
Corrective Action: Check the system job log, and correct the problem accordingly. Rerun the job.

IOA951S RELEASE OF LOG FILE NOT SUPPORTED BY THIS RELEASE OF IOA.
Explanation: Release of Log file is not supported by this release of IOA.
This could be due to one of the following:

- The release of IOA has been changed, and you are working on a file of a different release.
- Your Log file has been corrupted.

Access to the IOA Log is prevented. An “OPEN OF LOG FILE FAILED” message will appear.

**Corrective Action:** Correct the allocation of your Log file (the DALOG DD statement).

### IOA952S OPEN OF IOA LOG FILE FAILED

**Explanation:** Open of IOA Log file failed (the DALOG DD statement). Possible causes are:

- The DALOG DD statement is missing.
- The file allocated to the DALOG DD statement is not the IOA Log file.
- The file allocated to the DALOG DD statement is the IOA Log file, but it is of a different version or of a different IOA installation.

Termination of the requested function.

**Corrective Action:** Look on the computer log or job log SYSOUT for additional messages that clarify the reason for the failure. Then, correct the JCL for the job, or the allocations of the CLIST.

### IOA954S IOA LOG FILE - WRITE ERROR

**Explanation:** I/O error while writing to IOA Log file. Possible causes are:

- The file allocated to the DALOG DD statement is not the IOA Log file.
- Real I/O error on the Log file.

**Corrective Action:** Check the contents of the computer log for additional messages which may clarify the situation, or logon again.

### IOA957S FILE ALLOCATED TO DDNAME "ddName" IS NOT YOUR IOA LOG

**Explanation:** The data set described by the specified DD statement is not the IOA Log file of this IOA installation. It is an IOA Log file, but it is of a different QNAME. It belongs to another IOA installation.

**Corrective Action:** Correct the JCL for the job or CLIST.

### IOA958S FILE ALLOCATED TO DDNAME "ddname" IS NOT AN IOA LOG

**Explanation:** The data set described by the specified DD statement is not an IOA Log file.

**Corrective Action:** Correct the JCL for the job or CLIST.

### IOA959S IOA LOG FILE IS FORMATTED. IOABLG PROBABLY ABENDED

**Explanation:** The IOABLG program, which formats the IOA Log file, probably abended.

**Corrective Action:** Check the IOA Log format job output to see why the IOABLG program abended. Delete the file and recreate it using the INCONTROL Installation and Customization Engine (ICE).
IOA95AE UNABLE TO SYNCRONIZE THE LOG FILE

Explanation: Internal synchronization of the Log file failed, probably because another process in the same address space has been holding the Log file for a long time. A record might be missing in the IOA Log file.

The Log operation fails.

Corrective Action: Take a dump of the failing address space. When the dump completes, stop and restart it to release the internal lock. Have your system programmer call your IOA representative for assistance.

IOA960S MISSING INPUT PARAMETERS

Explanation: No input parameters were specified for utility IOADUL.

The IOADUL utility ends with a return code of 32.

Corrective Action: Rerun the IOADUL utility using valid input parameters. See the IOADUL utility in the INCONTROL for z/OS Utilities Guide for valid parameters.

IOA963S FORMATTING IOA LOG - WRITE I/O ERROR

Explanation: An I/O error occurred while formatting the IOA Log file. This error may occur when there is incompatibility between the definition of the Log file in the Installation Parameters (IOAPARM) and the JCL SPACE and DCB parameters.

The utility stops executing with a condition code of 08.

Corrective Action: Correct either the JCL or the Installation Parameters.

IOA964I FORMATTING OF IOA LOG FILE STARTED

Explanation: This information message indicates that the IOA Log file format process has started.

Corrective Action: No action is required.

IOA965I FORMATTING OF IOA LOG FILE ENDED

Explanation: This information message indicates that the IOA Log file format process has terminated normally.

Corrective Action: No action is required.

IOA966S IOA LOG FILE WAS NOT BUILT

Explanation: Formatting of the IOA Log file failed.

Corrective Action: Look in the job log or SYSPRINT for error messages that describe the type of error.

IOA9A0I action OF IOA LOG STARTED

Explanation: This information message is a normal start message of the IOACPLOG utility. IOACPLOG is used to copy the contents of the IOA Log to another IOA Log file or to a sequential file. The actions COPYTOSEQ and COPYTOLOG are currently supported.

Corrective Action: No action is required.
IOA9A1I action OF IOA LOG ENDED

**Explanation:** This information message is a normal termination message of the IOACPLOG utility. IOACPLOG is used to copy the contents of the IOA Log to another IOA Log file or to a sequential file. The actions COPYTOSEQ and COPYTOLOG are currently supported.

**Corrective Action:** No action is required.

IOA9A2S action OF IOA LOG ENDED WITH ERRORS.

**Explanation:** The IOACPLOG utility failed to copy the IOA Log file. IOACPLOG is used to copy the contents of the IOA Log to another IOA Log file or to a sequential file. The actions COPYTOSEQ and COPYTOLOG are currently supported.

The IOACPLOG utility ended with a condition code of 08 or 12.

**Corrective Action:** Check the preceding error messages in the job log or in the SYSPRINT sysout, correct the problem, and rerun the job.

Messages IOAA00 through IOAxx

This group includes messages for the IOA (infrastructure) product.

IOAA80E INVALID PARM LIST OR NO PARM LIST

**Explanation:** An invalid parameter was passed to the IOALOC program. The IOALOC program accepts either ALLOC or FREE as input parameters.

The IOALOC program stops executing.

**Corrective Action:** Supply the correct input parameter.

IOAAINI SSCT=add1,SSVT=add2,SWT=add3, SWT LENGTH=len

**Explanation:** This is one of the messages issued when either the Control-O monitor or the CMEM monitor starts, to provide information for use in case of any problem.

**Corrective Action:** No action is required.

Messages IOAB00 through IOABxx

This group includes messages for the IOA (infrastructure) product.

IOAB10E INTERNAL ERROR - INVALID TYPE

**Explanation:** An internal error occurred during the Display Type definition syntax check. The User Report List is not displayed.

**Corrective Action:** Notify BMC Software Customer Support.

IOAB11E INTERNAL ERROR - PREVIOUS WORK AREAS NOT FREE

**Explanation:** An internal error occurred during the Display Type definition syntax check.
The User Report List is not displayed.

**Corrective Action:** Notify BMC Software Customer Support.

**IOAB12E** ERROR TRYING TO READ FORMAT MEMBER

**Explanation:** An error occurred while reading a Display Type definition member. The required format member, $$xxx, probably does not exist in the MSG library.

The User Report List is not displayed.

**Corrective Action:** Make sure that the required format member, $$xxx, exists in the MSG library.

**IOAB13E** INTERNAL ERROR - MEMORY ALLOCATION FAILED

**Explanation:** An internal error occurred during the Display Type definition syntax check.

The User Report List is not displayed.

**Corrective Action:** Notify BMC Software Customer Support.

**IOAB14I** INVALID DEFINITION OF "ID=" KEYWORD

**Explanation:** This information message indicates that an invalid value for the ID keyword was specified in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. For more information, see the *INCONTROL for z/OS Installation Guide*.

The Display Type definition syntax check bypasses the current @STYLE line.

**Corrective Action:** Correct the invalid value for the ID keyword in the Display Type definition member.

**IOAB15I** INVALID DEFINITION OF "LTH=" KEYWORD

**Explanation:** This information message indicates that an invalid value for the LTH keyword was specified in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. For more information, see the *INCONTROL for z/OS Installation Guide*.

The Display Type definition syntax check bypasses the current @STYLE line.

**Corrective Action:** Correct the invalid value for the LTH keyword in the Display Type definition member.

**IOAB16I** VALUE OF "LTH=" KEYWORD NOT NUMERIC

**Explanation:** This information message indicates that a non-numeric value for the LTH keyword was specified in the Display Type definitions member. The LTH keyword must contain numeric characters only and a non-numeric character was detected. For more information, see the *INCONTROL for z/OS Installation Guide*.

The Display Type definition syntax check bypasses the current @STYLE line.

**Corrective Action:** Correct the invalid value for the LTH keyword in the Display Type definition member to a numeric value.
IOAB17E INTERNAL ERROR (FFU)

**Explanation:** An internal error occurred during the Display Type definition syntax check. The User Report List is not displayed.

**Corrective Action:** Notify BMC Software Customer Support.

IOAB18E INTERNAL ERROR IN GETSTL

**Explanation:** An internal error occurred during the Display Type definition syntax check. The User Report List is not displayed.

**Corrective Action:** Notify BMC Software Customer Support.

IOAB19I INVALID DEFINITION OF "LINES=" KEYWORD

**Explanation:** This information message indicates that an invalid value for the LINES keyword was specified in the Display Type definition member. The lines before this error message contain the problematic entry. Check the keyword in these lines for the invalid value. For more information, see the INCONTROL for z/OS Installation Guide.

The display type definitions syntax check bypasses the current @STYLE line.

**Corrective Action:** Correct the invalid value for the LINES keyword in the Display Type definition member.

IOAB1AI VALUE OF "LINES=" KEYWORD NOT NUMERIC

**Explanation:** A non-numeric value for the LINES keyword was detected in the Display Type definitions member. The LINES keyword must contain numeric characters only and a non-numeric character was detected. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @STYLE line.

**Corrective Action:** Correct the invalid value for the LINES keyword in the Display Type definition member to a numeric value.

IOAB1BI VALUE OF "LTH=" KEYWORD NOT 80 OR 132

**Explanation:** An invalid value for the LTH keyword was specified in the Display Type definition member. Valid values for the LTH keyword are 80 or 132. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @STYLE line.

**Corrective Action:** Correct the invalid value for the LTH keyword in the Display Type definition member to 80 or 132.

IOAB1CI THIS FORMAT ALREADY EXISTS

**Explanation:** The specified type ID, TYPE and CLASS combination was previously defined on a @STYLE line in the Display Type definition member. A Display Type ID cannot be defined twice. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @STYLE line.
**Corrective Action:** Change one of the Display Type IDs, or delete one of the Display Types.

**IOAB1DE INTERNAL ERROR IN GETHDR**

**Explanation:** An internal error occurred during the Display Type definition syntax check. The User Report List is not displayed.

**Corrective Action:** Notify BMC Software Customer Support.

**IOAB1EI NO CURRENT VALID STYLE**

**Explanation:** A @HEADER line was specified, but no valid preceding @STYLE exists. A @STYLE line must exist when a @HEADER line is specified. See the INCONTROL for z/OS Installation Guide for more information.

The display type definition syntax check bypasses the current @HEADER line.

**Corrective Action:** Add the @STYLE keyword or delete the @HEADER keyword in the Display Type definition member.

**IOAB1FE INTERNAL ERROR IN GETLNE**

**Explanation:** An internal error occurred during the Display Type definition syntax check. The User Report List is not displayed.

**Corrective Action:** Notify BMC Software Customer Support.

**IOAB20I INVALID VALUE FOR "NAME=" KEYWORD**

**Explanation:** An invalid value for the NAME keyword was detected in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the INCONTROL for z/OS Installation Guide for information.

The Display Type definition syntax check bypasses the current @STYLE line.

**Corrective Action:** Correct the invalid value for the NAME keyword in the Display Type definition member.

**IOAB21I FIELD CANNOT BE "DATA" AND "NAME"**

**Explanation:** Both DATA and NAME keywords were specified on a @FIELD line, in the Display Type definition member. DATA and NAME keywords cannot be specified on the same @FIELD line. See the INCONTROL for z/OS Installation Guide for information.

The Display Type definition syntax check bypasses the current @FIELD line.

**Corrective Action:** Delete either the DATA or the NAME keyword from the @FIELD line in the Display Type definition member.

**IOAB22I FIELD IS NOT "DATA" OR "NAME"**

**Explanation:** Neither DATA nor NAME keywords were specified on a @FIELD line, in the Display Type definition member. Either DATA or NAME keyword must be specified on a @FIELD line. See the INCONTROL for z/OS Installation Guide for more information.
The Display Type definition syntax check bypasses the current @FIELD line.

**Corrective Action:** Add either the DATA or the NAME keyword to the @FIELD line in the Display Type definition member.

IOAB23E INTERNAL ERROR - ALLOCATION FAILED FOR "DATA"

**Explanation:** An internal error occurred during the Display Type definition syntax check. The User Report List is not displayed.

**Corrective Action:** Notify BMC Software Customer Support.

IOAB24E INTERNAL ERROR IN GETFLD

**Explanation:** An internal error occurred during the Display Type definition syntax check. The User Report List is not displayed.

**Corrective Action:** Notify BMC Software Customer Support.

IOAB25E INTERNAL ERROR - ALLOCATION FAILED FOR "DFLT"

**Explanation:** An internal error occurred during the Display Type definition syntax check. The User Report List is not displayed.

**Corrective Action:** Notify BMC Software Customer Support.

IOAB26I NO CURRENT VALID LINE

**Explanation:** A @FIELD line was specified, but no valid preceding @LINE exists. When a @FIELD line is specified, a @LINE must precede it. See the INCONTROL for z/OS Installation Guide for more information. The Display Type definition syntax check bypasses the current @FIELD line.

**Corrective Action:** Add a @LINE after the @FIELD line or delete the @FIELD line in the Display Type definition member.

IOAB27I FIELD IS NOT EDITABLE

**Explanation:** The EDIT=YES keyword was specified on a field that is not editable in the Display Type definition member. See the INCONTROL for z/OS Installation Guide for more information. The Display Type definition syntax check bypasses the current @FIELD line.

**Corrective Action:** Delete the EDIT=YES keyword for this field in the Display Type definition member.

IOAB28I FIELD IS NOT DEFAULT-EDITABLE

**Explanation:** The DFLTEDIT=YES keyword was specified on a field that is not editable in the Display Type definition member. See the INCONTROL for z/OS Installation Guide for more information. The Display Type definition syntax check bypasses the current @FIELD line.

**Corrective Action:** Delete the DFLTEDIT=YES keyword for this field in the Display Type definition member.
IOAB29I VALUE OF "LTH=" KEYWORD IS AT LEAST 2

**Explanation:** An invalid value for the LTH keyword was detected in the Display Type definition member. The value for the LTH keyword should be at least 2, to accommodate the attribute byte and a data byte. See the *INCONTROL for z/OS Installation Guide* for more information.

The Display Type definition syntax check bypasses the current @STYLE line.

**Corrective Action:** Correct the LTH keyword value to at least 2 in the Display Type definition member.

IOAB2AI FIELD STARTS AFTER END OF LINE

**Explanation:** The current field starts after the logical end of line. See the *INCONTROL for z/OS Installation Guide* for more information.

The Display Type definition syntax check bypasses the current @FIELD line.

**Corrective Action:** Correct the current field start in the Display Type definition member.

IOAB2BI FIELD ENDS AFTER END OF LINE

**Explanation:** The current field ends after the logical end of line. See the section on customizing IOA display format members in the *INCONTROL for z/OS Administrator Guide*.

The Display Type definition syntax check bypasses the current @FIELD line.

**Corrective Action:** Correct the current field end in the Display Type definition member.

IOAB2CI INVALID DEFINITION OF "DFLT=" KEYWORD

**Explanation:** An invalid value for the DFLT keyword was detected in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the *INCONTROL for z/OS Installation Guide* for more information.

The Display Type definition syntax check bypasses the current @FIELD line.

**Corrective Action:** Correct the invalid value for the DFLT keyword in the Display Type definition member.

IOAB2DI INVALID DEFINITION OF "DATA=" KEYWORD

**Explanation:** An invalid value for the DATA keyword was detected in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the *INCONTROL for z/OS Installation Guide* for more information.

The Display Type definition syntax check bypasses the current @FIELD line.

**Corrective Action:** Correct the invalid value for the DATA keyword in the Display Type definition member.

IOAB2EI INVALID DEFINITION OF "NAME=" KEYWORD

**Explanation:** An invalid value for the NAME keyword was detected in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the *INCONTROL for z/OS Installation Guide* for more information.

The Display Type definition syntax check bypasses the current @FIELD line.
Corrective Action: Correct the invalid value for the NAME keyword in the Display Type definition member.

IOAB30I INVALID DEFINITION OF "DLM=" KEYWORD

Explanation: An invalid value for the DLM keyword was specified in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @DLM line.

Corrective Action: Correct the invalid value for the DLM keyword in the Display Type definition member.

IOAB31I INVALID DEFINITION OF "COLOR=/COLORA=" KEYWORD

Explanation: An invalid value for the COLOR or COLORA keyword was specified in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @STYLE, @LINE or @FIELD line.

Corrective Action: Correct the invalid value specified for the COLOR or COLORA keyword in the Display Type definition member.

IOAB32I INVALID VALUE FOR "COLOR=/COLORA=" KEYWORD

Explanation: An invalid value for the COLOR or COLORA keyword was specified in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @STYLE, @LINE or @FIELD line.

Corrective Action: Correct the invalid value specified for the COLOR or COLORA keyword in the Display Type definition member.

IOAB33I INVALID DEFINITION OF "HIGH=/HIGHA=" KEYWORD

Explanation: An invalid value for the HIGH or HIGHA keyword was specified in the Display Type definition member. The lines preceding this message contain the problematic entry. Check the keyword in these lines for the invalid value. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @STYLE, @LINE or @FIELD line.

Corrective Action: Correct the invalid value specified for the HIGH or HIGHA keyword in the Display Type definition member.

IOAB34I INVALID VALUE FOR "HIGH=/HIGHA=" KEYWORD

Explanation: An invalid value for the HIGH or HIGHA keyword was specified in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @STYLE, @LINE or @FIELD line.
**Corrective Action:** Correct the invalid value specified for the HIGH or HIGHA keyword in the Display Type definition member.

**IOAB35I FORMAT CANNOT HAVE A BLANK ID**

**Explanation:** The specified type ID has a blank value. The Display Type ID cannot be defined with a blank value. See the *INCONTROL for z/OS Installation Guide* for more information.

The Display Type definition syntax check bypasses the current @STYLE line.

**Corrective Action:** Enter a Display Type ID value other than blank.

**IOAB36I INVALID DEFINITION OF "PREF=" KEYWORD**

**Explanation:** An invalid value for the PREF keyword was specified in the Display Type definition member. The lines before this message contain the problematic entry. Check the keyword in these lines for the invalid value. See the *INCONTROL for z/OS Installation Guide* for more information.

The Display Type definition syntax check bypasses the current @FIELD line.

**Corrective Action:** Correct the invalid value for the PREF keyword in the Display Type definition member.

**IOAB37I INTERNAL ERROR - ALLOCATION FAILED FOR "PREF"**

**Explanation:** An internal error occurred during the Display Type definition syntax check.

The User Report List is not displayed.

**Corrective Action:** Notify BMC Software Customer Support.

**IOAB38I PREFIX LENGTH TOO LONG - MUST LEAVE ROOM FOR DATA**

**Explanation:** The specified PREF value is too long. The prefix length should be short enough to accommodate at least one data character in the field. See the *INCONTROL for z/OS Installation Guide* for more information.

The Display Type definition syntax check bypasses the current @FIELD line.

**Corrective Action:** Shorten the PREF value to accommodate for at least one data character in the field in the Display Type definition member.

**IOAB39E LINE TYPE BLANK IS NOT AFTER CONTINUATION MARK**

**Explanation:** An internal error occurred during the Display Type definition syntax check.

The User Report List is not displayed.

**Corrective Action:** Notify BMC Software Customer Support.

**IOAB3AE INVALID LINE TYPE**

**Explanation:** An invalid line type was specified in the Display Type definition member. In the Display Type definition member, the line type is determined according to the first ten characters of the line. See the *INCONTROL for z/OS Installation Guide* for more information.

The Display Type definition syntax check stops. The User Report List is not displayed.
Corrective Action: Correct the invalid line type.

IOAB3BE CONTINUATION LINE SHOULD BE WITH BLANK TYPE
Explanation: An internal error occurred during the Display Type definition syntax check. The User Report List is not displayed.
Corrective Action: Notify BMC Software Customer Support.

IOAB3CI NUMBER OF LINES IN FORMAT EXCEEDS MAXIMUM. LINE IGNORED
Explanation: Too many lines were specified for the current @STYLE keyword. The number of lines specified for the @STYLE keyword exceeded the maximum number of lines that can be defined. See the INCONTROL for z/OS Installation Guide for more information.
Corrective Action: Correct the number of lines in the @STYLE keyword in the Display Type definition member to a value that does not exceed the allowable maximum.

IOAB50I INVALID DEFINITION OF "IDLIKE=" KEYWORD
Explanation: An invalid value for the IDLIKE keyword was specified in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the INCONTROL for z/OS Installation Guide for more information.
Corrective Action: Correct the invalid value for the IDLIKE keyword in the Display Type definition member.

IOAB51I INVALID DEFINITION OF "TYPELIKE=" KEYWORD
Explanation: An invalid value for the TYPELIKE keyword was specified in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the INCONTROL for z/OS Installation Guide for more information.
Corrective Action: Correct the invalid value for the TYPELIKE keyword in the Display Type definition member.

IOAB52I INVALID DEFINITION OF "CLASSLIKE=" KEYWORD
Explanation: An invalid value for the CLASSLIKE keyword was specified in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the INCONTROL for z/OS Installation Guide for more information.
Corrective Action: Correct the invalid value for the CLASSLIKE keyword in the Display Type definition member.
IOAB53I "IDLIKE="", "TYPELIKE="" AND "CLASSLIKE="" MUST ALL BE PRESENT

Explanation: One of the keywords IDLIKE, TYPELIKE or CLASSLIKE, was specified and at least one of the other keywords was not present. When specifying one of the keywords IDLIKE, TYPELIKE or CLASSLIKE, the other two keywords must also be present. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @STYLE line.

Corrective Action: Add the other missing keywords to the Display Type definition member.

IOAB54I INVALID DEFINITION OF "EDIT=" KEYWORD

Explanation: An invalid value for the EDIT keyword was specified in the Display Type definition member. There is an invalid value specified for the EDIT keyword in the Display Type definition member. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @FIELD line.

Corrective Action: Correct the invalid value for the EDIT keyword in the Display Type definition member.

IOAB55I INVALID VALUE FOR "EDIT=" KEYWORD. SHOULD BE YES/NO

Explanation: An invalid value for the EDIT keyword was specified in the Display Type definition member. Valid values for the EDIT keyword are Y, YES, N, or NO. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @FIELD line.

Corrective Action: Correct the EDIT keyword value to Y, YES, N, or NO in the Display Type definition member.

IOAB56I INVALID DEFINITION OF "DEFAULTEDIT=" KEYWORD

Explanation: An invalid value for the DEFAULTEDIT keyword was specified in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the INCONTROL for z/OS Installation Guide for information.

The Display Type definition syntax check bypasses the current @FIELD line.

Corrective Action: Correct the invalid value for the DEFAULTEDIT keyword in the Display Type definition member.

IOAB57I INVALID VALUE FOR "DEFAULTEDIT=" KEYWORD. SHOULD BE YES/NO

Explanation: An invalid value for the DEFAULTEDIT keyword was specified in the Display Type definition member. Valid values for the DEFAULTEDIT keyword are Y, YES, N, or NO. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @FIELD line.

Corrective Action: Correct the DEFAULTEDIT keyword value to Y, YES, N, or NO in the Display Type definition member.
IOAB58I INVALID DEFINITION OF "AFORCE=" KEYWORD

Explanation: An invalid value for the AFORCE keyword was specified in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @FIELD line.

Corrective Action: Correct the invalid value for the AFORCE keyword in the Display Type definition member.

IOAB59I INVALID VALUE FOR "AFORCE=" KEYWORD. SHOULD BE YES/NO

Explanation: An invalid value for the AFORCE keyword was specified in the Display Type definition member. Valid values for the AFORCE keyword are Y, YES, N, or NO. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @FIELD line.

Corrective Action: Correct the AFORCE keyword value to Y, YES, N, or NO in the Display Type definition member.

IOAB5AI INVALID DEFINITION OF "LONG=" KEYWORD

Explanation: An invalid value for the LONG keyword was specified in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @STYLE line.

Corrective Action: Correct the invalid value for the LONG keyword in the Display Type definition member.

IOAB5BI INVALID VALUE FOR "LONG=" KEYWORD

Explanation: An invalid value for the LONG keyword was specified in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @STYLE line.

Corrective Action: Correct the invalid value for the LONG keyword in the Display Type definition member.

IOAB5CI INVALID DEFINITION OF "INTENS=" KEYWORD

Explanation: An invalid value for the INTENS keyword was specified in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @STYLE, @LINE or @FIELD line.

Corrective Action: Correct the invalid value specified for the INTENS keyword in the Display Type definition member.
IOAB5DI  INVALID VALUE FOR "INTENS=" KEYWORD. SHOULD BE YES/NO

Explanation: An invalid value for the INTENS keyword was specified in the Display Type definition member. Valid values for the INTENS keyword are Y, YES, N, or NO. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @STYLE, @LINE or @FIELD line.

Corrective Action: Correct the INTENS keyword value to Y, YES, N, or NO in the Display Type definition member.

IOAB5EI  INVALID DEFINITION OF "KANJI=" KEYWORD

Explanation: An invalid value for the KANJI keyword was specified in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @FIELD line.

Corrective Action: Correct the invalid value for the KANJI keyword in the Display Type definition member.

IOAB5FI  INVALID VALUE FOR "KANJI=" KEYWORD. SHOULD BE YES/NO

Explanation: An invalid value for the KANJI keyword was specified in the Display Type definition member. Valid values for the KANJI keyword member are Y (Yes) and N (No).

The Display Type definition syntax check bypasses the current @FIELD line.

Corrective Action: Correct the KANJI keyword value to either Y or N in the Display Type definition member.

IOAB60I  INVALID DEFINITION OF "SHOWBLINE=" KEYWORD

Explanation: An invalid value for keyword SHOWBLINE was specified in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @FIELD line.

Corrective Action: Correct the invalid value for the SHOWBLINE keyword in the Display Type definition member.

IOAB61I  INVALID VALUE FOR "SHOWBLINE=" KEYWORD

Explanation: An invalid value for keyword SHOWBLINE was specified in the Display Type definition member. Valid values for the SHOWBLINE keyword member are Y (Yes) and N (No).

The Display Type definition syntax check bypasses the current @FIELD line.

Corrective Action: Correct the SHOWBLINE keyword value to either Y or N in the Display Type definition member.
IOAB62I INVALID DEFINITION OF "OFFSET=" KEYWORD

Explanation: An invalid value for keyword OFFSET was specified in the Display Type definition member. The lines preceding this error message contain the problematic entry. Check the keyword in these lines for the invalid value. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @FIELD line.

Corrective Action: Correct the invalid value for the OFFSET keyword in the Display Type definition member.

IOAB63I VALUE OF "OFFSET=" KEYWORD NOT NUMERIC

Explanation: A non-numeric value for keyword OFFSET was detected in the Display Type definition member. The OFFSET keyword must contain numeric characters only and a non-numeric character was detected. See the INCONTROL for z/OS Installation Guide for more information.

The Display Type definition syntax check bypasses the current @STYLE line.

Corrective Action: Correct the invalid value for the OFFSET keyword in the Display Type definition member to a numeric value.

IOAB64I OFFSET VALUE IS OUT OF BOUNDS

Explanation: The value specified for the OFFSET keyword exceeds the maximum length of the current field. The value of the OFFSET keyword should be less than the length of the field.

The Display Type definition syntax check bypasses the current @FIELD line.

Corrective Action: Correct the invalid value for the current field's OFFSET keyword in the Display Type definition member.

Messages IOAC00 through IOACxx

This group includes messages for the IOA (infrastructure) product.

IOAC01I ENTER "M", "C", "CC" OR "MM" LINE COMMANDS

Explanation: An A or B location command was specified without a corresponding copy or move type command when using the IOA Edit Environment in a definition screen. A copy or move command must accompany each location command.

Corrective Action: Specify a copy or move type command.

IOAC02I ENTER "A" OR "B" LINE COMMANDS

Explanation: A copy or move type command was specified without a corresponding A or B location command when using the IOA Edit Environment in a definition screen. A location command must be specified in conjunction with copy or move commands.

Corrective Action: Specify an A or B location command.
IOAC03I ENTER A MATCHING "xx" COMMAND TO COMPLETE THE BLOCK COMMAND PAIR

**Explanation:** An unmatched CC, MM, RR or DD command was specified when using the IOA Edit Environment in a definition screen. To perform multiple line functions, the required lines block must be delimited by two Multiple Lines Editing commands CC, MM, RR or DD.

**Corrective Action:** Specify a matching CC, MM, RR or DD command.

IOAC04E INVALID INPUT PARAMETERS FOR IOAEDIT ROUTINE

**Explanation:** An internal IOA error occurred when using the IOA Edit Environment in a definition screen.

**Corrective Action:** Contact BMC Software Customer Support.

IOAC05E "xx" IS NOT A VALID LINE COMMAND. CORRECT IT OR BLANK IT OUT.

**Explanation:** An invalid Line Editing command was specified when using the IOA Edit Environment in a definition screen.

**Corrective Action:** Enter a valid Line Editing command.

IOAC06E "xx" COMMAND CONFLICTS WITH THE PRIOR SPECIFICATION. DELETE ONE.

**Explanation:** When using the IOA Edit Environment in a definition screen, a Line Editing command was specified that conflicts with a previously specified Line Editing command.

**Corrective Action:** Remove the conflicting specification.

IOAC07E INVALID RETURN CODE FROM IOAEDIT ROUTINE

**Explanation:** An internal IOA error occurred when using the IOA Edit Environment in a definition screen.

**Corrective Action:** Contact BMC Software Customer Support.

IOAC08E ENTER "xx" TO COMPLETE A BLOCK PAIR BEFORE ENTERING OTHER COMMANDS

**Explanation:** An A or B location command was specified within a lines block delimited by Multiple Lines Editing commands CC, MM, RR or DD, when using the IOA Edit Environment in a definition screen. A location command may not be specified within a multiple lines block.

**Corrective Action:** Remove the conflicting specification.

IOAC09E INTERNAL ERROR IN IOAEDIT ROUTINE

**Explanation:** An internal IOA error occurred when using the IOA Edit Environment in a definition screen.

**Corrective Action:** Contact BMC Software Customer Support.
IOAC11E REQUESTED EDIT FUNCTION NOT VALID FOR THIS LINE

Explanation: When using the IOA Edit Environment in a definition screen, a Line Editing command was specified which, if executed, would result in an invalid definition. When a Line Editing command is entered, Automatic Syntax Checking is performed to ensure that the definition remain syntactically correct after editing.

The requested edit action is not performed.

Corrective Action: Enter a valid Line Editing command.

IOAC12E COMMAND NOT SUPPORTED YET

Explanation: When using the IOA Edit Environment in a definition screen, a Line Editing command was specified which is not supported in the current IOA release.

Corrective Action: Enter a valid Line Editing command.

IOAC13E INSUFFICIENT MEMORY FOR EDIT MODE

Explanation: The EDIT command was entered on a definition screen in order to access the IOA Edit Environment, but insufficient storage was available.

Corrective Action: Suggested actions:
- Log on again using a larger SIZE parameter.
- If you are using many IOA screens concurrently, exit from some of them using the END command.

IOAC21E KANJI IS NOT ALLOWED IN THIS FIELD

Explanation: User-specified KANJI symbols, which use double bytes, were specified in a field which must contain single bytes only. Only certain fields support double-byte specification.

Corrective Action: Remove the double bytes from the field.

IOAC39I SECURITY FOR product IS {ACTIVE | INACTIVE}

Explanation: This information message gives the security status (either ACTIVE or INACTIVE) for a specific product.

In this message, product is IOA, Control-M, Control-D, Control-O, Control-M/Tape, or Control-M/Analyzer.

Corrective Action: No action is required.

Messages IOAD00 through IOADxx

This group includes messages for the IOA (infrastructure) product.

IOAD01I EXTERNAL TRACE LEVELS SET AS FOLLOWS:

Explanation: This information message indicates that either a TRACE modify command was issued or a TRACE request was received from a DATRCIN/DATRCBF input data stream for external trace, and the trace parameters are successfully processed. It is a header for subsequent IOAD02I messages.
**Corrective Action:** No action is required.

**IOAD02I lvl1[:lvl2] - TURNED status**

**Explanation:** This information message follows messages IOAD01I (or IOAT0CI followed by IOAT0DI) and indicates the specific trace level or number of levels following one after another that are set to either ON or OFF status. Sometimes, more than one IOAD02I messages are issued.

The variables in this message are:

- `lvl1` - a specific trace level that is set to status `status`. In cases when `lvl2` also appears in a message, it is a starting trace level set to status `status`.

- `lvl2` - the string `lvl2` may or may not appear in a message. In cases when `lvl2` also appears in a message, `lvl1` and `lvl2` indicate an interval of trace levels from `lvl1` through `lvl2` that is set to status `status`.

- `status` - may be either ON or OFF:
  - ON--trace was activated
  - OFF--trace was deactivated

**Corrective Action:** No action is required.

**IOAD03I THE FOLLOWING LEVELS ARE SET FOR xtrace :**

**Explanation:** `xtrace` can equal EXTERNAL TRACE or TRACE BUFFER: `bufid`. This message is issued as a result of command TRACE=SHOW or TRACE=DISP. It is a header for subsequent IOAD04I messages.

**Corrective Action:** No action is required.

**IOAD04I lvl1:lvl2 - status**

**Explanation:** This information message follows messages IOAD03I and indicates specific trace level or number of levels following one after another that are in either ON or OFF status.

The variables in this message are:

- `lvl1` - a specific trace level that is in status `status`. In cases when `lvl2` also appears in a message, its starting trace level is set to status `status`.

- `lvl2` - the string `lvl2` may or may not appear in a message. In cases when `lvl2` also appears in a message, `lvl1` and `lvl2` indicate an interval of trace levels from `lvl1` through `lvl2` that is set to status `status`.

- `status` - may be either ON or OFF.

Several IOAD04I messages may be issued for a single IOAD03I message.

**Corrective Action:** No action is required.
IOAD45E AT LEAST ONE VALID COND MUST BE SPECIFIED IN THE ISCPARM MEMBER

**Explanation:** No conditions to be passed to the other CPU were specified in the ISCPARM member allocated to one of the Control-M monitors. The DAI SCPRM DD statement should point to a library containing the ISCPARM member. This member should contain at least one COND= cond statement, where cond is a condition name up to 20 characters. Masking characters * and ? are allowed. Only these conditions are passed to the other CPU.

CTMISR routine returns a return code of 24 to the calling IOA Exit 7. No conditions are passed to the other CPU.

**Corrective Action:** Add at least one COND= cond statement in the ISCPARM member and then shut down and restart the monitor. COND=* is valid for passing all the conditions.

IOAD46S CTMBLT ENDED WITH ERRORS

**Explanation:** The CTMBLT utility ended due to errors. CTMBLT creates Control-M scheduling tables. If CTMBLT ended with errors, messages in the Error Messages file DAPRINT DD statement explain the reasons. The Error Table Definitions file DATABERR DD statement contains the input definition statements that have the errors.

The utility ends with a non-zero return code.

**Corrective Action:** Correct all problems, and rerun the job.

IOAD48I CTMBLT ENDED OK

**Explanation:** This information message indicates that the CTMBLT utility ended normally. The CTMBLT utility creates Control-M scheduling tables.

**Corrective Action:** No action is required.

IOAD90E INVALID PARM WAS PASSED TO IOALLOC

**Explanation:** Invalid parameters were passed to load the IOALLOC module.

The IOA session is ended.

**Corrective Action:** No action is required.

IOAD91E UNABLE TO OBTAIN ENQ FOR IOALLOC

**Explanation:** The IOALLOC module was unable to obtain an exclusive lock for processing.

The IOA session is ended.

**Corrective Action:** No action is required.

IOAD92E DAPARM DD STATEMENT MISSING

**Explanation:** The IOALLOC module is unable to continue its processing because the DAPARM DD statement is missing.

The IOA session is ended.

**Corrective Action:** No action is required.
IOAD93E GETMAIN FAILED, INSUFFICIENT STORAGE

**Explanation:** The IOALLOC module is unable to continue its processing because of a storage shortage. The IOA session is ended.

**Corrective Action:** No action is required.

IOAD94E IOALLOC BUFFERS ARE EXHAUSTED

**Explanation:** The IOALLOC module is unable to continue its processing because of a storage shortage. The IOA session is ended.

**Corrective Action:** No action is required.

IOAD95E IOAPRS INITIALIZATION FAILED

**Explanation:** The IOALLOC module is unable to continue its processing because the initialization of IOAPRS module failed. The IOA session is ended.

**Corrective Action:** No action is required.

IOAD96E PARSE ERROR OR MANDATORY PARAMETER IS MISSING, LINE lineNum MEMBER memName

**Explanation:** The IOALLOC module is unable to continue its processing because there is an incorrect member memName in line lineNum. The IOA session is ended.

**Corrective Action:** No action is required.

IOAD97E PARSING ERROR IN LINE : num MEMBER : memName

**Explanation:** The IOALLOC module is unable to continue its processing because there is an incorrect member memName in line lineNum. The IOA session is ended.

**Corrective Action:** No action is required.

IOAD98E EITHER DDNAME OR DSNAME WAS NOT SUPPLIED FOR KEY keyName

**Explanation:** The IOALLOC module is unable to continue its processing because of an incorrect key. The IOA session is ended.

**Corrective Action:** No action is required.

IOAD99E UNABLE TO CREATE TOKEN

**Explanation:** The IOALLOC module is unable to continue its processing because the creation of a token failed.
The IOA session is ended.

**Corrective Action:** No action is required.

**IOAD9AE** INVALID RECORD FOUND IN ALC MEMBER *memName* - LINE *lineNum*

**Explanation:** The IOALLOC module is unable to continue its processing because of an incorrect member *memName* in line *lineNum*.

The IOA session is ended.

**Corrective Action:** No action is required.

**IOAD9BE** REQUESTED KEY *keyName* WAS NOT FOUND IN IOADSN/IOADSNL

**Explanation:** The IOALLOC module is unable to continue its processing because of a missing key in the IOADSN or IOADSNL members.

The IOA session is ended.

**Corrective Action:** No action is required.

**IOAD9CE** ALLOCATION FAILED FOR DDNAME : *ddName*

**Explanation:** The IOALLOC module is unable to continue its processing because the allocation of DDNAME *ddName* failed.

The IOA session is ended.

**Corrective Action:** No action is required.

**IOAD9DE** DD "DAALOCIN" IS MISSING OR CONTAINS A NON PDS DATASET

**Explanation:** The IOALLOC module is unable to continue its processing because the allocation of a DD NAME failed.

The IOA session is ended.

**Corrective Action:** No action is required.

**IOAD9FE** MEMBER *memName* WAS NOT FOUND IN THE "DAPARM" DD STATEMENT CONCATENATION

**Explanation:** The IOALLOC module is unable to continue its processing because the *memName* member is missing in the DAPARM DD concatenation.

The IOA session is ended.

**Corrective Action:** No action is required.
IOADB1E PARAMETER parm WAS NOT FOUND BY IOADEFP (CALLER: progName)

**Explanation:** The progName program failed to find the parm parameter.

The action fails. Additional error messages follow.

**Corrective Action:** Make sure that:
- The DAPARM dd statement points to the correct IOA.PARM library.
- The parm parameter is defined correctly in the DEFPARM member in IOA PARM.

IOADB2E IOADEFP FOR parm FAILED WITH RC=rc (CALLER: progName MCT: address)

**Explanation:** The IOADEFP service failed when it was requested to retrieve the value of the parm DEFPARM parameter.

The variables in this message are:
- parm - the name of the DEFPARM parameter
- rc - the return code
- progName - the name of the calling program
- address - the address of the IOA main control block

The action fails. Additional error messages follow.

**Corrective Action:** Contact BMC Software Customer Support for assistance.

IOADJ1E COMMAND IS NOT RECOGNIZED

**Explanation:** An invalid line command was issued.

**Corrective Action:** Correct the command.

IOADJ2E COMMAND CONFLICT

**Explanation:** A conflicting line command was issued. For example, a block was marked for copying, and an M (Move) command was then issued.

The system waits for the command to be corrected.

**Corrective Action:** Erase the conflicting line command.

IOADJ3E UNABLE TO OBTAIN ENOUGH STORAGE FOR EDITING THE MEMBER

**Explanation:** There is insufficient storage available to edit the requested member.

Access is denied.

**Corrective Action:** Contact your INCONTROL administrator.
IOADJ 4I MEMBER SAVED

**Explanation:** This information message is issued when a member has been saved.

**Corrective Action:** No action is required.

IOADJ 5I MEMBER NOT SAVED

**Explanation:** This information message is issued when the user exits the EDIT screen without editing the member.

**Corrective Action:** No action is required.

IOADJ 6E MEMBER NAME HAS NOT BEEN SUPPLIED

**Explanation:** An edit command was issued, but the name of the member to be edited was not supplied. Access is denied.

**Corrective Action:** Supply a member name.

IOADJ 7E DSNAME HAS NOT BEEN SUPPLIED OR IS NOT ALLOCATED

**Explanation:** The library name was not supplied. Access is denied.

**Corrective Action:** Supply a library name.

IOADJ 8E BLOCK COMMAND INCOMPLETE

**Explanation:** In a block command (CC, MM, RR, DD), only one line was marked. Two lines must be marked.

The system waits for the command to be corrected.

**Corrective Action:** Complete the block definition.

IOADJ 9E COPY/MOVE IS PENDING

**Explanation:** A block copy or move command was issued with a line or block marked, but with no target line specified.

The system waits for the command to be corrected.

**Corrective Action:** Identify the target line, using the command A (After) or B (Before).

IOADJ AS INTERNAL ERROR

**Explanation:** An internal error has occurred. Access is denied.

**Corrective Action:** Contact BMC Software Customer Support.

IOADJ BI MEMBER NOT COPIED

**Explanation:** This information message is issued when a request to copy a member is cancelled.
**Corrective Action:** No action is required.

**IOADJCE ACCESS DENIED TO THE REQUESTED LIBRARY AND/OR MEMBER**

**Explanation:** A request was made to access a member, but the user is not authorized to access the member.

Access is denied.

**Corrective Action:** If you consider that you ought to be authorized to access the library or member, contact your INCONTROL security administrator.

**IOADJDE WRONG PARAMETERS**

**Explanation:** An internal error has occurred.

Access is denied.

**Corrective Action:** Contact BMC Software Customer Support.

**IOADJEE NUMBER IS NOT ALLOWED**

**Explanation:** An attempt was made to type numbers in a line command in which numbers are not allowed.

The system waits for the line command to be corrected.

**Corrective Action:** Remove the numbers from the line command.

**IOADJFE CONFLICTING NUMBERS**

**Explanation:** A block command was issued, but with different repetition, for example, RR4 and RR5.

The system waits for the block command to be corrected.

**Corrective Action:** Correct the block command so as to specify the same repetition.

**IOADJGE THE REQUESTED MEMBER IS IN USE BY ANOTHER USER**

**Explanation:** The user tried to edit a member, but that member is held by another user.

Access is denied.

**Corrective Action:** Try again later. If the problem persists, try to identify the user holding the member.

**Messages IOAE00 through IOAExx**

This group includes messages for the IOA (infrastructure) product.

**IOAE00E OPTIONS "S", "I", "J", "B", "F/O" AND "D" CANNOT BE MIXED**

**Explanation:** The options line commands S, I, J, B, F/O, and D cannot be requested simultaneously. Only one option type can be selected at a time.

None of the options selected is performed.

**Corrective Action:** Select options one at a time.
IOAE01E OPTIONS "S", "I", "J", "B" AND "G" CANNOT APPEAR ON MULTIPLE LINES

Explanation: The options line commands S, I, J, B, and G cannot be selected simultaneously on multiple lines. Only one of the options can be selected at a time.

None of the options selected is performed.

Corrective Action: Select the options one at a time.

IOAE02I FORCED BROWSE AS TABLE IN USE BY ANOTHER USER

Explanation: There was an attempt to select a table that is in use by another user. As a result, access is automatically given to the table in Browse mode only. No jobs may be added or deleted, and no changes may be made to existing jobs, when a table is accessed in Browse mode.

The Job List screen is displayed in Browse mode.

Corrective Action: If the required action cannot be performed when the table is in Browse mode, exit, and try again later. If required, contact your INCONTROL administrator to modify your User Profile definition to specify that the Table List screen remains displayed when an attempt is made to select a table that is in use.

IOAE03E OPTIONS "D" AND "I" ARE INVALID UNDER BROWSE

Explanation: An invalid request was specified while accessing a table in Browse mode. The D (Delete) and I (Insert) options are not valid when a table is accessed in Browse mode. A list of options valid in Browse mode is at the bottom of the screen.

The requested option is not performed.

Corrective Action: In order to delete or insert entries, exit the Job List screen and re-enter by specifying the S (Select) option.

IOAE04E FIELD MUST BE BLANK, OR NUMERIC WITH LEADING ZEROES

Explanation: An invalid value was specified for the field. This field must be blank (in some cases) or must contain a numeric value that includes leading zeroes.

No action is taken until a valid value is specified in the field, or until the screen is reset.

Corrective Action: Enter a valid value in the field, or reset the screen (if possible).

IOAE05E INVALID OPTION (TRY "Y", "N" OR BLANK)

Explanation: A value other than Y, N or blank was specified in a Yes/No field.

No action is taken until a valid value is specified in the field, or until the screen is reset or cancelled.

Corrective Action: Specify Y, N or blank in the field, or reset or cancel the screen, if possible.

IOAE06S ERROR WHILE PREPARING FORMATS

Explanation: Syntax errors were detected in the Display Type definition member. The Display Type definition member was loaded and analyzed and syntax errors were detected. Specific errors were previously displayed with the erroneous source lines.
The panel is not displayed.

**Corrective Action:** Correct the Display Type definition errors in the $$XXX member in the IOA MSG library and try to re-enter.

**IOAE07S** INTERNAL ERROR IN CTMTJOB RC=rc

**Explanation:** An internal error occurred while attempting to display the error messages that resulted from the syntax check of the Display Type definitions.

The error messages are not displayed.

**Corrective Action:** Have your INCONTROL administrator notify BMC Software Customer Support.

**IOAE08E** "OPT" FIELD MUST EXIST IN FORMAT

**Explanation:** An attempt was made to specify an option, for example, Insert, Update, and the like. However, the OPTION field is not present in the current Display Type. The OPTION field must be defined in a Display Type in order to specify a required operation option.

No operations are performed.

**Corrective Action:** Add the OPTION field to the Display Type.

**IOAE09E** INVALID OPTION

**Explanation:** Invalid option specified in the field.

**Corrective Action:** Correct the option, and try again.

**IOAE0AE** USER NOT AUTHORIZED

**Explanation:** The function requested is not authorized for the user. The message is issued by the IOA security mechanism.

**Corrective Action:** Check with your system security administrator.

**IOAE0CE** INTERNAL ERROR WHILE SETTING HEADER RC=rc

**Explanation:** An internal error occurred while attempting to place the Display Type header in the screen.

The screen is not displayed.

**Corrective Action:** Have your INCONTROL administrator notify BMC Software Customer Support.

**IOAE0DE** YOU MUST GIVE A ONE LETTER DISPLAY TYPE NAME

**Explanation:** No valid Display Type code was specified when entering the DISPLAY command. The DISPLAY command requires a one letter Display Type parameter. This parameter must indicate an existing Display Type.

The current Display Type is not changed.

**Corrective Action:** Specify a valid Display Type with the DISPLAY command.
IOAE0EE DISPLAY TYPE NAME SHOULD BE ONE LETTER ONLY

Explanation: More than one letter was specified for the Display Type code when entering the DISPLAY command. The DISPLAY command requires a one letter Display Type parameter. This parameter must indicate an existing Display Type.

The current Display Type is not changed.

Corrective Action: Specify a valid, one letter Display Type with the DISPLAY command.

IOAE0FE DISPLAY TYPE "X" NOT FOUND

Explanation: Display of an invalid Display Type was requested. Only Display Types that are defined in appropriate $$$xxx files in IOA MSG libraries are valid, for example, Default Display Type D.

The requested Display Type is not displayed.

Corrective Action: Specify a valid Display Type.

IOAE0GE RECORD LENGTH OF THE LIBRARY IS NOT 80

Explanation: Record length of the requested data set is not 80.

Corrective Action: Make sure you chose the correct library.

IOAE0KE ONLY ONE CALENDAR TYPE CAN BE SPECIFIED

Explanation: Both calendar types, Regular/Periodic and Rule-Based (RBC) (in screen 8), have been selected. Only one is allowed.

Corrective Action: Select one of the calendar types.

IOAE0LE SELECT CALENDAR TYPE

Explanation: Neither the Regular/Periodic nor the Rule-Based (RBC) calendar type (in screen 8) has been selected.

Corrective Action: Select either the Regular/Periodic or the Rule-Based (RBC) calendar type (in screen 8).

IOAE10E INVALID VALUE, USE "Y" OR "N"

Explanation: Invalid value specified in the field. The cursor points to the field that contains the invalid value.

Corrective Action: Select Y for yes, or N for no.

IOAE11E ONLY TRAILING BLANKS ALLOWED IN FIELD

Explanation: The field contains a leading blank, or two strings separated by blanks. Leading blanks and embedded blanks are not allowed in this field.

The cursor points to the first blank.

Corrective Action: Correct the field contents.
IOAE12E ERROR IN DEFINITION, DEFINITION SCREEN CANNOT BE BUILT

**Explanation:** The entry contains invalid data. Possible causes are:

- The entry requested does not contain definition data.
- The entry requested contains definition data but has been incorrectly modified (by means of an editor or program) and now its contents do not conform to IOA standards.

**Corrective Action:** If the contents of the entry were modified, try to restore the entry to its original state. If you cannot or if this is not the problem, have your system programmer call BMC Software Customer Support.

IOAE13S ERROR IN COMMAND MEMBER - NOTIFY THE IOA ADMINISTRATOR

**Explanation:** Each IOA screen is controlled by an external command member that contains a list of all commands and synonyms supported under the screen. Command members reside in IOA Parameter Libraries. They should be named TscrCMD1, where scr is the screen name. The Parameters library should be allocated to the DACMDxx DD statement, where xx is the application ID. Possible causes are:

- Somebody incorrectly changed the contents of the command member.
- The DACMDxxxx DD statement is allocated to the wrong library.

For more information about Command Members, see the section on defining new application types in the IOA Installation Considerations section of the INCONTROL for z/OS Installation Guide.

The screen is locked.

**Corrective Action:** To exit, press PA1 a few times. Ask your INCONTROL administrator for assistance.

IOAE14E INVALID SCROLL AMOUNT

**Explanation:** Invalid scroll amount specified. Valid scroll amounts are: PAGE, HALF, CRSR, and MAX.

**Corrective Action:** Correct the scroll amount field.

IOAE15S INSUFFICIENT STORAGE. INCREASE SIZE

**Explanation:** Insufficient memory to perform the task.

**Corrective Action:** For jobs, increase the REGION size. For TSO, log on again using a larger SIZE parameter, or exit one of the screens using an END command.

IOAE16S LOADING OF IOA INSTALLATION PARAMETERS FAILED

**Explanation:** Loading of IOA or Control- × Installation Parameters failed.

The function requested is terminated.

**Corrective Action:** Look on the system log for additional messages.
IOAE17E IOA SUBSYSTEM *subsys* IS ACTIVE FOR ENVIRONMENT (IOA QNAME)

**Explanation:** The *subsys* subsystem is already active for another IOA environment. The same subsystem name cannot be used for two IOA environments in parallel.

IOA subsystem initialization fails for the *subsys* subsystem.

**Corrective Action:** Either choose another subsystem name for the current environment of the IOA products, or deactivate the IOA online monitor and all the subsystem components of the old IOA environment and restart the subsystem.

IOAE18S SUBSYSTEM NAME *subsys* DOES NOT EXIST IN THE MVS TABLES

**Explanation:** If OPTION was set to D for IOASINIT, the subsystem name does not exist. If OPTION was set to M for IOASINIT, or Control-O is started, the subsystem name does not exist and dynamic allocation of the MVS subsystem tables is not allowed.

If OPTION was set to D for IOASINIT, possible causes are:

- There is a mismatch between the name specified in the AMNAME parameter in Control-D Installation Parameters and the name specified in the IEFSSNxx member on SYS1.PARMLIB.
- The IEFSSNxx member on SYS1.PARMLIB was not modified to include the subsystem name.

If OPTION was set to M for IOASINIT, or Control-O is started, possible causes are:

- There is a mismatch between the name specified in the SSNAME parameter in the IOA Installation Parameters and the name specified in the IEFSSNxx member on SYS1.PARMLIB, and dynamic allocation for the subsystem tables is not allowed (SSALLOC=N).
- The IEFSSNxx member on SYS1.PARMLIB was not modified to include the subsystem name, and dynamic allocation for the MVS subsystem tables is not allowed (SSALLOC=N).

Initialization of the subsystem fails.

**Corrective Action:** Define the subsystem name in the MVS table.

If OPTION was set to D for IOASINIT, see the section on Control-D Operational Parameters for details about the AMNAME parameter. See the section on installing the Compressed Dataset Access Method (CDAM) in the Control-D chapter of the *INCONTROL for z/OS Installation Guide* for details about defining the subsystem name in MVS tables.

If OPTION was set to M for IOASINIT, or Control-O is started, see the following:

- The section on IOA Operational Parameters for details about the SSNAME and SSALLOC parameters.
- The section that describes how to install the IOA Subsystem in the IOA chapter of the *INCONTROL for z/OS Installation Guide*.
- The section on installing the Control-M Event Manager Subsystem (CMEM) in the Control-M chapter of the *INCONTROL for z/OS Installation Guide* for details about defining the subsystem name in the MVS tables.

IOAE19E OPTIONS "D", "C" CANNOT BE MIXED

**Explanation:** Options D (Delete) and C (Change) were specified together. Options D and C cannot be mixed. Only one of these option types can be specified at a time.
**Corrective Action:** Remove conflicting options, and request one option type at a time. After one option type has been performed, request the other option type.

**IOAE1AE OPTIONS "A", "E" CANNOT BE MIXED**

**Explanation:** Options A (Add) and E (Erase) were specified together. Options A and E cannot be mixed. Only one of these option types can be specified at a time.

**Corrective Action:** Remove conflicting options and request one option type at a time. After one option type has been performed, request the other option type.

**IOAE1BS OPEN OF IOA LOG FILE FAILED**

**Explanation:** Open of IOA Log file failed (the DALOG DD statement). Possible causes are:

- The DALOG DD statement is missing.
- The file allocated to the DALOG DD statement is not the IOA Log file.
- The file allocated to the DALOG DD statement is the IOA Log file, but it is of a different version or of a different IOA installation.

The requested function ends.

**Corrective Action:** Look on the computer log for additional messages that clarify the reason for the failure. Then, correct the JCL for the job, or the allocations of the CLIST.

**IOAE1CE INSUFFICIENT STORAGE TO BUILD LIST - USE ANOTHER SELECTION CRITERIA**

**Explanation:** There is insufficient storage available to insert a new entry in the list. A new entry is not added.

**Corrective Action:** Increase the REGION size, exit any open screens, and retry the operation. An alternative is to reduce the number of generations.

**IOAE1DI PLEASE FILL IN THE ENTRY DATA**

**Explanation:** No data entered in an obligatory field.

**Corrective Action:** Fill in all obligatory fields.

**IOAE1EI ENTRY ADDED**

**Explanation:** Normal message of the I (Insert) option when a new entry is added successfully.

**Corrective Action:** No action is required.

**IOAE1FI SOME REPORTS WERE HIDDEN BY USER SECURITY EXIT**

**Explanation:** This information message indicates that for security reasons, one or more entries was not displayed. Control-M/Analyzer security exit CTBX003 determined that the user is not authorized to look at some entries.

One or more entries will be hidden from the user.
**Corrective Action:** No action is necessary. All entries for which there is authorization will be displayed. To change authorization settings, call your INCONTROL administrator.

**IOAE1UE INVALID VALUE, USE "Y", "N" OR "P"**

**Explanation:** An invalid value was entered in the SEND WITH CC field.

Valid values for the SEND WITH CC field are:

- **Y** - Yes
- **N** - No
- **P** - Page Break

The cursor points to the field that contains the invalid value.

**Corrective Action:** Correct the value in the field.

**IOAE1VE INVALID VALUE, USE "Y", "N" OR "L"**

**Explanation:** An invalid value was entered in the CONVERT TO ASCII field.

Valid values for the CONVERT TO ASCII field are:

- **Y** - Yes
- **N** - No
- **L** - Convert to ASCII and add line separator CRLF

The cursor points to the field that contains the invalid value.

**Corrective Action:** Correct the value in the field.

**IOAE20E AN ENTRY DELETED CANNOT BE HELD**

**Explanation:** A HOLD request was specified for an entry that was deleted. Once an entry is deleted it cannot be held.

**Corrective Action:** No action is required.

**IOAE21E ENTRY ALREADY HELD. NO ACTION TAKEN**

**Explanation:** A HOLD request was specified for an entry that is already being held. If an entry is already held, a new HOLD request is invalid.

The option is not performed.

**Corrective Action:** No action is required.

**IOAE22E CANNOT PERFORM "FREE" OPTION. ENTRY IS NOT HELD**

**Explanation:** A FREE request was specified for an entry that is not being held. Only an entry that is held can be freed.

The option is not performed.

**Corrective Action:** No action is required.
**IOAE23E "DELETE" OPTION SUPPORTED ONLY WHEN ENTRY IS HELD**

**Explanation:** A DELETE request was entered for an entry that is not being held. Only an entry that is held can be deleted.

The option is not performed.

**Corrective Action:** No action is required.

**IOAE24E ENTRY HAS ALREADY BEEN DELETED**

**Explanation:** A DELETE request was specified for an entry that was already deleted. Once an entry is deleted, it cannot be deleted again.

**Corrective Action:** No action is required.

**IOAE25E AN ENTRY DELETED CANNOT BE FREED**

**Explanation:** A FREE request was specified for an entry that was already deleted. Once an entry is deleted it cannot be freed.

**Corrective Action:** No action is required.

**IOAE26S SECURITY VIOLATION FOR OPTION opt**

**Explanation:** An option was rejected by a security or user exit. Each option request by a user is sent to both the security exit and the user exit, if any. Either can reject the option.

The option is not performed.

**Corrective Action:** To get authorization to perform this function, contact your INCONTROL administrator.

**IOAE27E "WHY" OPTION VALID ONLY WHEN ENTRY IS IN "WAIT ACTIVATION" STATE**

**Explanation:** The Why option ? was specified for an entry that does not have a WAIT ACTIVATION status. The Why option shows why an entry has a WAIT ACTIVATION status. The option is invalid if the entry has a different status.

**Corrective Action:** No action is required.

**IOAE28E INVALID TIME**

**Explanation:** An invalid TIME FROM and/or TO value was specified. Specified TIME values must be valid times based on a 24 hour clock, in format hhmm, where hh is hours and mm is minutes.

**Corrective Action:** Correct the specified TIME values.

**IOAE29S UNABLE TO LOAD MODULE modName**

**Explanation:** Loading of the modName module failed. Possible causes are:
The IOA Load library is not in the load modules search list.
- Insufficient storage available to load the module.
- The `modName` module does not exist in the IOA Load library.
- The IOA Load library was updated while you were working and the position of `modName` module has changed.

The function requested is terminated.

**Corrective Action:** Look on the system log for additional messages that clarify the problem. Suggested actions:
- If the IOA Load library is not in the search list, add a STEPLIB DD statement to the library.
- If the loading failed due to lack of storage then for batch jobs, increase the REGION size, and for TSO, try to log on again using a larger SIZE parameter. If you are using many IOA screens concurrently, try to exit a few using the END command. This can release storage that is used by the screens.
- Add the `modName` module to the Load library.
- If the IOA Load library was modified and you are working under TSO, try to log on again. If you are working under ROSCOE, you may have to shut down ROSCOE and bring it up again. If the IOA Load library is in the Linklist, a refresh to the LLA is needed.

**IOAE2AE INSUFFICIENT STORAGE TO INSERT NEW MEMBER**

**Explanation:** Insufficient storage available to insert a new entry.

**Corrective Action:** Suggested actions:
- Log on again using a larger SIZE parameter.
- If you are using many IOA screens concurrently, exit some of them using the END command.

**IOAE2BE DEFINITION IS TOO LARGE AND SHOULD BE SPLIT**

**Explanation:** Definition member is too large to be handled by IOA. Possible causes are:
- Insufficient storage available to process the definition member.
- The definition member is too large.

**Corrective Action:** Suggested actions:
- Log on again using a larger SIZE parameter.
- If you are using many IOA screens concurrently, exit some of them using the END command.
- Split the definition member into two.

**IOAE2CE INSUFFICIENT STORAGE TO SHOW DEFINITION**

**Explanation:** Insufficient storage available to enter the definition screen.

**Corrective Action:** Suggested actions:
Log on again using a larger SIZE parameter.
If you are using many IOA screens concurrently, exit some of them using the END command.

IOAE2DE INSUFFICIENT STORAGE TO PROCESS CHANGES TO DEFINITION. CHANGES IGNORED

**Explanation:** Insufficient storage available to process the changes in the definition screen. All changes are ignored, and the user returns to the list screen. You can still try to save the entry.

**Corrective Action:** Do one of the following:
- Log on again using a larger SIZE parameter.
- If you are using many IOA screens concurrently, exit some of them using the END command.

IOAE2EE NO ENTRIES FOUND IN THE LIBRARY. PLEASE SPECIFY AN ENTRY NAME

**Explanation:** IOA did not build the entry list as no entries were found in the library.

**Corrective Action:** Enter new entry name.

IOAE2FS INTERNAL PROGRAM ERROR. NOTIFY THE IOA ADMINISTRATOR

**Explanation:** Internal IOA error while processing an entry. Possible causes are:
- The entry requested is not a valid IOA entry, although its structure is very similar to one.
- The entry requested is a valid IOA entry but the entry was incorrectly modified by an editor or program, and now its contents do not conform to IOA standards.
- Internal IOA program error.

**Corrective Action:** If the contents of the entry were modified, try to restore the entry to its original state. If you cannot, or if this is not the problem, have your system programmer call BMC Software Customer Support.

IOAE30E HELP CODE NOT FOUND, CODE = *line_code*

**Explanation:** Code line_code could not be found in the help member. A HELP request was entered, but the line-sensitive help data could not be retrieved.

The Help screen displayed is the beginning of the help member of the screen, instead of the information relevant specifically to the line at which the cursor is located.

**Corrective Action:** Have your INCONTROL administrator inform BMC Software Customer Support of this message and the code displayed.

IOAE31E ENTRY DOES NOT CONTAIN A VALID DEFINITION

**Explanation:** The requested entry is not a valid IOA definition member.
Possible causes are:
The entry requested is not a valid IOA definition member.

The member requested is a valid IOA definition member, but the entry was incorrectly modified by an editor or program, and now its contents do not conform to IOA standards.

**Corrective Action:** Enter a valid IOA definition. If the specified entry was incorrectly modified, try to restore it to its original state.

**IOAE32E ENTRY IS IN USE BY ANOTHER USER**

**Explanation:** Another IOA user is currently working on the entry. Two users cannot work on the same entry simultaneously. The other user may be using the entry through either the IOA Online Facility or the ISPF editor.

**Corrective Action:** Try again later.

**IOAE33E INSUFFICIENT STORAGE TO LOAD DEFINITION**

**Explanation:** Insufficient storage available to load the definition member.

**Corrective Action:** Do one of the following:

- Log on again using a larger SIZE parameter.
- If you are using many IOA screens concurrently, exit some of them using the END command.
- Split the entry into two.

**IOAE34E MORE THAN num ENTRIES - CURRENT MAXIMUM EXCEEDED**

**Explanation:** Too many entries in the definition member. The maximum number of entries permitted is number. This variable is site modifiable, and has a default of 500.

**Corrective Action:** Split the IOA definition member into two. If necessary, contact your INCONTROL administrator to increase the maximum number of entries permitted.

**IOAE35E EXIT IOAX028 MSG - rc**

**Explanation:** This message is displayed from user exit IOAX028. The code displayed is an internal user code. Exit IOAX028 is invoked from certain IOA definition screens. For more information, refer to IOAX028 in the SAMPEXIT library.

**Corrective Action:** If necessary, contact your INCONTROL administrator for further information.

**IOAE36E EXIT IOAX028 WAS CALLED MORE THAN 10 TIMES ONE AFTER ANOTHER**

**Explanation:** This message indicates that user exit IOAX028 was called more than ten times consecutively between ENTER commands. This exit was modified and activated so that for each invocation it enforces a new check of the screen, and after each check of the screen the exit is invoked again before the user regains control of the screen. This probably indicates an inner loop.

After the tenth time exit IOAX028 is called in a row, it is not called again, and the user regains control of the screen.

**Corrective Action:** Notify your INCONTROL administrator of the occurrence of this message.
IOAE37E MEMBER $$SPACE MAY NOT BE DELETED

**Explanation:** An attempt was made to delete the $$SPACE member in one of the directory lists. The $$SPACE member is a not an IOA member. It is a member of PDSMAN, and therefore, user access to it is restricted. The IOA delete option is invalid for deleting non IOA members like $$SPACE.

The $$SPACE member is not deleted.

**Corrective Action:** No action is required.

IOAE38I cpuSmfId ENTRY memName LIBRARY libfunc

**Explanation:** This information message indicates that the memName member was:

- Deleted from an IOA definition library. Whenever a user deletes a member, the action is recorded in the IOA Log file.
- Sorted in an IOA definition library. The action may be recorded in the IOA Log file, depending on the TABUADT parameter in the IOAPARM member.
- Created in an IOA definition library. The action may be recorded in the IOA Log file, depending on the TABUADT parameter in the IOAPARM member.

In this message, cpuSmfId is the SMF ID of the CPU on which the session is active.

**Corrective Action:** No action is required.

IOAE39E MAXIMUM num. CANNOT ADD MORE ENTRIES

**Explanation:** The definition member is full. The maximum number of entries in an IOA definition member is number. This variable is site-modifiable, and has a default of 500.

**Corrective Action:** Split the IOA definition member into two. If necessary, ask your INCONTROL administrator to increase the maximum number of entries permitted.

IOAE3AE PLEASE FILL IN LIBRARY NAME

**Explanation:** Missing library name. The LIBRARY field is required.

**Corrective Action:** Fill in the name of the IOA definition library.

IOAE3BE ONE (AND ONLY ONE) EXIT OPTION MUST BE MARKED AS "Y" OR "N"

**Explanation:** Two exit options are marked. Only one exit option may be marked with Y or N.

**Corrective Action:** Fill in Y or N in only one of the exit options.

IOAE3CI ENTRY HAS BEEN SAVED/CREATED

**Explanation:** This information message indicates that an IOA definition entry was saved or created. In some of the IOA entry definition lists this message is displayed after a definition entry is saved or created.

**Corrective Action:** No action is required.
IOAE3DS ERROR IN COMMAND MEMBER - NOTIFY THE IOA ADMINISTRATOR

**Explanation:** The command member could not be accessed. Each IOA screen is controlled by an external command member. The Parameters library should be allocated to the DACMDxx DD statement, where xx is the application ID.

Possible causes are:
- The contents of the command member were incorrectly changed.
- The DACMDxx DD statement points to the wrong library.

The screen is locked.

**Corrective Action:** To exit, press PA1 a few times. Call your system programmer for assistance.

IOAE3EE NAME MUST BE FILLED IN

**Explanation:** No value was specified for the NAME parameter. The NAME parameter is mandatory.

**Corrective Action:** Specify a valid name.

IOAE3FE INVALID MODE. USE "P" - PROD, "T" - TEST

**Explanation:** An invalid value was specified in the MODE field. The MODE parameter enables the user to determine whether specific actions are really performed, or only recorded and not implemented. Valid modes are P (Prod) and T (Test). In mode P, actions are implemented normally. In mode T, actions that would have been performed in mode P are merely recorded and not implemented.

**Corrective Action:** Specify a valid mode.

IOAE40E PLEASE FILL IN OWNER

**Explanation:** An OWNER value was not specified. The OWNER parameter is mandatory. It identifies the ID of the user who requests IOA services.

**Corrective Action:** Specify a valid OWNER (user ID).

IOAE41E FIELD SHOULD BE NUMERIC

**Explanation:** A non-numeric value was specified in a numeric field.

**Corrective Action:** Specify a numeric value.

IOAE42E INTERNAL ERROR IN modName RC=rc

**Explanation:** An internal error occurred during preparation or transmission of a panel for display on the screen. The name of the module in which the error occurred, and the return code, appear in the message.

The panel is not displayed.

**Corrective Action:** If modName is IOADAS and RC=000016, check the IOA LOG for message CTDE12E. If CTDE12E was issued, see “CTDE12E RESOURCE LIBRARY HAS AN INCORRECT FORMAT”.
INCONTROL for z/OS Messages Manual

Try to reenter the online environment after logging out and reconnecting. If this is unsuccessful, call BMC Customer Support with the information in the message.

IOAE43E INVALID NAME

**Explanation:** An invalid name was specified in the NAME field. A valid name must begin with an alphabetic character or with one of the following characters: $, # or @. All other characters must be alphabetic, numeric or one of the following: $, #, @, _, . or %. Characters * and ? are valid only for mask representations.

**Corrective Action:** Correct the name specification.

IOAE44E INVALID DATE

**Explanation:** An invalid date was specified. The date should be a valid date in the format determined by Installation Parameters. Valid formats are ddmmyy, mmddyy, or yymmdd. In some date fields, four digits (no yy year) or eight digits with a 4-digit year (ddmmyyyy, mmddyyyy or yyyymmdd) are valid.

**Corrective Action:** Specify a valid date.

IOAE45E "FROM" VALUE CANNOT EXCEED "TO" VALUE

**Explanation:** User specified an invalid range in FROM and TO fields. The FROM value cannot exceed the TO value.

**Corrective Action:** Specify a valid range or a mask, if a mask is valid in the FROM field.

IOAE46E FILL IN THE REQUESTED FIELD

**Explanation:** The cursor is positioned in a required field but the field was not filled in.

**Corrective Action:** Fill in the field.

IOAE47S INTERNAL ERROR IN SENDMSG ROUTINE

**Explanation:** The IOA Online Facility sent a message to the screen but the message cannot be displayed due to an internal program error.

**Corrective Action:** Call BMC Software Customer Support for assistance.

IOAE48E REDUNDANT "ON" STATEMENT AFTER AN EMPTY AND/OR/NOT OPTION

**Explanation:** An ON statement is not linked to the preceding ON statement by the AND/OR/NOT parameter. When more than one ON statement is specified, the relationship between them must be defined. The AND/OR/NOT field for an ON statement cannot be blank if another ON statement follows.

Valid AND/OR/NOT field values are:

- A (AND)
- O (OR)
- N (NOT).

**Corrective Action:** Fill in a valid AND/OR/NOT parameter, or delete the unlinked ON statement.
IOAE4AE FIELD MUST BE ENTIRELY FILLED IN

Explanation: The field is not entirely filled in. The field specifies data that is valid only if all character positions are used. In some cases these fields may receive masked values.

Corrective Action: Fill in the field entirely.

IOAE4BE VALID OPTIONS ARE "A", "O", "N" AND " "

Explanation: An invalid value was specified in the AND/OR/NOT field. AND/OR/NOT parameter links ON statements. The AND/OR/NOT field for an ON statement cannot be blank if another ON statement follows.

Valid values: A (AND), O (OR), N (NOT) and blank (no more ON statements).

Corrective Action: Specify a valid AND/OR/NOT field value.

IOAE4CE AT LEAST ONE "ON" STATEMENT MUST BE FILLED IN

Explanation: No ON statement was specified. At least one ON statement must be defined in the Rule Definition.

Corrective Action: Specify at least one ON statement.

IOAE4DE VALID OPTIONS ARE "A", "O" AND " "

Explanation: An invalid value was specified in the AND/OR field.

Valid values for the AND/OR field are:

- A (AND)
- O (OR)
- Blank (no connection with following statement).

Corrective Action: Specify a valid value in the AND/OR field.

IOAE4EE PLEASE FILL IN THE PREREQUISITE CONDITION NAME

Explanation: A prerequisite condition name is missing in a DO COND statement.

At least one condition must be specified in a DO COND statement.

Corrective Action: Specify a prerequisite condition name.

IOAE4FE INVALID DATE REFERENCE

Explanation: An invalid date or date reference was specified in the date field. The date reference should be a valid date in the format determined by Installation Parameters: mmdd or ddmm. In some date reference fields, the following values are also valid: PREV, DATE, NEXT, ODAT, *** * or $$$$. For details, refer to the appropriate user guide.

Corrective Action: Specify a valid date reference.
IOAE4GE INTERNAL ERROR RC=XXXXXXXX, RS=XXXXXXXX, DG=XXXXXXXX

**Explanation:** The common API for the condition file failed.
Execution stops.

**Corrective Action:** Contact your IOA administrator for assistance.

IOAE4IE Control-M IS NOT INSTALLED. "CONDITION" MUST BE "Y"

**Explanation:** Control-M is not installed and the CONDITION option has not been marked as Y.
Mark at the CONDITION option as Y.

**Corrective Action:** No action is required.

IOAE50E MISSING/INVALID CONDITION OPTION. USE "+" (ADD) OR "-" (DELETE)

**Explanation:** The condition option is invalid or missing. Use condition option + (plus) to add a condition to the IOA Conditions file, or - (minus) to delete a condition from the IOA Conditions file.

**Corrective Action:** Specify + (plus) or - (minus) in the condition option field.

IOAE51E INTERNAL ERROR. WINDOW IS OUTSIDE OF SCREEN

**Explanation:** The screen window requested by the IOA Online Facility cannot be displayed because of an internal program error.

**Corrective Action:** Re-enter the information. Notify BMC Software Customer Support if the error occurs again.

IOAE52E INVALID PARAMETERS FOR ZIP ROUTINE

**Explanation:** The screen window requested by the IOA Online Facility cannot be displayed because of an internal program error.

**Corrective Action:** Contact BMC Software Customer Support.

IOAE53E THERE IS NO DATA TO DISPLAY

**Explanation:** The screen that is being prepared for display does not contain any data.

The screen which is being prepared is not displayed. The previous screen is displayed with the error message.

**Corrective Action:** Consider one or more of the following:
If no reports meet the selection criteria, this is an informational message.

If CTDTREE was recently changed (for example, if a new Recipient was added), make sure that CTDTREE was reloaded. For more information on loading the Recipient Tree, see the INCONTROL for z/OS Administrator Guide.

If the SHOW command is available, use it to check whether or not the SHOW settings are affecting the display. If the SHOW command is not available, change the selection or Show criteria, and then re-enter.

IOAE54E INVALID SHOUT DESTINATION CODE

Explanation: An invalid SHOUT destination code was specified.

Corrective Action: Correct the SHOUT destination field. For valid destinations, refer to the appropriate user guide.

IOAE55E INVALID URGENCY. USE "R" - REGULAR, "U" - URGENT OR "V" - VERY URGENT

Explanation: An invalid SHOUT urgency was specified. Valid SHOUT urgency values are R (Regular), U (Urgent), or V (Very urgent). For details, refer to the appropriate user guide.

Corrective Action: Specify R, U, or V in the SHOUT urgency field.

IOAE56E FIELD MUST BE FILLED IN

Explanation: The mandatory field in which the cursor is positioned was not filled in.

Corrective Action: Fill in the field.

IOAE57E ONLY CODE OPTION "- " ALLOWED FOR DATE REFERENCE $$$$/*****

Explanation: Code option + (plus) was specified for a generic date reference. The Add condition option + cannot be specified with generic date references ($$$$/****).

Corrective Action: Specify - (minus) as the code option, or use a different date reference.

IOAE58E PLEASE FILL IN THE "QUANTITATIVE" RESOURCE NAME

Explanation: A quantitative resource quantity was specified without a corresponding quantitative resource name.

Corrective Action: Fill in the quantitative resource name.

IOAE59E STYLE IS RESERVED FOR SYSTEM PURPOSES

Explanation: The specified style ID on a @STYLE line in the Display Type definition member is reserved by the IOA Online Facility for system purposes. See the INCONTROL for z/OS Installation Guide for more information.

Corrective Action: Specify another style ID.
IOAE5AE A DATE WHICH HAS PASSED CANNOT BE SPECIFIED

Explanation: A date that passed was specified in a DATE field. Only the current date or a future date can be specified in the DATE field.

Corrective Action: Specify the current date or a future date.

IOAE5BE PLEASE FILL IN A VALID AUTOEDIT STATEMENT

Explanation: An invalid AutoEdit statement or expression was specified in the DO SET statement.

Corrective Action: Specify a valid AutoEdit statement. For an explanation of the AutoEdit Facility, see the appropriate user guide.

IOAE5CE INVALID ACTION

Explanation: An invalid action was specified in a DO statement.

Corrective Action: Correct the DO action field. For valid actions, refer to the appropriate user guide.

IOAE5DE INVALID SIGN. USE "<", ">", OR BLANK

Explanation: An invalid character has been specified in the SHIFT field. Valid values are < (Shift back), > (Shift forward) or blank (do not shift).

Corrective Action: Specify a valid value.

IOAE5EI TOP OF DEFINITION LIST

Explanation: This information message indicates that the current entry is the first entry in the entry list. This message can be displayed if a PREV command (PF10) is specified in a list screen when the first entry of the list is already displayed.

Corrective Action: No action is required.

IOAE5FI BOTTOM OF DEFINITION LIST

Explanation: This information message indicates that the current entry is the last entry in the entry list. This message can be displayed if a NEXT command (PF11) is specified in a list screen when the last entry of the list is already displayed.

Corrective Action: No action is required.

IOAE60E LOGICAL ERROR ON CONTROL-M/TAPE MDB

Explanation: A logical error was detected in the Control-M/Tape Media Database (MDB) when reading a record. Probable causes:

- There is a data set record in the MDB, but the corresponding volume record does not exist.
- One of the volumes of a multivolume data set is not found in the MDB.

Corrective Action: Notify your system administrator.
IOAE61E INVALID SIGN. USE "<" OR ">"

Explanation: The user has specified an invalid sign preceding a numeric value.
Corrective Action: Specify the correct sign: < or >.

IOAE62E A NEW "ON" STATEMENT MUST BE FILLED IN AFTER AND/OR/NOT IS SPECIFIED

Explanation: An AND/OR/NOT parameter was used without a subsequent ON statement. The AND/OR/NOT parameter links a subsequent ON statement with the preceding ON statement. Every AND/OR/NOT value must be followed by an ON statement.
Corrective Action: Either delete the value in the AND/OR/NOT field, or enter the missing ON statement.

IOAE63E A RANGE IS INVALID WHEN A MASK IS USED

Explanation: A TO value cannot be specified if the FROM field contains a mask. A group is specified by a mask in the FROM field, or by filling in the TO field to specify a range. However, these methods cannot be combined.
Corrective Action: Clear the TO field, or do not specify a mask in the FROM field.

IOAE64E TOO MANY DIGITS SPECIFIED IN FIELD

Explanation: Too many digits were specified in a field. When a numeric value is specified in this field, a limited number of digits or columns can be filled in. This may occur when the field receives different types of data, for example a date or a four digit number.
Corrective Action: Decrease the number of digits specified in the field.

IOAE66I ENTRY LOCATION CHANGED IN TABLE AFTER SORT

Explanation: This information message indicates that changes in the definition screen or Entry List caused the entry to change location in the table after exit from the definition screen and return to the Entry List Panel. Automatic sort of the table is active. The sort criteria of an entry changed in the particular definition screen or in the Entry List.
The order of entries in the table is changed.
Corrective Action: No action is required.

IOAE67I AN UNSORTED TABLE WAS SORTED ON ENTRY TO LIST

Explanation: This information message indicates that an unsorted table member was sorted on entry to list of entries in a table.
Automatic sort of the table is active. If the sort changed the order of entries in the table, this message is issued. This situation may occur when selecting tables that were created by conversion utilities, or if sort was previously inactive when modifying the table.
The order of entries in the table is changed.
Corrective Action: No action is required.
IOAE68E INVALID FORMAT OF CHANGE COMMAND

Explanation: The CHANGE command was issued using an invalid format. Valid format of the CHANGE command is:

CHANGE string_in_definition replacement_string

Corrective Action: Reissue the command using the valid format.

IOAE69E PF9 RCHANGE IS VALID ONLY AFTER SUCCESSFUL CHANGE

Explanation: The RCHANGE could not be performed because the original CHANGE command was not successfully completed.

Corrective Action: Use the CHANGE command to substitute a string in an IOA definition with another string.

IOAE6AI FIELD CHANGED SUCCESSFULLY

Explanation: This information message indicates that the CHANGE command was used to change the value of a certain string in an IOA definition to the value of another string.

Corrective Action: No action is required.

IOAE6BI NO FIELDS FOUND TO MATCH CHANGE STRING

Explanation: This information message indicates that the user issued a CHANGE command to change the value of a string in an IOA definition to another string's value. However, no matching string was found in any of the fields of the definition.

The requested string substitution does not take place.

Corrective Action: No action is required.

IOAE6CE CHANGE OF FIELD WILL CAUSE AN ERROR

Explanation: The change requested by means of the CHANGE command is not performed because it would cause an error in the IOA definition. Before performing the requested change, a validity check is performed to ensure that the field will not grow beyond its boundaries, and that its contents remain valid for the IOA definition.

The requested change is not performed.

Corrective Action: No action is required.

IOAE6FE CANNOT DISPLAY A MONTH OUTSIDE THE SPECIFIED RANGE

Explanation: The user requested the Online Scheduling Plan for a specific range of dates and then attempted to view the job scheduling dates for a month that is outside the defined date range.

Corrective Action: To view the scheduling plan for the requested month, exit the current display of the plan, define a new range, and reenter.
IOAE70E VALID SORT OPTIONS ARE "J"-JOB, "G"-GROUP OR "A-APPLICATION"

Explanation: An invalid sort option or no sort option was requested when activating the SORT command from the scheduling job list.

Corrective Action: Specify one of the valid sort options shown in the message when activating the SORT command.

IOAE71E INVALID CODE

Explanation: An invalid return code, abend code or reference was entered in one of the IOA definition panels.

Corrective Action: Enter a valid code. For information on valid codes, see the appropriate product guide.

IOAE72E INVALID COMMAND NUMBER

Explanation: A command was activated that was incorrectly defined in the Command member of the current screen. The number of a command defined in the Command member of the current screen must be positive, but less than 45.

The command is not executed.

Corrective Action: Correct the corresponding Command member in the IOA Parameter Library. See the section on defining new application types in the section on IOA installation considerations of the INCONTROL for z/OS Installation Guide.

IOAE73E OPERANDS "","","N" ARE INVALID FOR THIS TYPE OF CODE

Explanation: One of these operands, which are invalid for this type of code, was specified.

Corrective Action: Use only valid operands for this type of code.

IOAE74E SIGN OF QUANTITY MUST BE EITHER "+", "-" OR BLANK

Explanation: An invalid sign was specified for quantity change in the CHANGE window.

Valid quantity signs are:

- (minus) - Subtract the amount from the maximum available quantity.
- + (plus) - Add the amount to the maximum available quantity
- blank - Set a new quantity.

Corrective Action: Specify one of the above quantity signs.

IOAE75E COMMENT LINE CANNOT BE INSERTED HERE

Explanation: An attempt was made to open a comment line in an IOA definition. However a comment line cannot be inserted before the line on which the cursor is positioned.

Corrective Action: Try to open the comment on a different line.
IOAE76E OPTION INVALID FOR INSERTED RECORD

**Explanation:** An invalid option or command was entered in an IOA list. The current list of valid options or commands appears at bottom of the screen.

**Corrective Action:** Enter a valid option.

IOAE77E TOO MANY PARMS

**Explanation:** The specified command contained too many parameters.

The command is not issued.

**Corrective Action:** Delete parameters until the remaining ones are accepted.

IOAE78E INVALID cmd PARAMETER - parm

**Explanation:** The parameter specified is not a valid parameter of the command.

The command is not issued.

**Corrective Action:** Either delete the parameter or replace it with a valid one.

IOAE79E REQUESTED FILTER filterName NOT FOUND

**Explanation:** Command SHOW filterName was entered to activate predefined selection criteria, but the filter specified was not in the user profile member or in the global profile member ($PROFILE).

The command is not issued.

**Corrective Action:** Edit and save this filter as a new filter using the EDIT keyword, or specify an existing filter with the command. If the fields of the specified filter match those of the DEFAULT filter, the filter is not saved in the user profile member.

IOAE7AE AT LEAST ONE OF THE FOLLOWING FIELDS MUST BE "Y"

**Explanation:** All Y/N fields in a logical group of fields in the SHOW window are set to N. At least one must be set to Y; otherwise no lines will be displayed.

The selection criteria of the SHOW window are not activated.

**Corrective Action:** Set at least one field to Y.

IOAE7BE FILTER filterName IS A GLOBAL FILTER WHICH CANNOT BE SAVED

**Explanation:** A request to save a GLOBAL filter defined in the $PROFILE member failed because a GLOBAL filter cannot be saved by a user.

The filter is not saved.

**Corrective Action:** Specify a filter name that is not defined in the $PROFILE member.

IOAE7CE MISSING FILTER NAME TO BE SAVED

**Explanation:** The SAVE field on the SHOW WINDOW was set to Y, but no filter name was specified.

SAVE can be performed only on a specific filter.
SAVE is not performed.

**Corrective Action:** Specify a filter name.

IOAE7DE FILTER *filterName* HAS BEEN CHANGED. ENTER Y/N OR "RESET"

**Explanation:** The currently edited filter in the SHOW window was changed, but the SAVE field was left empty.

**Corrective Action:** Suggested actions:

- Enter Y in the SAVE field to save the changes and activate the new selection criteria.
- Enter N in the SAVE field to activate the new selection criteria without saving them.
- Press the RESET key (PF4 is the installation default) to restore the original values to what they were upon entering the SHOW command, and reactivate the original selection criteria.

IOAE7EE INSUFFICIENT MEMORY TO SAVE FILTER *filterName*

**Explanation:** A request to save changes made to a filter failed because there is not enough memory available. When filter fields are changed, the changed values are first saved in memory. Because the current region is used up, changes cannot be saved.

The changes are not saved.

**Corrective Action:** Exit the SHOW window without saving the changes by specifying N in the save field, or by pressing the RESET key (PF4 is the installation default). To enable saving a new filter, or changes to an existing filter, either exit some open online applications, or increase the value of the REGION parameter.

IOAE7FE COMMAND "x" CANNOT BE ISSUED FOR A SMART TABLE

**Explanation:** The x line command is supported for job entries, but not SMART tables.

The command is not executed.

**Corrective Action:** No action is required.

IOAE7GE VALID SORT OPTIONS ARE "R"-RULE, "T"-TYPE

**Explanation:** An invalid sort option or no sort option was requested when activating the SORT command from the rule definition list.

**Corrective Action:** Specify either R or T when activating the SORT command.

IOAE7HI *cpuSmfl'dDEFINITION defn IN lib(memName) func*

**Explanation:** This information message indicates that the *defn* definition was:
INCONTROL for z/OS Messages Manual

- Deleted from a member of an IOA definition library. The action may be recorded in the IOA Log file, depending on the TABUADT parameter in the IOAPARM member.
- Changed into a member of an IOA definition library. The action may be recorded in the IOA Log file, depending on the TABUADT parameter in the IOAPARM member.
- Created into member of an IOA definition library. The action may be recorded in the IOA Log file, depending on the TABUADT parameter in the IOAPARM member.
- Copied from a member of an IOA definition library to another member. The action may be recorded in the IOA Log file, depending on the TABUADT parameter in the IOAPARM member.

In this message, cpuSmfId is the SMF ID of the CPU on which the session is active.

Corrective Action: No action is required.

IOAE7KE ROUTCODE route_code OF parameter PARAMETER IS INVALID

Explanation: This message is issued when the error occurred during parsing the IOADEST member of the IOA PARM library. The ROUTCODE of parameter parameter is invalid. A valid value of ROUTCODE is a number between 1 and 15.

Corrective Action: Update the route_code with the correct value.

IOAE80S STATEMENT PARSING ERROR. RC= rc. EXECUTION WILL TERMINATE

Explanation: Highlighted, unrollable message.

An internal error occurred while building the online environment.

The online environment is not started.

Corrective Action: Try to reenter the online environment after logging out and reconnecting. If this is unsuccessful, contact BMC Software Customer Support with the information in the message.

IOAE81E OPERATION NOT GRANTED

Explanation: A user exit or security exit did not allow performance of the specified operation in the online environment.

The operation is not performed.

Corrective Action: Contact your IOA security administrator to get authorization to perform this operation.

IOAE83E JOB WILL NOT BE SCHEDULED DURING THIS PERIOD

Explanation: The selected job or SMART table is not scheduled to run within the specified time period.

Option P on the Job List screen of the Job Schedule Definition facility (2.P) shows when the selected job or SMART table will run in the specified time period.

The system waits for a response from the operator.

Corrective Action: Press the PF3 key to continue.
IOAE84I ENTRY MODIFIED

**Explanation:** This information messages indicates that an entry in an IOA list has been modified.

**Corrective Action:** No action is required.

IOAE85E DUPLICATE RBC *rbcName*

**Explanation:** Two rule-based calendar entries with the same name were defined in the SMART Table Entity. Rule-based calendar names must be unique within a SMART Table Entity.

**Corrective Action:** Change one of the rule-based calendar names so that all the rule-based calendar names in the SMART Table Entity are unique.

IOAE86E PLEASE FILL IN AT LEAST ONE RBC ENTRY

**Explanation:** An attempt to exit a SMART Table Entity definition for which no rule-based calendar name was defined failed. At least one rule-based calendar entry must be defined in a SMART Table Entity.

**Corrective Action:** Specify at least one rule-based calendar name in the SMART Table Entity.

IOAE88E INVALID HEXADECIMAL DIGIT

**Explanation:** When specifying the WHEN string (x'######') in hexadecimal format the user used an invalid digit. Valid hexadecimal digits are: 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F.

**Corrective Action:** Correct the WHEN string to contain valid digits only.

IOAE89E HEXADECIMAL STRING MUST CONTAIN AN EVEN NUMBER OF DIGITS

**Explanation:** An odd number of hexadecimal digits was specified in the WHEN string, for example, x'40A12'. The WHEN string must contain an even number of digits since each pair of digits represents one byte.

**Corrective Action:** Correct the WHEN string to contain an even number of valid digits.

IOAE8AW FILTER *filterName* WILL NOT BE SAVED - IDENTICAL TO "DEFAULT" FILTER

**Explanation:** An attempt was made to save a filter that is identical to the default filter. A user filter can be saved only if its filtering criteria are different from the default filter criteria (filter DEFAULT).

**Corrective Action:** Change some of the criteria in the current filter, or use filter DEFAULT whenever these criteria are desired.

IOAE8BS IOATDRV RC=rc ID/TYP/CLS=id/type/class CALL=func PGM=pgmName #=num

**Explanation:** The main screen formatting routine encountered an internal error. The ID, type, and class are specified as three characters in the message. The first character represents the ID, the second character represents the type, and the third character represents the class.

The screen is not displayed, or displayed incorrectly.
**Corrective Action:** Save the contents of the message and try to reenter the environment. If the problem persists, report the information from the message to your INCONTROL administrator.

**IOAE8CE CHARACTERS '*' AND '?' ARE INVALID IN RBC NAME**

**Explanation:** In a SMART Table Entity scheduling definition, an invalid character has been typed in the RBC field. The RBC field may contain any displayable characters except for '* ' and '?'.

The SMART Table Entity scheduling definition cannot be saved.

**Corrective Action:** Remove invalid characters from the RBC field.

**IOAE8DE THIS OPTION MUST BE THE LAST ENTERED**

**Explanation:** An option that must be the last option entered in the screen was requested. No other option can be entered on any line after this line.

The request is ignored.

**Corrective Action:** Either delete the option that must be the last in the screen, or delete all options that follow it.

**IOAE8EE THIS OPTION MUST STAND ALONE**

**Explanation:** An option that cannot be combined with any other option was requested. No other option can be entered on any other line.

The request is ignored.

**Corrective Action:** Either delete the option that must be specified alone, or delete all other options.

**IOAE8FE THIS COMMAND IS ONLY ALLOWED IN SCROLLABLE SCREEN**

**Explanation:** An UP, DOWN, FIND, or LOCATE command was entered in a nonscrollable screen. The requested command is not performed.

**Corrective Action:** No action is required.

**IOAE8GE ILLLEGAL FIRST CHARACTER**

**Explanation:** The first character is used for the exclude sign, therefore the RBC name cannot start with that character.

**Corrective Action:** Change the first character in the RBC name to a different character.

**IOAE8LE FIRST CHARACTER CANNOT BE "x"**

**Explanation:** The first character is used for the exclude sign, therefore the RBC name cannot start with that character.

**Corrective Action:** Change the first character in the RBC name to a different character.

**IOAE8RE FIRST CHARACTER CANNOT BE "!"**

**Explanation:** Even when the Exclude RBC feature is turned off (EXCLUDRC=N in CTMPARM), new RBCs cannot have a name starting with "!".
However, existing CTM-level RBCs with such names can be used, but will be processed according to the setting of EXCLURBC. If EXCLURBC=N, the CTM-level RBCs will be processed as regular (Include) RBCs. If EXCLURBC=Y, the CTM-level RBCs will be processed as reference to Exclude RBCs (without the “!” and will result with a message of missing RBC).

When editing a SMART table RBC section, an existing Table level RBC with a name starts with “!”’, will be treated according to the value of EXCLURBC. With EXCLURBC=N, it will be treated as an include RBC, while with EXCLURBC=Y, it will be treated as an Exclude RBC.

**Corrective Action:** Change the name of the RBC so it starts with a character other than “!”’, and make sure that all jobs referring to this RBC are updated with the new name (and do not use “!” as the first character of the name).

**IOAE90E THE DATE RANGE ALLOWED IS UP TO 3 YEARS**

**Explanation:** The date range in the scheduling plan of a job or group entity in calendar format exceeds 3 years.

The requested command or option is not performed.

**Corrective Action:** Correct the date range and press Enter.

**IOAE91E CALENDAR CONTAINS A DUPLICATE YEAR. RESET WINDOW IN ORDER TO FIX IT**

**Explanation:** An attempt was made to define a calendar that duplicated an existing calendar.

The duplicate calendar is not saved.

**Corrective Action:** Enter N (No) in the Save window.

**IOAE92E USER IS NOT AUTHORIZED TO USE OPTION**

**Explanation:** The current attempt to run a job or enter a command is not authorized. This error message is issued when there is an attempt to perform an operation that is not allowed. For example, someone tried to use an IOA Online option without the necessary authority.

The operation terminates.

**Corrective Action:** Notify your INCONTROL administrator.

**IOAE93E THE COMMAND ENTERED REQUIRES AN OPERAND**

**Explanation:** A command that requires an operand was entered without an operand.

The command is not performed.

**Corrective Action:** Reenter the command with the operand.

**IOAE95E COMPLETE THE INSERT OPERATION BEFORE USING OTHER COMMANDS**

**Explanation:** A new line or record was inserted, but no other step was taken before another command was entered.
When a new line or record is inserted, no other command can be performed until either the new line or record is deleted, or data is entered in the new line or record.

**Corrective Action:** Either delete the newly inserted line or record, or type some data into the newly inserted line or record and press **Enter**.

**IOAE0E GETMAIN FAILED**

**Explanation:** There was insufficient memory to perform a task.

The action that could not be performed accompanies this message. It may vary depending on the environment in which the message was issued.

**Corrective Action:** For jobs, increase the REGION size. For TSO, log on again using a larger SIZE parameter, or exit one of the screens.

**IOAE1E TOKEN CREATE/RETRIEVE FAILED**

**Explanation:** An error occurred during the initialization of an INCONTROL product. The CREATE or RETRIEVE service failed, and the related IBM Module (IEANTCR or IEANTRT) ended with a nonzero return code.

**Corrective Action:** Refer to the relevant IBM publication.

**IOAE2E TOKEN MUST EXIST FOR SERV/TERM FUNCTION**

**Explanation:** An internal error occurred during the initialization of an INCONTROL product.

**Corrective Action:** Contact BMC Software Customer Support.

**IOAE3E IOALDPRM FOR PARAMETER MEMBER parm FAILED[: MODULE modName NOT FOUND]**

**Explanation:** During IOA environment initialization, processing of the parm source parameter failed. Sometimes the optional part of the message is displayed, indicating that the modName module was needed to process the parm parameter, but the module was not found in a load library.

This message is usually preceded by a message detailing either a READ error or a syntax error. The program stops.

**Corrective Action:** Check and correct the parm member in the IOA PARM library. BMC Software recommends that you use the ICE Customization option to correct this member.

**IOAE4E INIT FOR SERVICE serv FAILED**

**Explanation:** During IOA environment initialization, the initialization of the module that provides the serv service failed.

Valid values for serv are:
IOALOGR - read or write to the IOA LOG file
MESSAGES - message retrieval
WISHES - optional wishes retrieval
TRACE - IOA trace facility
IOALLOC - IOA dynamic allocation facility

This message is usually preceded by a message issued by the service module, which usually describes the problem.

The probable source of the problem is either the IOADSN or the allocation members in the libraries referenced by DD name DAPARM.

The program stops.

**Corrective Action:** Attempt to solve the problem described in the service module message.

IOAEA5E UNABLE TO OBTAIN ENQ FOR IOAENV

**Explanation:** An internal error occurred during the initialization of an INCONTROL product.

Initialization stops.

**Corrective Action:** Contact BMC Customer Support.

IOAEA6E JES NOT RECOGNIZED

**Explanation:** No value was set for the JESTYPE parameter, and the IOAENV module could not identify the type of JES in use.

The program stops.

**Corrective Action:** Check and correct the JESTYPE parameter in the IOAPARM member in the IOA PARM library.

IOAEA7E INVALID FUNCTION PASSED

**Explanation:** An internal error occurred during the initialization of an INCONTROL product.

Initialization stops.

**Corrective Action:** Contact BMC Customer Support.

IOAEA8E SUBPOOL NOT EQUAL TO THE MCT SUBPOOL

**Explanation:** An internal error occurred during the initialization of an INCONTROL product.

Initialization stops.

**Corrective Action:** Contact BMC Customer Support.

IOAEA9E DAPARM DD STATEMENT MISSING. PROCESS ENDED

**Explanation:** The initialization of the desired environment could not be completed because the DAPARM DD statement was not found.

The session ends.
Corrective Action: Add the DAPARM DD statement to the relevant JCL.

IOAEAAE CALL TO IOALOC FAILED
Explanation: An internal error occurred during the initialization of an INCONTROL product. Initialization stops.
Corrective Action: Contact BMC Customer Support.

IOEEABE LOAD/LINK FOR MODULE modName FAILED
Explanation: The IOAENV module could not load the modName module. Initialization stops.
Corrective Action: Contact BMC Software Customer Support.

IOAEB1E ROUTINE rtn-name FAILED. RC=rc REASON=rsn
Explanation: The IOA/Control-M routine, rtn-name, failed with a return code of rc and a reason code of rsn.
When the rtn-name is CTMBAPI and the rc=8, refer to the explanation in message IOA723I for a complete list of all the reason codes and their meaning.
When the rtn-name is CTMBAPI and rc=4, and rsn=0 the meaning is that an internal request to the Control-M application interface program (CTMAPI) to Search for a specific job in the AJF failed because the job was not present in the AJF.
Corrective Action: Take action based on the rc and rsn. Contact BMC Customer Support if you are unable to determine an appropriate course of action.

Messages IOAF00 through IOAFxx
This group includes messages for the IOA (infrastructure) product.

IOAF00I UTILITY IOADBF STARTED
Explanation: This information message indicates that the IOADBF utility has started. The IOADBF utility allocates and formats an IOA Access Method file component primary or secondary extent.
Corrective Action: No action is required.

IOAF01I FORMATTING ENDED WITH RETURN CODE rc
Explanation: This information message indicates that the IOADBF utility ended with a return code of rc. Possible values of rc are listed in message CTD908S. The IOADBF utility terminates.
Corrective Action: If rc is not zero, check the IOA Log file and the system log for additional messages that describe the error. Correct the problem before rerunning the IOADBF utility.
IOAF01S INSUFFICIENT STORAGE FOR TRANSFER SUBTASK

Explanation: Insufficient storage to initialize the File Transfer task.
The file transfer task is not started.

Corrective Action: Increase the REGION size in the File Transfer monitor procedure. Stop and restart
the File Transfer monitor.

IOAF02E SPECIFIED NUMBER OF RECORDS IS NOT CORRECT. UNABLE TO
CONTINUE PROCESSING

Explanation: This message is issued in two cases:

- The IOADBF utility was unable to allocate an IOA Access Method file component. The number of
  blocks specified in the SPACE parameter of the IOA Access Method file Definition statements member
  is invalid.
- The IOADBF utility EXTEND function was unable to allocate an IOA Access Method file component.
  The number of secondary blocks is not specified in the SPACE parameter of the IOA Access Method
  file Definition statements member.

The SPACE parameter specifies the number of primary and secondary blocks to be allocated. Primary and
secondary SPACE parameter values must be a number from 2 through 65535. Database file definition
statements are usually located in a member of the IOA INSTWORK library.

The IOADBF utility terminates.

Corrective Action: Do the following:

1. Modify the DEFxxx member to allocate secondary blocks.
2. Allocate IOA Access Method file components by running the IOADBF utility twice, as follows:
   - the first time, with the FUNC parameter set to CHANGE
   - the second time, with the FUNC parameter set to EXTEND

For more information on the IOADBF utility, see the INCONTROL for z/OS Utilities Guide.

IOAF02S ERROR IN DYNALLOC FUNCTION: func rsn RC=rc

Explanation: The File Transfer monitor could not dynamically allocate a file to be transferred. The
function that failed, ALLOC, DEALLOC, or CONCATENATE, the reason code, and the return code from SVC
99 are displayed in the message.

The File Monitor continues processing other files.

Corrective Action: See the IBM manual MVS Programming: Authorized Assembler Services Guide for an
explanation of the reason code and return code in the message.

IOAF03I FILES ARE NOT TRANSMITTED. USER usr IPA=ipAdd

Explanation: This information message indicates that one or more files listed in the Active Transfer file
cannot be transmitted to the specified IP address.

The task continues processing other files. The status of the entry in the Active Transfer file is set to WAIT
TRANSMIT.
Corrective Action: Check if the server with the specified IP address is active.

IOAF03S INDEX FILE BLKSIZE AND LRECL MUST BE EQUAL. UNABLE TO CONTINUE PROCESSING

Explanation: The BLKSIZE and LRECL parameters specified in the IOA Access Method file Definition statements member for an IOA Access Method file index component are not equal. The logical record length and block size of IOA Database file index components must be equal. Database file Definition statements are usually located in a member of the IOA INSTWORK library.

The IOADBF utility terminates.

Corrective Action: Delete the LRECL parameter to set the logical record length to the value of the BLKSIZE parameter, and rerun the IOADBF utility.

IOAF04S UTILITY IOADBF UNABLE TO OPEN FILE. REFORMAT FAILED

Explanation: The IOADBF utility could not open an IOA Access Method (IAM) file component for reformatting. During reformatting of an IAM file index or data component, the IOADBF utility failed to open and read the file control record from the first extent.

The IOADBF utility terminates.

Corrective Action: Check the IOA Log file and system log for additional messages that describe the error. Correct the problem before rerunning the IOADBF utility.

IOAF05S ERROR IN OPENING SYSPRINT FILE. UTILITY IOADBF UNABLE TO CONTINUE PROCESSING

Explanation: This is one of two messages with the same ID, but different text.

The IOADBF utility could not open the SYSOUT file or the data set referenced by the SYSPRINT DD statement. The IOADBF utility encountered an error while opening the file referenced by the SYSPRINT DD statement. This file is used to write message output during utility execution.

The IOADBF utility terminates.

Corrective Action: Check the IOA Log file and system log for additional messages that describe the error. Correct the problem before rerunning the IOADBF utility.

IOAF05S text

Explanation: This is one of two messages with the same ID, but different text.

An error occurred during transmission of a file to the PC. The message text describes the reason for the problem.

The file is not transmitted.

Corrective Action: Correct the problem, and restart the File Transfer monitor.
IOAF06I FILES ARE TRANSMITTED OK FOR USER userName IPA=ipAddPort
FILE=fileName.CDM

Explanation: This information message indicates that the specified files were successfully transmitted to
the PC. The message specifies
- userName - the user name
- ipAddPort - the IP address and port
- fileName - the file name

Corrective Action: No action is required.

IOAF06S INSUFFICIENT STORAGE FOR RUNNING UTILITY IOADBF

Explanation: The IOADBF utility could not obtain the memory required for execution. The IOADBF utility
received a non-zero return code from macro GETMAIN.
The IOADBF utility terminates.

Corrective Action: Take the following steps:
1. Check the IOA Log file and system log for additional messages that describe the error
2. Correct the problem, or increase the REGION size
3. Rerun the IOADBF utility

IOAF07E INCONSISTENT PARAMETERS. UTILITY IOADBF UNABLE TO
CONTINUE PROCESSING

Explanation: The IOADBF utility detected inconsistent parameters for formatting an IOA Access Method
file in the member that contains the IOA Access Method definition statements. The parameters that were
passed to the IOADBF utility were not of the type required for formatting the file.
The IOADBF utility terminates.

Corrective Action: Take the following steps:
1. In the case of Control-M/Tape, verify that
   - DUAL was set to N
   - EXTEND was set to M
   - TYPE was not set to V
   - the SPACE parameter for this index file had no secondary allocation
2. In the case of Control-M/Analyzer, verify that
   - EXTEND was set to M, or was not set
   - TYPE was not set to V
   - BUFL was set to 0
   - the SPACE parameter had no secondary allocation
3. Correct the member that contains the IOA Access Method definition statements.
4. Rerun the utility.

**IOAF08S KEYLEN IS NOT DEFINED FOR INDEX FILE**

**Explanation:** The KEYLEN mandatory parameter was not specified in the IOA Access Method (IAM) file definition statements member for the IAM file index component being processed. The KEYLEN parameter is mandatory when allocating and formatting an IAM file index component. IAM file definition statements are usually located in a member of the IOA INSTWORK library.

The IOADB utility terminates.

**Corrective Action:** Set the value of the KEYLEN parameter to the value required for the IAM file index component being processed. Rerun the utility.

**IOAF09S REMOVE LRECL FROM THE INDEX FILE DEFINITION STATEMENTS MEMBER**

**Explanation:** The LRECL parameter is specified in the IOA Access Method (IAM) file definition statements member for the IAM file index component being processed. The internal structure of the Database file index component being processed requires that each block consist of one record. Therefore, the LRECL parameter is not applicable and may not be specified. IAM file definition statements are usually located in a member of the IOA INSTWORK library.

The IOADB utility terminates.

**Corrective Action:** Remove the LRECL parameter from the member. Rerun the program.

**IOAF0AI FILE TRANSFER STARTED. FOR USER userId IPA=ipAdd:port FILE=fileName.CDM**

**Explanation:** This information message is issued when the File Transfer monitor starts to transfer a package to the identified IP address.

The variables in this message are:

- **userId** - the identity of the user to whom the report belongs
- **ipAdd** - the IP address
- **port** - the port number
- **fileName** - the name of the file being transferred

**Corrective Action:** No action is required.

**IOAF0CI UNRECOVERABLE ERROR ENCOUNTERED.**

**Explanation:** During the operation of the File Transfer monitor, an unrecoverable error occurred when access was attempted to the Active Transfer file.

The File Transfer monitor shuts down.

**Corrective Action:** Contact your INCONTROL administrator.
IOAF0DS SECURITY VIOLATION IN THE FILE TRANSFER MONITOR.

**Explanation:** A serious error occurred while the File Transfer monitor was working. The transfer of the package was rejected by a security exit, or by User Exit 23.

Every transfer request is sent to both the security exit and the user exit, if they exist. Either exit can reject a transfer request.

The package is not transferred.

**Corrective Action:** If you consider that you ought to have authority to transfer the package, contact your INCONTROL administrator.

IOAF0EW ATF IS REFRESHED. SUBTASK IPA=IPaddress IS CLOSED.

**Explanation:** This warning message is issued when the transfer process fails because the status of the corresponding record in the ATF can not be updated. It can occur if a package, whose time has come for transfer, can not find the corresponding record in the ATF because it was reformatted and refreshed during the NEWDAY process.

CTDFTM continues to work and the subtask with the specified IP address is closed.

**Corrective Action:** If the package remains at the status NOT TRANSMITTED, reorder the package.

IOAF10S REMOVE KEYLEN FROM THE DATA FILE DEFINITION STATEMENTS MEMBER

**Explanation:** The KEYLEN parameter should not be specified in the IOA Access Method (IAM) file definition statements member for IAM file data components. Key fields are only applicable to IAM file index components. The KEYLEN parameter should not be specified for an IAM file data component. IAM file definition statements are usually located in a member of the IOA INSTWORK library.

The IOADBF utility terminates.

**Corrective Action:** Remove the KEYLEN parameter from the member. Rerun the program.

IOAF11S SET VALUE FOR PARAMETER TYPE TO I, F OR V

**Explanation:** The value specified for the TYPE parameter in the IOA Access Method (IAM) file definition statements member is invalid. Database file definition statements are usually located in a member of the IOA INSTWORK library.

Possible TYPE parameter values are:

- I - IAM file index components
- F - IAM file data components containing fixed length records
- V - IAM file data components containing variable length records

The IOADBF utility terminates.

**Corrective Action:** Specify a valid TYPE parameter in the member. Rerun the program.
IOAF12S QUANTUM IS NOT CORRECT IN THE DEFINITION STATEMENTS MEMBER

**Explanation:** The value specified for the QUANT1, QUANT2, or QUANT3 parameter in the IOA Access Method (IAM) file definition statements member for the IAM file component being processed is invalid. The QUANT1, QUANT2 and QUANT3 parameters are used with variable record length IAM file components for managing free space areas when new records are written. These parameters must correlate with the BLKSIZE parameter as follows:

\[ \text{QUANT1} < \text{QUANT2} < \text{QUANT3} < \text{BLKSIZE} \]

IAM file definition statements are usually located in a member of the IOA INSTWORK library.

The IOADBF utility terminates.

**Corrective Action:** The QUANT1, QUANT2, and QUANT3 parameters are for internal use only. Do not modify them without prior consent of BMC Software Customer Support. When appropriate values are approved, specify valid QUANT1, QUANT2, and QUANT3 parameters in the member, and rerun the utility.

IOAF13S BLKSIZE VALUE IS TOO SMALL

**Explanation:** The block size specified in the IOA Access Method (IAM) file definition statements member is less than the length of the control record of the IAM file component being processed. The BLKSIZE parameter of the IAM file definition statements member for the IAM file component being processed must not be less than the length of the control record of the component. IAM file definition statements are usually located in a member of the IOA INSTWORK library.

The IOADBF utility terminates.

**Corrective Action:** For IAM file components containing variable length records, change the relevant definition statements member to increase the BLKSIZE value or reduce the number of blocks specified in the SPACE parameter. For IAM file components containing fixed length records, the BLKSIZE parameter should be more than 255.

IOAF14S ERROR IN DYNALLOC OF DATABASE FILE RC=rc

**Explanation:** An attempt to dynamically allocate or deallocate an IOA Access Method (IAM) file component failed. IAM Database processing routines received a non-zero return code from an allocation or deallocation request using SVC 99. The data set name of the IAM file component is specified in message IOAF20S.

The IOADBF utility terminates.

**Corrective Action:** See the IBM manual *MVS Programming: Authorized Assembler Services Guide* for a description of the return code and reason code received. If the problem remains unresolved, contact BMC Software Customer Support.

IOAF15S ERROR IN OPENING DATABASE FILE

**Explanation:** During processing of an IOA Access Method (IAM) file index or data component, the IOADBF utility could not open and read the file control record from the first extent.

The IOADBF utility terminates.
Corrective Action: Check the system log for additional messages that describe the error. Correct the problem before rerunning the program. If the problem remains unresolved, contact BMC Software Customer Support.

IOAF16S ERROR IN READING CONTROL RECORD

Explanation: The IOADBF utility could not read an IOA Access Method (IAM) file component header record. During processing of an IAM file index or data component, an attempt to read the file control record from the first extent failed.

The IOADBF utility terminates.

Corrective Action: Check the system log for additional messages that describe the error. Correct the problem before rerunning the program. If the problem remains unresolved, contact BMC Software Customer Support.

IOAF17S ERROR IN UPDATE OF DB0 (CONTROL RECORD)

Explanation: The IOADBF utility could not update an IOA Access Method (IAM) file component control record. During processing of an IAM file index or data component, an attempt to update the file control record in the first extent failed.

The IOADBF utility terminates.

Corrective Action: Check the system log for additional messages that describe the error. Correct the problem before rerunning the program. If the problem remains unresolved, contact BMC Software Customer Support.

IOAF18S ERROR IN CLOSING DATABASE FILE

Explanation: The IOADBF utility could not close an IOA Access Method (IAM) file index or data component.

The IOADBF utility terminates.

Corrective Action: Check the system log for additional messages that describe the error. Correct the problem before rerunning the program. If the problem remains unresolved, contact BMC Software Customer Support.

IOAF19S parm PARAMETER IS NOT CORRECT

Explanation: An invalid parameter was passed to the IOADBF utility. A parameter specified in the IOA Access Method (IAM) file definition statements member or the FUNC parameter specified in the JCL procedure is invalid.

The IOADBF utility terminates.

Corrective Action: Set the parameter in error to a valid value. Rerun the program.

IOAF20S DATASET NAME: dsn

Explanation: A dynamic allocation or deallocation error occurred when processing data set dsn. This message indicates the name of the IOA Access Method (IAM) file component that could not be allocated or deallocated. The preceding IOAF14S message indicates the return code received from the allocation or deallocation request using SVC 99.
The IOADB utility terminates.

**Corrective Action:** See the IBM manual *MVS Programming: Authorized Assembler Services Guide* for a description of the return code and reason code received. If the problem remains unresolved, contact BMC Software Customer Support.

---

**IOAF21S SPECIFIED FILE NAME IS TOO LONG**

**Explanation:** The length of the name of the IOA Access Method (IAM) file component being processed exceeds the 44-character maximum for data set names. The IAM file component data set name includes the value assigned to the DSN parameter in the IAM file definition member, plus the data set extent number suffix appended automatically by IOA. IAM file definition statements are usually located in a member of the IOA INSTWORK library.

The program terminates.

**Corrective Action:** Set the DSN parameter to a value defined by 39 characters or less, and rerun the program.

---

**IOAF22S OPENING OF PARAMETER LIST FAILED**

**Explanation:** During processing of an IAM file index or data component, an attempt to open and read the IAM file definition statements member failed. IAM file definition statements are usually located in a member of the IOA INSTWORK library.

The program terminates.

**Corrective Action:** Check the system log for additional messages that describe the error. Correct the problem before rerunning the program. If the problem remains unresolved, contact BMC Software Customer Support.

---

**IOAF23S REQUESTED OPERATION IS RESTRICTED BY EXIT ROUTINE**

**Explanation:** Access was denied by IOA Access Method (IAM) allocation and formatting exit routine IOAX036. An attempt to allocate, format or extend an IAM file component was denied, because exit routine IOAX036 returned a non-zero return code.

The program terminates.

**Corrective Action:** If the executing program should have been granted access to process the IAM file, contact your system or security administrator for assistance.

---

**IOAF24I INPUT PARAMETERS FOR THE FORMAT**

**Explanation:** This information message is the header for IOA Access Method (IAM) file definition statement parameter settings that follow.

Processing continues. IAM file definition statement parameter settings are displayed in message IOAF25I.

**Corrective Action:** No action is required.

---

**IOAF25I parm**

**Explanation:** This information message displays the setting of an IOA Access Method (IAM) file definition statement parameter.

**Corrective Action:** No action is required.
IOAF26S INTERNAL ERROR. FILE FORMATTING FAILED

**Explanation:** An internal error occurred while attempting to format an IOA Access Method (IAM) file component. Formatting of an IAM file component could not be completed because an internal error was encountered by an IAM service routine.

The program terminates.

**Corrective Action:** Check the system log for additional messages that describe the error. Correct the problem before rerunning the program. If the problem remains unresolved, contact BMC Software Customer Support.

IOAF27S NUMBER OF RECORDS IN BLOCK IS MORE THAN 256.

**Explanation:** During formatting of an IOA Access Method Data File type F, the IOADBF utility issues this message when the number of records per block in the IOA Access Method Data File type F exceeds 256.

The IOADBF utility terminates.

**Corrective Action:** Correct the LRECL and BLKSIZE parameters in the corresponding member in the installation library to provide no more than 256 records per block in IOA Access Method Data File type F. Rerun the IOADBF utility.

IOAF2CS IOADBE: INVALID FUNCTION

**Explanation:** An internal error occurred in an IOA Access Method routine while processing an IOA Access Method file.

I/O request fails.

**Corrective Action:** Notify your INCONTROL administrator.

IOAF2DS IOADBE: INVALID BLKSIZE SUPPLIED

**Explanation:** An internal error occurred in an IOA Access Method routine while processing an IOA Access Method file.

I/O request fails.

**Corrective Action:** Notify your INCONTROL administrator.

IOAF2ES IOADBE: INVALID BUFFER ADDRESS SUPPLIED

**Explanation:** An internal error occurred in an IOA Access Method routine while processing an IOA Access Method file.

I/O request fails.

**Corrective Action:** Notify your INCONTROL administrator.

IOAF2FS IOADBE: TRKCALC FAILED. RC=rc

**Explanation:** Function TRKCALC returned a non-zero return code.

The I/O operation fails. Further action depends on the current IOA function.

**Corrective Action:** Contact BMC Software Customer Support.
IOAF30S IOADBE: TTR OUTSIDE FILE EXTENTS - rba

**Explanation:** An internal error occurred in an IOA Access Method routine while processing an IOA Access Method file. The I/O request fails.

**Corrective Action:** Notify your INCONTROL administrator.

IOAF31S IOADBE: I/O ERROR. CC: cc STAT: status SENSE: sense RESIDUAL COUNT: count

**Explanation:** An I/O error occurred while trying to access an IOA Access Method file. This message can be the result of a software or hardware error. The I/O operation fails. Further action depends on the current IOA function.

**Corrective Action:** Check if there are any hardware problems with the disk on which the IOA Access Method file resides. If the problem seems to be a software problem, contact BMC Software Customer Support.

IOAF40I DATABASE PRINT UTILITY STARTED

**Explanation:** This information message indicates that the IOADPT utility started. The IOADPT utility prints IOA Access Method (IAM) file component records in dump format.

**Corrective Action:** No action is required.

IOAF41I DATABASE PRINT UTILITY ENDED

**Explanation:** This information message indicates that the IOADPT utility ended.

**Corrective Action:** If the IOADPT utility ended with a non-zero return code, check the system log for additional messages that describe the error. Correct the problem before rerunning the IOADPT utility. If the problem remains unresolved, contact BMC Software Customer Support.

IOAF42S INVALID INPUT STATEMENT stmt

**Explanation:** An invalid parameter or sequence of parameters was passed to an IOA Access Method (IAM) print the IOADPT utility. The IOADPT utility terminates.

**Corrective Action:** Correct the parameter or parameter sequence. Rerun the utility.

IOAF43S ERROR IN SYSPRINT OPENING

**Explanation:** The IOADPT utility could not open the SYSOUT file or the data set referenced by the SYSPRINT DD statement, which writes message output during program execution. The IOADPT utility terminates.

**Corrective Action:** Check the system log for additional messages that describe the error. Correct the problem before rerunning the program. If the problem remains unresolved, contact BMC Software Customer Support.
IOAF44S OPERATION opn FAILED DUE TO INTERNAL ERROR IN IOADBS.
RC=rc

Explanation: An IAM service routine encountered an internal error while attempting to access an IOA Access Method (IAM) file component.

The utility terminates.

Corrective Action: Check the system log for additional messages that describe the error. Correct the problem before rerunning the utility. If the problem remains unresolved, contact BMC Software Customer Support.

IOAF45S OPERATION opn FAILED DUE TO INTERNAL ERROR IN IOADBI.
RC=rc

Explanation: An IAM service routine encountered an internal error while attempting to access an IOA Access Method (IAM) file index component.

The utility terminates.

Corrective Action: Check the system log for additional messages that describe the error. Correct the problem before rerunning the utility. If the problem remains unresolved, contact BMC Software Customer Support.

IOAF46E INVALID PARAMETER "FUNC"

Explanation: The FUNC parameter specified in the JCL procedure of the IOADPT utility is invalid.

Valid FUNC values are:

- 1 - Print IAM file index and data component records.
- 0 - Print IAM file index component records only.
- DB0 - Print IAM file data control record.

The IOADPT utility terminates.

Corrective Action: Set the FUNC parameter to a valid value, and rerun the utility.

IOAF47S PARAMETER ERROR. PARAMETERS ARE NOT SPECIFIED

Explanation: An empty parameter string was passed to the IOADPT program.

The IOADPT program terminates.

Corrective Action: Specify needed parameters, and rerun the program. Refer to the INCONTROL for z/OS Utilities Guide for more information.

IOAF48I NUMBER OF PROCESSED RECORDS WAS number

Explanation: This information message indicates the number of records printed by the IOADPT program.

The IOADPT program terminates.

Corrective Action: No action is required.
IOAF49W NO RECORDS WERE FOUND IN THE REQUESTED RANGE

**Explanation:** No record was found in the key range that the customer used.

The IOADPT program continues.

**Corrective Action:** Validate that the key range (set by parameters KEYFROM and KEYTO in job IOALOGXD in the IOA JCL library) are correct. If not, change them and resubmit the job.

IOAF70I database err descr - line 1

**Explanation:** Processing of an IOA Access Method (IAM) file component cannot be completed because an internal error was encountered by an IAM service routine. Messages IOAF70I and IOAF71I display information describing the internal error that occurred while attempting to process an IAM file component.

The program terminates. Additional diagnostic messages may precede or follow this message.

**Corrective Action:** Check the IOA Log or the system log for additional messages that describe the error. Correct the problem before rerunning the program. If the problem remains unresolved, contact BMC Software Customer Support.

IOAF71I database err descr - line 2

**Explanation:** Processing of an IOA Access Method (IAM) file component cannot be completed because an internal error was encountered by an IAM service routine. Messages IOAF70I and IOAF71I display information describing the internal error that occurred while attempting to process an IAM file component.

The program terminates. Additional diagnostic messages may precede or follow this message.

**Corrective Action:** Check the IOA Log or the system log for additional messages that describe the error. Correct the problem before rerunning the program. If the problem remains unresolved, contact BMC Software Customer Support.

IOAF72W WARNING: PROBLEMS WITH DUAL DATABASE - USING MAIN DB ONLY

**Explanation:** Mirror database file is not identical to the main database file. If the database files have mirror files, during each database access request, IOA Access Method programs check that the main and mirror files are identical. If they are not, this message is issued, and only the main database file is used.

IOA Access Method uses only the main file.

**Corrective Action:** Reformat the mirror database file, and copy the main database file into it, using the IOADCPY utility.

IOAF74E NO MEMORY FOR ERROR MESSAGE ROUTINE HANDLE - ERROR MESSAGE IS NOT PRODUCED

**Explanation:** An attempt to obtain storage for message edit processing failed because not enough memory was available to edit and issue an error message from the IOA Access Method.

Processing continues if the unissued message was for a noncritical event.

**Corrective Action:** Increase the REGION size. If the problem remains unresolved, contact BMC Software Customer Support.
IOAF80I XCF COMMUNICATION IS ACTIVE, GROUP=grp, MEMBER=mem

Explanation: This information message indicates that XCF communication is supported under this implementation of Control-O. Control-O is joined to the grp XCF group as member mem.

Corrective Action: No action is required.

IOAF82S IOAXCF ACTION xcf_cmd FAILED. RC=rc, RSN=rsn

Explanation: An error was detected while issuing XCF command xcf_cmd. The return code is rc. The reason code is rsn.

Possible values of xcf_cmd and the XCF macro indicated by each:
- QUERY - IXCQUERY macro
- JOIN - IXCJOIN macro
- SEND - IXCMSGO macro
- LEAVE - IXCLEAVE macro

Return code rc and reason code rsn are documented separately for each XCF macro in the IBM manual MVS Programming: Authorized Assembler Services Guide.

Corrective Action: Fix the problem according to the specific xcf_cmd/XCF MACRO.

IOAF83I IOAXCF-GUI MODULE NOT ACTIVATED

Explanation: This information message indicates that Control-O did not initialize the XCF Group User Interface module under the current installation.

Corrective Action: No action is required.

IOAF84E STORAGE ALLOCATION FOR COMMUNICATION FAILED, MODULE modName RC=rc

Explanation: During initialization of the modName communication module, storage allocation for the Control-O communication facility failed because the communication component could not obtain sufficient working storage for processing. The return code rc is obtained from register R15 of the STORAGE OBTAIN macro.

XCF communication is not activated. Processing continues.

Corrective Action: Check current memory usage for unknown problems. Based on the return code, fix the problem and restart Control-O to activate XCF support.

IOAF85I IOAXCF-SUI MODULE NOT ACTIVATED

Explanation: This information message indicates that the XCF Statistic User Interface module was not activated. During its initialization, Control-O did not initialize the Statistic User Interface.

Corrective Action: No action is required.
IOAF86E IOAXCF CANNOT INITIALIZE WITHOUT MUI MODULE- modName

Explanation: Control-O attempted to initialize the XCF Message User Interface (MUI) module and failed. In this message, modName is the name of the Message User Interface module that Control-O attempted to initialize.

XCF support is not activated.

Corrective Action: Verify that the modName MUI module is in the STEPLIB. Restart the last XCF operation. If the problem persists, contact BMC Software Customer Support.

IOAF87I XCF COMMUNICATION IS DOWN, GROUP=grp, MEMBER=memName

Explanation: This information message indicates that Control-O communication by means of XCF is down. The memName Control-O XCF member from the grp group is down.

Corrective Action: No action is required.

IOAF88S IOAXCF INTERNAL ERROR OCCURRED.RC=g_rc,RET=s_rc, RSN=rsn

Explanation: During XCF processing, Control-O detected an internal error. The IOAXCF module failed with general return code g_rc, specific return code s_rc, and reason code rsn.

Corrective Action: Restart the last XCF operation. If the problem persists, contact BMC Software Customer Support.

IOAF91E ERROR DURING PROCESSING

Explanation: The IOA housekeeping routine found an unexpected error during one of its cycles. The Control-O or CMEM monitor terminates. Other monitors may behave differently.

Corrective Action: Use earlier messages to determine the cause of the failure.

IOAF95S ERROR WHILE PROCESSING REQUESTS

Explanation: The XES housekeeping routine found an error while it was either processing a request that was queued by an XES exit, or while it was checking an XES control block. The XES housekeeping routine processes requests that are queued by asynchronous execution of XES SRB exits.

The Control-O or CMEM monitor terminates. Other monitors may behave differently.

Corrective Action: Send the sysout files for your monitor to BMC Software Customer Support.

IOAF96S INTERNAL ERROR

Explanation: An internal error occurred during internal chaining. An internal chaining mechanism queues requests as they pass from one component to another, for example, from SRB exits from XES to the housekeeping task. This mechanism detected an internal error that may result from a programming error.

The Control-O or CMEM monitor terminates. Other monitors may behave differently.

Corrective Action: Send the SVCDUMP of the address space issuing the message and the sysout files for your monitor to BMC Software Customer Support for analysis.
IOAFA0I XES HOUSEKEEPING TASK STARTED

Explanation: This information message indicates that Control-O or CMEM started initialization of the subtask that performs XES housekeeping.

Corrective Action: No action is required.

IOAFA1E XES HOUSEKEEPING ERROR DURING PROCESSING

Explanation: The subtask of Control-O or CMEM that performs XES housekeeping found an unexpected error during one of its cycles.
Both the subtask and Control-O or CMEM terminate.

Corrective Action: Use earlier messages to determine the cause of the failure.

IOAFA2I XES HOUSEKEEPING TASK ENDED

Explanation: This information message indicates that Control-O or CMEM finished initializing the subtask that performs XES housekeeping.

Corrective Action: No action is required.

IOAFB1I IOACMI STARTED

Explanation: This information message indicates that the IOA initialization routine started initializing XES activities, and is currently in control.

Corrective Action: No action is required.

IOAFB2I IOACMI ENDED

Explanation: This information message indicates that the IOA initialization routine stopped initializing XES activities. It does not indicate whether or not all activities were completed successfully.
The routine that initializes XES activities passes control back to the caller.

Corrective Action: No action is required.

IOAFB3S IOACMI RECEIVED AN INVALID PARAMETER LIST

Explanation: The IOA initialization routine for XES activities received an invalid list of parameters from the caller.
The Control-O or CMEM monitor terminates. Other monitors may behave differently.

Corrective Action: Send the sysout files for your monitor to BMC Software Customer Support for analysis.

IOAFB4E IOACMI - NOT ENOUGH STORAGE

Explanation: The IOA initialization routine for XES failed to get enough storage space. The routine could not GETMAIN one of the chunks of storage needed to process the XES request.
The Control-O or CMEM monitor terminates. Other monitors may behave differently.
Corrective Action: Review calculations of storage requirements for Control-O or CMEM (private, E/CSA). If you cannot find the problem, send the sysout files for your monitor to BMC Software Customer Support for analysis.

IOAFB5E IOACMI - PROBLEM INITIALIZING XES AUTOEDIT SUPPORT

Explanation: The IOA initialization routine for XES failed to get enough resources for the XAE (SYSPLEX-wide AutoEdit) facility of Control-O or CMEM. Initialization of the XAE facility requires resources, such as storage, programs and calculations.

The Control-O or CMEM monitor terminates.

Corrective Action: Use earlier messages to determine the cause of the failure.

IOAFB6E IOACMI - PROBLEM CONNECTING XES STRUCTURES RELATED TO AUTOEDIT (XAE)

Explanation: Connection to one of the required XAE structures produced a nonzero return code. A list, a cache, and a lock structure must be allocated for the XAE (SYSPLEX-wide AutoEdit) facility on Coupling facility units. This error indicates that one of these structures could not be allocated or connected.

The Control-O or CMEM monitor terminates.

Corrective Action: Check the following:
- The definition of the structures in the CFRM.
- The space allocated for each structure.
- The contents of the IOAPLEX member.
- The number of XAE databases in the DAGBLST member of CTO prefix.PARM or in the IOAGLBVL member of IOA prefix.IOAENV and the contents of each database.

IOAFB7E IOACMI - PROBLEM TERMINATING XES STRUCTURES RELATED TO AUTOEDIT (XAE)

Explanation: Disconnection from one of the required XAE structures produced a nonzero return code. A list, a cache, and a lock are allocated for the XAE (SYSPLEX-wide AutoEdit) facility on Coupling facility units. This error indicates that one of these structures could not be released or disconnected.

The Control-O or CMEM monitor continues with its other actions, without performing the action that caused this error.

Corrective Action: Check the messages that precede this error. If you cannot find the problem, send the sysout files for your monitor to BMC Software Customer Support for analysis.

IOAFB8E IOACMI - PROBLEM ESTABLISHING RESOURCE MANAGERS

Explanation: The RESMGR service macro of MVS produced a nonzero return code. XES requires MVS resource managers to protect the system from unexpected EOT or EOM events before disconnection from structures is completed.

The Control-O or CMEM monitor terminates.
**Corrective Action:** Send the sysout files for your monitor to BMC Software Customer Support for analysis.

**IOAFB9E IOACMI - PROBLEMS DURING TERMINATION OF XES**

**Explanation:** Termination of XES facilities produced an error. Some resources, such as programs or memory, could not be released.

Termination of XES facilities stops. The Control-O or CMEM monitor continues with its other actions.

**Corrective Action:** Send the sysout files for your monitor to BMC Software Customer Support for analysis.

**IOAFBAE CONNECT TO STRUCTURE structureName FAILED. REASON: rsn**

**Explanation:** Control-O or CMEM failed to connect to the structure.

Control-O or CMEM fails to start.

**Corrective Action:** Check the reason in the message to see why the connection failed, and whether this can be solved by changes to the CF or IOA parameters. If not, contact BMC Software Customer Support for assistance.

**IOAFBBI CONNECT TO STRUCTURE structureName WILL BE RETRIED.**

**Explanation:** This information message indicates that Control-O or CMEM failed to connect to the structure because a system-managed process is currently in progress.

Control-O or CMEM waits for a short time and tries to connect again. After 10 retries, Control-O or CMEM ends.

**Corrective Action:** If Control-O or CMEM ends, and there is a system-managed process in progress, wait until it ends and start Control-O or CMEM. Otherwise, contact BMC Software Customer Support for assistance.

**IOAFBBW CONNECT TO STRUCTURE structureName IS TEMPORARILY PREVENTED BY XES**

**Explanation:** This message indicates that Control-O or CMEM failed to connect to the structure because a system-managed process is currently in progress.

Control-O or CMEM issues message IOAFBCW and waits until the structure becomes available, or the operator responds to message IOAFBCW.

**Corrective Action:** See message IOAFBCW.

**IOAFBCW monitor IS WAITING UNTIL CONNECT IS ALLOWED. TO CANCEL THE WAIT REPLY 'CANCEL'**

**Explanation:** This message follows message IOAFBBW and lets the operator decide whether to let Control-O or CMEM wait until the structure is available, or cancel Control-O or CMEM and start it later.

If the operator replies CANCEL, Control-O or CMEM will terminate. Otherwise, Control-O or CMEM waits for the structure to become available, connects to the structure and continues the initialization process.
Corrective Action: Check the status of Control-O or CMEM structures and the status of the coupling facility to determine the reason why the connection was prevented. Decide whether to reply CANCEL, or let Control-O or CMEM wait until the structure is available.

IOAFBDW ENFREQ LISTEN/DELETE FOR EVENT 35 FAILED WITH RC X'rc'

Explanation: The ENFREQ LISTEN or DELETE request for event 35 failed. If LISTEN failed, Control-O or CMEM will not be able to wait after connection to a structure is prevented, to be notified when the structure becomes available for connection.

For the LISTEN request, if connection to the XAE structures is allowed, Control-O or CMEM will work normally. If connection to the XAE structures is prevented, Control-O or CMEM will not wait to be notified when the structure is available, but will fail. For the DELETE request, Control-O or CMEM will continue to work normally.

Corrective Action: Contact BMC Software Customer Support for assistance.

IOAFE1I STRUCTURE structureName IS UNAVAILABLE DUE TO SYSTEM-MANAGED REBUILD

Explanation: This information message indicates that a system-managed rebuild started for the structureName structure. Requests issued for this structure will be deferred until the system-managed rebuild ends, and the structure becomes available again. This will cause delays in accesses to IOA Global variables.

Corrective Action: No action is required.

IOAFE2I SYSTEM-MANAGED REBUILD ALLOCATED STRUCTURE structureName IN COUPLING FACILITY cfname

Explanation: This information message indicates that the structureName structure created by the system-managed rebuild was allocated on the cfname coupling facility.

Corrective Action: No action is required.

IOAFE3I STRUCTURE structureName IS AVAILABLE

Explanation: This information message indicates that the system-managed rebuild or duplex rebuild finished processing the structure, and it is available again. Requests to the structure will be processed by XES.

Corrective Action: If this message is preceded by message IOAF2EI or IOAF5I, the system-managed process ended successfully. Otherwise, the system-managed process was stopped or failed. See the system log (syslog) for details about the system-managed process.

IOAFE4I STRUCTURE structureName IS UNAVAILABLE DUE TO SYSTEM-MANAGED DUPLEX REBUILD

Explanation: This information message indicates that the system-managed duplex rebuild started for this structure. Requests issued for this structure will be deferred until the system-managed duplex rebuild ends and the structure becomes available again. This will cause delays in accesses to IOA Global variables.
Corrective Action: No action is required.

IOAFE5I STRUCTURE structureName IS IN mode MODE
Explanation: This information message provides information about the structure mode. The message is issued when:
- Control-O or CMEM connects to a structure that is duplexed. Mode will be DUPLEX.
- System-managed duplex rebuild was performed for the structure. Mode will be DUPLEX.
- System-managed duplexing was stopped for the structure. Mode will be SIMPLEX. In this case, this message should be preceded by message IOAFE6W.

Corrective Action: No action is required.

IOAFE6W SYSTEM-MANAGED DUPLEXING HAS BEEN STOPPED FOR STRUCTURE structureName
Explanation: System-managed duplexing was stopped for this structure. There are several instances when structure duplexing is stopped:
- The operator issued the SETXCF STOP,REBUILD,DUPLEX... MVS command for the structure.
- The structure definition was changed to DUPLEX (DISABLED).
- Connection to one of the coupling facilities holding a version of the structure was lost.

Corrective Action: If duplexing is required for this structure, check the system log for messages explaining why duplexing was stopped, and act accordingly.

IOAFE7W STRUCTURE structureName IS UNAVAILABLE DUE TO *UNKNOWN* PROCESS (code)
Explanation: The structureName structure is unavailable, but the reason is unknown. Requests for this structure will not be honored by XES until the structure becomes available again.

Corrective Action: Contact BMC Software Customer Support for assistance.

IOAFE8E RESPONSE TO EVENT eventCode FOR STRUCTURE structureName FAILED. REASON: rsn
Explanation: Control-O or CMEM failed to respond to an XES event. Detailed information is written to DATTRACE.

Corrective Action: If the error causes problems in the interface to XES, restart Control-O or CMEM. Contact BMC Software Customer Support for assistance.

Messages IOAG00 through IOAGxx
This group includes messages for the IOA (infrastructure) product.
**IOAG001I UTILITY IOADCPY STARTED**

**Explanation:** This information message indicates that the IOADCPY utility has started.

**Corrective Action:** No action is required.

**IOAG01E ERROR OPENING SYSPRINT FILE. UTILITY IOADCPY UNABLE TO CONTINUE PROCESSING**

**Explanation:** The IOADCPY utility was unable to open the syprint file. The IOADCPY utility terminates with a return code of 4.

**Corrective Action:** Check that the SYSPRINT DD statement exists in the IOADCPY procedure in the PROCLIB library, and that the syprint file is correctly specified in it. Rerun the IOADCPY utility.

**IOAG02E UTILITY IOADCPY UNABLE TO OPEN INPUT FILE**

**Explanation:** The IOADCPY utility was unable to open the input file. The IOADCPY utility terminates with a return code of 8.

**Corrective Action:** Check that the DAIN DD statement exists in the IOADCPY procedure in the PROCLIB library, and that it references the undamaged file. Rerun the IOADCPY utility.

**IOAG03E INVALID IOA NAME**

**Explanation:** The file referenced by the DAIN DD statement was not an IOA Access Component file. The name of the file as it appears in the block of the file is not a valid name for an IOA Access Method file. The IOADCPY utility terminates with a return code of 12.

**Corrective Action:** Correct the DAIN DD statement in the IOADCPY procedure in the PROCLIB library to reference a file that is the IOA Access Method file. Rerun the IOADCPY utility.

**IOAG04E SPECIFIED FILE NAME IS TOO LONG**

**Explanation:** The name of the file referenced by DAIN DD statement was too long. The IOADCPY utility terminates with a return code of 16.

**Corrective Action:** Correct the file name referenced by the DAIN DD statement in the IOADCPY procedure in the PROCLIB library, and rerun the IOADCPY utility.

**IOAG05E ERROR IN DYNALLOC OF FILE RC=rc**

**Explanation:** The IOADCPY utility could not dynamically allocate a file. This message is followed by message IOAG06I that details the file name. The return code specified in the message is that returned by SVC 99.

The IOADCPY utility terminates with a return code of 20.

**Corrective Action:** See the IBM manual *MVS Programming: Authorized Assembler Services Guide* for a description of the reason of return codes received. After correcting the problem, rerun the utility.
IOAG06I FILE NAME: fileName

**Explanation:** This information message details the name of the file that the IOADCPY utility could not dynamically allocate. This message follows message IOAG05E informing of the dynamic allocation error.

**Corrective Action:** No action is required.

IOAG07E UTILITY IOADCPY ENDED WITH ERRORS

**Explanation:** The IOADCPY utility ended after detecting one or more errors. This message follows a message or messages that detail the errors that occurred.

**Corrective Action:** Check for previous messages and correct the problem accordingly. Rerun the IOADCPY utility.

IOAG08I UTILITY IOADCPY ENDED SUCCESSFULLY

**Explanation:** This information message indicates that the IOADCPY utility ended without errors.

**Corrective Action:** No action is required.

IOAG09E INSUFFICIENT STORAGE FOR RUNNING UTILITY IOADCPY

**Explanation:** The IOADCPY utility could not obtain sufficient storage to run.
The IOADCPY utility terminates with a return code of 28.

**Corrective Action:** Increase the REGION size for the IOADCPY utility and rerun it.

IOAG0AE UTILITY IOADCPY UNABLE TO OPEN OUTPUT FILE

**Explanation:** The IOADCPY utility could not open the input file.
The IOADCPY utility terminates with a return code of 8.

**Corrective Action:** Check for messages in the sysout of the IOADCPY utility and in the system log, and correct accordingly. Rerun the IOADCPY utility.

IOAG0BI IOA ACCESS METHOD COMPONENT FILE IN USE

**Explanation:** The IOADCPY utility discovered that the IOA Access Method file to be used to restore the damaged file was in use.
The IOADCPY utility waits until the file becomes free.

**Corrective Action:** No action is required.

IOAG0CE UNIT NAME SUPPLIED IS INVALID.

**Explanation:** The unit name supplied as a parameter to the IOADCPY utility is invalid.
The dynamic allocation of the IOA Access Method file fails and the IOADCPY utility terminates with an error.

**Corrective Action:** Check the input parameters to the utility. See the IOAG05E message that follows this error message for the dynamic allocation return code. Correct the parameters accordingly, and rerun the utility.
Messages IOAI00 through IOAIxx
This group includes messages for the IOA (infrastructure) product.

IOAI01E ProdName1 cannot be set to Y unless ProdName2 was set to Y

**Explanation:** Product ProdName1 is dependent on product ProdName2. Therefore, ProdName1 cannot be installed unless ProdName2 is also installed.

**Corrective Action:** First set ProdName2 to Y and then set ProdName1 to Y.

IOAI02E The STEPLIB parameter was set to a non library (PDS) file

**Explanation:** The specified Load library dsname is not a PDS or PDSE library.

**Corrective Action:** Check the file and make sure it is a partitioned data set.

IOAI03E The STEPLIB library that was set does not exist

**Explanation:** The specified Load library dsname has not been allocated.

**Corrective Action:** Check the file and make sure it is allocated and populated.

IOAI04E The STEPLIB library RECFM is not "U"

**Explanation:** The specified Load library dsname has a record format that is not U.

**Corrective Action:** Check the file and make sure that attribute U has been allocated in the RECFM parameter.

IOAI05E The STEPLIB library that was set is empty

**Explanation:** The specified Load library is empty.

**Corrective Action:** Check that the specified Load library exists. If it does, check why the library is empty.

IOAI06E The reference Library is not found or unavailable: datasetName

**Explanation:** The specified datasetName reference library dsname does not exist or is unavailable for processing.

**Corrective Action:** Check the file and make sure it is allocated and is available for processing.

IOAI07E Base library prefix can not be one qualifier only

**Explanation:** The specified BASE library prefix has only one qualifier.

**Corrective Action:** The BASE library prefix must have at least two qualifiers.

IOAI08E Low level qualifier of Base library prefix MUST be BASE

**Explanation:** The specified low level qualifier of the BASE library prefix is not BASE.

**Corrective Action:** Change the low level qualifier to BASE.
IOAI09E ICELOG data set *DsName* is missing

**Explanation:** ICE or a utility failed to allocate the *DsName* data set in *ilprefa.ICELOG*. As a result, messages cannot be written to ICELOG.

**Corrective Action:** If the data set does not exist, allocate a new ICELOG data set. If it does exist, but it is in use, release it. Then run the tool again.

IOAI0AE Failed to *Action* *DsName*

**Explanation:** ICE or a utility failed to perform the specified *Action* on the *DsName* data set. The *Action* can be one of the following:

- allocate
- write to
- read from

**Corrective Action:** Check that the *DsName* data set exists and is available for performing the specified *Action*.

IOAI0BE Failed to *Action* the table *TblName*

**Explanation:** ICE or a utility failed to perform the specified *Action* on the *TblName* table. The *Action* can be one of the following:

- open
- create
- get from
- skip
- add to
- put into
- update
- save
- close

**Corrective Action:** Check that the *TblName* table is available for performing the specified *Action*.

IOAI0CE Invalid parameter *ParmName*

**Explanation:** The value of the parameter *ParmName* is invalid.

**Corrective Action:** Change the value of the parameter *ParmName* to a valid value. Refer to the ICE Online Help or the *INCONTROL for z/OS Installation Guide: Installing* for information regarding the valid values for the *ParmName* parameter.

IOAI0DE One of Cloning tools is already running

**Explanation:** An instance of one of the cloning tools is already running.
Corrective Action: Wait until the running instance of the cloning tool terminates before invoking the cloning tool.

IOAI0EE Failed to Action the Characteristic of ParmName

Explanation: ICE or a utility failed to perform the specified Action on the Characteristic of the ParmName parameter.

The Action can be one of the following:
- get
- update

The Characteristic can be one of the following:
- value
- description

Corrective Action: Check that the utility is invoked according to the information provided in the INCONTROL for z/OS Utilities Guide.

IOAI0FE The environment EnvId does not exist

Explanation: ICE or a utility failed to locate the EnvId environment.

Corrective Action: Check that the specified EndId environment exists. If the message is issued by a utility, check that the utility is invoked according to the information provided in the INCONTROL for z/OS Utilities Guide and the value of the ENVID parameter for the utility is correct.

IOAI0GE The environment origin must be EPD

Explanation: The origin of specified environment is not EPD.

Corrective Action: Check that the specified environment origin is EPD. If the message is issued by a utility, check that the utility is invoked according to the information provided in the INCONTROL for z/OS Utilities Guide and the value of the ENVID parameter for the utility is correct.

IOAI0HW Invalid syntax at the line LineNum

Explanation: The file-based Express Installation process failed because of a syntax error in the LineNum line of the input member.

Corrective Action: Fix the syntax error in the LineNum line of the input member of the file-based Express Installation. For more detailed information, please refer to the "Express Install" chapter in the INCONTROL for z/OS Installation Guide: Installing.

IOAI0II Checking the parameter ParmName

Explanation: ICE or a utility checks the validity of the ParmName parameter.

Corrective Action: No action is required.
IOAI0J \ ParmName = \ ParmValue

**Explanation:** ICE or a utility assigns the \ ParmValue value to the \ ParmName parameter.

**Corrective Action:** No action is required.

IOAI0KI \ Action Entity Direction Name

**Explanation:** ICE or a utility performs an I/O operation.

The \ Action can be one of the following:

- reading
- writing

The \ Entity can be one of the following:

- parameters
- definitions

The \ Direction can be one of the following:

- to
- from

The \ Name is the name of a data set, or a data set and a member.

**Corrective Action:** No action is required.

IOAI0LE \ ExecName can run only in the TSO/ISPF environment

**Explanation:** The \ ExecName EXEC was invoked in an incompatible system environment.

**Corrective Action:** Invoke the \ ExecName EXEC in the TSO/ISPF environment.

IOAI0ME \ ExecName should be invoked from the IOA INSTALL library

**Explanation:** The \ ExecName EXEC was invoked in an inappropriate library.

**Corrective Action:** Invoke the \ ExecName EXEC from the IOA INSTALL library.

IOAI0NE Failed to establish TSO ALTLIB \ DsName

**Explanation:** ICE or a utility failed to allocate the \ DsName data set.

**Corrective Action:** Check that the \ DsName data set exists and it is the IOA LOAD library.

IOAI0OI \ The exec \ ExecName terminated with RC= \ RetCode

**Explanation:** \ ExecName EXEC terminated with a return code of \ RetCode.

**Corrective Action:** No user response is required if \ RetCode is zero. If it is not, please refer to the \ INCONTROL for z/OS Utilities Guide for further information regarding the return codes of the \ ExecName utility.
IOAI0PE Failed to create the member MemName
Explanation: ICE or a utility failed to create the ilprefa.INSTWORK(MemName) member.
Corrective Action: Compress the ilprefa.INSTWORK data set and ensure that the ilprefa.INSTWORK(MemName) member is not open. Then rerun the utility.

IOAI0QI The exec ExecName started
Explanation: The ExecName EXEC was invoked and the execution started.
Corrective Action: No action is required.

IOAI0RI The member MemName created
Explanation: The MemName member was created by ICE or a utility.
Corrective Action: No action is required.

IOAI0SW Used space is over nn% in DsName
Explanation: The Renaming tool failed to write to the DsName data set, because the data set is almost full.
Corrective Action: Free some space in the data set or enlarge the data set. Compress the data set and rerun the Renaming tool.

IOAI0TE ENVID value is not specified
Explanation: The value of the mandatory ENVID parameter is not specified.
Corrective Action: Specify the value of the mandatory ENVID parameter.

IOAI0UW The parameter ParmName is ignored
Explanation: The value of the superfluous ParmName parameter is ignored.
Corrective Action: No action is required.

IOAI0VE Failed to identify the data set DsName
Explanation: The Renaming tool failed to identify the DsName data set which is specified in the ilprefa.INSTWORK(IOACDDSL) Data Set List.
Corrective Action: Fix the ilprefa.INSTWORK(IOACDDSL) Data Set List and rerun the Renaming tool.

IOAI0WI Processing data set DsName
Explanation: The Renaming tool is processing the DsName data set.
Corrective Action: No action is required.
**IOAI0XI  Setting up *Prod***

**Explanation:** The Renaming tool is setting up the *Prod* product.

**Corrective Action:** No action is required.

**IOAI0YE  Failed to *Action* *Prod***

**Explanation:** The Renaming tool failed to perform the *Action* operation on the *Prod* product.

The *Action* can be one of the following:
- setup
- post-done

**Corrective Action:** Please examine the messages in the *ilprefa*.ICELOG data set to identify the reason of the failure.

**IOAI0ZI  Data set *DsName* already exists**

**Explanation:** The Renaming tool is invoked with the parameter MODE(ALLOC) and the *DsName* data set is listed in the *ilprefa*.INSTWORK(IOACDDSL) Data Set List. The tool will not allocate the *DsName* data set because the data set already exists.

**Corrective Action:** No action is required.

**IOAI10E  OPTION R IS INVALID, SINCE THE REFERENCE ENVIRONMENT WAS NOT SPECIFIED**

**Explanation:** Specifying the R option for the capacity of a product refers the installation to the reference environment. If no reference environment was specified, the R option is meaningless.

**Corrective Action:** Specify the capacity using an available option or specify the reference environment.

**IOAI11E  SMP/E data sets are not exclusively owned by this IOA**

**Explanation:** The SMP/E CSI of this IOA environment contains other (non-INCONTROL) products, or other IOA instances. SMP/E Enabled IOA Cloning is not supported in this case.

**Corrective Action:** For more information, see the Limitations section of the "Cloning an IOA environment" chapter in the INCONTROL for z/OS Installation Guide: Installing.

**IOAI12E  SMP/E Cloning can be done using ICE only.**

**Explanation:** Cloning can only be performed using ICE.

**Corrective Action:** Perform the cloning from ICE.

**IOAI20E  ECAPARMx validation error message**

**Explanation:** Where *ECAPARMx validation error message* can be one of the following:
Application Appl cannot share a channel with application C
Application Appl cannot share a channel with application F
Application C cannot share its channel with other applications
Application F cannot share its channel with other applications
Application F must have TCP protocol
Applications D, F must have MULTCONN channel
Channel ChanID is not used by any application
Channel ChanID not defined for APPL Appl
Control-M (M) must have TCP DUALCONN channel
Control-M/CM COMTASK should be left null or set to 1
Control-M/CM must have TCP MULTCONN channel
Control-M/CM UPERTASK should be left null or set to 1
Control-O (O) must have MULTCONN channel
Errors found. ECAPARMx was not built
Join of applications is not supported. APPL = Appl
Mixed TCP vendors. Channel: TCPVendor ChanID - Channel: TCPVendor ChanID
No application was defined
No channel was defined
Only one Control-M (M) allowed in ECAPARM
Only one Control-M/CM allowed in ECAPARM
Only one Control-O (O) allowed in ECAPARM
Only one PATROL (P) allowed in ECAPARM
PATROL (P) must have TCP MULTCONN channel
The APPLID Appl in channel ChanID is already used
The channel ChanID must have Node and Map parameters
The port PortNum in channel ChanID is already used
Corrective Action: Correct the problem and run the Renaming tool again.

IOAI21I Renaming tool informative message
Explanation: Where Renaming tool informative message can be one of the following:
- Active Balancing File Space Calculation
- Activity File Space Calculation
- Adjust CTV members in CTD JCL data set
- Adjust members in CTD SKL data set
- Build ECAPARMC
- Build ECAPARMD for APPL=(D)
- Build ECAPARMD for APPL=(F)
- Build ECAPARMM
- Build the IOAKPRM parameters member
- Build the IOARULES member
- Build the IOASPRM parameters member
- Build the IOAXPRM parameters member
- Build the SECPARM member
- Copy \textit{Prod} procedures
- Copy \textit{Prod} started tasks
- Format IOA Data Base
- Group File Space Calculation
- IOA Log File Space Calculation
- Media Database Space Calculation
- Post-clone \textit{Prod}
- Report File Space Calculation
- Resolve \textit{Prod} libraries
- Save Parameters
- Space Calculation for ACTive User File
- Space Calculation for Columns File
- Space Calculation for Databases File
- Space Calculation for HiSTory User File
- Space Calculation for MIGrated User File
- Space Calculation for PeRManent User File
- Space Calculation for Variables File
- Stacking Database Space Calculation
- Trace File Space Calculation
- Update Global Index File parameters
Validate *Prod* parameters

- Vars Definition File Space Calculation
- Vars Generations File Space Calculation

**Corrective Action:** No action is required.

**IOAI22E** Failed to process data set *DsName*

**Explanation:** The Renaming tool failed to process the *DsName* data set.

**Corrective Action:** Examine the informative message IOAI23I that follows to obtain more information about how to correct the problem.

**IOAI23I Renaming tool informative message**

**Explanation:** This informative message can be issued either independently or following the IOAI22E error message, providing more detailed information about the failure. The Renaming tool informative message can be one of the following:

- RC= Rc Routine
- The job *JobName* *(JobID)* failed

(Only issued when the failure was caused by a job.)

**Corrective Action:** If necessary, make the necessary correction, using the information provided, and run the Renaming tool again.

**IOAI25E Renaming tool error message**
