

Control-M

Application Integrator

Extend the power, convenience, and stability of Control-M to any application workflow.

Enable any application workflow to be managed by Control-M

Support authentication for both on-premises and public cloud provider services

Support modern software development pipeline with Jobs-as-Code

Exchange and share job types online at Control-M's Application Integrator Hub

DESCRIPTION

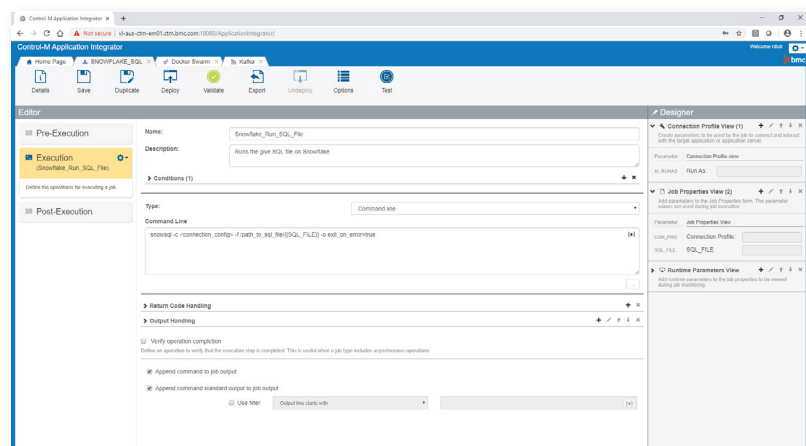

Control-M's Application Integrator is a web-based application that allows you to create custom job types that can be easily deployed to the Control-M environment. These jobs can be managed alongside any Control-M job, giving you the ability to manage on-premises and multi-cloud application workflows for commercial, custom and home-grown applications in a single, consistent way.

BUSINESS CHALLENGE

Developers and Operations need to deliver business services and the application workflows that underpin them quickly, securely, and cost effectively. They are often unable to keep up with demand, having to support application workflows differently across environments. Using home-grown scripts and one-off methods requires too much time to create and maintain and when application workflow issues occur they are difficult to troubleshoot.

BMC SOLUTION

Control-M's Application Integrator guides you through the steps for integrating your critical application workflows with Control-M, resulting in a single, enterprise view. Backed by **Control-M's Application Integrator Hub**, an open community exchange where users can find, use, and share crowdsourced job types, both on-premises and multi-cloud based digital services can be easily and quickly delivered in a scalable and sustainable way.

CAPABILITIES

Control-M's Application Integrator allows anyone responsible for application workflows to design, test, deploy, and schedule workloads and business services in on-premises and multi-cloud environments.

Modernize application workflow creation and management:

Control-M's Application Integrator makes building workflows easy, flexible, and repeatable—eliminating inefficient workflow designs, saving time, and reducing risk. Taking a **Jobs-as-Code** approach supports application workflow creation and management in the SDLC just like any other code component of an application.

Support any application:

Control-M's Application Integrator job types support a variety of application interfaces, including Web Services, REST APIs, and command line.

Easy to use:

The intuitive web-based interface enables developers and schedulers to avoid scripting and redesigning workflow logic to fit generic job forms and includes drop-down menus and other features that minimize user data entry and configuration to support rapid, accurate implementation.

Crowd-sourced community:

Control-M's Application Integrator Hub allows users to share Application Integrator-created job types and easily deploy them in their Control-M environment.
